The Architects' and Builders' Journal : Supplement, January 25th, 1911,

1910.

VOLUME
THIRTY-TWO.

JULY—
DECEMBER.

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

THE ARCHITECTS' & BUILDERS' JOURNAL.

A Weekly Journal for Architects Surveyors Builders and Constructional Engineers.

It is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious art; for the disciplined ranks of a distinguished profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . .

CAXTON HOUSE, WESTMINSTER.

CONTENTS.

See also Concrete and Steel Section.

ABBATTOIR FOR ISLINGTON, NEW, 638, 792.
Aberdeen Building Trades, 232.
Accidents During Building Operations, 112.
Acoustics, Ventilation and Architectural, 24.
Acton School Competition, 298, 320.
Admiralty Buildings, The New, 212.

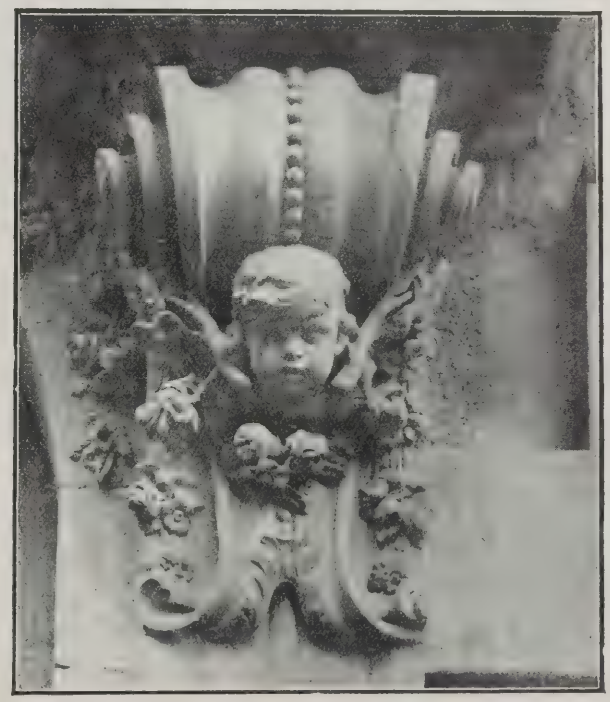
THE ARCHITECTS' &
BUILDERS' JOURNAL

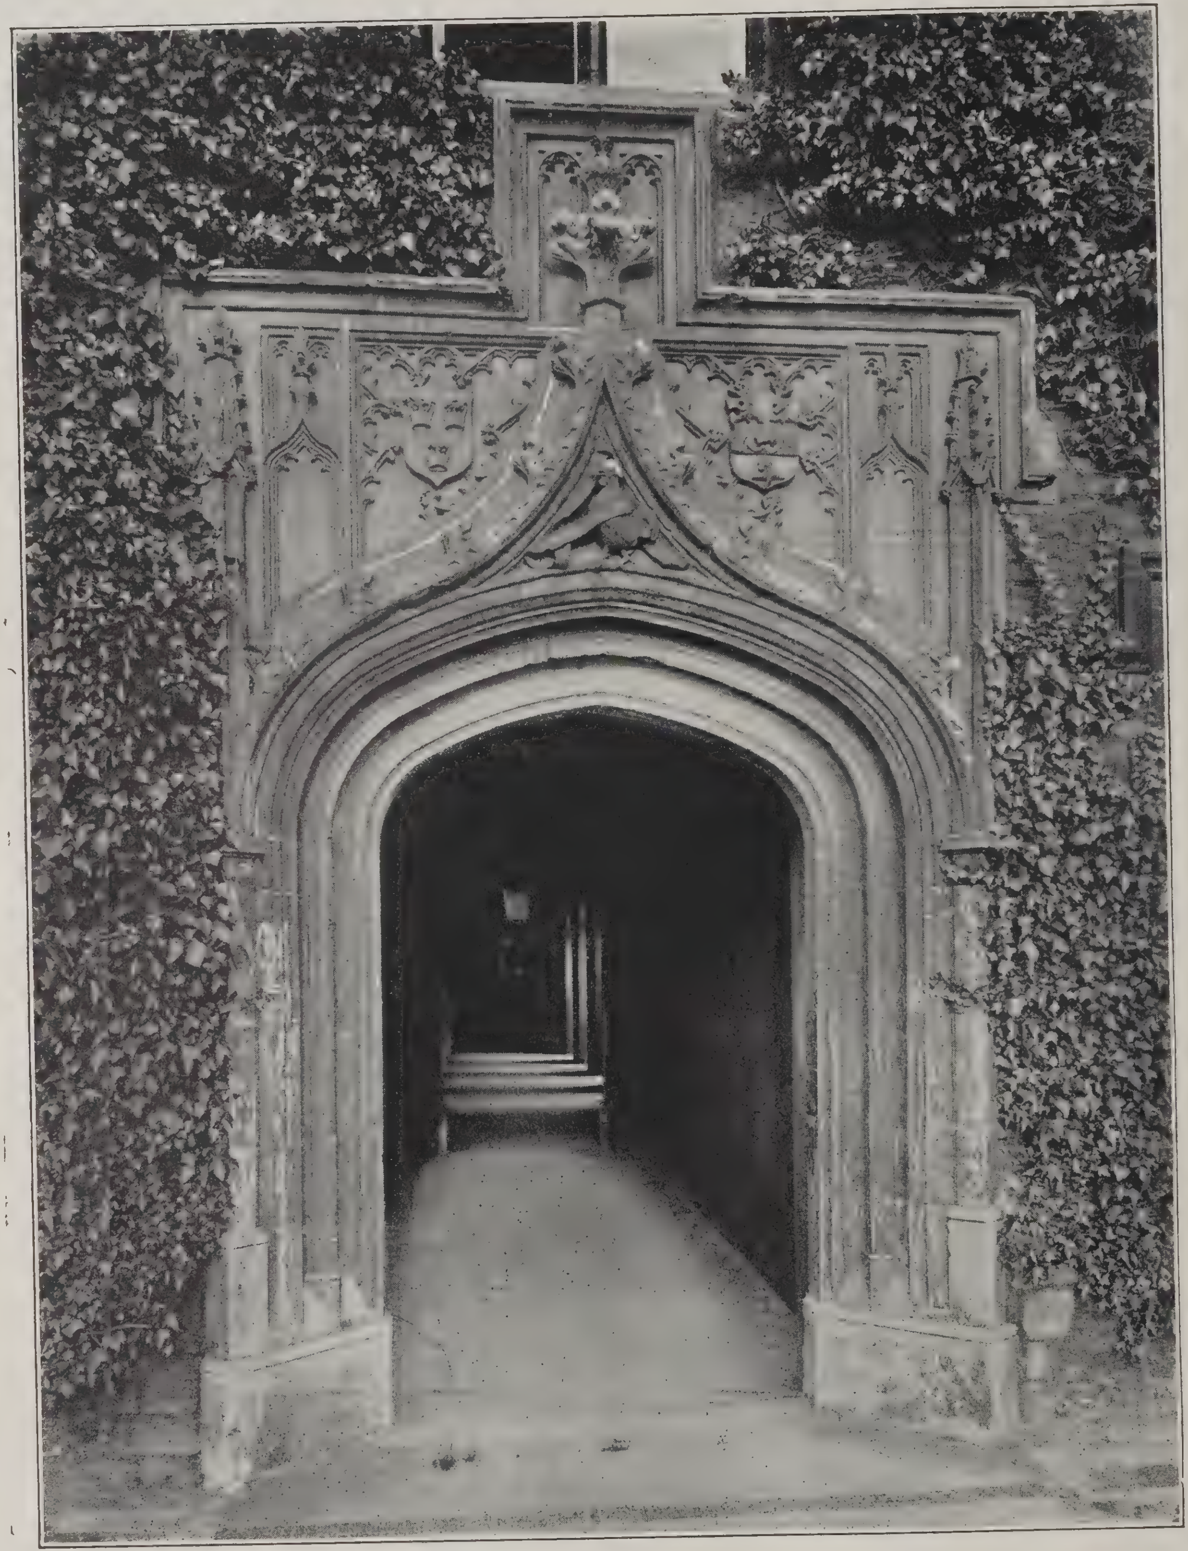
WEDNESDAY,
JULY 6th, 1910.

Volume XXXII. No. 805.



The door showing the bracket of which this is a detail gives access to the base of the geometrical stairs in the southern or clock tower. The tympanum is filled with winged heads of children, but it is the brackets that give the door its distinction.

DETAIL OF BRACKET, THE DEAN'S DOOR, ST. PAUL'S CATHEDRAL.



This doorway, which leads into the second court, is noticeable for the cock which can be seen above the middle of the arch. The cock is the principal emblem of the College, and recalls John Alcock, Bishop of Ely, who, by a charter of 1497, converted the old existing nunnery into a college.

DOORWAY TO SECOND COURT, JESUS COLLEGE, CAMBRIDGE.

THE ARCHITECTS' & BUILDERS' JOURNAL.

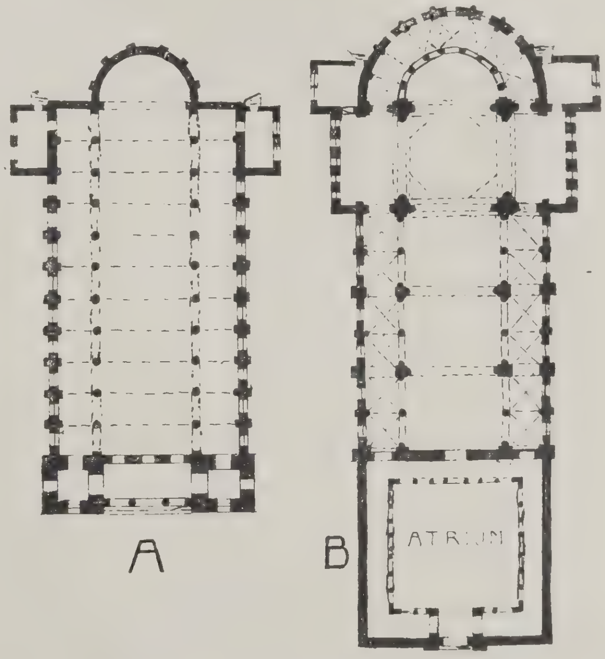
The Basilica Plan for the Modern Church.

WHEN the Gothic revival was in its first exuberance, coinciding as it did with a passionate revival of mediæval ecclesiology, no one doubted that the revived mediæval church plan was the best, the only possible plan to suit the Anglican church service, and to respond to the aspirations of the devout churchman. A deviation from it, or from orthodox Gothic detail, was a fault for which the architect guilty of it was held up to reprobation in ecclesiological journals, and by ecclesiological committees.

The Gothic revival, however, had not died out, had indeed only arrived at its central career, when practically-minded church architects, whatever their faith in Gothic, began to discover that an area with two rows of large piers running through the middle of it, had obvious disadvantages for a congregation who wished to see and hear priest and preacher, and the device was started by one very eminent church architect, and followed by others, of making the side-aisles narrow, using them for passage only, instead of for seating, thus retaining the three-aisled idea, and the architectural effect of the nave arcades, while materially altering the plan and section from that of the mediæval building. This arrangement is now to be frequently met with in the church designs of the day, most frequently in those which are otherwise Gothic in style and treatment; sometimes in the very rare instances which we see of a modern church of Classic character.

Very rare; for in spite of the fact that Gothic has been now almost entirely abandoned for secular buildings, it is still for the most part accepted as the correct, if not the only, style for a church, as a matter of religious association. But it seems to be forgotten that the mediæval church, after all (whether we speak of the material or spiritual church), was a late form both architecturally and ritually, and that there is a form of church which has far older religious associations than anything mediæval. The Latin Basilica church goes back to the earliest times when Christian public worship was openly instituted, and received the protection of the Imperial power. And its plan presents, in a more convenient form, that kind of passage-aisle arrangement which is only obtained in a mediævally designed church by a plan somewhat at variance with the traditional design and proportions of the mediæval three-aisled church.

We may recognise two forms of the Basilica plan of church—that which the earliest churches in Rome, after the date of Constantine, assumed; and that which came into shape when the Romanesque school of architecture was struggling into shape. Types of the two plans are subjoined. That marked *A* represents the earliest and simplest type of the Latin Basilica church, except that the western towers were not a usual feature; they belong rather to German and French than to Italian architecture. But the remainder of the plan represents the Latin Basilica arrangement. Simple as it is, this is a plan which can be made very effective as an interior. The aisles are divided off by a long unbroken range of columns, which forms a fine perspective leading up to the apse. The long choir of the mediæval parish church (both the genuine and the revived mediæval) is omitted, and we return to the simple apse of early days, because it has been recognised by many, and will be recognised by more as the subject becomes better understood, that the chancel is a bad position for the choir, in a musical sense, as they are not well heard by the congregation whom they are supposed to lead; and that a choir of secular persons, selected merely for musical reasons, have really no traditional place within a screened-off chancel; they are occupying a special place formerly occupied by the monks who sang the service, but which the latter occupied, not as singers, but as clerics. The placing the choristers in the chancel is therefore a completely false tradition. In this plan the organ and choir are supposed to be in a west-end gallery over the narthex; a better situation at all events than in a long chancel. In an architectural sense the west-end towers are very valuable, not only as giving a dignified façade, but as masking the weak line formed by the sloping roofs of the aisles. This sloping outline of the façade is the weak point of the Italian form of basilica. The church as shown here is supposed to have a wooden roof, which might either be open-timbered, or have a decorative ceiling below the tie-beams; the form usually adopted in the ancient Latin basilica. It is a construction favourable for acoustic effect. The columns are more convenient than the compound Gothic pier, taking up less room. They might carry either an arcade or a horizontal entablature; both were employed in the ancient basilicas; but



TYPES OF BASILICA CHURCH PLANS.
A=The Latin type. *B*=The Early Romanesque Type.

the arcade has the best effect. This plan would produce a church convenient both for sight and hearing, and in accordance with the oldest Christian tradition. There is much to be said, therefore, in its favour.

The other sketch plan, *B*, shows the type which obtained in many instances in the earlier times of Romanesque architecture. The most essential distinctions between this and the Latin type of church are, first, that the apse is the whole width of the nave, the aisle being continued round it; secondly, that there is a grouping of the points of support in an alternating fashion; a compound pier and a column alternately. In the later Romanesque this is generally a device for carrying a central vault over the wider central avenue of the nave; the nave and choir, in ancient churches of this period, being frequently planned with the aisles just half the width of the centre, so that two square compartments of vaulting in the aisles went to one compartment of the centre vault. But long before builders had ventured on vaulting the central space, this alternating arrangement of piers had been devised, with the object of throwing a solid arch across the church above the larger piers, thus giving the building a more monumental character, both in appearance and in reality, for the solid built arches formed a tie between the arcades and the wall above them, and strengthened the whole fabric. This device occurs as early as the beginning of the ninth century in the basilica church of St. Praxede at Rome, though it is there carried out in a very clumsy fashion; it is carried out in much more artistic style in the beautiful and almost Classic interior of San Miniato at Florence, some two centuries later. In the sketch plan here given this system is suggested, the centre roof between the cross arches being of timber, and the side aisles vaulted in brick or stone. In the plan here given the transepts are wider and are entirely thrown into the church, and in them would be placed the organ and choir, the organ being divided into two, a part of it on each side, so as to blend alternately with each side of the choir; an arrangement which, with modern electrical mechanism, can always be carried out if desired; it is only a question of cost. Or otherwise, there might be only a small organ in each transept, sufficient to support the choir, and a large one at the west end, above the entrance, for grander effects, and for accompanying congregational singing. The four large piers at the crossing would carry an octagonal lantern which would form the dominant exterior feature; a composition frequently suggested in the Romanesque churches of the south of France, as also occasionally in German Romanesque. The colonnaded atrium, though only shown in plan *B*, is really more a Latin than a Romanesque feature (though found in some Romanesque churches); but it is such a beautiful approach to a church, and has such an effect of seclusion and separation of the place of worship from the outer world, that one would be very glad to see it revived sometimes.

As there seems some inclination at present to experiment a little in the planning of churches, and as it is probable that the comparative disfavour into which revived Gothic has fallen, for secular buildings, will before long extend to church architecture also, we recommend to those whose good fortune it is to build churches the consideration of the basilica type of church, as one which for modern congregational worship has a good many practical advantages; which is susceptible of very fine architectural effect; and which, we may once more remind them, represents a Christian tradition a great deal older than that represented by mediæval building.

The Proposed French Palace, Aldwych.

It is to be hoped that the French Palace of Arts and Industries, which it is definitely stated is now to be erected in Aldwych, opposite the axis of Kingsway, will be a building architecturally worthy of so exceptional a site. One feels a little anxious about it, because in a building of this class, which may be said to be a kind of superior bazaar, we know that show is generally sought for, rather than mere solid architectural qualities. A French architect of repute has been engaged, and French architects have a certain faculty for combining show with artistic quality. But the western termination of Aldwych is already occupied by two buildings of a monumental character, and it would be a great mistake if the centre of the convex quadrant were allowed to be occupied by a building in a less dignified and more florid style. What we should like to see would be a domed building of monumental style in the centre, and an ultimate finish of the east end of the quadrant on the same design as the west end, with appropriately designed lower buildings connecting the centre and end blocks.

The New R.A.

We may congratulate Mr. Arthur Hacker, A.R.A., on his promotion to the full dignity of "R.A."; he is a fine and accomplished painter of the figure, and has done some very pleasing pictures; but we confess that there are some names in the list of Associates who we should have thought had a prior claim, unless it goes partly by seniority, a point we have not statistics for testing. But what of Mr. Pomeroy, and Mr. Pegram, and Mr. Colton among sculptors? And Sir Alfred East and Mr. Cope among the painters? We should hardly be persuaded that none of these had equal claims with Mr. Hacker.

Proposed Edward VII. Monument at Hyde Park Corner.

The proposal made by that irrepressible amateur town-planner, Mr. Speaight, for a monument to the late King at Hyde Park Corner might be worth considering if the question were about laying out ground at present vacant. But as it is, the scheme involves the absurdity of a second time pulling down and rebuilding the Constitution Hill arch, which is really not worth pulling down and rebuilding again; it has no doubt been very badly placed where it is, but it had better be left undisturbed now. Then the scheme also involves the moving of the Wellington monument, which is now in its appropriate position opposite Apsley House. It is absurd to suppose that all these changes and this pulling about of existing monuments would be tolerated merely for the sake of finding a site for a monument to the late King. As we have already urged, the really suitable and useful monument to him would be the carrying out of a new façade to Buckingham Palace, a scheme which would interfere with nothing else, and would supply to the Queen Victoria memorial what it needed from the first—an adequate and dignified architectural culmination.

The New Coinage.

It is satisfactory to learn that a really fine sculptor, Mr. Bertram Mackennal, has been commissioned to model the new coinage for the new reign. There have been a good many failures in recent times in the design of new coinage, a matter in which we compare badly with France, which has at her disposal the services of the two greatest medallist artists living, M. Roty and M. Chaplain. The object of coinage design is three-fold: To give a good portrait of the reigning sovereign; to combine it with details so arranged and spaced as to produce a good decorative effect; and to give a distinctive difference in appearance to coins which nearly resemble each other in size and value, such as the four-shilling and five-shilling pieces, and the florin and half-crown. The modelling of the portrait head on a coin is one of the most delicate problems of bas-relief sculpture, having to combine realism and expression with very low relief on a very minute scale. We may expect from Mr. Mackennal, the author of one of the most beautiful and expressive statuette groups ("Mother and Daughter") ever exhibited at the Royal Academy, an accomplished treatment of this difficult task.

NOTES AND NEWS.

The Lady Chapel, Liverpool Cathedral.

To-day (Wednesday) the Lady Chapel, which is the first completed instalment of the new Liverpool Cathedral, is to be opened. The See of Liverpool is essentially a modern one, the date of its foundation being so recent as 1880. Dr. Ryle was enthroned Bishop in the Cathedral Church of St. Peter, which is in the most central thoroughfare of the city, on July 1 in that year. Since that time St. Peter's has served as the Pro-Cathedral. It may be useful to recall that the new cathedral is being erected in an elevated position known as St. James's Mount, about three-quarters of a mile from the site of the existing Pro-Cathedral, in Church Street. The foundation stone was laid by King Edward VII., who was accompanied by Queen Alexandra, on July 19, 1904. The ceremony of dedication was performed by the then Archbishop of York (Dr. Maclagan). The designs are those of Mr. Gilbert Scott, who for the details of the work was associated with Mr. G. F. Bodley, as joint architect, until the death of the latter in November, 1907. When the cathedral scheme was originally projected, it was estimated that approximately £600,000 would be required for the entire erection, but it is now computed that before the final stone has been laid the outlay will have approached close upon three-quarters of a million sterling. Towards this aggregate about £300,000 has been subscribed. In addition to the donations in cash, there have been many munificent gifts in the form of memorial windows, chancel furnishings, etc., and the Freemasons of West Lancashire are erecting the Lathom Chapter House in memory of the first Earl of Lathom, their Provincial Grand Master. The cathedral, including the Lady Chapel, will have an external length of 611ft., with central towers 260ft. in height. There will be seating accommodation for 8,000 persons. It will be the largest cathedral in the United Kingdom. The structural operations have been in progress for nearly six years. The red sandstone used is being obtained from quarries at Woolton, Runcorn, Helsby, and Rainhill, with special stone for steps from the Forest of Dean. The total cost of the Lady Chapel is about £60,000. The chapel will hold about 500 worshippers.

Ashburnham House.

Though now a part of Westminster School, Ashburnham House preserves much of its original seventeenth-century character. This is notable especially in the staircase, one of the finest in England. Its plan proclaims the master-hand of its designer (generally assumed to be Inigo Jones), and its details have all the vigour of the period. It is so admirably adapted for the pageant of a richly dressed procession that it seems as if Inigo Jones had in this staircase given permanence to one of his scenic inventions, and fixed for later generations the *mise en scène* of an antique play. Some fine views of it are given in the July issue of "The Architectural Review, as well as others of the great drawing-room (with its beautiful plaster ceiling), the dining-room, and other parts of Ashburnham House.

Of particular interest, too, are the illustrations of Crosby Hall, all from specially taken photographs. The greatest credit is due to the architects, Messrs. Wratten and Godfrey, who were entrusted with the rebuilding of Crosby Hall on a site at Chelsea facing the river, after its demolition in the city. The work, carried out by Messrs. Trollope and Colls, has been done in the most skilful and successful manner. The roof—that magnificent specimen of fifteenth-century woodwork—can now be seen to perfection, and the beauty of the oriel window is no longer hidden.

Other features of the July issue are an article by Mr. Edwin F. Reynolds, on "The Imperial Mosques of Constantinople" (the concluding article of a valuable series); some excellent drawings and a photograph of that amazing geometrical staircase, 24ft. in diameter, which Wren contrived in the southern tower of St. Paul's Cathedral—a stair with the inner ends of the steps pinned into the wall as the only means of support, so that, in ascending it, one has a curious feeling of treading the air; some reproductions of Mr. Frank Brangwyn's fine decorative paintings in the hall of the Skinners' Company; illustrations of the new club for students of Liverpool University, which is being erected from designs by Professor Reilly; and, in the "Town Planning and Housing Supplement," a critical and suggestive article on Port Sunlight, by Mr. Macartney, and an illustrated article on the London County Council's White Hart Lane Estate at Tottenham, where some good types of houses for the working classes have been erected.

Selby Abbey.

Mr. J. Oldrid Scott has felt himself constrained to reply to an anonymous correspondent of an evening paper who deprecated the erection of the missing south transept of Selby Abbey as a memorial to the late King. The correspondent said that the idea of a "memorial restoration" was a grotesque one. But, replies Mr. Scott, as no transept exists, there can be no proposal to restore it. The correspondent also spoke of the transept dating from a period some 600 years back, and declared that the duty of its due reparation belongs to those responsible for its wellbeing. Mr. Scott recalls that the Norman transept, built about 800 years back, was completely destroyed when the tower of the abbey fell in 1690, since when there has been no south transept, and what should be the most beautiful view of the building is sadly marred by its absence. It is therefore no restoration or reparation that is proposed, but the replacing of a missing feature of the first importance. Surely, Mr. Scott supposes, such a good work as this would form a fitting memorial, and be one in which others besides the inhabitants of Selby would be glad to take a part.

The United University Club, London.

(See Centre Plate.)

The United University Club, Pall Mall, S.W., which is the subject of the first of our new series of centre plates (for the facilities for the reproduction, we are indebted to the courtesy of the architect, Professor Reginald Blomfield, A.R.A.), was rebuilt some two or three years ago on the old site, and upon the same area of ground as the former building. As the club accommodation had to be greatly increased, and bedrooms for members provided, the plan had to be carefully considered in order to comply with the conditions of the problem. The old club house followed the usual practice of devoting the centre third of the building to a grand staircase, which took up a great deal of room, and wasted more by separating the club into two halves. Such a plan was out of the question in the new building, and in order to provide the requisite accommodation it was necessary to place the hall and main staircase at the north end of the building facing west down Suffolk Place. This arrangement has the further advantage of opening up the entrance from the Haymarket along Suffolk Place. The club-house contains, in the basement, kitchen and all offices and cellars; on the ground floor, smoking-room (west), reading-room (south), entrance hall, main and back stairs, and lavatories; on the first floor are the club dining-rooms, *en suite*, and occupying the whole of the fronts to Suffolk Place and Pall Mall, coffee room, main and back stairs, lavatories, etc.; on the second floor, library, billiard-room, card-room, secondary main stairs and back stairs, lavatories, etc.; on the third floor, billiard-room, card-room, three members' bedrooms, bathrooms, lavatories, etc., and secondary main and back stairs; on the fourth floor, seven members' bedrooms, steward's room, and boys' bedroom, bath-room, etc., and secondary main and back stairs. A passenger lift runs up to the third floor; a double-service lift from basement to fourth floor, with service-rooms on every floor, and double-service lifts from basement to dining-rooms on the first floor. The façade is faced with Portland stone, and the roof covered with Westmorland slates.

WESTMINSTER CATHEDRAL.

[*Westminster Cathedral was consecrated last week, and the occasion seems appropriate for the following brief account of a building that has excited much admiration and perhaps more controversy.*]

The Inception of the Cathedral.

THE conception of a cathedral for the Metropolitan See of Westminster originated in the mind of Cardinal Wiseman, and after his death, at a meeting held with the object of arranging for a memorial to him, his ambition for the erection of a splendid cathedral was applied to the circumstances, and its realisation was entered upon by Cardinal Manning. The site for the cathedral was acquired by a limited company, who made it over to Cardinal Manning at its cost price of £55,000.

The Choice of Architect and Style.

A design that appears to have been greatly admired by Cardinal Manning was submitted by Mr. Henry Clutton. It resembled the cathedral of Cologne, and the external measurements were to be 450ft. by 250ft. When Cardinal Vaughan became Archbishop of Westminster, there was much discussion as to the choice of an architect, and the style to be adopted. When Mr. John Francis Bentley was chosen as architect, it was decided not to invite comparison with Westminster Abbey by adopting Gothic; and, apart from that consideration, it was important to observe that the cost of a Gothic building would have been about three times that of the cathedral that has been erected. It is interesting to recall what Mr. Bentley himself said as to the choice of style: "It was thought by the Cardinal," wrote Mr. Bentley, "that to build the principal Catholic church in England in a style that was absolutely primitive Christian, that was not confined to Italy, England, or any other nation, but that was up to the ninth century spread over many countries, would be the wisest thing to do. Personally, I should have preferred a Gothic church, yet, on consideration, I am inclined to think that the Cardinal was right." Further, he remarked concerning the style: "It is early Christian Byzantine. In fact, the church will be unique as far as this part of Europe is concerned. . . The new cathedral will, in style, be the same as that in which St. Sophia at Constantinople is built."

Progress of the Work.

The foundation stone, which was laid on June 29th, 1895, by Cardinal Vaughan, assisted by Cardinal Logue, is a block of granite, 5ft. long, 3ft. wide, and 2ft. 8in. high. The foundations were completed in 1896, at an outlay of about £14,000. The contract for the superstructure was signed in 1896, and by 1899 the outer walls were nearing completion, while the brickwork and stonework of the aisles, chapels, transepts, and apsidal choir, and the outer walls of the clerestories, were up to the level of their copings, and the remainder of the walls had reached the height of 85ft. from the pavement level. Great transverse arches, of 60ft. span, and 90ft. high from the floor to their soffits, carrying the four domes, were then being turned. The domes are formed of concrete, composed of four parts of broken bricks and one part of Portland cement. The concrete was prepared on a stage round each dome, and thrown fresh on to the boarded centre (which was previously sanded to prevent adhesion), in rings varying from three to five feet deep, and screeded on the upper surface to a graduated thickness to ensure an absolute uniformity in longitudinal and latitudinal sections. The architect would not permit the use of any cement until it had been at least thirteen weeks on the site in bins, where it was periodically turned over, and the temperature taken regularly. The entire shell of the building, except some work on the façade, and the last 50ft. of the campanile (which was finished in the early part of 1903) was ready by 1901.

THE LATE JOHN FRANCIS BENTLEY.
(Reproduced by courtesy of Messrs. Burns and Oates.)

Dimensions.

The dimensions of the cathedral are as follows: External—Extreme length, 360ft.; width, 156ft.; height of nave, 117ft.; height of façade (not including the turrets), 99ft.; height of campanile, 273ft., and to the top of the cross, 284ft. Internal: Length from the main entrance to the sanctuary, 232ft.; depth of the sanctuary, 62ft.; and of the raised choir beyond it, 48ft.—making the total internal length 342ft.; width of the nave, 60ft.; width across the nave and aisles, 98ft.; and across nave and aisles and side chapels, 148ft.; height of the main arches of the nave, 90ft.; and of its three domes, 112ft. The whole building covers an area of about 54,000 square feet.

The Interior.

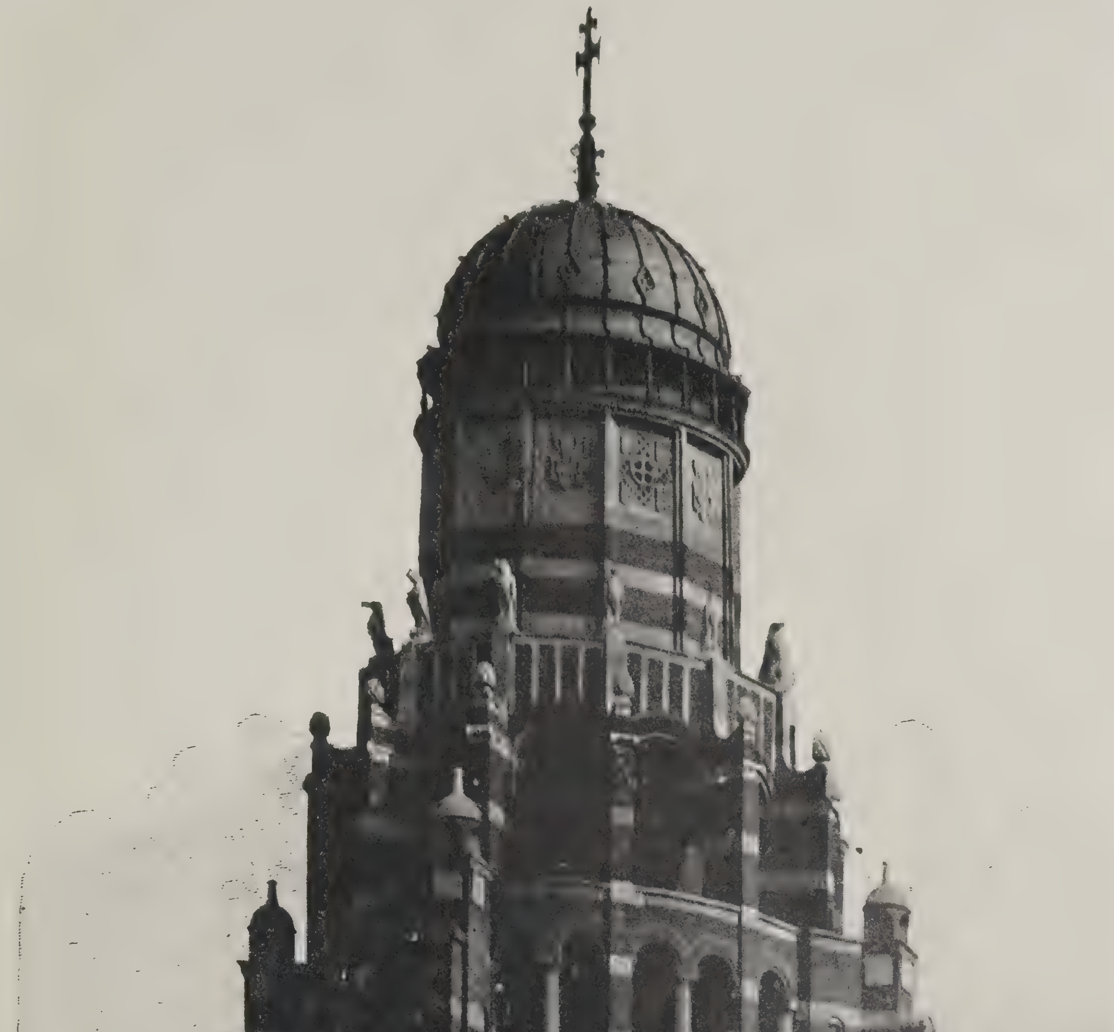
The interior of the cathedral consists of a large porch, a noble vestibule, the nave, two aisles with transepts, a baptistery, and eight side chapels; a sanctuary 4½ft. above the level of the nave having on one side a fine Lady Chapel, and on the other a Blessed Sacrament Chapel.

Beyond the sanctuary is the apsidal choir, raised 13 feet above the nave, with a crypt beneath it; over the aisles and vestibule are fine galleries or tribunes, and behind the Lady Chapel are the sacristies.

Among the most striking features are the twelve lower arches on each side of the nave, supporting the tribunes; above each two of these arches rises a lofty arch 73ft. high; above each two of the latter rises a still loftier arch of 90ft.; over the highest arches rise the three great domes, each 60ft. in diameter.

The High Altar and Baldacchino.

The High Altar is composed of one stone of Cornish grey granite, unpolished, but fine-axed, 12ft. long, and 4ft. wide, and weighing 12 tons. The baldacchino, 31ft. wide and 38ft. high, is supported by eight monoliths of yellow Verona marble. Their shafts rest on pedestals of verde antico inset with panels of purple breccia, and surmounted with white marble capitals. The centre of Carrara marble is carried on two transverse arches joined by a vault, which is ornamented with a floral pattern in mosaic on a gold ground; the soffits of the arches are inlaid with panels of breccia. The main arches are ornamented with quarrels of mother-of-pearl and lapis lazuli within circles enriched with porphyry and Thessalian marble. The cost of the baldacchino was £7,500. "I have spent a great deal of thought upon it," said Mr. Bentley, "and I think it is the best thing about the cathedral." Great trouble was experienced in getting eight columns of the desired length of 15ft., in onyx doré and onyx nuagé, and they were brought over from Africa and worked at Marseilles.



The tower is built of hard red brick, banded with Portland stone, and is crowned with a metal-covered cupola, surmounted by a double cross of bronze. The total height is 284 feet.

WESTMINSTER CATHEDRAL: SUMMIT OF ST. EDWARD'S TOWER.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

The Bishops of England presented the late Cardinal 'aughan with an Archiepiscopal throne modelled on that of he Pope in St. John Lateran, Rome. It is composed of white tatuary marble and mosaic, with heraldic bearings; the anopy is a fine specimen of English wood-carving in fumed ak and walnut, inlaid with holly and ebony.

The Chapels.

There are in all eleven chapels, the most beautiful being hat of the Blessed Sacrament. The gates and screen, the atter composed of two corniced wings, are the most beautiful eature of the chapel, and they owe much to Mr. Bentley's riend and successor, Mr. John A. Marshall, who in April, 907, read before the Architectural Association an excellent aper on the cathedral.

Monolithic Columns.

The great feature about the marble columns is that each carved out of a single block. To obtain a sufficient number f blocks of the required size, two ancient classical quarries, ne in Thessaly, and one in Eubœa, were specially reopened. esides the verde antico columns from Thessaly, there are thers of another and more delicate shade of green, the amous cipollino marble from Switzerland and Eubœa; from e quarries near Verona have come the breccia marbles, urple and grey and yellow, with streaks of white; and there re columns of red marble from Languedoc. The two stately olumns in the vestibule are of red polished Norwegian ranite, with carved capitals of Carrara marble. Of the venty-seven columns in the nave and transepts, which support e vaulting of the aisles on each side of the nave, and also e arches of the transepts, twenty-one are of verde antico, reek and Swiss cipollino, Languedoc, Italian breccia, grey ranite from Norway, and also the red granite which has the haracter of the ancient porphyry. Each of these monoliths ands on a moulded base of Norwegian granite, and terinates in an elaborately carved capital of white Carrara arble, among all of which capitals there are no duplicates pattern.

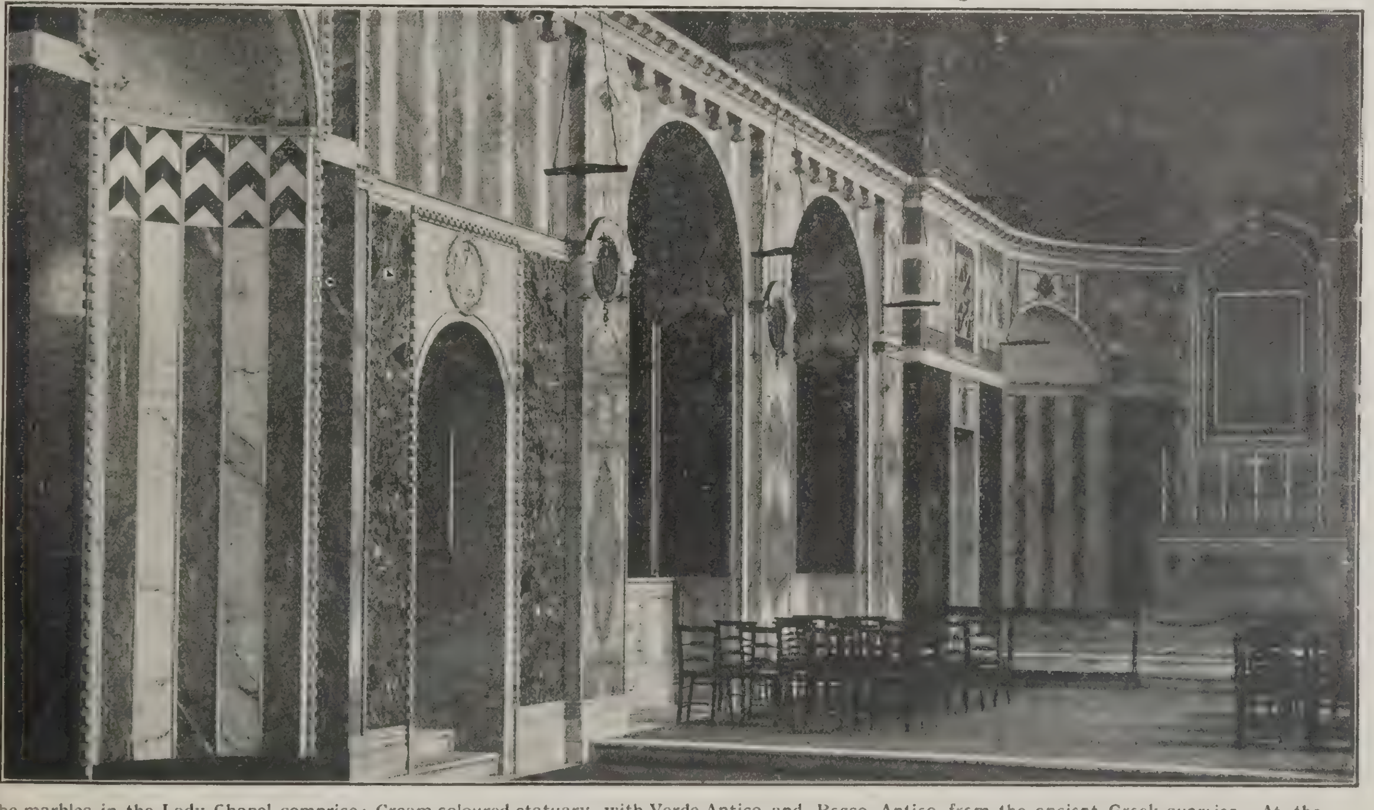
The six columns dividing the aisles of the Blessed Sacra ent Chapel and Lady Chapel from the sanctuary are of jasper and red Norwegian marble, and are of very beautiful colour and figure. The bases are of Derbyshire fossil marble, and the capitals are of white Carrara marble. Besides these columns there are above them fourteen columns of pavonazzo in the sanctuary galleries.

St. Edward's Tower.

The Campanile, or St. Edward's Tower, is built of hard red brick, banded with Portland stone; on the summit is some very effective carving in stone, the whole being crowned with a metal-covered dome or cupola, surmounted by a double cross of bronze. The total height is 284ft., and there are wide staircases to enable visitors to reach the top easily. Its name commemorates at once "the great saint and king" whose body lies in Westminster Abbey, and, in a way, King Edward VII., from whose coronation day the dedication was dated. An excellent guide to the cathedral is published by Messrs. Burns and Oates, 28, Orchard Street, W., and a good description was given in last week's "Catholic Herald."

The Architect.

The late Mr. John Francis Bentley, the architect of the cathedral, was born in 1840, and died on March 2nd, 1902. He was articled to Henry Clutton, and was at first enthusiastic for Gothic. He went to Italy to study the Roman and Byzantine styles; Rome, Palermo, Ravenna, Milan, Venice, and Santa Sophia, furnished him with object lessons. "What he saw and took in," Cardinal Vaughan said of him, "he steadily digested; and then, after a mental process that went on quietly and silently for months, he poured out rapidly and silently on paper his matured conception of a Byzantine cathedral, and presented his plans, complete in all their wondrous lines and details, exactly as they have been carried out." Mr. Bentley, the Cardinal declared, "was a poet; he saw and felt the beauty, the fancy, the harmony and meaning of his artistic creations. He had no love of money, he cared little for economy; he had an immense love of art, a passion for truth and sincerity in his work. . . He was exquisitely gentle and considerate in dealing with suggestions and objections, but he would have his own way whenever it was a question of fidelity to his standard of artistic execution." He was the R.I.B.A. Gold Medallist of 1902.



The marbles in the Lady Chapel comprise: Cream-coloured statuary, with Verde Antico and Rosso Antico from the ancient Greek quarries. At the of the altar there are Lapis Lazuli and Mother of Pearl, and other portions of the work show choice Breccia of Seravezza, Italy, and Campan Vert Pyrenees. The work has been executed by Messrs. Farmer and Brindley, Ltd., 63, Westminster Bridge Road.

WESTMINSTER CATHEDRAL: THE LADY CHAPEL. BENTLEY, SON, & MARSHALL, ARCHITECTS.

NEWS IN BRIEF.

We have received the following communication from the Secretary of the Royal Institute of British Architects :—"Dear Sir, —For some years past an impostor has been obtaining money and other assistance from architects throughout the country by representing himself as Mr. John W. Little, A.R.I.B.A., of Tonbridge. His action has caused the greatest annoyance to Mr. Little, and the police have been appealed to to check his operations. I shall be much obliged if you will kindly publish a note in your paper warning architects and others against giving any help to this man.—Faithfully yours, IAN MACALISTER, Secretary.

* * *

With reference to the note on "Brick Court," Temple, in our issue of June 29th, it may be mentioned that the general contractors for the new building, of which Sir Aston Webb, R.A., is the architect, were Messrs. Patman and Fotheringham, Ltd.

* * *

We are informed that Mr. F. R. Gould Wills, A.R.I.B.A., has resigned the secretaryship of the Architects' Technical Bureau, and joined in partnership Mr. J. Evelyn Daw, of 31-33, High Holborn. The style of the firm will be Daw, Gould, Wills and Co., architects, surveyors, and valuers, and will continue to practise at Chancery Lane Station Chambers, High Holborn, W.C.

* * *

The preamble of the Eastbourne Corporation Bill has been passed by the Local Legislation Committee (Section B) of the House of Commons, so far as it relates to the proposed extension of the boundaries by taking in part of the adjoining parish of Willingboro', and also as to the constitution of a new County Borough.

* * *

The Aberdeen Municipal buildings have, during the past two months, been under a process of washing with a solution of strong soda and washing powder. The contractor for the cleaning and repointing is Mr. George Farquhar, and for the repainting Mr. William Philip. The cost will be about £200, and the work has been carried out under the supervision of Mr. John Rust, the city architect.

* * *

A factory suddenly collapsed at Nottingham last week, four workpeople being injured, whilst a number of others had narrow escapes. The building, an old one, three storeys high, situate in Houndsgate, a business quarter of the city, was occupied by a boxmaker. Adjoining premises had been demolished, and new foundations had been put in preparatory to rebuilding. It was during a heavy gale that one of the walls gave way and fell.

* * *

Sir J. H. de Villiers, Chief Justice of the Supreme Court of South Africa, unveiled at Capetown, on June 28th, the statue erected by public subscription to the late Mr. Rhodes. The memorial is composed of four platforms of granite flanked by eight lions in bronze, surmounted by a bronze bust of the late Cecil Rhodes. The whole was the work of the late Mr. John Macallan Swan, R.A., who at the time of his death on February 14th last had not quite finished the work upon the bust.

* * *

Mr. William Adams Murphy, of Eliot Lodge, Sydenham, architect, who died on February 6th, 1909, left a will dated February 4th, 1909, which has recently been the subject of an action, judgment having been pronounced for its validity. His estate is of the gross value of £29,867, with net personalty £5,615, and after bequests amounting to £1,700, he left the residue of his estate to the Hospital for Sick Children, Great Ormond Street.

* * *

At a recent sitting of the Municipal Council, the Prefect of the Seine brought forward a motion for the immediate voting of a sum of £76,000 to be devoted to the repair of drains, which suffered seriously during the floods at the beginning of the year. M. Colmet Daage, the chief of the Seine Engineers, has presented a report which describes the situation as alarming. The drains resisted admirably during the floods, but their powers of resistance have necessarily diminished under the strain.

* * *

It having been stated that if the proposals of the Bill for the extension of the boundaries become law, Birmingham will become the second city of the Empire (with a population of 880,000), a newspaper correspondent contends that this ought to read "the fourth city of the Empire," as both Calcutta and Bombay would still be larger than Birmingham, the population of the former being 992,718, and of the latter 977,822. Should Birmingham be enlarged as proposed, it will become the second largest city of Great Britain—not of the Empire.

* * *

A correspondent of the "Glasgow Daily Record" draws attention to the number of "small tenement houses to be found in country places where one would naturally conclude to find small houses built on the cottage principle. Ground is not so heavily rented as to warrant this kind of building, and gardens, including everything therewith, are most complicated. Some of these houses, he states, do not seem to have any deafening (Anglicé : sound-proofing) used in their construction, so that privacy cannot be looked for even in the most trivial conversation. People go to the country for freedom in every respect, but such privileges are sadly curtailed by stupid surroundings."

* * *

The Board of Agriculture and Fisheries announce that the first caterpillars of the Large Larch Sawfly (Nematus Erichsoni, Hart) were seen this year on June 19th. They are now probably found in all places infested with this pest, and owners of larch plantations should arrange to have their trees examined with a view to the discovery of the pest, which must be notified to the Board in conformity with the Destructive Insects and Pests Order of 1910. A memorandum explaining the means of detecting the caterpillar and of distinguishing it from other pests of the larch can be obtained free on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.

* * *

Mr. E. J. Dixon, A.R.I.B.A., Hon. Secretary of the Guild of Architects' Assistants, writes to the "Daily Mail" regarding Mr. T. G. Jackson's statement at Cambridge that he "had long maintained that architecture was to be regarded, not as a profession but as an art." In order that readers of that paper may not derive any inflated impression of the "art" of architecture from this statement, Mr. Dixon points out, on the authority of a well-known practitioner that an unqualified architect recently advertised for an assistant for the salary of £2 per week, and received 225 replies, some of them from associates of the Royal Institute of British Architects.

* * *

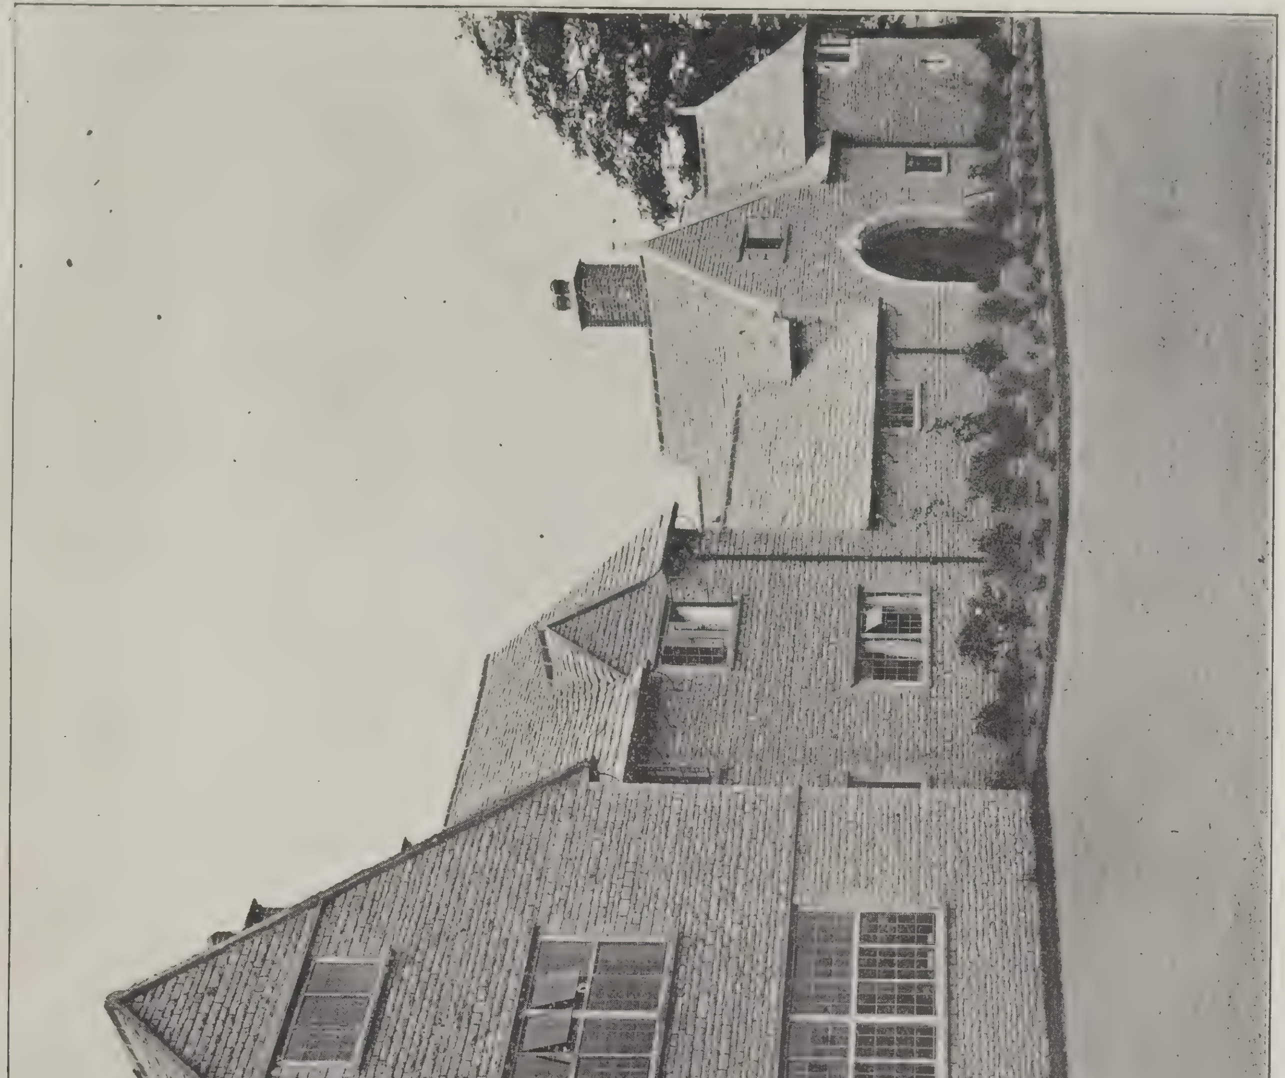
West Square Garden, which is situated just off St. George's Road, Southwark, was last week thrown open to the public by the Mayor of Southwark, Canon J. W. Horsley. The cost to the London County Council and the Southwark Borough Council has been £3,616, and the laying out of the square has been undertaken by the Metropolitan Public Gardens Association, whose chairman, the Earl of Meath, stated that there were difficulties in obtaining for public use these privately owned squares. We had no right as a public to take over such private squares without giving compensation. Personally, he did not think that it was beyond the wisdom of our rulers to find a way by which those squares might be maintained for the benefit of the public without, at the same time, doing injury to private individuals.

* * *

Answering a question put by Mr. Barnes (on behalf of Mr. J. R. Macdonald) in the House of Commons, regarding complaints by exhibitors regarding the bad arrangement of the British section of the Brussels Exhibition, Mr. Buxton said that the Board of Trade had received no complaints from exhibitors regarding the organisation of the British section, but, on the other hand, a large number of the exhibitors had expressed their entire satisfaction with the arrangements which have been made, and their gratitude for the assistance which they have received from the Department. In his judgment the officers in charge of the British section have thoroughly proved their competence by the way in which they have carried out their duties, and he had every hope that the arrangements made in regard to the exhibitions at Turin and Rome next year will be equally satisfactory, Naturally, the advice of competent artists and architects has been and will be sought so far as necessary.

* * *

In the House of Commons last week, Mr. Hindle asked the Chancellor of the Exchequer whether when preparing the new Budget he would consider the advisability of introducing a clause exempting from the incidence of the new increment duties all conveyances of land where the consideration was of less value than £500, on the same grounds and subject to the same conditions as those on which such conveyances were exempt from the increased stamp duties, seeing that in that class of small conveyances the expense and delay necessary in obtaining the official certificate required before the completion of the sale would be out of all reasonable proportion to the amount of revenue which would actually be receivable by the Exchequer. Mr. Hobhouse (Financial Secretary to the Treasury) replied : If the intention of my hon. friend's proposal is, in cases of properties of small value, to obviate expense and delay in connection with the presentation of the conveyances for the purpose of being impressed with the stamp referred to in Section 4 (3) (b) of the Finance (1909-10) Act, 1910, my right hon. friend does not think that there is any sufficient reason for the suggested exemption. The obtaining of the stamp in question does not entail any appreciable degree of either expense or delay. Documents deposited with the Inland Revenue for stamping are not in the great majority of cases retained for more than twenty-four hours.



This house is situated some few miles from Moreton-in-Marsh, on a slope overlooking a wide tract of undulating country, backed by a range of hills which rise from the plain to the west. It is built of local oolite stone (quarried near the site), which laminates freely into thin layers. The walls are in coursed rubble, with similar stone for the angle quoins and dressings, with joints raked out with a stick to emphasise the character of the local walling. The only dressed ashlar work is in the entrance porch and gable over, with a carved panel by Mr. A. Broadbent. The roofs are of stone slates from the Eyford pits, coarse in texture and varied in colour, and the chimney stacks are of red sand-faced bricks from Berkshire.

FIRE-PREVENTION NOTES.

Preventable Disasters. It is stated that since January 1st, 1909, "250 communities have been the scenes of hotel fires," presumably on the American continent alone, and twenty or more of the disasters had death rolls and lists of injured. Men, women, and children perished, or were crippled or disfigured; and yet nearly every one of the casualties could have been averted. The fires occur chiefly in a class of building known as "the summer hotel," which is "notorious kindling." "Insurance Engineering" once again insists on the familiar but greatly neglected moral that nothing will diminish the fire perils in hotels except good construction, adequate fire protection on the premises, a fire-alarm system in the house for quick communication with the fire department, a local alarm system for arousing guests, non-combustible stairways, an efficient watchman service, and stationary and portable fire-escapes of reliable types. What is above all essential is the awakening of the public to the point of demanding these safeguards. They want educating and arousing. So long as they go on taking, without protest, the terrible but avoidable risks from fire that still abound, so long will highly inflammable buildings be put up, in spite of the fact that reasonable and systematic precautions against fire are easily within reach.

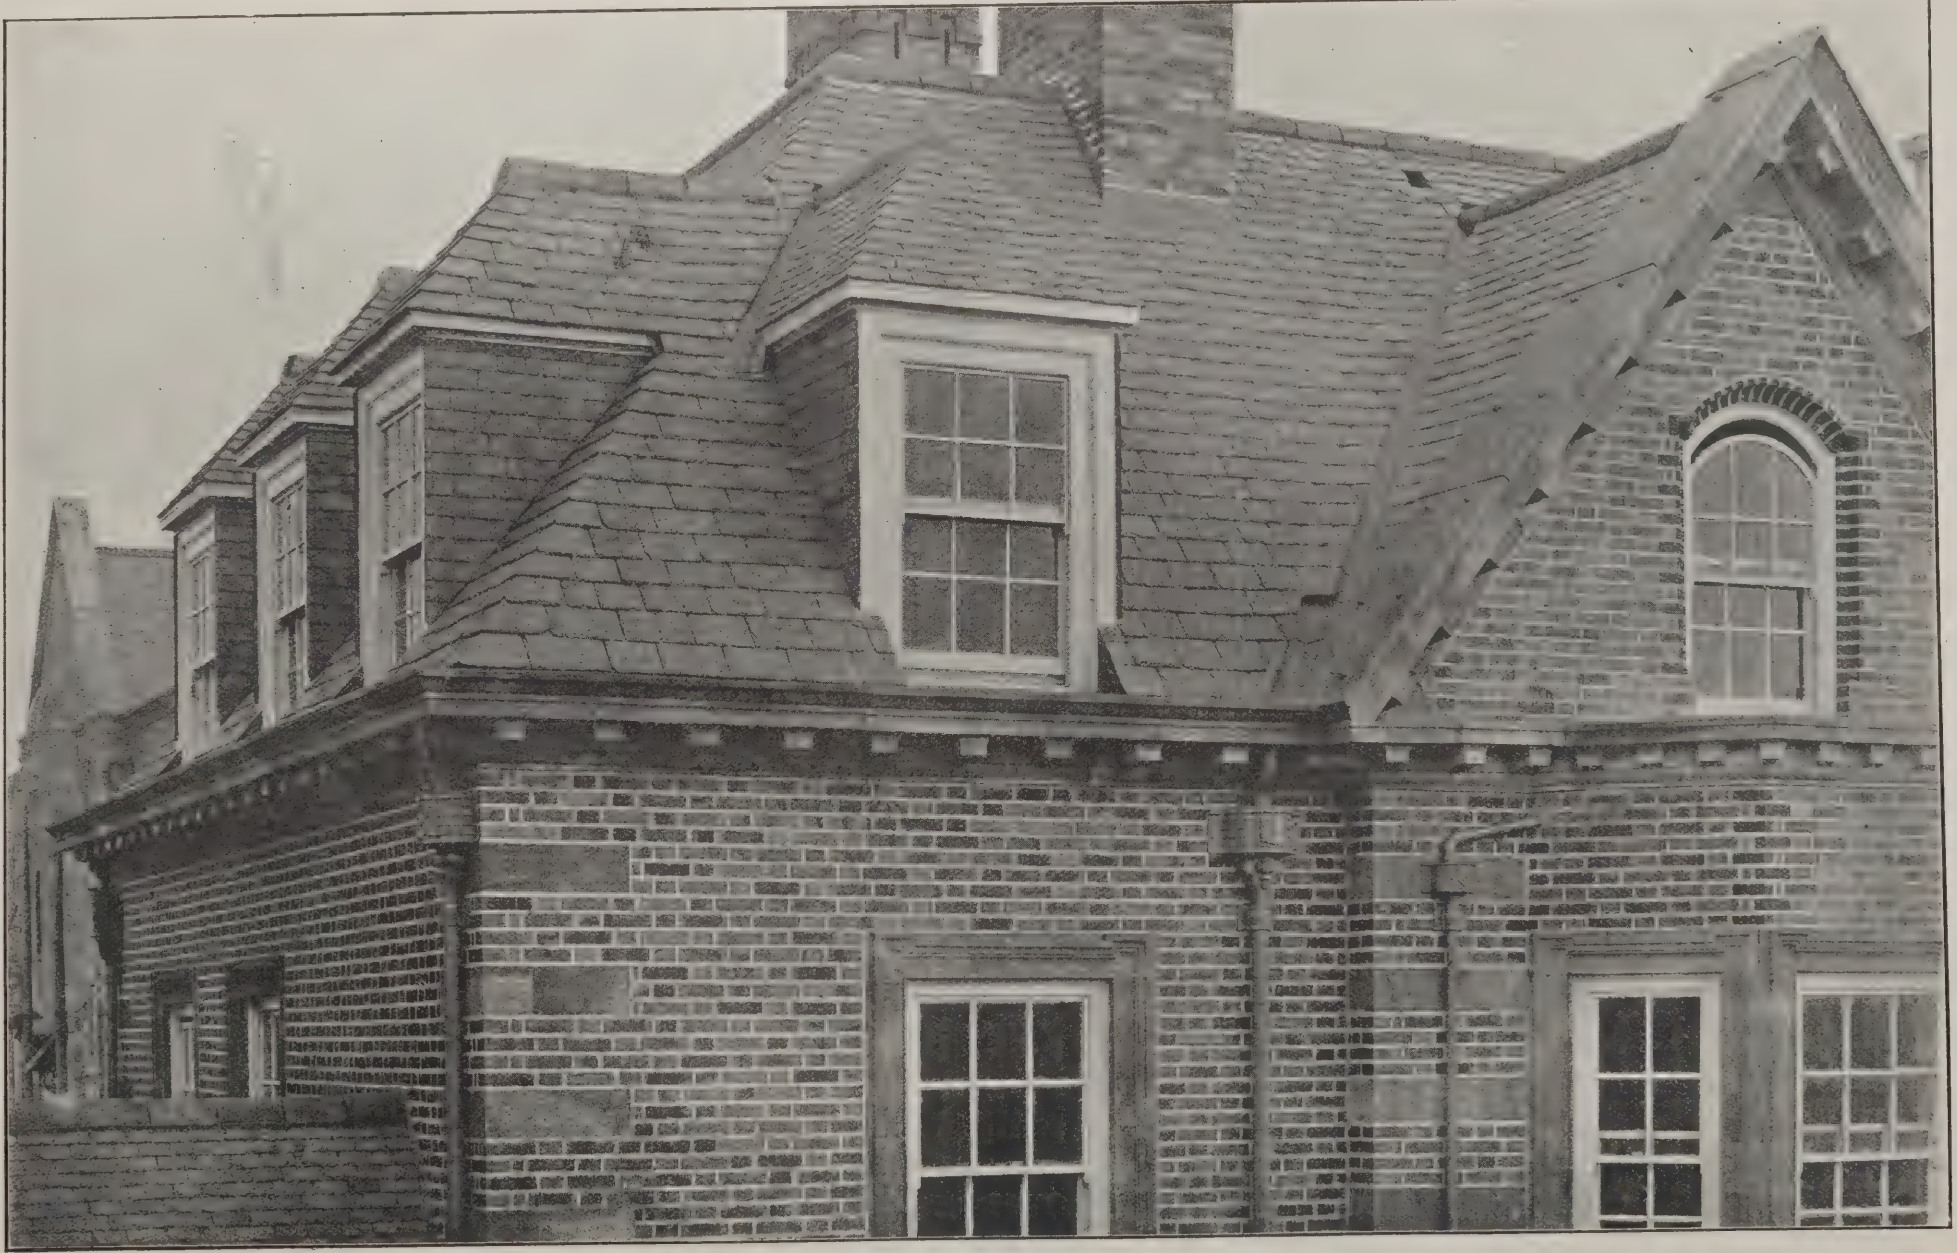
Honouring the Fire Brigade. The London County Council Fire Brigade Committee report that by command of his Majesty King George V. a detachment of the London Fire Brigade took part in the procession on the occasion of the funeral of his Majesty King Edward VII. The detachment consisted of an officer and 24 men, and was similar in number and character to that furnished by the Metropolitan Police. The position assigned to it was in the rear of the procession, but in front of the closing escort. The committee feel sure that the Council will appreciate the honour conferred upon it by his Majesty's gracious recognition of one of its most important services. The distinction thus afforded to the brigade will give an additional incentive to the officers and men to do all in their power to maintain the brigade in the highest possible state of efficiency. To this we may perhaps be permitted to add that the recognition of the importance of the service may also tend to popularise the brigade; and possibly, therefore, to stimulate the too languid interest of the public in this and in other means of fire prevention.

Fire-Resisting Paints. In discussing the question as to what sort of paint is best adapted for use upon interior woodwork in order to render it as fire-resisting as possible, an American contemporary presents the following: Experience has shown that paints consisting mainly of linseed oil, driers, and pigment are not fire-resisting, let alone fireproof. However, repeated coatings of water glass (silicate of soda) will serve the purpose. Apply to the wood three coats of silicate of soda, 33 deg. Beaume, and before the last coat has set hard, apply a thin lime wash, which unites with the silicate of soda, forming silicate of lime, which is an insoluble substance. Another fire-resisting paint is made as follows: Eighty pounds powdered silex, 40 pounds bolted china clay, and 20 pounds air-slacked lime are mixed intimately with 60 pounds liquid silicate of soda, 33 deg. Beaume, and then thinned to painting consistency. It may be coloured with any earth colour, such as ochre, umber, sienna, or red oxide, but not with chemical colours. Two coats are necessary. If the paint is to be pure white, add in place of any colour sufficient dry zinc white, using additional silicate of soda in the first mixing.

Insurance on Fireproof Buildings. A report presented to the National [American] Association of Cement Users by the Committee on Insurance will be in the nature of a revelation to insurance companies. It will also surprise the public to know that 28 per cent. of the owners of concrete buildings who replied to the committee's inquiries do not carry insurance on their buildings, some even refusing to insure contents, so thoroughly are they convinced of the fireproof qualities of concrete. This bears out our frequently repeated contention that insurance companies would be quick to see that it is better to accept a low rate on a thoroughly fireproof structure than to have the owner decline to take out insurance, and that that was exactly what would happen if excessive rates prevailed. It now appears that in America the refusal to take out insurance has happened in a number of instances. There has been a disposition on the part of some insurance companies to make concessions in the case of reinforced concrete, but it is said to be extremely difficult to persuade owners of buildings of this type that it is necessary so far as protection to the building itself is concerned. This is going too far. Building owners in our own country are more prudent, not to say less foolish. But while they do not absolutely refuse to insure, they reasonably look for lower rates in consideration of the expense they incur to render fire improbable; and we think that, as a rule, British insurance companies are very willing to do business on these lines. They recognise that it is to their advantage, as well as to the advancement of fire-prevention construction, to encourage a movement that must be profitable to both parties.

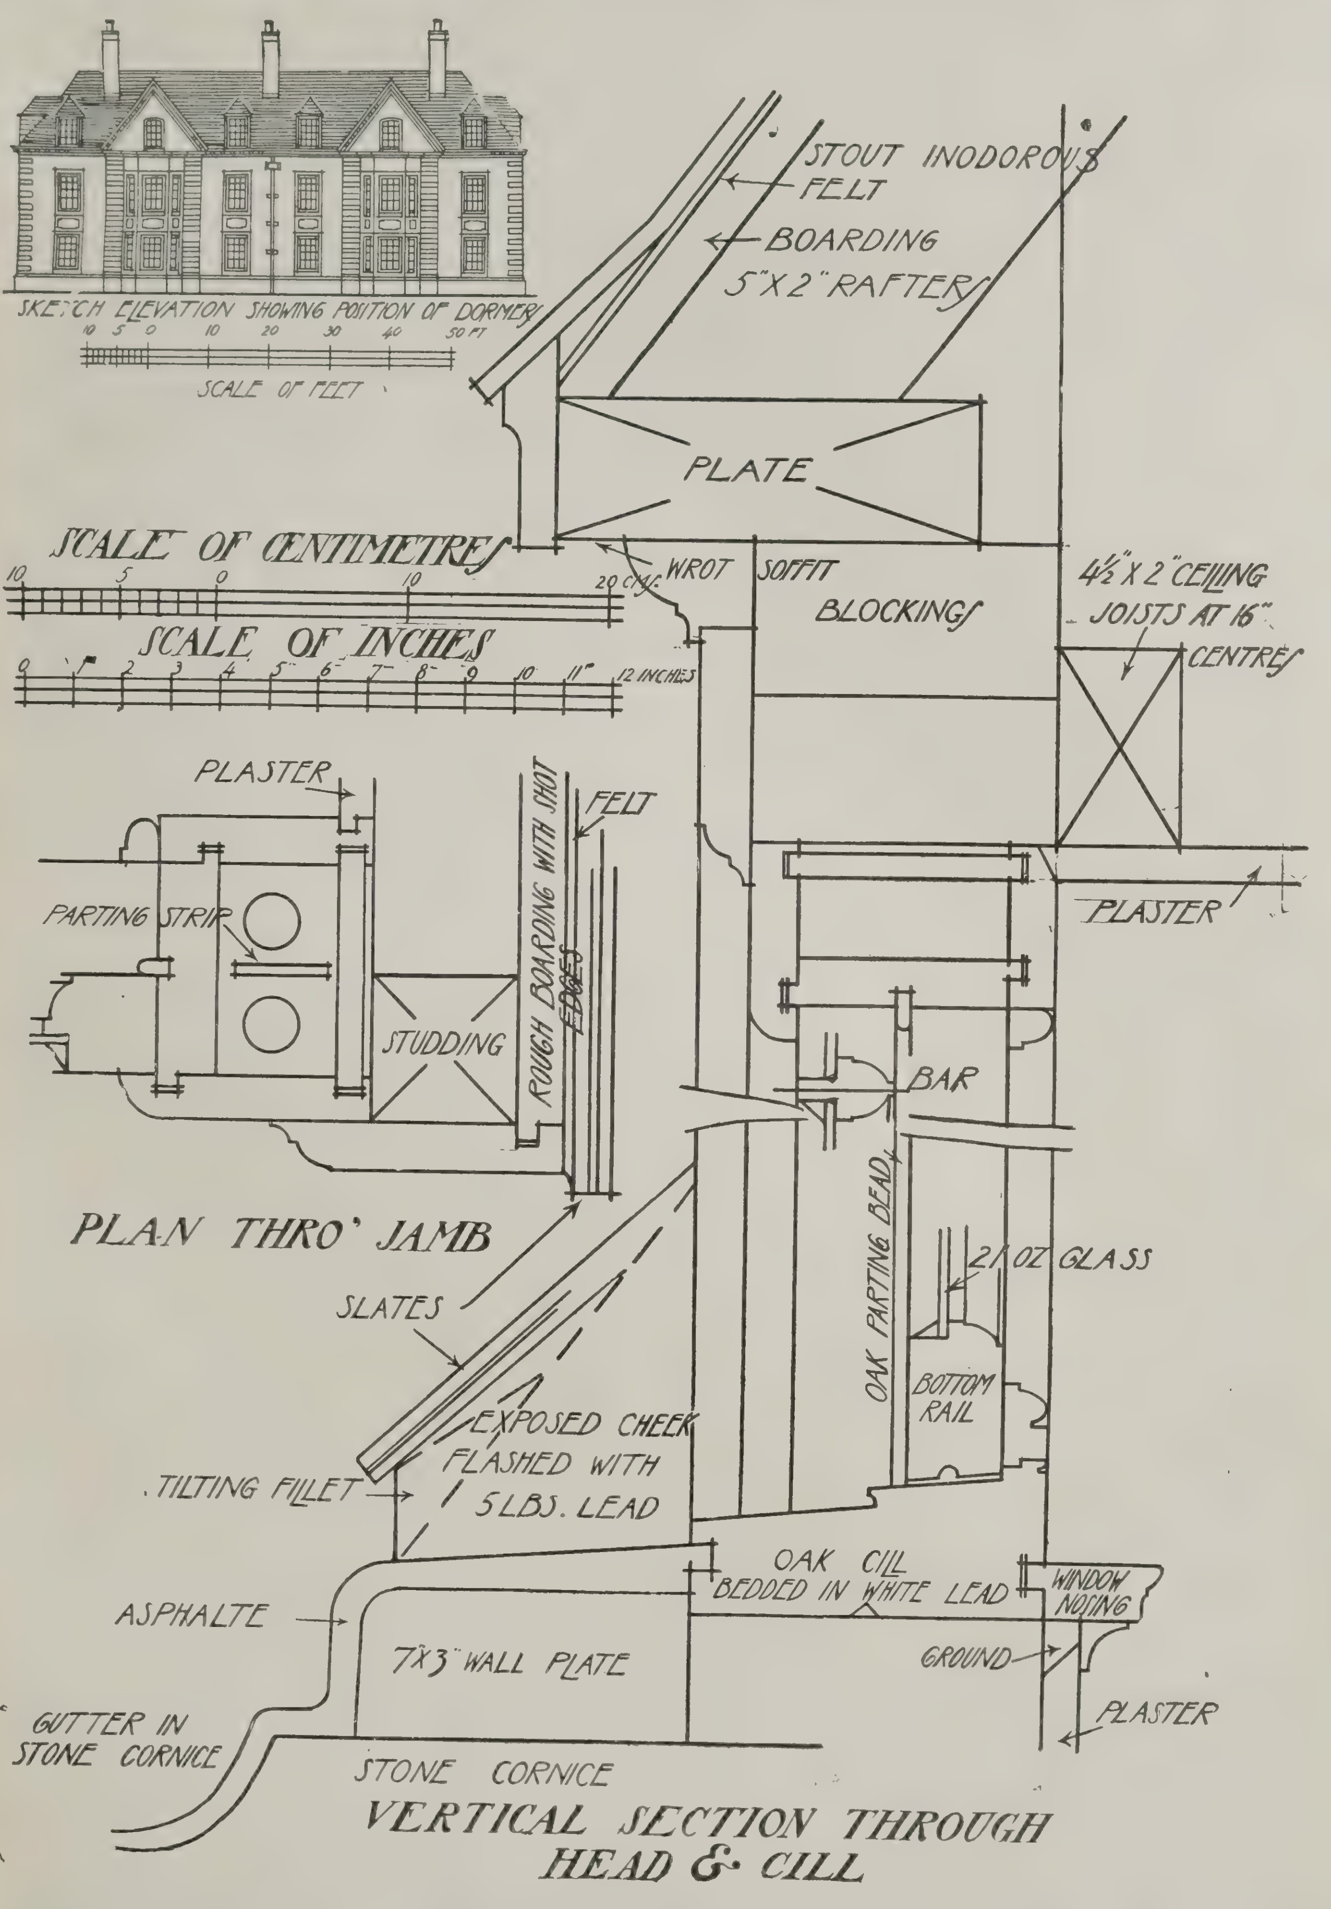
Fire Resistance of Reinforced Concrete. A number of official fire tests have been made on reinforced concrete floors in this country and the United States, and there have been one or two on completed buildings. Of course many actual fires have occurred in reinforced concrete buildings. The nett result has been to show that with a few obvious precautions reinforced concrete construction is exceedingly well adapted to resist fire, and that it seems to give more uniform and excellent results in practice than do other methods of fire-resisting construction. A fire test has recently taken place in an American city with a floor in an actually completed building under a test load. The structure was a ten-storey office-building, with floor panels measuring 22ft by 20ft. centre to centre of columns. The floors were designed for a working load of 100lbs. per sq. ft., and were required to stand a test load of 200 lbs. per sq. ft., with a deflection not exceeding ¾in. The actual deflection obtained with this load on the test panel was only ⅛in. The building inspector then had a fire test made of the loaded panel, and with a hot fire beneath the deflection increased to 1¼in. Water from a fire hose was then thrown on the bottom of the heated slab, and the recovery was ⅞in., leaving ¼in. deflection. A small amount of concrete spalled off under the action of the stream of water Notwithstanding this apparently excellent result, the building inspector strangely considered the result unsatisfactory in leaving ¼in. permanent deflection, and the approval of the structure on behalf of the City authorities is in dispute. The suggestion has been put forward that the bars on the underside of the slab may have taken a permanent set due to the heat, though it is more probable that the concrete has taken a certain amount of adjustment. But supposing the argument were correct, surely the result is very satisfactory, for the deflection was nearly all recovered, showing that the steel was quite able to do its work. For all practical purposes the floor was as good after the test as before.

Unnecessary Risks. Some interesting notes on fire insurance, by Mr. William Schooling, in the "Daily Telegraph," get down to first principles in this wise: "First and foremost, the object of insurance is to make sure. . . The second object of fire insurance is to enable people by co-operating with others to pay annually the cost of damage done by fire in such cases as their own. For this purpose it is important to see that those with whom we co-operate are subject to risks in the same class as ourselves; at least, this is important for any man whose own risk is a good one. It is advisable for birds of a feather to flock together in this respect, and for a man to see that he is not helping to pay for other people's bad risks while they are only contributing to his good risk. Of course, one man may insure the contents of his private house, and another in the same office insure printing works or cotton mills, or some other hazardous risk. Such distinctions are of little moment. because, by adjusting the rates of premiums the inherent inequalities of different risks are more or less equalised. What is important is to know that the office in which you are insured obtains its business from a good class of people, and charges adequate rate of premium." The rest of the article is mainly about finance, combines, management, and other matters with which for the moment we have but little concern. The point that appeals to us is that which refers to diversity of risks. This diversity is unnecessarily wide. Householders know this very well indeed, and refrain wholesale from insuring, because they think that their risk is infinitesimal. and that their premiums are inflated in view of the immense losses on large and hazardous risks. If, however, they could be assured that the companies insisted on the adoption of up-to-date fire-prevention methods in the big business buildings, and if, consonantly with that assurance, the premiums were made almost nominal, business from this source would rapidly multiply. It would therefore seem very well worth the while of the insurance companies to insist more rigorously than they do on the more complete adoption, down to the minutest detail, of modern fireproofing methods in business buildings; and they might use the undoubtedly powerful influence which they have in high quarters to make fireproofing methods compulsory. This they could do with a good grace, because of the manifest unfairness of making a man pay for his neighbour's bad risks, whether it happens to take the form of enhanced premiums, or the more horrent shape of actual damage from the fire next door or over the way.



This building, which is at Bournbrook, is a hall of residence for women students of Birmingham University. It is faced with thin Black Country bricks, with mottled Hollington stone dressings, and the roofs are covered with Buttermere green slates.

DORMERS TO WOMEN'S HOSTEL, BIRMINGHAM. HERBERT T. BUCKLAND AND E. HAYWOOD-FARMER, ARCHITECTS.



DORMERS TO WOMEN'S HOSTEL, BIRMINGHAM. HERBERT T. BUCKLAND AND E. HAYWOOD-FARMER, ARCHITECTS.

TOWN PLANNING.

The Duke of York's School Chapel Site. The War Office has decided to purchase the Duke of York's School at Chelsea. The chapel building will be adapted to military purposes, and the site of the school will be utilised as a training ground for territorials. This decision will give much satisfaction to those who feared that the site would be sold for building purposes and a valuable breathing space lost.

Wimbledon and Putney Commons Extension. The subscriptions towards the extension of the Wimbledon and Putney Commons now amount to about £6,000, most of which has been collected from residents in the immediate neighbourhood of the commons. The first object of the Council is to purchase the long strip of land on the western bank of the Beverley brook from the Robin Hood bridge to the wooden bridge, and, on the other side of the stream, from the latter bridge to Coombe Lane. This accomplished, the whole course of the Beverley brook from the Kingston Road to Coombe Lane will have been secured.

Liverpool and Town Planning. At the annual meeting of the Association of Municipal and County Engineers at Plymouth, it was announced that Mr. J. A. Brodie, Liverpool city engineer, had been elected a member of the Advisory Committee of the National Housing and Town-Planning Council. Mr. H. E. Stilgoe, city engineer of Birmingham, read a paper on town planning, in the course of which he remarked that the desirability of constructing wide streets or boulevards on town-planning lines was not a new one in this country. It was strongly urged by Mr. Jas. Newlands, borough engineer, in his report to the Health Committee of Liverpool in 1848. The spirit of Mr. Newlands was revived by Mr. J. A. Brodie, the present city engineer of Liverpool, who was now carrying out the work.

London Garden Squares. Mr. W. H. Dickinson, M.P., writes a long letter to the "Times" suggesting that the time has now come to safeguard the London squares from destruction by the intervention of Parliament. He points out that the London County Council made an attempt in 1906 to arrive at a solution of the problem by way of agreement, and negotiations were opened up with the owners of some 400 squares, an Act being passed, a result which secured immunity in the case of 64 of them. In most cases these were public bodies, such as the Crown and the Ecclesiastical Commissioners, but a few private landowners also fell in with the Council's wishes. The majority, however, would not consent, and it is in regard to these that intervention is proposed. "In many instances, Acts of Parliament have been obtained by the owners for the purpose of providing for the upkeep by means of imposing rates upon various other persons. But the leases and the Acts of Parliament leaving the reversion in the freeholder, with the result that, after a hundred years or so of uninterrupted existence as an open space—or rather as a breathing space—in the city, the land speculator rushes in, buys up the reversion, together with the fag-end of the leases, and proceeds to lay out the land so as to clear off with a profit. Or else he offers it to some public authority at an exorbitant price, which that body is generally compelled to pay rather than risk the injury to the public health which the destruction of these air spaces involves."

German Housing Scheme. The City of Charlottenburg has opened a Municipal "Wohnungsnachweis," or Housing Exchange, the idea of which is to supply, free of cost, information and assistance in providing dwellings for the poorer part of the population. The exchange acts gratuitously as house agent for those who apply to it, and by means of advertisements and the publication of lists. This is done without charge to either landlord or tenant, and the cost is found to be inconsiderable. In Cologne it is put at 1s. 6d. for each completed transaction. In some of the other German housing exchanges a small charge is made to the landlord; and in houses above a certain rental a percentage charge has to be paid by the landlord. The latter has to furnish exhaustive information about his premises, and the filing of scale plans showing the accommodation, position of fixtures, etc., is encouraged.

Municipal Housing in Ulm. The system of housing the working classes in Germany is bad. Such is the almost universal opinion of onlookers who have carefully studied it on the spot. I have been shown over those well-equipped barracks in Berlin and other large German towns, says Mr. T. Cox Meech, in the "Sheffield Independent," with the splendid wide streets ornamented by trees and looking out on to parks; and I have heard all the advantages explained by people who believe in this system. I have lived in what is known as a German "house" under conditions which made it possible to see the comfortable side of the life; and I have discussed the matter now and on previous visits to German towns. Naturally, there are people in Germany who contend that their system is the only one possible for their people, just as there are people in this country who refuse to believe that it is possible to learn anything from foreigners. The local rulers of the ancient free town of Ulm have taken a lesson from England. They have adopted the English system of cottages; and thus we see in this picturesque spot on the banks of the Danube an application of modern housing conditions in direct antagonism to the settled prejudices of the country. It is an even greater test than beginning a new system, yet it is succeeding well, and the death-rate is going down. Ulm is a manufacturing town of about 56,000 inhabitants—a delightfully clean old place with a history for splendid independence and courage as a free city going back to the ninth century, and coming down through all the most eventful and fascinating struggles of old-time German chivalry. The old landmarks still remain; but the surroundings have been brought up to date without destroying the romance or beauty of the ancient town. The municipality made up its mind that houses were needed for the working classes. It bought up the old fortresses, which, like those of other old towns, are now out of date; and still it wanted land. In Paris and in some other towns this would be a difficulty, but the State in German countries has a habit of asserting itself when the needs of the people are jeopardised by the interest of the individual. It does not argue and gesticulate and coax and scold. It clanks its heels together, salutes with the greatest respect, and somehow the individual gets to understand very quickly that he is less important than the State. The town of Ulm to-day possesses more than three-quarters of the freehold land within the boundary of Ulm and some beyond. The town is thus able to keep the price of land at a reasonable limit, and also to carry out its own improvement schemes unhampered by private owners, who may be inclined to turn cantankerous.

NOTES FROM PARIS.

The jury of the "Société des Artistes Français" (Old Salon) have awarded the medal of honour in the Salon for architecture to M. Hébrard, holder of the Grand Prix de Rome, for his great set of drawings of the restoration of Diocletian's Palace at Spalato. We repeat what we have already said, in reviewing the architectural gallery at the Salon, that this set of drawings ought to be seen in London. They are the property of the French Government, and we feel sure that the loan of them would be granted in response to an official request by the Council of the Institute of Architects.

* * *

The Municipal Council of Paris have decided on the prolongation of the Ourcq Canal, commenced by Napoléon, to join the Canal de l'Oise at Aisne. The new portion of the canal will be 108 kilomètres in length. The port of La Villette is to be enlarged as a part of the same scheme. The Municipal Council have also under consideration the erection of two new monuments in Paris, one to Haussmann, the other to the eminent French engineer Belgrand.

* * *

The Conseil Supérieur des Beaux-Arts have awarded a prize to M. Adolphe Thiers, architect, for his studies of the Byzantine churches of Constantinople, exhibited at the Salon; and they have awarded travelling studentships to M. Danis and M. Guidetti for their architectural exhibits at the Salon. Both architects exhibited fine sets of water-colour drawings of ancient monuments.

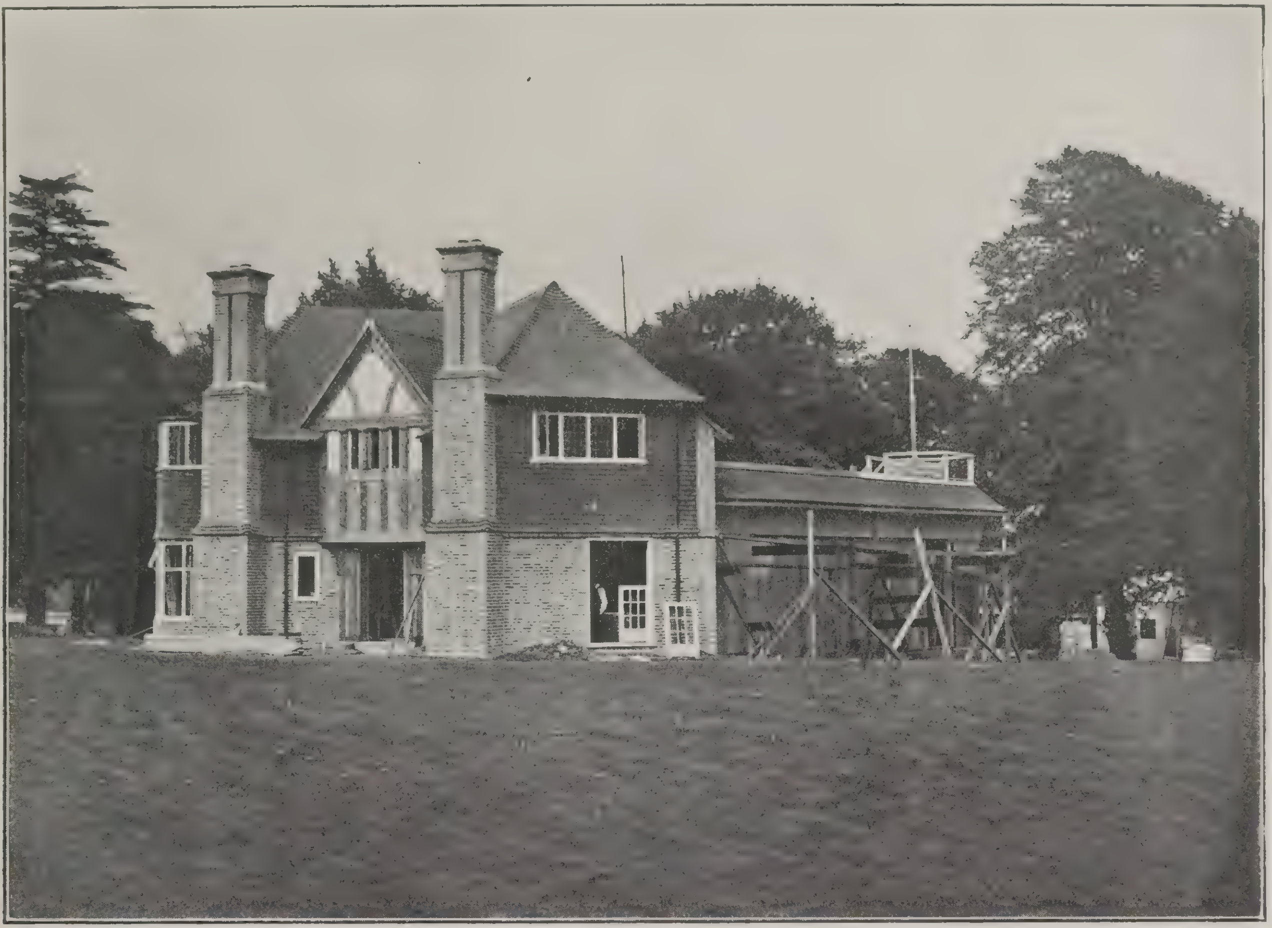
* * *

The Department of the Seine-et-Marne has opened a competition for a new asylum at Chailly-en-Brie.

PICTURE EXHIBITIONS.

The Leicester Gallery.

At the Leicester Gallery there is a large collection—not the first shown there, if we remember aright—of Du Maurier's original drawings in black and white made for "Punch." The amount and variety of humorous characterisation of social types to be seen in the collection is remarkable, and shows what a keen observer of every-day life Du Maurier was, and what a faculty he had for pourtraying such types. And the best of it is that there is really hardly any caricature in these figures; there is hardly a figure or face that one might not have met with some time or other in London; for this is emphatically a London show. But it cannot be denied that a whole room full of Du Maurier's drawings impresses one with his limitations, as well as with his powers. One is less impressed by the artistic quality of the drawings than by their satirical humour. The style of drawing is finished, precise, and careful, but we never seem to find the freedom of line which belongs to the work of such artists as Keene and Phil May. It is careful drawing of life, but hardly goes further than



THE AERO COTTAGE AT THE CRYSTAL PALACE. GORDON JACKSON AND KENDALL, ARCHITECTS.

that. Occasionally he hits upon a figure so typical of a whole movement as to seem a summary rather than a mere illustration of an individual. Such is the figure of the young man reading in a Greek attitude in No. 120—"Modern Æsthetics," which sums up all the more harmless side of the æsthete craze, as well as the odious figure of "Maudle" (No. 54) sums up its noxious aspect.

In another room at the Leicester Gallery is a collection of very beautiful water-colours of scenes in Japan—chiefly gardens—by Mr. Walter Tyndale; interesting both in the topographical and the artistic sense. Mr. Tyndale has great power in the treatment of the colour effect of Japanese scenery and gardens. A very interesting drawing is "The castle moat at Kofu," the moat being only visible as a closely packed assemblage of the leaves of water-plants, which look as if one could walk over them. Some bits of Japanese architecture are shown, but the exhibition is mainly one of garden scenery.

The Dowdeswell Gallery.

A collection of "studies and sketches, and some pictures," by Mr. Vereker Hamilton, at the Dowdeswell Gallery, contains some beautiful work. Many of the slighter sketches in oils are what nowadays would be often exhibited as finished pictures, so wedded have artists and critics become to impressionism; but Mr. Hamilton, in claiming no higher title for them than "sketches," leaves us free to admire them frankly as such. Many of them show exceedingly fine qualities of composition and colour; "The Princess in the Forest" has the making of a great picture in it. "Kensington Gardens in June" and "A Spate" are full of air and light. The large finished painting, "Sylviana," a knight in armour galloping away with a captive nymph, has been exhibited at the Academy, if we remember aright; it is an exceedingly clever painting. The one which we should specially single out, however, is "Madame de Château Chimère," an evening landscape with figures, of singular beauty and truth of light and colour. As a composition we think the small sketch for it, with a different placing of the figures, is still better, but it has not full effect of the larger work.

THE AERO COTTAGE AT THE CRYSTAL PALACE.

The Aerial League of the British Empire consider it desirable to impress upon the public that the development of aeronautics and aviation will very shortly reach a point (in its practical application as a means of locomotion in every-day life) in which its utility will be recognised as being on a par with that of the motor-car. It has been the aim of the Aerial League, in the inception of the Aero Cottage at the Crystal Palace, to show that any private gentleman with an acre or two of ground can utilise the same for the purpose of making flights and returning, and also that an aeroplane shed may be constructed, adjoining his country residence, which will not be any disfigurement to the general design of such a house, but, on the contrary, will add to the artistic effect. Two members of the League, Mr. Gordon Jackson and Mr. Sydney Kendall (of the firm of Messrs. Gordon Jackson and Kendall, of 17, Clifford's Inn, Temple Bar, E.C.), took up the project with enthusiasm, and brought the aero cottage and aeroplane house into actual existence on a site in the grounds of the Crystal Palace. The cottage is built principally of Dutch brickwork in the lower part of the walls and chimney-stacks, with red tile hanging above and roofs of the same material. A half-timbered gable and porch with plastered panels overlook the entrance court, the windows being lead glazed casements framed in white woodwork. Against one side of the building the aeroplane house, or hangar, is placed, the lower portion of which accommodates a machine, while its flat roof forms a balcony approached from the first floor of the cottage. Internally, the cottage consists of two sitting-rooms with kitchen and usual offices on the ground floor, and four bedrooms, including bathroom, etc., on the upper floor, which are ranged about a central hall having an upper gallery round it. The architects are Messrs. Gordon Jackson and Sydney V. Kendall, of 17, Clifford's Inn, London. The following are some of the contractors:—Dutch bricks and tiling, supplied by Ames and Hunter; partitions and entire plastering in "Xelite," Clark and Co.; jointless floors, Fenning and Co.; oak panelling, H. C. Cleaver, Ltd.; tile floors, Woolliscroft and Son; lead glazing and casements, F. A. Norris and Co.; paints, enamels, etc., Thos. Parsons and Sons; electric lighting and special fittings, Tredegar and Co. The general contractors were Messrs. Grace and Marsh.

ART ITEMS.

Phil May Memorial. Some time ago a committee was formed at Leeds to raise a fund for a memorial to Mr. Phil May. The house in which the artist was born is No. 66, Wallace Street, New Wortley, an industrial suburb of Leeds. It was decided that a tablet should be placed on the house, and Mr. Caldwell Spruce, of Leeds, was commissioned to make it. The tablet was unveiled by Mr. E. T. Reed, the caricaturist and colleague of May on "Punch."

The Young Collection. The third and concluding portion of the fine collection formed by the late Alexander Young, of Blackheath, who "stood easily first, in point of taste and judgment," among the British purchasers of about thirty years ago, took place at Christie's last week-end. The section comprised Barbizon and modern Dutch pictures.

"Chill October." At the Armstrong sale, at Christie's last week, 4,800 guineas was given by Messrs. Agnew for Millais's "Chill October." This is not the highest price ever given for a Millais, two other pictures of his having exceeded it; and his record standing at 5,200 guineas for the "Boyhood of Raleigh," bought in 1900, and now in the Tate Gallery.

Black and White. Sir Hubert von Herkomer, visiting the Southampton School of Art, where he received his early training, delivered a lecture on "Black and White Art." The fault of the decay of such work to-day must, he thought, be put down first at the door of the publishers, who no longer gave adequate payment; secondly, to the rush of the period, which left no time for study; and thirdly, to the indifference of the public, who had become satisfied with the snapshot illustration. Yet he was convinced that there were to-day artists as capable of fine work in black and white as at any other period in the history of art. The conditions, however, imposed upon them had disheartened them and rendered their ambitions inert. The beautiful art of etching, too, was well-nigh played out. Photography had achieved amazing things, but it had also brought confusion and cheapness.

Philip Sidney Memorial. A committee of Dutchmen has been formed at Zutphen for the purpose of honouring the memory of Sir Philip Sidney, who assisted the Dutch during their struggle for freedom against Spain. The name of the chivalrous soldier poet, which is held in such affectionate memory by Englishmen, is well known in Holland, and his many admirers there now desire to erect a statue to him at Zutphen, where he gave up his life in the cause he had espoused, on September 2nd, 1586. As it is feared that the total cost of the statue may not be entirely defrayed in Holland, it is hoped that sympathisers with the scheme in Great Britain may be willing to subscribe to it, not only to enable the committee to carry out their intention, but also to help to strengthen the bonds of friendship that subsist between the two countries. Subscriptions may be sent either direct to the treasurer of the committee, Count van Limburg-Stirum, or through his Britannic Majesty's Minister at the Hague.

THE DEVELOPMENT OF MODERN ARCHITECTURE.

Abstract of a paper read before the Birmingham Architectural Association by Gerald C. Horsley, F.R.I.B.A.

Note.—The author has made one or two quotations in this paper from a paper read by him at the Architectural Association in London in February, 1907, entitled "Some Aspects of Training and Design."

Modern Progress.

Those of us who have been engaged in our work in England during the last twenty or thirty years have witnessed a remarkable progression not only in the higher realisations of architectural art, but also in those arts which are allied to it. It will be conceded that we have witnessed the growth of a real understanding between artists which did not exist at the beginning of this period. We have seen workers in different crafts becoming acquainted with some of the difficulties, some of the possibilities, and some of the limitations in each other's work. This has been due to societies which have been founded, and to congresses which have been held (there was one at Liverpool and one in Edinburgh), where artists of all kinds have met and talked together, but chiefly, perhaps, to the efforts of the members of the Art-Workers' Guild in London, who determined to break down a certain antagonism and ignorance of each other's work which existed among artists. The Arts and Crafts Exhibition Society, which sprang from the Guild, has shown in a more public way what the crafts can do. The mutual knowledge gained has created a sympathetic alliance which has had the happiest effect, and we see the result of it in an increasing production of fine and beautiful work. Nevertheless, despite our progress in this direction, I believe an examination of our position will disclose that we have still far to go—that we are still on the threshold of our kingdom.

A Backward Glance.

To understand something of the present position of modern architecture and the lines of its future advance, it is necessary to glance back and view some of the previous steps on the road. The real beginnings of our modern phase of architecture date from some 300 years ago, for then took place the momentous change from mediævalism to modernism. From the time of Inigo Jones in the early part of the seventeenth century, when his work decided its course, the development of our architecture has been clearly defined and made known to us by our historians.

Starting with Inigo Jones,

English architecture made a stately progress during 200 years. As witness to this we possess the work of Wren, Gibbs, Hawksmoor, Taylor, Adam, Stuart, Soane, Dance, Elmes, Cockerell, and Burton; and such buildings as the "Banqueting Hall," in Whitehall, St. Paul's, St. Mary-le-Strand, St. Martin's-in-the-Fields, Ely House, Kedlestone, St. George's Hall in Liverpool, and many others, which illustrate the dignity, soberness, and intelligence of the architecture of this period. But this fine and interesting manifestation in architecture was killed by the great wave of enthusiasm which passed over the country in the middle of the last century, and culminated in the Gothic revival.

The Gothic Revival.

Some of us vividly remember this enthusiasm, which had amongst its aims the determination to suppress all forms of art expressed in the terms of the Renaissance, and to encourage solely an architecture which should reflect the spirit, or be in direct imita-

tion. of Gothic art. When we think of the change in architectural expression brought about by the Gothic Revival in England in the middle of the last century, we must realise that there was some more fundamental cause for the collapse of the great architecture of modernity represented by the work of Jones, Wren, and their followers than either the reawakening of the English Church or the revived interest in mystery and romance, powerful as we know these causes to have been. We may be sure that if our architecture in the first half of the nineteenth century had been a living cohesive force, it could not have gone down so easily before the enthusiasm of Pugin and his followers, backed by the influence of the universities. Doubtless this artistic revolt which we call the Gothic Revival had to come, but it arrested for some time the development of our architecture on the lines of the Renaissance. We all know it was an honest movement, a very living force which has done great good, a protest against the pedantry and cold academic influence which for some years before its coming had done their best to stifle freedom in art; and that it succeeded in reviving principles which have animated all great periods of art. We must, however, notice that though it has left its effects, the movement, built up as it was on a wide basis of sentiment, was ephemeral; and that, compared with the sober progress during the first two hundred and fifty years of the three hundred I have spoken of, the advance in the last fifty years has been a stormy one, full of much vigorous fresh growth, but also of disturbance, eclecticism, and plagiarism.

The Cause of the Overthrow.

I have suggested that if the architecture before 1850 had been a living cohesive force, it could not have collapsed as we know it did. Had this been the case, literature and the Church, coloured with Romanticism as they were, and harking back as they did to the Middle Ages for their models, would still either have accepted the tradition in art and assimilated it to their needs, or, as was the case in France, work on what I may call Gothic lines would have run concurrently with the old tradition; I believe, therefore, that we must attribute the overthrow and break-up of tradition at this period, in the main, to the neglect of provision of the highest educational methods at the incoming of the New Learning into England, in the seventeenth century.

Unsystematic Progression.

From the day that happened to a time only a few years ago, we have been content to trust the progress of our architecture to individual genius, and to the transmission of tradition, the great torch of art, from studio to studio, and workshop to workshop, by the apprenticeship system, unaided by a really well-organised system of additional and necessary instruction; and without means of development or sufficient encouragement.

During these years we have had our full share of genius; but while its influence has supported the weaker brethren in the work of design and building, it has been necessarily a circumscribed influence, owing to the want of backing. The leading was the leading of a few individual artists with groups of followers, and no organised effort was made to train and level up the intelligence of the men engaged upon building. Thus no great artistic school was formed, and the result has been that there has been no practical realisation of a great National architecture.

National Architecture.

In France, on the other hand, adequate preparation was made when the Renaissance from Italy opened up new ways and avenues in the national life. The Renaissance movement began in France about the time of Francis I., and was due in great measure to the Italian workers brought over by him. Their work appealed to the French people; its spirit was assimilated, and inspired them to efforts and productions of their own. Louis XIV. in the seventeenth century was quick to feel what a transformation had taken place in life and art. He sympathised with the artists, and, aided by his Minister, Colbert, he made ample provision for the education of workers in the movement, and thus raised them intellectually, so that they could understand the New Learning brought from Italy. We find that Louis XIV. founded the Academy of Architecture in Paris in order to draw together the architects of the time for purposes of mutual edification. Inspiring addresses were made to the members of this institution by the presidents. François Blondel in 1671 said, "Let us confer together in good faith, and communicate our thoughts for the development of architecture. For it is true that it suffices not to have a medium acquaintance with the rules of this excellent art in order to be veritably an architect, and that this quality demands the co-operation of so many virtues and different attainments that a lifetime is insufficient to acquire it."

The Rise of Architectural Education.

And we know that they conferred together to good purpose, and spent laborious days and nights in the classes founded by the King; for Blondel tells us that the King decreed that "the sound principles" of architecture should be publicly taught by the Academy, "in order that a nursery, so to speak, of young architects might be formed."

In 1666 Louis bought a palace in Rome for the accommodation of the prize-winners in his architectural classes, for purposes of study. In such ways were founded, 250 years ago, the French Academy of Architecture, the Ecole des Beaux Arts. and the Grand Prix de Rome.

Ever since his time, the Government has encouraged by its protection and material grants in aid the fostering of an artistic spirit and improvement in attainment.

In consequence this great school of architecture has continued in France to this day. I will ask you to consider presently some of its results, but it is important for us to note, in the short comparison I am now drawing between our own country and France during the last 300 years, that precisely at the time when our own Renaissance architecture came to an apparently complete termination in the middle of the last century, French architects were at the height of their intelligence and vigour.

England Backward.

Compare with the conduct of Louis XIV. that of our own monarchs, James I. and Charles I., when the new spirit in architecture penetrated to England. They did nothing at all for architecture, although Charles I. encouraged the sister art of painting. Such help as architecture received, then and during the reigns of his successors, came from the learned and cultivated men of the land—patrons we call them. Such help was necessarily isolated and individual, often virile and valuable, but also often intolerant and narrow-minded. Thus there was no cohesion, no co-ordination, and, except for individual effort, a policy of drift, of *laisser faire*, which has led to disaster in other aspects of our national life besides that of our architecture.

French Decadence and Vitality.

It may be urged that, in spite of their training, there has been latterly a certain weakening in modern French architecture, too great a fondness for l'Art Nouveau, and too great a predilection for a form of architecture imitative of the well-known styles of Louis XV. and Louis XVI., and that if this is the result of so much school architecture, we are better without it. I do not think so; for we must bear in mind that the French have never lost their tradition; and however much we may regret the favour shown by a few French architects to l'Art Nouveau, and the taste for imitating too closely in some of their modern work that of the time of Louis XVI., they have, as a basis, a system of training which has passed through many vicissitudes, and has lived through them all; which has influenced the national taste, and which makes us hope that the present phase is merely a passing one.

The names of Duban, Labrouste, Duc, and Ginain constrain us to admit that that basis has helped to produce some of the greatest masters in architecture of modern times. As an example of the importance of tradition backed by systematic training in the art of building and in the planning of cities, we have only to compare some of the towns of France and of England in order to acknowledge how far France is ahead of us in these respects. Paris, with her ordered streets and uniform buildings so frequently beautiful, is far removed from the chaos which often disfigures many of our best cities.

Having made this short review of the steps in England and France which have led up to our own time, I turn now to a brief account of some of the principal works in this chain of years. Of these there are a few typical works of the time of Inigo Jones and Sir Christopher Wren, also a few of the later period of which St. George's Hall at Liverpool is the most notable.

Our Own Times.

From this period we pass to the time in which we have ourselves grown up, and with which, consequently, we are very familiar. It is only of them I propose to speak in any detail. I divide them into an ecclesiastical group, a house group, and a public buildings group.

The first group contains works by Butterfield, Norman Shaw, Bodley, Sedding, and the late George Gilbert Scott. The second, work by Norman Shaw, Nesfield, and some of their followers, a group of men who by their admirable work have picked up the threads of English tradition.

In addition to these three groups, the lecturer showed illustrations of some of the English and some of the French work executed approximately at the same period, namely, the middle of the last century. Some of the modern English examples are influenced by the Gothic Revival, others proclaim in their characteristics the return which has taken place within the last few years to the influences of the old English Renaissance tradition.

In the ecclesiastical group, we have work by Butterfield, Norman Shaw, Bodley, Sedding, the late G. G. Scott, and Bentley, work showing a fine sense of scale and proportion; the elimination of unessentials; a right employment of materials; and a proper restraint and judgment in the use of ornament.

Modern Domestic Work.

Although this English modern Church architecture is remarkable for fine qualities in design, the development during the last fifty years of a fine style in English house building is still more remarkable. In the development of the plan and design of the English modern house we have one of the beneficent outcomes of the Gothic Revival; for, thanks to it, the whole question of the treatment and arrangement of the English house was then closely investigated. It is, however, as we all know, owing particularly to the genius of Mr. Norman Shaw that the English house plan has in these latter years become a new organic element in architecture. The qualities of broad and dignified spacing, so great a feature of Mr. Shaw's plans, appear also most conspicuously in his elevations, and have contributed probably more than any other contemporary influence to the elimination of petty detail, unnecessary "breaks" and "features," from English house design [To illustrate this the lecturer showed the following views of some of Mr. Shaw's work, namely, (1) "New Zealand" Chambers in Leadenhall Street; (2) Lowther Lodge, Kensington, both dating respectively from the sixties and the seventies; (3) Swan House, Chelsea; (4) Alliance Assurance Company. St. James's Street, (5) Dawpool; (6) New Scotland Yard, all dating from the eighties; and of more recent work Bryanston, Chester, Parr's Bank in Liverpool, offices in St. James's Street, and the new hotel building in Piccadilly.]

(*To be concluded.*)

CROSBY HALL.

To mark the completion of the reconstruction of Crosby Hall, on the site of Sir Thomas More's garden at Chelsea, a reception was held last week by the chairman and council of the University and City Associations of London and the Warden of University Hall of Residence, Chelsea (Professor Geddes). The formal opening ceremony, owing to the death of the late King, has been postponed until next year. Among those present was the Right Hon. John Burns, M.P., who said it was appropriate in these days when the love of the beautiful in the City and in the home was becoming not only the possession of the rich, but the desired possession of the very poor, that they should make a feature in that fine building of housing and town planning, and that connected with it should be the work of that brave pioneer and fine spirit, Mr. Geddes, to whom town-planning owed so much. He confessed that as a London apprentice he possibly owed more to the reading of Sir Thomas More's "Utopia" than to any three names that he had any association with. As a Londoner he was delighted that they could claim the great Sir Thomas More as a citizen of London. It was well that a man could embody in his work, and life, and death the fine qualities that Sir Thomas More possessed—poet and lawyer (not often combined), prophet and economist, town-planner and labour leader, the friend of public health, the apostle of rational leisure and exalted pleasure.

A METAL LATHING TEST.

An interesting test on Hy-Rib, a new product of the Trussed Concrete Steel Co., Ltd., Caxton House, Westminster, has been carried out at the new extension works, British Museum, by the contractor, Mr. W. E. Blake, of Montague Place, W.C., and Plymouth. Hy-Rib is a metal lathing of great rigidity, which is attained by doubling the sheet in a ridge every 3in. along its length, the space between being expanded. This obviates the need of studs or other supports in the vertical, and will span up to 5ft. on the flat as a reinforcement to floor panels or roofs, the mesh being of a nature capable of containing the liquid concrete without the aid of the usual centering. It was to ascertain the degree to which this was successful that the two slabs were cast 6 weeks earlier, and the intention of the test was to load them to destruction.

Regarding the ability of the Hy-Rib to retain the liquid, the result was highly satisfactory. Each slab was 4ft. 6in. by 4ft. 3in. clear span. No. 1 was cast 3½in. thick with furnace clinker, of which a very trifling amount percolated and fell on the paper spread below to receive it. No. 2 was ballast concrete of the same thickness, and practically nothing fell. The mixture in each case was one part of Portland cement, two parts of sand, and three parts of aggregate. Hy-Rib of No. 24 gauge of a sectional area of .335 sq. in. per foot of width was used in each case.

The load was applied by means of blue bricks stacked so as to prevent arching. Slab No. 1 was loaded first and the deflection noted at various stages was as follows:—

Load per sq. foot.	Deflection.
266lbs.	1/32in.
324lbs.	1/16in.
440lbs.	3/32in.
673lbs.	1/8in.
1,080lbs.	5/32in.

Slab 2 was only loaded to the extent of 673lbs. per sq. foot, the deflection being 1/16in., and as the available headroom was nearly reached by the load of 1,080lbs. per foot super on No. 1 slab, it became evident that the original intention to break even the furnace clinker slab was out of the question.

NOTICE.

The Index to Vol. 31 of "The Architects' and Builders' Journal" is published gratis as a supplement to the present issue.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries embodying questions which have been set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Sound-proofing Partitions.

With reference to an enquiry and answer on this subject in our issue of February 16th, p. 132, Mr. Arthur L. Gibson, of Messrs. Arthur L. Gibson and Company, Radnor Works, Strawberry Vale, Twickenham, writes to say "that two layers of our Cabot's double-ply sound-deadening quilt, applied to the studding underneath the panelling, will give far better results than the method suggested, and that if silicate cotton plugging were to be used at all, it should not be packed tightly. Tight packing defeats the very purpose for which it is inserted. When the partition is packed with common plugging, it will be found that its efficiency as a sound-deadener gradually deteriorates, as the material disintegrates, settles, and packs tightly. Under these conditions you have at the top of the partition a solid air space left by the settling material, and this solid air space conveys sound. The solidly packed material below also conveys sound, and it is only by breaking up a space into numerous air spaces, which break the sound waves, as is done with Cabot's quilt, that you can get the best results."

Books on Reinforced Concrete.

W. B. F. W. (MOFFAT) writes: "Kindly give a list of the latest and best works on reinforced concrete, with an indication as to price. If you could include French and American works, which might be better than English, I should be obliged."

—"Concrete-Steel Construction," by Prof. Emil Mersch (London: Archibald Constable and Co., Ltd., 21s. nett). "Reinforced Concrete," by Chas. F. Marsh and Wm. Dunn (London: Archibald Constable and Co., Ltd. 31s. 6d. nett). "Principles of Reinforced Concrete Construction," by F. E. Turneave and E. R. Maurer (London: Chapman and Hall, Ltd. 16s. nett). "Concise Treatise on Reinforced Concrete," by Charles F. Marsh (London: A. Constable and Co. 7s. 6d. nett). "Manual of Reinforced Concrete," by Charles F. Marsh and Wm. Dunn (London: A. Constable and Co. 7s. 6d. nett). "Reinforced Concrete," by Frederick Rings (London: B. T. Batsford. 7s. 6d. nett.). "Reinforced Concrete Construction," by Albert W. Buel and Chas. S. Hill (London: A. Constable and Co. 21s. nett). "Concrete Steel," by W. Noble Twelvetrees (London: Whittaker and Co. 6s. nett). "Beton-Kalender" (Berlin: Wilhelm Ernst. und Sohn). The first mentioned book was reviewed in our issue dated June 15th. It is a translation from a German work and therefore it is unnecessary for us to refer to other German books, except the "Beton-Kalender," which is a useful pocket book of formulae and practical data. There are good French books, but we prefer the ones above mentioned. We would advise the purchase of the first, second, and fifth if a selection has to be made, though the other books are all valuable.

Removing Graves for Building Purposes.

R. J. H. (LLANFAIRFECHAN) writes: "I should know what the necessary requirements are, in the case of a place of worship situated in a graveyard, to gain the authorities' sanction for the removal of graves when extensions or rebuilding on the same site are contemplated."

—It is an offence against ecclesiastical law to remove the remains of the dead from consecrated ground without a 'faculty' in that behalf (Adam v. Colthurst, 1867, 2 A. and E. 30), but it is not anticipated that there will be any difficulty in obtaining a faculty in the circumstances above mentioned. A faculty is nominally obtained from the ordinary, but in practice it is granted by the Chancellor of the Diocese. Proceedings on an application for a faculty are commenced by a petition in the consistory court. They may be taken by the incumbent and churchwardens, with or without the addition of other parishioners, or they may be commenced by any parishioner. As the incumbent and the churchwardens are probably interested in the erection of the proposed building there should be no difficulty in our correspondent obtaining the necessary faculty. It may be mentioned that a faculty will be granted, in a proper case, notwithstanding the opposition of interested persons. Our correspondent will be well advised to communicate with the churchwardens.

X.

Preservative Solution for External Stucco.

H. J. T. (SCUNTHORPE) writes "Please advise me as to the best kind of solution for covering external stucco new work."

—What is required is apparently a kind of distemper or colour-wash. These are always somewhat difficult to apply satisfactorily, because the cement tends to make them peel away. For cream-coloured work, a mixture of china clay and water is often satisfactory, but querist's best method is to apply to a builders' merchant, as there are a number of distemper paints which may be used if expense is of secondary importance.

A. B. S.

Charge for Extra Pointing.

N. A. R. (GT. BERKHAMSTED) writes: "In a school now being built, of which I am the architect, the internal walls are faced with Arlesey bricks, which were to be pointed in the ordinary mortar (lias lime and sand 3 to 1), as the work was carried up. As soon as the walls began to rise above the ground floor level, I saw that the pointing looked too dark, and so I instructed the foreman to have the joints raked out and left for pointing at completion in stone lime mortar. I wrote to the contractors and asked them to quote me the difference in cost between the lias lime (3 to 1) pointing as the work was carried up and the stone lime (2 to 1) pointing as the scaffolding was taken down at completion. For a long time I was unable to obtain this price, but now the contractor asks an extra of 1d. per foot super, which means an extra on the contract of between £30 and £40. I should be greatly obliged if you would tell me what you would consider a fair and reasonable extra per foot super. My own idea was about ¼d. per foot extra.

Also, could you tell me whether the words 'fir framed in common rafters' could reasonably be held to include the labour of notching over purlins."

—(1) The builder no doubt bases his price upon current price books, which give the cost of struckjoint work at 1½d. per foot, and of "rake joints as work proceeds and point at completion" at 2½d. Had the work been originally specified as it is now carried out, however, it is most probable that there would have been no difference in cost between one method and the other, as contractors are often willing and anxious voluntarily to substitute pointing for struck joint, for their own convenience and credit in securing a uniform finish at completion. If the specification definitely says "finish with a struck joint as the work proceeds" without reference to raking the joints, the contractor is undoubtedly entitled to charge the net difference in cost of the two methods as above, since he uses no less lias lime mortar and extra labour and materials in making up the stone lime mortar, while the operation of raking joints is entirely extra. It should be possible, however, to bargain with him and secure lower terms, though your suggestion of ¼d. per foot super (representing 5ft. run of pointing) seems scarcely adequate. Notice the time occupied by a bricklayer in executing this quality and calculate the cost in labour on that basis. (2) Fir framed in common rafters certainly includes the labour of notching over purlins. Fletcher's book on quantities states that "where timbers are framed, that is, mortised and tenoned . . . such framing necessarily entails an additional amount of labour. In quantities, all works are understood to be fixed unless stated to the contrary, and would include the labour in nailing, laps, dovetails, etc." This is the common practice. G.

Concrete Gable Wall.

J. H. (Westminster) writes: "What width is necessary for this concrete gable end wall [diagram not reproduced] to be in order to remain consistent with safety?"

—If the building has brick division walls behind the large stanchions, they will form a good abutment for horizontal beams between the stanchions, but the span is so great that the beams would have to be constructed like lattice girders laid on their sides. Intermediate stanchions merely to support these girders would be required, and the brickwork would then be only a screen. The amount of wind pressure to be resisted will have to be very carefully fixed, according to the exposure of the wall. It may vary between a minimum of 21lbs. per sq. ft. and maximum of 42lbs. per sq. ft. For a warehouse wall of brickwork, according to the model by-laws, the thickness at the base would be not less than three bricks thick, and the top 16ft. would be 1½ bricks thick. But a brick wall must not in any storey be less than one-fourteenth of its height in thickness; therefore the thickness at base of this wall should be $\frac{50}{14} = 3{\cdot}57$ft., a part of which may be provided in piers of a collective width of one-fourth the length of wall. Reinforced concrete might be used dividing the wall up into rectangular panels, with horizontal and vertical beams, and it would then be calculated like a floor under distributed load, but the vertical beams should be arranged as triangular buttresses.

Henry Adams.

Removing a Chimney Breast.

S. C. (Fenton) writes: "I wish to remove a chimney breast in a ground-floor room, and should be pleased to know if the ¼in. wrought iron flat plate as shown in sketch [not reproduced] would be sufficient to support the back hearth, etc., of fireplace above. Also, in match-boarding a room that is already plastered, is it a good plan to put a boarding flush with the plaster or to remove plaster from walls before match-boarding same?"

—(1). The construction proposed would be most unsound. The iron plate loaded at its extreme edge would be extremely likely to deflect; the fixing by screws driven upwards into the trimming joists would depend entirely on the holding power of the screws in the wood, and, should they draw the entire weight of the projecting breast and hearth (applicant does not say what projection or how high so exact calculation is impossible) would be thrown on the wall, tending to overturn it. It would appear from the sketch that no system of corbelling would be sound in this case. It will probably be necessary to substitute R.S.J.s for the wood trimming joists, or to run a R.S.J. parallel with the wall, below the present joists, though if the weight is moderate and the wood trimming joists ample, it may be sufficient to fix a short length of tee steel between them by angle cleats on a level with the springing of the trimmer arch, to carry the hearth and chimney breasts, the construction in this case coming within the thickness of the floor.

(2). Boarding should not be fixed in contact with either brickwork or plaster, but should have an air-space at the back. The match-boarding, however, cannot be nailed direct to the plaster; it will require some fillets fixed to plugs in the wall, which will give air space, but encroach on the room. If this is a serious matter the plaster had best be removed and the fillets be fixed to the brickwork. . G.

Overheating of a Chimney Flue.

Ionic (Wokingham) writes: "The brickwork to the flue from a 5-ft. kitchen range gets so very hot that it is impossible to bear the hand upon the brickwork on the first floor. It also gets very warm on the second floor. The flue is perfectly clean and clear. The first and second-floor fireplaces are immediately over the range, and the flue is practically straight until going up out of the roof, when it is carried over about 2 ft. to miss a valley. The angle of carrying over cannot be too sharp, as the rods go up easily. The flue is 4½ in. with 9 in. back, and is built of ordinary red wire cuts. The brickworks gets dangerously hot, and the adjacent woodwork has split in places. Can the flue be lined outside with asbestos? If so, with what kind? Without the bend I think the flue would be satisfactory, although it is hard to believe that the bend is sufficient to 'bottle' the hot air. The range works perfectly."

—The flue can certainly be covered with an asbestos mixture, such as is used for covering boilers. Although it is not clear from the plans accompanying the enquiry [not reproduced] as to where any bottling of the hot air takes place, there is evidently some portion of the flue which prevents a proper draught. Would it be possible to make an outlet above where the flue is carried over to miss the valley? If this could be done easily it should be tried. It is very doubtful, however, whether it is possible to suggest an adequate remedy without elevation drawings showing the direction taken by the flue. A. B. S.

Pupilage Agreement.

F. G. C. (Bletchworth) writes: "I want to serve as pupil to a district surveyor, giving my services for a term in return for training, but not paying a premium. Can you advise me of any points which require special care when making such an arrangement?

—A simple memorandum setting out the terms of the arrangement for the pupilage should be drawn up, signed by both parties. I suggest that it should contain the following provisions:—Names and decription of parties and date when made: That the employer accepts, and the pupil agrees to serve for the purpose of learning the profession: That the pupil shall conform to all the office rules, and shall observe secrecy as to the business transactions which take place there: Office hours should be stated, and holidays, etc.—provision being made, if necessary, for their elasticity: Date of commencement of articles of pupilage, and provision for their termination by notice (or by effluxion of time): It is usual to state that when travelling expenses are incurred by the pupil, they shall be paid by the employer when they arise out of business done for him, but by the pupil when merely for his own benefit in obtaining experience: If the pupil be under age, his father's concurrence in the agreement is necessary. It will be well to have the agreement stamped by the Inland Revenue Department. F. S. I

By-law and a Building Site.

Boundary writes: "An urban district council have the following by-law: 'Every person who shall erect a new domestic building shall provide in the rear of such building an open space exclusively belonging to such building . . . he shall cause such open space to extend laterally throughout the entire width of such building to the boundary of any lands or premises immediately opposite or adjoining, to be not less than 10ft. If height of such building be 15ft., it shall be 15ft. at the least, and if height be 25ft. it shall be 20ft. at least, etc., etc.' This council have approved plans of an estate adjoining my client's property, and a road has been made. It is fairly obvious that any person building on this estate cannot leave the above amount behind his building. What course must I adopt to safeguard my client?"

—It is difficult to advise with certainty without seeing an entire copy of the by-laws in question, and without knowing by what authority they have been put in force. Assuming, however, that the by-laws are made pursuant to S. 157 (3) of the Public Health Act, 1875, it is clear that there is power in the district council to make them; for, by that section, an urban authority may make by-laws "with respect to the sufficiency of the space about buildings to secure a free circulation of air, and with respect to the ventilation of buildings." The query is not explicit; but it appears that the first building owner is endeavouring to make use of the highway as his air space. This is not sufficient (see *Jones v. Parry*, 57 L.T., 492), and he would apparently be liable for an infringement of the by-law. The question then arises: Has the other landowner, for whom our correspondent is acting, any remedy? We know of no form of action which he can launch against the district council for failing to put its by-laws in motion: his only remedy would appear to be to summon his neighbour for building in contravention of the by-laws. Yet it is not certain how far such a proceeding would be effective. We are unable to find a report of any case in which by-laws have been enforced at the instance of a private person, but there is no reason in law why they should not be. The only thing is that the defendant to such a proceeding would probably call the surveyor of the district council to prove that the plans had met with his approval. B.

Weatherproofing a Bungalow.

Fenland (Cricklewood) writes: "I have been commissioned to erect a two-room bungalow, or studio, on the Essex coast (30 ft. by 18 ft., interior dimensions) for a client—an artist—and I enclose a section [not produced] which shows a timber-built structure on brick and concrete, and covered with either feather edge boardings or planed rebated chamfered boards—in either case tarred on the outside. The inside is to be lathed, plastered, floated, and set. The angle timbers are to be 4 by 4, horizontals 4 by 3, and intermediates 4 by 2, base plate 4 by 3. Would you consider this sufficiently weather proof, if well built? I suppose that Willesden paper or felt would be an improvement if placed between the studs and boarding, but the question of cost enters into consideration. Would it be safer to bolt the base plate into the brickwork at intervals, or would you consider the weight of the building itself sufficient to withstand any gales that may arise? My client has set his mind on a weather-boarded structure, so I am anxious to have it weatherproof. Any practical hints that you care to give me I shall appreciate."

—A timber building makes a perfectly warm and comfortable house, if properly constructed, but (particularly in an exposed situation on the coast) requires care to exclude the weather.

In "Fenland's" sketch design there are several points capable of improvement. If the sketch is to scale, the roof-pitch is certainly insufficient (about 35 degs.); a pitch of 45 degs. at least should be adopted, and the tiles should be bedded in lime and hair, or torched from beneath, after laying. Four inches by 2in. is hardly heavy enough for the rafters, unless supported by purlins, which, however, are useless unless they can be strutted from partitions; 6in. by 2in. rafters should be used with the construction shown, and if the roof is covered with diagonal boarding it will be stiffened considerably. There is no good reason for setting the sill or wall plate central on the foundation wall; it should be set flush with the outer face, as in the sketch A, thus economising surface concrete by contracting the foundation, and permitting the splay board to project, and throw water clear of the brickwork. The floor joists should also rest on the sill, and be nailed to the side of each shed. Bolts to secure the structure to its foundation would certainly be advisable. They should be bedded in the concrete and the nuts turned on above the sill. Willesden paper would greatly improve the equability of internal temperature if used under the boarding and roof, and the cost is so small—for a cottage it would be inconsiderable—only 1,600 feet super would be required. Another means of securing freedom from draught and rain, which is commonly used in America, is to cover the studding with double boarding, the first layer being rough, close-jointed boarding, applied diagonally. A few other points not arising out of the sketch may be useful to "Fenland." The studs should be doubled on either side of door and window openings. The angle timbers should not be square, but wider in one direction than the other, to give a nailing to the laths and boarding, and a fillet must be nailed up the broad face, as in the sketch B, to receive the lathing at right angles. The weather boarding must be stopped at the angles on vertical corner boards. The structure will require bracing; a cheap method is to let in a 6 in. by 1 in. board, diagonally at each angle, flush with the faces of the studs below the sheathing, and nail to each stud crossed. If the double boarding is used the diagonal under layer will be sufficient bracing. The best form of weather boarding is that shown in sketch C, which, owing to only one rigid fixing, is free to move without splitting.

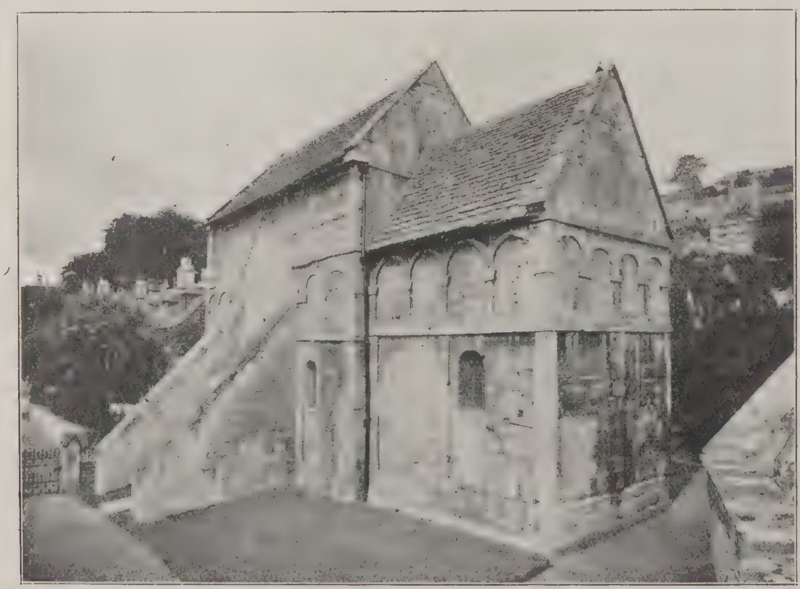
AN ANCIENT GUILD OF BUILDERS.

The Comacines: Their Predecessors and their Successors. By W. Ravenscroft, F.S.A., F.R.I.B.A. London: Elliot Stock, 62, Paternoster Row, E.C. Crown 8vo., cloth gilt, 3s. 6d. net.

There is a fascinating air of mysticism about this charming little book. Who are the Comacines? They were, Mr. Ravenscroft tells us, a community of builders who, at the fall of Rome, left that city and settled on an isle in Lake Como. But their real origin is lost in the mists of antiquity which float over Solomon's Temple and encircle the ark. They were of the mystic Brotherhood of Masons, and the work of their hands is rich in more or less vague and sacred symbolism. And it was good work. The wall shown on p.23 is a remnant of one of the three ruined churches which are all that remain of their work on the tiny Isola Comacine, in Lake Como. It is perhaps of the seventh century. One of their symbols, the Comacine knot or endless cord, as illustrated on p. 24, is to this day known in Italy as "King Solomon's knot." The Comacine influence on Saxon work is exemplified in the round-arched external arcades, with shafts, capitals, and bases, at Bradford-on-Avon. Without committing ourselves to Mr. Ravenscroft's theories, we can say without reserve that he has produced a charming and scholarly little monograph of much architectural and antiquarian interest.



SAXON CHURCH, BRADFORD-ON-AVON.
(From "The Comacines," published by Mr. Elliot Stock.)

NEW BUILDINGS.

PROPOSED.

Annfield Plain.—The Urban District Council has approved the following plans:—Four dwelling-houses on land at the rear of Century Terrace, Catchgate; dwelling-house on Messrs. Ritson's Estate, near Greencroft; five dwelling-houses at Mordue Terrace, Annfield Plain; dwelling-house and shop at Delight Bank, Dipton; two dwelling-houses on Messrs. Ritson's estate, near Greencroft.

Edinburgh.—The Earl of Rosebery has formally opened the new Corn and Cattle Markets and Slaughter-Houses which the Corporation of Edinburgh have erected, at a cost of £140,000 at Slateford, on the western outskirts of the town.

Glasgow.—The Glasgow Dean of Guild Court has granted the following linings:—Warehouse at 95, Morrison Street; new play-sheds at Kent Road and Strathclyde Public Schools and dressing-rooms at Woodside Public School; electric theatre at the corner of Charles Street and London Road, Bridgeton Cross; buildings in Ingram Street and College Street.

Harrogate.—The following plans have been approved by the Town Council:—Model dairy at "Larchfield," Leadhall Lane; bedrooms and motor car house at 17, Victoria Avenue; house at Warwick Crescent; additions to the Home for Incurables at Cornwall Road; additions to "Notton Turret," at Haddon Grove; motor houses at Cornwall Road; w.c.'s to houses, plot 16, Vernon Road; bay window, 40, Ripon Road; house and shop at Knaresborough Road.

Hebden Bridge. — The Salem Sunday-schools, Hebden Bridge, are to be extended at a cost of £2,000

Johnstone.—Ground has been purchased adjacent to St. Margaret's Roman Catholic Church, Johnstone, on which it has been decided to erect a new school at a cost of £3,000, providing accommodation for 500 scholars.

Ripon.—Messrs. Atkinson Bros., of Newcastle, have been commissioned to place seven stained-glass windows in St. Wilfrid's, Ripon, as a memorial to the late Lord Ripon, of Studley Royal.

Southend-on-Sea.—The following plans have been approved by the Town Council:—Six houses, Cotswold Road; two houses, Ronald Park Avenue; additions to refreshment room, Western Esplanade; two houses, South Avenue; five houses, San Remo Parade; house, Silversea Drive; house, Galton Road; two new roads, Wick Estate; making-up road, San Remo Parade; four houses, Rockleigh Avenue; two shops and houses, West Road; two houses, Leigh Road;

house, Leigh Road West; house, Galton Road; 18 houses, Chinchilla Road; house, Silverdale Avenue; additions, Clifton Terrace; two houses, Westcliff Park Drive; conversion of two houses into one; Imperial Avenue; house, Cossington Road; house, Ann's Road; five houses, Silverdale Avenue; house, Southchurch Beach; two houses and workshop, Whitegate Road.

Southampton.—The General Purposes Committee of the Harbour Board have considered a report from the Surveyor on the proposed enlargement of the pier pavilion, and at a subsequent meeting of the Works Committee it was moved and seconded "That the Works Committee endorse the General Purposes Committee's recommendations that a gallery be provided, and the size of the Pavilion increased in accordance with the Surveyor's plans, at a cost not exceeding £4,000."

Waterloo-with-Seaforth.—New schools for the Urban District Council for Waterloo-with-Seaforth are in course of erection in Rawson Road and Elm Drive. The buildings are divided into three departments—viz., (1) a mixed school for 400 scholars, containing eight classrooms, central hall, manual instruction and science rooms, and the usual teachers' rooms, etc.; (2) an infants' school to accommodate 200 scholars, containing four classrooms, central hall, etc.; and (3) a housewifery centre, which comprises a dwelling-house and special instruction rooms. It is proposed only to erect the mixed school and housewifery centre at present, the infants' school to be built at a later date. The contractors are Messrs. Wm. Hall and Sons, Ltd., Liverpool, and the architects Messrs. Appleyard and Quiggin, A.R.I.B.A., Liverpool.

Worksop.—The erection of the permanent chapel at St. Cuthbert's College, Worksop, made possible by the gift of £10,000 by Viscount Mountgarret, has been begun. The laying of the foundation-stone took place in July of last year, but only the foundations were proceeded with ere winter set in. The nave is 90ft. long by 36ft. wide, the total length being about 120ft., and the height approximately 60ft. The style is designed to harmonise with the other college buildings as far as practicable, and accommodation will be provided for the whole school. There are an ante-chapel, nave, and shallow chancel with sacristy. The fittings will be added from time to time, the contract only including the fabric. Mr. Ingelow originally designed the college premises, and Sir Aston Webb, with whom he has been associated, is the architect of the chapel. Messrs. Lowe and Sons, of Burton-on-Trent, have secured the contract, and their portion of the work is due to be completed by April next.

Westcliff-on-Sea.—The foundation-stone of the Lecture Hall in connection with the new Congregational Church at Crowstone Road has been laid by the Mayor of Southend, Councillor W. R. King, J.P. The new hall adjoins the church now in course of erection. It is being constructed of similar material, and considerable progress has been made with the work. The buildings comprise lecture hall, minor hall, vestries, church parlour, etc., with frontage to King's Road. On either side of the lecture hall there will be a number of classrooms divided from the hall by movable glass partitions, so that the whole area can be thrown open at any time. The hall will have a width of 51ft. and a total length of 76ft., and be amply lighted by clerestory and gable windows. The minor hall will be 40ft. by 53ft., thoroughly lighted and ventilated. Provision is also being made on the same level for the heating chamber, kitchen, etc. The vestries will be placed at the side of the lecture hall and over them a church parlour, a large room of 35ft. in length by 16ft. in width. The buildings have been designed in the Decorated Gothic style, and will be faced with Kentish rag stone and Bath stone dressings. Mr. F. E. Woodhams, of Southend, is the builder, and the work is being carried out under the supervision and from the designs of Messrs. Burles and Harris, architects, Southend.

IN PROGRESS AND COMPLETED.

Creaton (Northampton).—The new Northamptonshire Consumptive Sanatorium, which has been erected at Creaton at a cost of £7,000, has been opened by the Marchioness of Exeter. Mr. Fred W. Dorman, A.R.I.B.A., was the architect, and Mr. J. T. Powell the builder.

Farndale.—The Archbishop of York has reopened the Church of St. Mary's, Farndale, which has for some time past been undergoing extensive renovations. They have been carried out by Mr. Brotton, of Bilsdale, under the supervision of Mr. Temple-Moore, F.R.I.B.A., and consist principally in the enlargement of the chancel, which has been provided with a new oak roof. A new altar, pulpit, and font have also been provided, and the entire church re-seated at a total cost of £800.

Immingham (Grimsby).—The foundation-stones of the new Primitive Methodist Church at Immingham have been laid, and the total cost of the building will be about £1,000. The site of the building is on the road to the Dock, the style of architecture selected being Gothic. It is to be built of brick, having stone dressings, and will provide seating accommodation for about 200 people, while there is a schoolroom at the rear, with accommodation for about 70 or 80. Mr. G. H. Allison, of West St. Mary's Gate, Grimsby, is the architect.

Leicester. — The new Aylestone and Knighton baths, situate on the Knighton Fields Road West and erected at a total cost of about £6,000, have been formally opened. The baths are plainly built, being faced with pressed brick, relieved with stone dressings. The main building is about 120ft. long by 52ft. wide, and the swimming bath is 100ft. by 33ft., with a depth of from 3 to 6ft. Mr. Arthur H. Hind was the architect, and Mr. E. Fox the contractor.

London, N.—An enquiry has been held at the Municipal Offices, Southwood Lane, Hornsey, by Major C. E. Norton, a Local Government Board Inspector, into the application of the Hornsey Town Council for sanction to the sale of six acres of land at Highgate, acquired by the authority for erection thereon of houses for the working classes, and also to the application of the proceeds towards the repayment of the moneys borrowed for the purchase of this land, but conditionally that the land should only be sold for the erection thereon by private enterprise of houses suitable for the working classes.

Newton Abbot.—A provisional scheme has been adopted by the Newton Abbot Guardians for enlarging their workhouse infirmary so as to provide additional accommodation for 60 more patients at a cost of between £4,000 and £5,000. The scheme is to be submitted to the Local Government Board for sanction.

Newcastle-on-Tyne.—The foundation-stone of the new St. John's Schools, which are in course of erection in Bath Lane, has been laid by Earl Percy. The building will be three storeys in height to accommodate 320 children, in eight classes, including the infants' department on the ground floor. The upper floors will be approached by means of two fireproof staircases, and the teachers' rooms, cloak-rooms, etc., will be provided in the back wing of the building, the roof of which is to be asphalted to serve as a playground for boys to supplement the ground floor playground. The external walls are being faced with Lowry's Penshaw bricks, with stone-dressings from Darney Quarry, Woodburn. Covered playsheds are provided under portions of the main building, the superstructure being carried on arches and pillars. It is expected that the new building will be ready for opening in February or March next year. The contractors are Messrs. J. and W. Lowry, and the architect is Mr. Charles E. Errington, A.R.I.B.A., Newcastle.

Rothwell.—The restoration of the largest church in Northamptonshire, namely, the ancient and beautiful Parish Church of Rothwell, Holy Trinity, is now practically completed, the nave and old vestry having been recently opened by the Bishop of Peterborough. Since 1902, between £8,000 and £9,000 has been expended on the renovations, and all that remains to finish the work is the replacing of some of the perished stones in the north side of the Lady Chapel and some necessary attention to the windows in the chancel. A debit of £750 still remains on the restoration fund.

Sabden (Blackburn).—The foundation-stones of a new Baptist Church and School, to cost £5,000, have been laid at Sabden, the birthplace of Richard Cobden, by Mr. G. W. Macalpine, J.P.

Wattstown.—Erected at a cost of £3,600, the new Workmen's Institute has been opened by Mr. F. Shadforth Watts (chairman of the directors of the United National Collieries, Limited). The ground floor consists of reading-room and library, games room, and ladies' room, and caretaker's office, while the first floor consists of committee-room and a large billiard-room. The building is heated throughout by low-pressure system hot water, which was supplied and erected by Messrs. Proger and Sons, Cardiff, and lighted by electricity, fitted by Messrs. Beavan and Company, Newport. Messrs. Evans Bros., Cardiff, were the contractors, and the architect Mr. B. Hort Huxham, of Wattstown.

(From "The Comacines," published by Mr. Elliot Stock. See page 22.)

VENTILATION AND ARCHITECTURAL ACOUSTICS.

It was suggested during the planning of the Boston Symphony Hall, U.S.A., that its acoustical properties would be greatly benefited by introducing the air for ventilation at the front and exhausting at the back, thus carrying the sound by the motion of the air the length of the room. The same suggestion has been made to the writer by others in regard to other buildings, but this case will serve as sufficient example. The suggestion was unofficial and the gentleman proposing it accompanied it by a section of a very different hall from the hall designed by Mr. McKim, but as this section was only a sketch and without dimensions the following calculation will be made as if the idea were to be applied to the present hall. It will be shown that the result thus to be secured, while in the right direction, is of a magnitude too small to be appreciable. To make this the more decisive, Prof. Wallace C. Sabine in a paper communicated to the New York "Engineering Record," assumes throughout the argument the most favourable conditions possible.

If a sound is produced in still air in open space it spreads in a spherical wave diminishing in intensity as it covers a greater area. The area of a sphere being proportioned to the square of the radius, we arrive at the common law that the intensity of sound in still air is inversely proportional to the square of the distance from the source. If in a steady wind the air is moving uniformly at all altitudes, the sound still spreads spherically, but with a moving centre, the whole sphere being carried along. If the air is moving toward the observer, the sound reaches him in less time than it otherwise would, therefore spread over a less spherical surface and louder. If, on the other hand, the observer is to windward, the sound has had to come against the wind, has taken a longer time to reach him, is distributed over a greater surface, and is less loud.

The three cases are represented in the accompanying diagram. The stationary source of sound being at *S*, *a* is the wave in still air arriving at both observers at the same time and with the same intensity. If the air is moving to the left, the centre of the wave will be shifted by an amount *d* to the left while the wave has spread to o_1 On arrival it will have the size *b*, less than *a*, and will be louder. On the other hand, while the wave is reaching o_2, the observer to windward, the centre will have been shifted to the left by an even greater amount d_2. In this case the size of the wave will be *c*, larger than *a*, and the sound will be less. The loudness of the sound in the three cases is inversely as the three surfaces *a*, *b* and *c*. If the distance of the observer from *S* is denoted by *r*, the loudness of the sound in three cases will be as

$$\frac{1}{r'} \quad \frac{1}{(r-d_1)^2} \text{ and } \frac{1}{(r+d_2)^2}.$$

The above result may be expressed in the following more simple and practical form. If, in the diagram, *a* is the wave in still air, its corresponding position when of the same size and, therefore, of the same intensity in moving air will be *a′*, the movement of the air having been sufficient to carry the wave a distance *d* while it has expanded with the velocity of sound to a sphere of radius *r*. The distance *d* and the radius *r* are to each other as the velocity of wind and the velocity of sound. If the observers o_1 and o_2 move, the one away from the source and the other toward it, by a distance *d*, the sound will be of the same intensity to both as in their first positions in still air.

In order to make application of this to the particular problem in hand, we shall assume a normal air supply to the room for ventilation purposes of one-seventieth of a cubic metre per person per second. This, if introduced all at one end and exhausted all at the other, in a room 17.9 m high, 22.8 m broad and seating about 2,600 persons, would produce a velocity of the air of 0.09 m per second, assuming the velocity to be the same at every point of the transverse section. Leaving out of account the questionable merits of this arrangement from the ventilation standpoint, its acoustical value can be calculated readily.

The velocity of sound under normal conditions being about 340 m per second, the time required to traverse a hall 40 m long is only about one-ninth of a second. In this short interval of time the motion of the air in the room, due to the ventilation, would be sufficient to advance the sound wave only 0.01 m, or 1 cm. It would thus arrive at the back of the room as a sphere with its centre 1 cm nearer than the source. That is to say, the beneficial effect of this proposed system of ventilation, greatest for the auditor on the rear seat, would to him be equivalent at the very maximum to bringing the stage into the room 1 cm further, or it would be equivalent to bringing the auditor on the rear seat forward 1 cm. This distance is so slight that without moving in his seat, in fact, without moving his shoulders, a slight inclination of the head would accomplish an equivalent gain. Thus, while the effect is in the right direction, it is of entirely imperceptible magnitude. If we take into account the sound reflected from walls and ceiling, the gain is even less.

The first adequate explanation of the variation in loudness of a sound with and against the wind was by the late Sir George G. Stokes in an article "On the Effect of Wind on the Intensity of Sound" in the report of the British Association for the Advancement of Science for 1857.

The essence of his explanation is that the great difference in loudness of sound with and against the wind is not due to the fact that the sound has been simply carried forward or opposed by the wind, but rather to the fact that its direction has been changed and its wave front distorted. The application of this consideration in the present architectural problem leads to the conclusion that the greatest benefit will come not from an attempt to carry the sound by the ventilating movement of the air, but by using the motion of the air to incline the wave front forward and thus direct the sound down upon the audience.

This can be done in either one of two ways, by causing the air to flow through the room from front to back, more strongly at the ceiling than at the floor, or by causing the air to flow from the back to the front, more strongly at the floor than at the ceiling. The one process carrying the upper part of the wave forward, the other retarding the lower part of the wave, will tip the wave in the same way and by an equal amount.

Again, taking an extreme case, the assumption will be made that the motion of the air is such that it is not moving at or near the floor, that it is moving with its maximum velocity at the ceiling, and that the increase in velocity is gradual from floor to ceiling. Keeping the same amount of air moving as in the preceding calculation, the velocity of the air under this arrangement would be twice as great as the average velocity at the ceiling; in the preceding case the wave was advanced one centimetre by the motion of the air while travelling the whole length of the hall. In this case, obviously, the upper part of the wave would be carried twice as far, two centimetres, and the lower part not advanced at all. This would, therefore, measure the total forward tip of the wave.

Fortunately, the acoustical value of this can be expressed in a very simple and practical manner. An inclination of the sound wave is equivalent acoustically to an equal angular inclination of the floor in the opposite direction. The height of the hall being 17.9 metres, the inclination forward of the sound wave would be 2 in 1790. The length of the hall being 40 metres, an equal inclination, and thus an equal acoustical effect would be produced by raising the rear of the floor about 5 centimetres. This considers only the sound which has come directly from the stage. It is obvious that if the reflection of the sound from the ceiling and the side walls is taken into account, the gain is even less.

It therefore appears that, using the motion of the air in the most advantageous way possible, the resulting improvement in the acoustical property of the hall is of an amount absolutely negligible. A negative result of this sort is perhaps not so interesting as if a positive advantage has been shown; but the problem of properly heating and ventilating a room is sufficiently difficult in itself, and the above considerations are worth while if only to free it from this additional complication.

The effect of uniformly raising the temperature of the air is to increase the velocity of propagation of sound in all directions. It is therefore essentially unlike the effect produced by motion of the air. In the case of a uniform motion of the air, the sound spreads spherically but with unchanged velocity, moving its centre in the direction and with the velocity of the wind. Thus, when blown toward the observer, it reaches him as if coming from a nearer source. Blown away from the observer, it arrives as from a more distant source. An increasing temperature of the air increases the velocity, but does not shift the centre. The sound reaches the observer coming from a source at an unchanged distance. A rise in temperature, therefore, provided it be uniform, neither increases nor decreases the apparent intensity of the sound. The intensity at all points remains wholly unaltered.

The above is on the assumption that the temperature of the air at all points is the same. If the temperature of the air is irregular, the effect of such irregularity may be pronounced; for example, let us assume a room in which the temperature of the air at the upper levels is greater than at lower levels. In order to make the case as simple as possible, let us assume that the temperature increases uniformly from the floor to the ceiling. To make the case concrete, let us assume that the hall is the same as that described above, practically rectangular, 40 × 22.8 × 17.9 metres. The velocity of the sound at the ceiling, the air being uniform, is greater than it is at the floor. In traversing the room the sound wave will thus be tipped forward. The effect is practically equivalent as before to an increased pitch of the floor or to an increased elevation of the platform. Without going into the details of this very obvious calculation, it is sufficient to say that in the case of the hall here taken as an example a difference of temperature top and bottom of 10 deg. C. would be equivalent to an increase in pitch of the floor sufficient to produce an increased elevation of the very back of 10 centimetres. A difference in temperature of 10 deg. C. is not excessive, and it is obvious that this has a greater effect than has that of the motion of the air.

In the above discussion of the effects of motion and of temperature on the acoustical quality of a room, it has been assumed that we are dealing solely with the sound which has come directly from the platform. The argument holds to a less degree for the sound reflected from the ceiling and from the walls. The above estimates, therefore, are outside estimates. The effect is on the whole certainly less. It is safe to say that the total attainable result is not worth the effort that would be involved in altering the architectural features or in compromising the engineering plans.

But, while uniform variation in the motion or in the temperature of the air in the room are on the whole negligible factors in its acoustical character, this is by no means true of irregularities in the temperature of the air, such as would be produced by a column of warm air rising from a floor inlet. That this is a practical point is shown by the testimony of Dr. David B. Reid before the Committee of the Houses of Parliament published in its report of 1835. This committee was appointed to look into the matter of the heating, ventilation and acoustics of the houses which were being designed to replace those burned in 1832. Of the gentlemen called before the committee, Dr. Reid gave by far the best testimony, part of which was as follows.

Speaking of the hall temporarily occupied by the House of Commons, he said: "Another source of interruption which might be guarded against is the great body of air which I presume arises whenever the heating apparatus is in action below. In different buildings I have had occasion to remark that whenever the atmosphere was preserved in a state of unity as much as possible, equal in every respect, the sound was most distinctly audible; it occurred to me that when the current of hot air rises from those large apparatus in the middle of the House of Commons it would very likely interfere with the communication of sound. On inquiry, one gentleman told me he had frequently observed it was impossible to hear individuals who were on the opposite side of this current, although those at a distance were heard distinctly where the current did not intervene."

This and other evidence seems to demonstrate fairly clearly that under certain circumstances abrupt irregularities in temperature may result in marked and, in general, unfavourable acoustical effects. The explanation of these effects in both cases is somewhat as follows: Whenever sound passes from one medium to another of different density or elasticity a portion of the sound is reflected. The sound which enters the second medium is refracted. The effects observed above were due to these two phenomena, acting jointly. In a large room with speaker and auditor facing each other at a comparatively short distance apart, but with a cylindrical column of hot air rising from a register immediately between, the voice of the speaker, striking this column of air, lost a part by reflection; a part of the sound passed on, entered the column of warm air, and came to the second surface, where a part was again reflected and the remainder went on to the auditor. Thus, the sound in traversing the column of hot air lost by reflection at two surfaces and reached the auditor diminished in intensity. It reached the auditor with diminished intensity for another reason. The column of warm air acted like a lens. The effect of the column of air was not like that of the ordinary convex lens, which would bring the sound to a focus, but rather as a diverging lens. The effect of a convex lens would have been obtained had the column of air been colder than that of the surrounding room. Because the air was warmer, and therefore the velocity of sound through it greater, the effect was to cause the sound in passing through the cylindrical column to diverge even more rapidly and to reach the auditor very considerably diminished in intensity. Which of these two effects was the more potent in diminishing the sound, whether the loss by reflection or the loss by lens-like dispersion was the greater, could only be determined if one knew the temperature of the air in the room, in the column, and the diameter of the column. The phenomenon is a real one, and one to be avoided. If, instead of having a single screen of great temperature difference between speaker and auditor, there were mainly such differences in temperature, though slight in amount, the total effect might be great. This corresponds, in the effect produced, to what Tyndall calls a "floculent condition of the atmosphere" in his discussion of the transmission of fog signals. Tyndall points out that if the atmosphere is in layers alternately warm and cold, sound is transmitted with much more rapid diminution in intensity than when the atmosphere is of very uniform temperature. This phenomenon is, of course, much more important with such temperature differences as occur out of doors than in a room, but it suggests that, in so far as it is a perceptible effect, the temperature of a room should be homogeneous. This condition of homogeneity is best secured by that system of ventilation known as "distributed floor outlets."

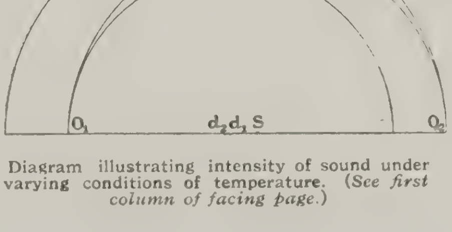

Diagram illustrating intensity of sound under varying conditions of temperature. (*See first column of facing page.*)

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

JULY 9. PROPOSED USHER HALL, EDINBURGH. **Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.**

JULY 20 YSTRADGYNLAIS SEWERAGE SCHEME. **The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower.** Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

JULY 25. NEW ELEMENTARY SCHOOL, WINCHESTER. Designs are invited from Hampshire Architects for Elementary School Buildings to accommodate 330 children. Particulars of Thomas Holt, Town Clerk, Town Hall, Winchester.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. **Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.**

SEPT. 5. THE QUEEN'S UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to Architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

COMING EVENTS.

Saturday, July 9th, 1910.
Visit of Guild of Architects' Assistants to Wesleyan Methodist Hall, Westminster, S.W., at 3 o'clock.

Saturday, July 16.
NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Sketching Club.

Tuesday, July 19.
ROYAL ARCHÆOLOGICAL INSTITUTE.—Annual Meeting at Oxford commences and continues till July 28th.

Wednesday, July 20.
NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Excursion to Rievaulx and Byland Abbeys.

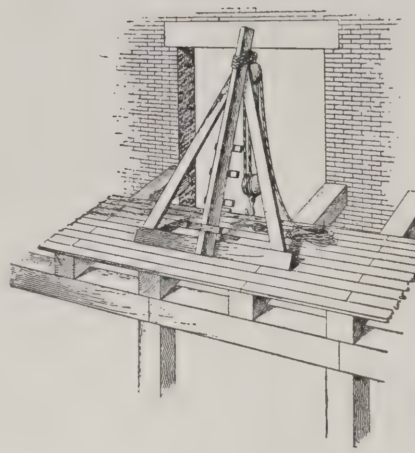
Monday, July 25th.
INSTITUTION OF MECHANICAL ENGINEERS.—Summer meeting commences at Birmingham and continues till Friday, July 29.

AN IMPROVISED DERRICK.

There are rather frequent occasions when it becomes necessary hastily to lower into or raise from basement or cellar, or from one storey of a building to another, great weights, such for example, as safes, machinery, wooden cases, etc., and for this purpose it is often necessary to devise some extemporised means in order to accomplish the work quickly and satisfactorily. An appliance for such a purpose is illustrated in the sketch shown herewith (with acknowledgments to the "Building Age"), the apparatus being rapidly put together by a builder for lowering a boiler, elevator machinery, and dynamos from the street into the basement of a recently erected building.

The drawing explains itself. The derrick is placed on a platform or bridge extending over the sidewalk, this bridge being not only for the purpose of providing a protection for pedestrians passing underneath against materials and scraps falling from the new building while in process of construction, but also affording a clear working space for the mechanics and the materials with which they are concerned.

The derrick is built up of 2in. by 8in. or 3in. by 12in. balk, which is set on edge. Square to one end a piece of 1in. by 8in. flooring is solidly nailed, and then on each side the derrick plank or timber, as it may be termed, is braced with two 1in. by 6in. strips or pieces securely nailed as indicated in the sketch. The derrick slopes at an angle of about 60 degrees when placed against a well or lintel of a window opening, for example, and is provided with climbing cleats and tackle. Its construction is but the work of a few minutes, and it is most useful when a job of this nature is to be done in a hurry. Its makeshift and temporary character will be fully recognised, and judgment must be used as to its strength and sufficiency for any particular purpose.



AN IMPROVISED DERRICK.

FEDERATION NEWS.

Lancashire, Cheshire, and North Wales Federation.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held on June 10th, the president, Mr. Wm. Cooke, junr., in the chair.

The half-yearly report drafted by the secretary was taken as read, and, after several slight amendments had been suggested, the same was provisionally adopted to present to the quarterly meeting of the Executive Board.

A recommendation of the Finance Sub-Committee with reference to the examination of the accounts, was then considered, and it was resolved:—"That in future the accounts be laid before the Finance Committee, prior to presentation to this Committee." It was also decided to recommend to the annual general meeting:—"That in future the Finance Sub-Committee should be composed of the President, two Vice-Presidents, the last retiring President, the Hon. Treasurer, and the two Hon. Auditors."

A letter was read from the Northern Centre Executive respecting the proposed amendment to National Rule 4, of which notice had been given by Mr. Smith, to provide that "ex-Presidents" of the National Federation shall remain on the National Committees for one year after the expiry of their term of office. The Centre Executive proposed a further amendment that the term be extended to "two years." It was agreed that this Federation support the amendment proposed by the Northern Centre Executive

A letter was read from the Liverpool Association requesting the Federation to take the necessary steps to have the law altered to make it illegal for the same person to act as architect or engineer, and arbitrator. After some considerable discussion, it was resolved:—"That the matter be sent on to the National Committee and Northern Centre Executive, with a request that they take action therein."

A letter was read from the Northern Centre Executive asking the Federation to pay the expenses of a representative from this Federation to the meetings called to consider and amend the N.A.O.P. Agreement, and it was agreed that the same be paid.

A deputation then attended from the Liverpool Association in support of a letter received from them and read at the last meeting of the Administrative Committee. The deputation complained of the delay in the publication of a certain report, and after some considerable discussion thereon, it was agreed to call a special meeting of this Committee for Friday, June 17th, to consider the matter.

The quarterly meeting of the Executive Board was held at the Boardroom, Blackfriars Street, Manchester, on Monday, June 20th, Mr. Cooke, junr., presiding over an attendance of twenty representatives from the Federated towns.

The half-yearly report, as provisionally adopted by the Administrative Committee, was taken as read, and after some considerable discussion the same was adopted to present to the annual general meeting.

The annual statement of accounts, which had been duly audited, was approved. It was agreed to pay a further contribution to the National Reserve Fund in accordance with the amount allocated to June 30th, 1910.

The Insurance Committee recommended all members of the Federation to protect their own interests by having a "special Federation policy," and at the same time support the Company formed by the Building Trade for their protection. This recommendation was confirmed.

The chairman explained the recommendation of the Administrative Committee, that in future the Finance Sub-Committee should be composed of the officers and the retiring president, and after some discussion on the best manner of filling the vacant offices rendered necessary by the retirement of some of the members, the meeting terminated.

The annual general general meeting of the Federation was held at the Victoria Hotel, Deansgate, Manchester, on Monday, June 20th, at 2.30 o'clock, when the president (Mr. W. Cooke, junr.), presided over an attendance of 45 representatives from the federated towns.

Mr. B. B. Moss, Liverpool, called attention to the lack of information in the possession of the local associations regarding the reserve fund account, and moved:—"That it be a recommendation to the Finance Sub-committee to consider the advisability of keeping the accounts for the National and County Federation reserve funds separate in future." This was carried.

The President, in moving the election of Mr. Frank Woods, of Bolton, as president for the ensuing year, stated that he had been in comumnication with Mr. Thomas Meadows (the senior vice-president), who had replied to the effect that as he was going out of business he would be unable to accept the office of president. Mr. Cooke then referred to the excellent work Mr. F. Woods had been doing for some time past in the interest of the Federation, and formally moved his election. This was seconded by Mr. H. S. Daniels, and carried with acclamation. Mr. Woods then took the chair vacated by the retiring president.

The new president then moved that the best thanks of this meeting be tendered to the retiring president (Mr. W. Cooke, junr.), for the excellent services he has rendered to the organisation during his term of office. This was seconded by Mr. W. Bullen, and carried unanimously. Mr. Cooke suitably acknowledged the vote of thanks.

Councillor Thomas Woolfenden, Rochdale, was elected the senior vice-president, and Mr. Samuel Gerrard (Manchester) junior vice-president. Mr. N. R. Stirling (Liverpool) was elected the hon. treasurer, Messrs. James Ramsden (Bury) and James Merritt (Birkenhead) were elected the senior and junior hon. auditors respectively.

The following were elected on the Administrative Committee, along with the officers and chairmen of the seven branch trade committees, ex-officio:—Messrs. John Cartmell (Preston), J. S. Brown (Liverpool), W. Tinker (Manchester), and J. Jackson (Radcliffe).

The Insurance Committee were re-elected for the ensuing year, with the substitution of Mr. Hugh Oldham (Rochdale) for Mr. J. E. Tinline (Bury).

A recommendation of the Administrative Committee: "that the President, along with the vice-presidents, retiring president, hon. treasurer, and the two hon. auditors, in future constitute the Finance Sub-Committee," was considered, and after some explanation duly confirmed.

The president, two vice-presidents, together with Messrs. Robert Hall (Bury) and Bertram B. Moss (Liverpool), were re-elected on the Organising Sub-Committee.

The recommendation of the Executive Board to amend Rule 31 of the Federation as follows, was considered and adopted:—"That the names of honorary members shall not be included in any official list of Federation members which is circulated amongst the affiliated local associations"; and that "If Rule 31 be amended as above suggested, the names of such honorary members shall be inserted in the next issue of the half-yearly report after the list of 'Ordinary Members for the respective towns.'"

The recommendation of the Administrative Committee: "That Mr. Robert Innes, of Norfolk Street, Manchester, be appointed solicitor to the Federation on the terms agreed upon, was then considered and duly confirmed.

A recommendation of the Insurance Committee to renew the business of the Insurance Department with the Federated Employers' Insurance Association, Limited (as per resolution included in the Executive meeting reported above), was then considered, and, after some considerable discussion thereon, it was resolved:—"That the same be confirmed, printed, and circulated to the presidents and secretaries of the local associations."

Under the head of general business, Mr. Robt. Hall called attention to the present constitution of the various Federation Committees, and moved:—"That it be a recommendation to the Administrative to take into consideration the advisability of giving the Executive Board full power to appoint the various Sub-Committees from amongst their members at a meeting to be held prior to the annual general meeting of the Federation, on lines similar to those adopted by the public bodies and county councils." This was carried.

A member from Rochdale called attention to the unsatisfactory conditions of a form of contract that had been issued in their district, which he understood had been accepted by several members of the Manchester Association, and he was instructed to forward particulars thereof on to the Federation secretary, with a view to having the matter brought before the notice of the Administrative Committee.

It was decided to place the following on the agenda for consideration at the half-yearly meeting of the National Federation, to be held at Chester on July 27th:—"To consider the question of recommending all local associations to adopt a reference list of architects, quantity surveyors, and clerks of work."

The President, in closing the meeting, asked the members to make a special effort to attend the half-yearly meeting of the National Federation, to be held in Chester on July 27th.—JOHN TOMLISON, Secretary.

Hull.

The annual picnic of the Hull Association was held on June 16th, when 140 members and friends journeyed by the Hull and Barnsley Rly. to Liverpool. After luncheon the party went by steamer to New Ferry, and enjoyed a close view of the liner "Lusitania." Thence they went to Port Sunlight, where Messrs. Lever Bros., Ltd., had kindly arranged to have the party conducted round their works. The drive was continued through Birkenhead and Seacombe to New Brighton, whence, by means of another ferry boat, the visitors returned to Liverpool, where they dined, their number being augmented by the presence of the President and Treasurer of the Liverpool Master Builders' Association. The Hull president (Mr. R. Finch), and Messrs. J. Townsley and E. Quibell, and Mr. Costain, the Liverpool president, addressed the company.—A. PEERS, Secretary.

Edinburgh, Leith, and District.

The tenth annual tour of the Edinburgh, Leith, and District Building Trades Association and Building Trades Exchange took place on June 22, to Aberfoyle and the Trossachs. A company of over 80 ladies and gentlemen left the Waverley Station by special train, going to Aberfoyle, via Stirling. On reaching Aberfoyle, coaches were in waiting at the Bailie Nicol Jarvie Hotel to convey the party over the hills to the Trossachs. On arrival at the Trossachs Hotel dinner was served, Mr. David Wilson, J.P., president, being in the chair. The afternoon was spent visiting the local places of interest, including Losh Katrine, whence the Glasgow water supply is derived. The return journey was made over the mountain passes to Aberfoyle, where the special train was again boarded, and Edinburgh was reached shortly after 9 o'clock in the evening.—JAMES CAMERON, Secretary.

Sheffield Master Builders' Association.

Death of Mr. Arthur Mastin.

By the death of Mr. Arthur Mastin, which took place on Sunday, the 26th June, the Sheffield Association loses its most enthusiastic member. Though he was only in his forty-third year, the stamp of his individuality was indelibly fixed on the association, which had accorded him all the honours it was within its power to bestow. For ten years he was honorary treasurer, and in 1905 was president, being at that time the youngest president the association had ever had. His illness has been a long and painful one. The funeral took place at the City Road cemetery on Wednesday last, and was very largely attended, amongst those present being many representatives of the Master Builders' Association, the Plasterers' and Plumbers' Associations, the Building Trades Exchange Club, and the Sheffield Wednesday Football Club, Ltd. The bearers were six of the oldest employees of Messrs. J. Mastin and Son, Ltd., of which the late Mr. Mastin was managing director.—THOS. SMITH.

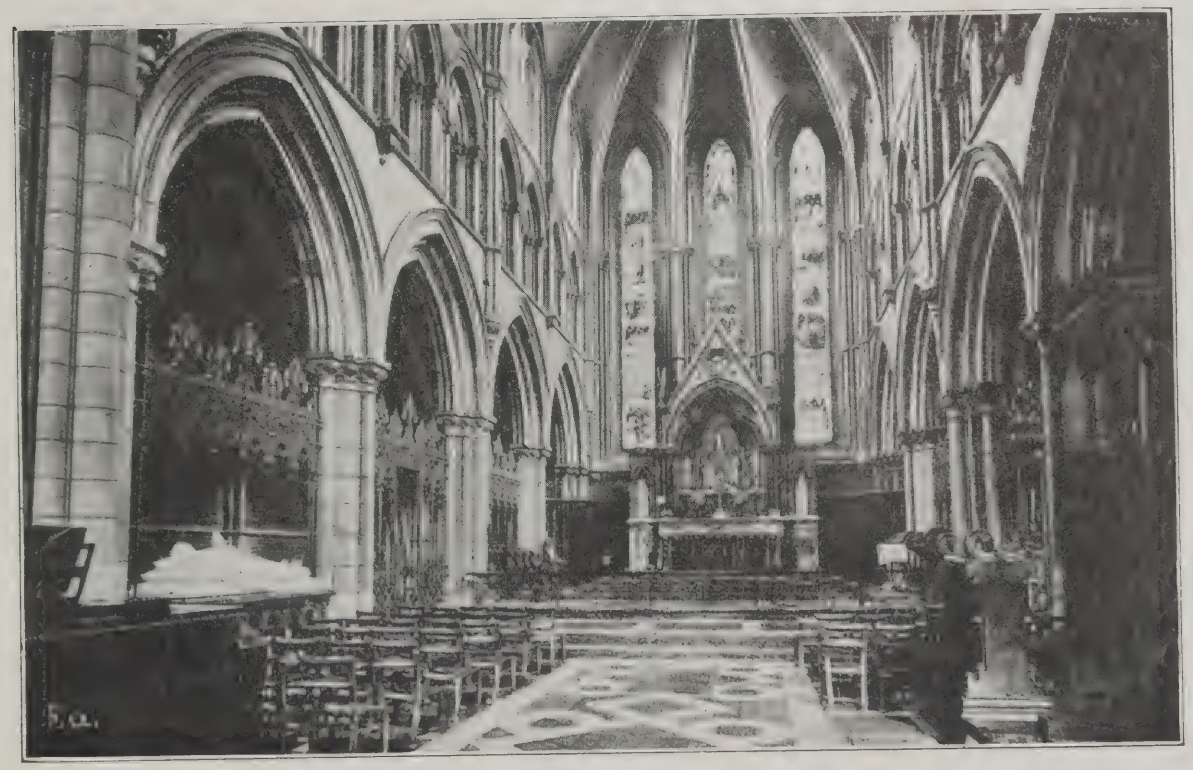
LLERY. H. HEATHCOTE STATHAM, F.R.I.B.A., ARCHITECT

LIBRARY
OF THE
UNIVERSITY OF [illegible]

THE ARCHITECTS' & BUILDERS' JOURNAL

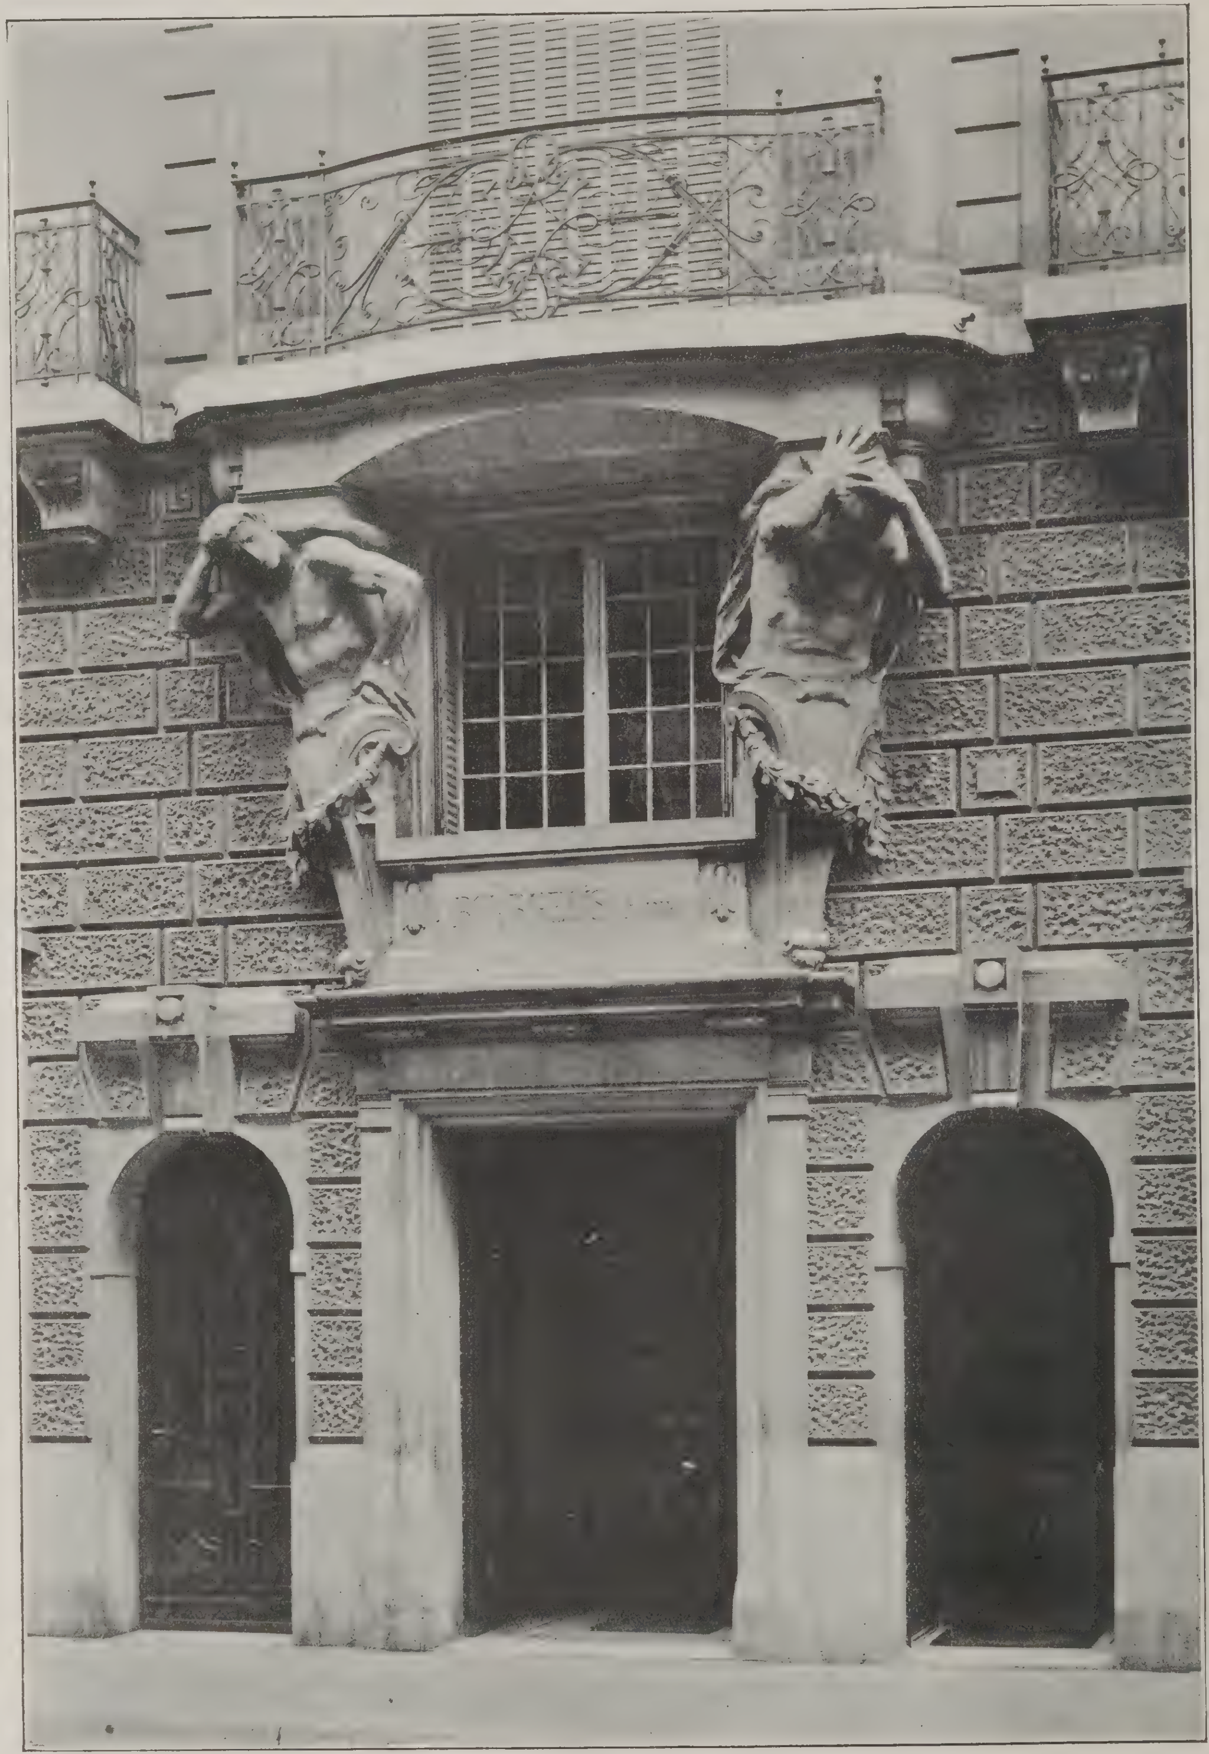
WEDNESDAY,
JULY 13th, 1910.

Volume XXXII. No. 806.



Edinburgh Cathedral, it has been said, "is undoubtedly one of the most beautiful of all Scott's designs, and shows him at his best." It is the result of a competition opened in 1873. The date of this issue coinciding with the birthday of Scott, a portrait of the architect is given on page 31.

ST. MARY'S CATHEDRAL, EDINBURGH: THE CHOIR. THE LATE SIR GILBERT SCOTT, R.A., ARCHITECT.



A thoroughly representative example of modern French work, noteworthy more especially for the sculptured figures supporting the balcony at first-floor level. Caryatid treatments are common enough, but more often than not the figures are not disposed so as to give an appearance of strength—they seem to be crushed down by the mass above, or in consequence of it. In this example the result is quite the reverse, and, as such, merits attention. The whole is in stone.

ENTRANCE, NO. 18, RUE CROIX DES PETITS-CHAMPS, PARIS. M. BRÉFFENDILLE, ARCHITECT.

THE ARCHITECTS' & BUILDERS' JOURNAL.

JULY 13th, 1910. *CAXTON HOUSE, WESTMINSTER.* VOLUME 32. No. 806.

Note: The List of Contents will be found on Page V of the front advertisements in this and subsequent issues.

Criticism: Professional and Amateur.

THE American Institute of Architects recently published, in a schedule of articles defining what they regarded as "unprofessional conduct," a notification to the effect that no member of their Institute should criticise the work of any other member, except openly under his own signature, under pain of being branded with the charge of having acted in an unprofessional manner. This is the first time, to our knowledge, that any such proposition has been made by an architectural body; but it seems to have attracted some attention in England, and in case of any such idea being seriously canvassed on this side of the water, it may be well to point out what would be the consequences of the adoption of any such position by the Institute of Architects; consequences which perhaps those who discuss it (for we have reason to believe that it is being discussed) do not altogether realise.

Whether any special reason had occurred for the American Institute issuing that ukase we do not know; there may have been such. But it should be realised that the effect in the United States would be very different from what it would be here. America issues a very good monthly architectural magazine, the "Architectural Record," in which the articles are signed; that is a system which can be very well carried out in a monthly magazine, which consists of a few articles on the broader aspects of architecture; though we have some doubts whether it is, even there, the best system, for this reason: An anonymous article is judged on its internal merits, and is allowed weight accordingly; it is a good and well-reasoned or well-informed article, or it is not, and it is read on its merits; but a signed article is read or neglected according to the reader's respect for or prejudice against the writer of it. The "Quarterly Review" has hardly improved its position or its influence by recently taking largely to signed articles. The position is not such a strong one.

But whatever may be done with a monthly review or magazine, it is practically impossible to run a weekly paper, made up of all kinds of articles, on a basis of signatures. And in regard to weekly papers, the ukase of the American Institute of Architects would have a very different effect from that which would follow on any similar prohibition issued from No. 9. Conduit Street. The American weekly papers are largely made up of reprints of papers read at meetings in the States or in England; the anonymous editorial portions consist usually of only a few short notes on current events, which might be written by any journalist who had some acquaintance with the architectural world. The English weekly papers often contain long articles on important architectural subjects which could not possibly be treated except by professional architects, having special artistic or technical knowledge. And that is why the English architectural Press, taken all round, is, we believe, the best in the world. It is written for the most part by people with special knowledge. An editor of long experience used frequently to receive applications from professional journalists to be accepted as contributors, referring to the papers they wrote for, etc. His reply was always, in effect, "I have no use for journalists; this is a paper written by architects for architects; I can take no article on an architectural subject except from an architect." Surely this is the right position. Journalism, which means the power of collecting information and putting it, *extempore,* into readable and interesting form, is a special talent by no means to be despised in its own proper sphere; but when it comes to dealing critically with such a subject as architecture, journalism only means making readable sentences on things the writer knows nothing about; a little happily acquired phraseology serving perhaps to give a varnish of apparent acquaintance with the subject. We can hardly think that is the way in which architecture, or the works of architects, ought to be treated.

As things at present stand in England, an adoption of the American Institute theory in the matter would mean (if the principle were loyally acted upon) that four Fellows of the Institute, three of them members of the Council, would either have to resign from the Institute or to give up their connection with as many architectural journals. In the latter case, the result would be that architectural criticism in the professional journals would be reduced to the level of the architectural criticism of the daily newspaper. Does any architect seriously think that would be an advantage to the profession? We may add that we do not believe there is any precedent for such a view in connection with other subjects. The two leading engineering papers are, if we mistake not, edited by members of the Institution of Civil Engineers. The literary reviews in the "Athenæum" are written by men who are themselves authors, and we have never heard that the Society of Authors have issued any *caveat* against its members reviewing each other's books. And then it must be remembered that there is not only the case of hostile, but also that of friendly criticism, to be considered. The American Institute ukase was obviously directed against the case of a professional architect writing anonymously a hostile criticism of a brother architect. But criticisms (thank goodness!) are not all hostile; there is such a thing as appreciative—even enthusiastic—criticism. And is it not far pleasanter and more delicate for both parties, the praiser and the praised, that such appreciation should be anonymous? On this point we will tell a little story, which is true, except the assumed names. Brown, who was a critical writer on art, in a signed article in a well-known magazine, bestowed great praise on a picture at the Academy by Robinson. He did not know Robinson; but a mutual friend, Jones, the sculptor, told him Robinson was much pleased, and was going to write to thank him. "Oh," said Brown, "I hope he will not do that; I only said what I thought was the truth." A month later Jones again met Brown, and said: "Robinson was speaking of you yesterday; he says he really *must* write to you." Robinson never did write; and the moral of the anecdote is, that an artist may be very much pleased at a favourable notice of his work, but that he may feel embarrassed by a sense of personal obligation if the article is signed; and that the situation is much pleasanter for him if he does not know (or need or not be supposed to know) to whom he is indebted. It then becomes not a personal but an impersonal tribute.

The line to be drawn, and to be drawn rigidly, is that no one should ever write anonymously, or (if an editor) allow others to write anonymously on any subject in which his own interests are concerned. To do so is simply to throw dust in the eyes of the public, which reads the article as an expression of independent opinion. Time was when one of the foremost architects of the day, in the middle of last century, frequently wrote the anonymous notices of his own works, and was allowed to do so by a too friendly editor. It is to be hoped we have got beyond that now.

Nor, again, should any correspondent be allowed to write anonymous letters to a paper on a matter in which he is personally concerned. Disappointed candidates in a competition, for instance, who think the wrong award has been made, sometimes write letters showing where the selected candidate has not complied with the instructions, etc.; well, if they have a good case let them write, but let them put their names to their letters; they have no right to make believe that they are disinterested critics of the competition. No one who is a competitor, or is professionally connected with a competitor, ought to write, or ought to be allowed to write, a criticism of a competition exhibition. And an anonymous professional critic who has a full sense of his responsibility to the public would, in reviewing a collection of designs (such as the Academy Architectural Room) omit reference to his own, save perhaps as merely recording its presence; a matter in which the writer of these words has at all events practised what he preaches.

There is a great deal, certainly, to be careful about in the carrying out of anonymous criticism by professional architects. But if it is honestly and conscientiously done, no other set of people are so competent to do it; and to put an end to it, and throw architectural criticism into the hands of the laity, would be a *reductio ad absurdum.*

Chinese and Japanese Paintings: British Museum.

THE large collection of Chinese and Japanese paintings now on view at the British Museum is no doubt, in an historical sense, a very valuable and interesting one, but in the Press notices which have appeared, and in the essay and notes in the printed catalogue, it is spoken of with a solemnity and importance which are very much exaggerated. In the way of painting of birds and flowers, there is, as everyone acquainted with Chinese and Japanese art would expect, some most beautiful work. The seventeenth-century studies of flowers (No. 90), for instance, are exquisite; so, in a much larger and grander fashion, is the "Lotuses and White Heron" (57); the large leaves of the plants, in their varying outlines and colours, may be said to be in a grand style. Among other fine things we noted among the Chinese paintings are the "Eagle attacking a bear" (58), which has a wonderful realism and vigour of action, and the cock in the picture of "Fowls, bamboos," etc. (62). But when it comes to figures and landscape, to pretend that these things are to be regarded as seriously as we regard Italian, French, and English painting is absurd, and to tell the innocent visitor so is misleading his mind. Look at the Chinese painting called "The Beginning of Winter" (36); did anyone ever see mountains like those represented here? Look at "A Waterfall" (102); is that painting a waterfall? Or come to figures; look at "Kwannon the unsurpassable" (137); look at the way the feet and hands are drawn—or not drawn. We are accustomed to think that the adequate drawing of feet and hands is one of the tests of a figure-painter; why are we to accept absurd drawing because the artist is a Japanese? It is really necessary to say seriously that the power to draw the figure correctly and learnedly belongs to Western artists, and is an important element in painting which the Chinese and Japanese do not possess; they produce grotesques, some of them very clever as grotesques, some of them merely hideous, like the nightmare figures in the set of drawings of "The Haunted House," which are really only like the kind of things children draw when they want to make something "very horrid." That one should be asked to go and look at such things seriously and call them "art," and be told that they are in their way quite as valuable as Western art, is as much as to ask us to admit that beauty and accuracy of drawing count for nothing in painting. People who would maintain such a paradox must, we should think, have gone a little out of their minds.

New Peals of Bells.

TWO peals of bells of some interest to the world have just been rung for the first time; that at Truro Cathedral and that in the rebuilt Venice Campanile. Truro has a peal of ten bells which were dedicated and rung at the same time as the opening of the new western towers. In a paper of the same date we read of the first ringing of the bells in the rebuilt Campanile at Venice, which appears to have been an occasion of considerable public excitement. The number of bells is not given. There is no mention of either peal being used for carillons, which is just as well. The carillon is a system which can only be rendered effective with a large number of bells, and it is at its best a rather unsatisfactory form of music, seldom found quite in tune; the full tone of the bells is not got out of them, as they cannot be swung, but must be fixed and struck by a hammer on the outside. The wild clang of a swung peal of bells, though it is not exactly music, is a fine effect, unlike anything else in the world of sound; and on the whole the best use to be made of bells is to swing them in peal-ringing. The perpetual repetition of a fixed carillon tune every hour or half-hour, moreover, is apt to become a nuisance, while the simpler tunes or scale-passages of the swinging peal can be constantly varied.

The Borough Council and the Poets.

A BOROUGH COUNCIL always feels itself fully competent to dispose offhand of any mere question of art. The Borough Council of Swansea has as lightly assumed the functions of the literary critic. According to a Swansea newspaper, the Housing Committee of the Council recommended that certain single tenements should be known as "Shelley Crescent"; and certain double tenements as "Bryon [*sic*] Crescent"; whereupon up rose a member demanding "who was responsible for choosing the names of such neurotic poets as Bryon and Shelley." We interrupt him with the suggestion that probably some wild Welsh compositor is responsible for "Bryon." "What," he asked warmly, "had those names to do with the tenements at all? There were more sensible names to be found, and he suggested that if possible they should choose names having some connection with Wales." Alderman Morris said the committee thought that as other streets had been named after great men in literature, the names chosen would be suitable, whereupon it was retorted: "They are the two most lawless poets we have in England, and the names may have the tendency to make the people more lawless." The council had the grace to laugh; but the committee's proposal was referred back, so that "Bryon" and Shelley, by their "lawlessness," have missed their supreme moment of immortality in Wales; but is the refusal to attach their names to cheap tenements a climax of poetic justice? It does seem a ridiculous proposal, when one comes to think of it, to label the most prosaic of buildings with the names of Byron and Shelley; to whom, therefore, the indignant councillor was doing a greater service than he was perhaps aware.

NOTES AND NEWS.

Bournemouth's Centenary.

The celebration of the centenary of Bournemouth takes its date from the building of a solitary house by Mr. Tregonwell; "and around this house, above, below, and beyond, other people built and planned streets and gardens, so that now there is a population of 80,000, and the county borough claims to be the handsomest and best laid out resort on the British coast." For an unconcerted essay in town-planning, Bournemouth is pretty well; and its houses, tiled and gabled, and showing a wonderful variety of bargeboards, many of which are really beautiful in design, are in some cases quite architectural. But architects attracted to the resort by the celebrations will turn with relief towards the neighbouring quaint little town of Christchurch, where the venerable priory and the adjacent ancient villa will well reward them for the tedium of the journey and the turmoil of the "fêtes."

A Germ Theory of Stone Decay.

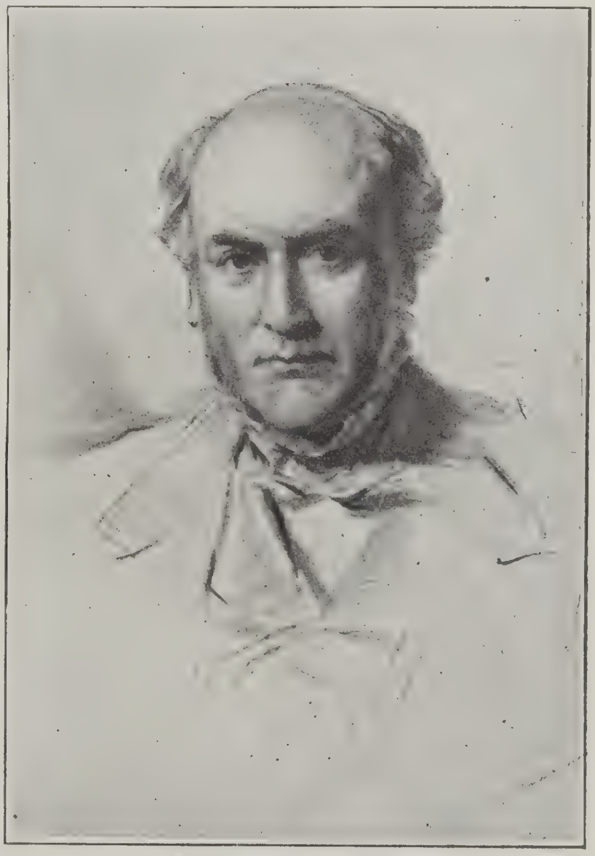
A short time back we chronicled a curious theory with respect to the "diseases" of metals. A germ theory of stone decay is now advanced. At the annual conference of the Museum Association, held at York last Wednesday, the president (Dr. Tempest Anderson) contributed a paper in which he said that he had taken stone from some of the eroded buildings in York and cultivated the germs which it contained, and which he believed were the cause of the erosion. He believed the process was similar to that caused by micro-organisms in the decaying of wood, and that sulphate of copper dressings would enable the stone to resist the attacks. Mr. Sheppard (Hull) and Mr. Platnauer (York) declined to accept the germ theory, and contended that the erosion was due to the action of the carbonic acid gas and sulphurous hydrates present in the atmosphere. Dr. Bather, F.R.S. (British Museum), was inclined to accept the theory that the erosion was due to a bacillus, as they were daily finding that microbes were responsible for processes hitherto believed to be purely due to physical causes. He agreed that sulphate of copper was an excellent germicide and preventive agency.

The King and St. Nicholas, Deptford.

The King has forwarded a donation of 20 guineas towards the fund which is being raised for the restoration of the historic Church of St. Nicholas, Deptford. It is estimated that £5,000 will be required to render the church safe for Divine Service. St. Nicholas is the mother church of the parish. It is an ancient foundation, and, in the twelfth century, the advowson was granted by the Countess Juliana de Vere to the Premonstratensians, or White Canons. In 1630 a new north aisle was added, and the chancel was enlarged. The nave was rebuilt in 1697. In 1795 a writer in the "Gentleman's Magazine" thus described it: "The church of St. Nicholas, Deptford, in its present state, has a strange disjointed exterior. The tower is evidently of very great age. The earth round it appears to have been raised, as there is a descent of several steps, contrary to the usual manner of entrance into such places. Nothing, surely, can exceed the monstrous incongruity of the church and its tower—stone and brick, Gothic, and a defiance of every order, jumbled together. Yet the person employed in rebuilding the church must have been a man of taste, as the inside plainly demonstrates, for that is elegant. The chancel is small, and railed off from the church; it is richly ornamented with carving of foliage, figures, etc. (the work of a parish worthy, Grinling Gibbons), and two paintings of Moses and Aaron. Over the Commandments there is an oval painted glass representing the Adoration of the Infant Jesus, that has considerable merit." Whether or not Grinling Gibbons was born in Deptford, the son of a Dutchman settled there, it appears to be firmly believed that Evelyn, another Deptford worthy, dragged him from obscurity there, and introduced him to the King. The church was repaired in 1876, but in 1884 Mr. Thomas Dinwiddy reported the whole fabric as being in a dilapidated condition. The building, which measures 74ft. by 62ft., with an extreme length, including the chancel, of 86ft., is a very plain brick structure. Christopher Marlowe is buried in the graveyard, and a painting of Queen Anne by Sir Godfrey Kneller hangs in the chancel. But what may more have influenced the King's generous donation is the fact that its graveyard holds the remains of many fine old sailors.

Holland House.

For some time past there have been rumours to the effect that the whole of the historic estate on which stands Holland House is to fall into the hands of the builder. It is now announced, however, that the estate is not in any immediate danger. It is only a portion of it that is offered for sale, and it constitutes a part advertised for sale a few years back, but afterwards withdrawn. The frontage, which is in Kensington Road, is about 500ft. long, and it is not proposed to cut off more than 100ft. of the width. The main portion of the estate, therefore, will remain untouched, and there seems to be no immediate danger of realising the dismal foreboding of Macaulay, who predicted "the time when a few old men, the last survivors of our generation, will in vain seek amidst new streets and squares and railway stations for the site of that dwelling which was the favourite resort of wits and beauties, of painters and poets, of scholars, philosophers, and statesmen." Holland House, originally built in 1607, did not become really celebrated till the reign of George I., when the widow of its owner, the Earl of Holland and Warwick, married Addison, who died there. It afterwards belonged to the family of Fox, Lord Holland, first as tenants and afterwards as owners of the freehold. An interesting account of Holland House, from the pen of Mr. J. M. W. Halley, with fine photographic views of the building, and a reproduction of John Thorpe's plan, appeared in the "Architectural Review" of April last. Some of the internal staircasing and panelling are "not very wisely" attributed to Inigo Jones, who, however, designed some gate piers which are illustrated in the same article.



SIR GILBERT SCOTT, R.A.

After the drawing by Sir George Richmond, R.A. The portrait is reproduced *apropos* of the date of this issue coinciding with the architect's birthday. He was born July 13th, 1811; elected F.R.I.B.A. in 1849. A.R.A in 1855, R.A. in 1861, knighted in 1871, and died March 19th, 1878.

B

AN ARCHITECT'S RECOLLECTIONS.

BY H. H. STATHAM, F.R.I.B.A.

[*We are happy to have succeeded (after considerable difficulty) in persuading Mr. Statham to set down a few reminiscences of his long connection with the profession, and to show some of his drawings.*]

It is at the special request of the proprietors of this Journal that I have agreed to have my portrait sketched by Mr. Paxton, and to give some account of myself—a kind of personal demonstration rather foreign to my usual predilections. But the management seemed to think their readers would like to know something about me; and if this is a mistake, and they are bored—which may be only too probable—they must put the saddle on the right horse, and regard me as writing under a kind of friendly compulsion.

As all the facts would have to be furnished by myself, it is simpler to write in the first person, rather than make a pretence of the article being written by someone else.

I received my professional education in the office of the late George Williams, of Liverpool, who was a pupil, and I believe rather a favourite one, of Decimus Burton, whom I call therefore my architectural grandfather. I remember Burton calling at the office on a visit to his old pupil; a tall, fine-looking old gentleman, with a very military air about him. He was, I should think, one of the best representatives of the early nineteenth-century school of English architects, who from the artistic point of view would perhaps be thought little of now, but who had some high merits of their own, including thoroughness of practical knowledge and a very high standard of professional conduct. (To be sure, the field of practical knowledge was more easily covered in those days than it is now.) My principal, Mr. Williams, was a follower in the steps of Burton. Before commencing practice, he had toured in Greece with a sketch-book, at a time when such touring was both less common and less easy than now, and drawn the details of Greek monuments *in situ*. His sketches were exceedingly neat and clean in style, and scrupulously accurate.

In the office, Classic and Renaissance taste ruled. As a pupil, I was set down at once to copy the Parthenon Order out of Normand, and subsequently that of the monument of Lysicrates (I have the drawings still), on which latter I worked so conscientiously as to elicit from my master the complimentary remark that I "had rivalled the engraver," but with the result also of bringing on a temporary blurring of the eyesight which compelled me, on medical advice, to knock off all work for six weeks. However, no permanent injury resulted; I have been short-sighted always, but my sight is as strong now as it ever was.

Gothic was turned out of the office now and then, when a church or a chapel came in hand, but I was conscious even then that it was very weak Gothic. My own sympathies were with Gothic at a very early date, and Bowman and Crowther's "Churches of the Middle Ages" was a kind of Bible to me; Ewerby and Heckington were as sacred shrines. Now that the Gothic revival has departed, it must be difficult for students of this day to understand at all or to realise what was the glamour of Gothic architecture to young enthusiasts in the sixties of last century.

If the office could hardly be called an artistic one, it was at least a practical one, and I was indebted to my then principal for a very good grounding in the practical side of building and constructional detail. The fact that we had the laying out and the care of one or two public parks led to my acquiring a knowledge of the section and structure of roads. There was a good deal of surveying, which I always enjoyed. I have never had any sympathy with the æsthetic architects who despise surveying as a pursuit beneath their notice. It is a valuable training in habits of care and accuracy, and an architect who himself surveys the site for a country house knows much more about the land than he can know otherwise. And there are few pleasanter open-air occupations than country surveying in fine weather. To be sure, when a survey was wanted immediately, irrespective of any such saving clause as "God willing and weather permitting," chaining for a whole morning in two or three inches of snow was not quite so enjoyable.

On entering on my articles I became at the same time a student member of the Liverpool Architectural Society, at that time a very active and energetic body, so much so that in some public print it was held up as an example to the Institute. Some of the best architectural papers I have ever listened to were read there (by the ordinary members, not by distinguished persons invited from outside); the attendances were full, and the discussions very interesting. For some years I acted as Hon. Secretary to the Society, and worked hard at my post, to the satisfaction, I believe, of the council and members; at least, they gave me every reason to think so.

On the expiration of my articles, I had a short engagement in the office of Messrs. Hay, who then did much church work in the neighbourhood and elsewhere, but was soon invited back to take the post of draughtsman and assistant in the office where I had been a pupil. One of my pleasantest recollections about this time is taking part in the first annual excursion of the Architectural Association, when the party visited Lincoln and the neighbourhood, under the guidance of Mr. Edmund Sharpe. I had never joined in a sketching raid till then, and it was one of the happiest weeks of my life. I wrote the account of it for the "Builder," and subsequently lithographed all my sketches (I had early acquired facility in drawing "on stone," that is, on transfer paper) and made them the illustrations to a paper on the subject at the Liverpool Architectural Society, copies being distributed to the meeting—one of the best methods of illustrating a lecture, which I have often employed since.

I can only remember one building I carried out in Liverpool after the retirement from practice of my principal; this was a big brick school round three sides of a quadrangle, designed a good deal under the influence of Street, in which I tried a new sectional treatment of roofing, something like the arangement shown in the accompanying design (below) the buttresses being arched inward to meet the thrust of the principals. It looked bold and effective, at all events; whether the building is still in existence, I know not. I have another interesting recollection connected with that building, that my excellent foreman of bricklayers, who had just been occupying the same function on a building by one of the most eminent architects of the day (now dead), told one of the committee that he thought their architect a much greater one than Mr. ——, on whose building he had been previously employed. The testimony of a good workman is worth having, and I think of it with a certain amusement when I find people who will not believe I am an architect because I have been an editor.

But before this the call of London was upon me. I felt that I had some abilities which would find more scope in London. I had written various articles already for the "Builder"; one of them, "How John ye Son of Smith decorated ye House of ye Lord" (a little satire on the violent chromatic effects of some of the Gothic architects), had a great success, and has been quoted to me several times by people who had no idea that I was the author. For two or three years I had been coming up to London every year, in May, to review the exhibitions, painting and sculpture having always had a great attraction for me; and a move to London was rendered possible by the offer of Mr. George Godwin (editor, and practically founder, of the "Builder," and one of the best friends I ever had), that he would guarantee me sufficient work on his paper to afford me a certainty of a "living wage."

For some years I was largely occupied in contributing to the "Builder" under the editorship of Godwin, who left me free scope to develop my own ideas, and rarely altered a line of my articles. I took immense trouble over some of these. One rather amusing result of a week's work was the demolition of Parker's archæo-

logical theories on the Colosseum. Parker was the most dictatorial of archæologists, who collected a great many facts, but could not understand their bearing, and laid down the law in the most peremptory manner. I felt sure his theories were wrong, but could not go to Rome to test them on the spot; but I remembered the existence in the British Museum of the great set of drawings of the Colosseum made in the early part of last century by the French engineers, in which every stone was shown (except the portions not then laid bare). They were amply sufficient to show the absurdity of Parker's restorations. Calling on Godwin the week after, he said: "Well, you have brought Parker down on his knees! I never had such a humble letter from him in my life"; and, in fact, his letter, which I saw, practically gave up his case. The article was generally attributed, I believe, to a rival archæologist in Rome.

I took a good deal of part in the proceedings of the Architectural Association in those days. Among the papers I read there was one on "Plan as the basis of design" (a subject which, oddly enough, the Association have just done me the honour to ask me to treat of in the coming session), and one on "landscape and architecture," illustrated by about fifty large monochrome brush sketches on cartridge paper, which fairly lined the walls of the long narrow room on the ground floor at 9, Conduit Street, where the Association then had their meetings. Later I contributed some important papers to the Institute proceedings; one, as I remember, on the architectural treatment of bridges; and when the Government offices sites were under discussion, the Council did me the honour to invite me to treat the subject: a paper which led to my being asked to give evidence before the special Commission. The special point I maintained then, and still maintain, was that a great public building, like the War Office, ought not to have been allowed to be defined by the irregular lines of streets, but should have made its own *place* with a symmetrical plan; in other words, such a building should control the street lines, and not be controlled by them. At the Institute meeting I brought forward my own block plan for a War Office opposite to and axial with the Horse Guards, but on a much more extended plan; it received most flattering approval at the meeting, but was far too expensive a plan for an economical Government.

During some years of my earlier London life I had ceased to look out for any architectural practice, in great measure from a feeling of disbelief in modern architecture, as consisting only of imitating old work (which was pretty much the case then). It seemed a question whether the game was worth the candle, except for the making of money (for which I have never had any faculty). I think now it was a mistake, but that was my feeling at the time, and I had a good many other interests connected with Art and Literature. Having attended some of the Friday evening lectures at the Royal Institution, I felt that I should like to stand behind the green table and talk to that rather exceptional audience on something that interested me. Accordingly I wrote to Professor Tyndall, then all-powerful at the Institution, merely saying that I understood the subject of architecture pretty well, and should like to offer a lecture on it. He referred, I believe, to Fergusson, who reassured him, and I gave my first lecture there, on "The Logic of Architectural Design," using the system of handing round lithographed diagrams among the audience. There was a large and very attentive "assistance," and it was, I suppose, a success, as it was immediately followed by an engagement to give a series of afternoon lectures on the history of architecture. I twice afterwards had the honour of addressing a Friday evening audience; on "The Philosophy of Ornament," and on "The Metaphysical Basis of Music." For one person to have addressed that audience on three different subjects, and be received each time with attention, is, I fancy, a rather unusual event. My connection with the "Edinburgh Review" was another source of interest. It began by an offer to write an article on Wagner's operas, none of which had then been heard in London, but I had all the scores. This article was the beginning of a life-long friendship with Mr. Henry Reeve, Clerk of the Privy Council, and for half a century editor of the "Edinburgh Review," and many were the articles I contributed after that. Among those connected with my own profession were one on "St. Sophia and Byzantine Building," one on "Formal and Landscape Gardening," and one on "London Architecture in the Nineteenth Century"; the last-named had the amusing result of bringing me a letter from an eminent architect asking why I had not noticed and quoted "this admirable article" in the "Builder." Another interest to me was the opportunity of giving organ recitals at the Albert Hall, which I did during the London season for several years, in the 'eighties. This was through the intervention of Mr. Godwin, who was a member of the Albert Hall Council. I told him if they wanted organ-playing there on Sundays I could furnish it, in return for leave to practise on the organ. He told the Council that if I said I could do it, he had no doubt I could, and no more diplomacy was necessary. It was one of my greatest enjoyments, but was a puzzle to my professional friends, one of whom asked me one day if it was any relation of mine who was playing at the Albert Hall. I said I had been playing there. "You?" he said, "was it you I was listening to all the time?" All this was not architecture, to be sure, nor was it the way to what is called "getting on in the world"; but I am inclined to accept "Punch's" moral to the fable of the Hare and the Tortoise, viz.: "What a dull time the tortoise had of it." My life has certainly not been dull, whatever other disadvantages it has had.

I had continued to carry out architectural work from time to time, when it came in my way, and, with my friend Mr. Slater, went in for the great competition for the Edinburgh Municipal buildings, where our design was selected among those for special consideration. I set a good deal of store by my treatment of the flank elevation, on the side of a steep hill; but the only drawing I have of it is a pencil one, which is too slight to reproduce well. But I have ventured to give another competition elevation, that for Sheffield Town Hall, which was hung on the line at the Royal Academy, and is one of the best elevation drawings I ever made. I was amused at the question asked me by an eminent provincial architect whom I found looking at it there: "It is a capital drawing," he said, "*who did it for you?*" The idea that one should have made one's Academy drawing onself did not seem to have occurred to him. The elevation and details of an office front in Catherine Street (pp. 36, 37) was also hung on the line at the Academy, and brought me perhaps the more practical testimony, that the Duke of Bedford's agent, on seeing the building, on each side of which there was a vacant plot, put it as a condition in the leases of those two sites that I should design the

buildings erected on them, which was duly done, after great trouble with one of the lessees, who did everything he could to evade the condition. The building called "Offices in York Street" (p. 38) is the other one, and was planned to provide, on a very narrow site, for the offices of a well-known specialist journal, which had expressed an intention to take over the building; and I think as much has been got into the narrow space as could be. Unfortunately, their offer fell through; the building has been erected nearly as shown, but with only an empty floor plan for letting off. This drawing was also hung at the Academy.

In default of large works in actual practice, I have interested myself a good deal in suggestions for the improvement of certain classes of public work. The subject of bridges has especially interested me for a long time, as I think that where what are called architectural features (an unhappy expression) are introduced, it is generally done in a wrong way; columns are constantly introduced on the piers, where there is no vertical weight to carry, and it is not perceived that the extension of the pier beyond the line of the face of the arch is really of the nature of a buttress, and requires to be treated accordingly. In the "Study for a Stone Bridge," (p. 35) which was exhibited at the Academy, and in some other designs for bridges, I have shown the pier treated in a buttress fashion, but in what is really a new form. Another suggestion in this design is that the lamp standard, containing three lamps, need not necessarily be placed parallel with the parapet of a bridge; it can just as well, as shown here, be placed at right angles to the parapet, by which arrangement the outermost lamp throws a light on the arches of the bridge for the benefit of the river traffic. There is a good field for new architectural treatment in stone and granite bridges, which have hitherto in almost all cases been treated in an entirely conventional manner, and with architectural features bearing no logical relation to their position.

I have also interested myself for a long time back in the idea of suggesting a recasting of the front block of the National Gallery, which, in spite of Wilkins's refined detail (which no one appreciates more than I do), is as a whole manifestly unworthy of its splendid position, the central cupola especially being very poor. My first attempt, a perspective view and plan, which was exhibited at the Academy a good many years ago, showed a very lofty central dome, and was treated with a semicircular columned bay on each of the end pavilions. The dome, as I felt afterwards, was too large, but the design brought me a letter of appreciation from Professor Aitchison, and a very enthusiastic one from H. W. Brewer, so I conclude there must have been something in it. Subsequently I made another design, in the shape of an elevation showing a lower dome, but retaining the semicircular alcoves to the end pavilions; this was also exhibited at the Academy. I came to the conclusion afterwards that the semicircular alcoves were out of keeping with the general character of Wilkins's front, and made the design published in this issue (see Centre Plate).

One of the weakest points in the building as at present existing is its absurd plan, the result of the tinkering of the Office of Works, whose architect (whoever he was), instead of making a clean sweep of the old staircases and planning a new grand staircase, left the old ones and squeezed in the present absurd arrangement by which, to get from the east to the west galleries, one has to go down one staircase and up another. A glance at the "plan as existing" (below) will sufficiently show this; nothing is axial, and space is wasted by two sets of staircases with no architectural relation to each other. My idea is that if the whole of the ground westward of the centre gallery could be acquired, a completely symmetrical set of galleries could be planned, and the front range could be made into sculpture galleries, with a long colonnaded vista, carrying the eye across the intervening space of the staircase hall. I think no one will deny that there is the making of a grand interior effect in this. I have never made any design for the treatment of Trafalgar Square; but my idea, of which the commencement is indicated in the drawing, is that the square should be arranged with two great flights of steps right across it, dividing it into three plateaux rising towards the building, with fountains on the centre plateau. This is only a rough general idea, however, and has not been worked out.

The history of my treatment by the Royal Academy in connection with this subject is rather amusing. My first design was at once rejected, but I did not remove it immediately, and on "varnishing day" found it hung in a central position. I never got any explanation of this mystery, but the fact that after it was published I received a complimentary letter on the design from one of their own body, and that a well-known architect mentioned it in an art paper as the most remarkable architectural exhibit of the year, furnishes a curious commentary on the way things are done in connection with the Academy architectural room. My second design, as noticed, was hung; the third, here published, was sent to the Academy last year and provisionally accepted, but crowded out. I had a little broader effect put on the drawing by a water-colour artist, and sent it in this year, when I was informed that it was a thing which the Council "cannot accept"; that is to say, having hung my two other designs, the third and certainly the best is not fit for their exhibition.

I must apologise to readers of the paper for having inflicted this egotistical screed upon them, only claiming their indulgence again on the ground that I have written under special request.

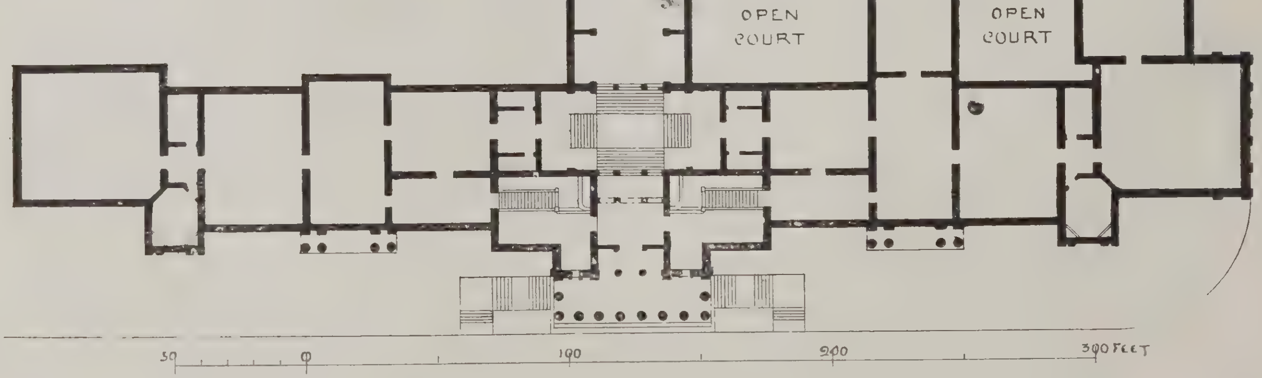
PLAN AS EXISTING



PROPOSAL FOR REMODELLING THE FRONT BLOCK OF THE NATIONAL GALLERY. H. H. STATHAM, ARCHITECT.

(See Centre Plate.)

THE LEGAL EFFECT OF A SPECIFICATION.

By OUR LEGAL EDITOR.

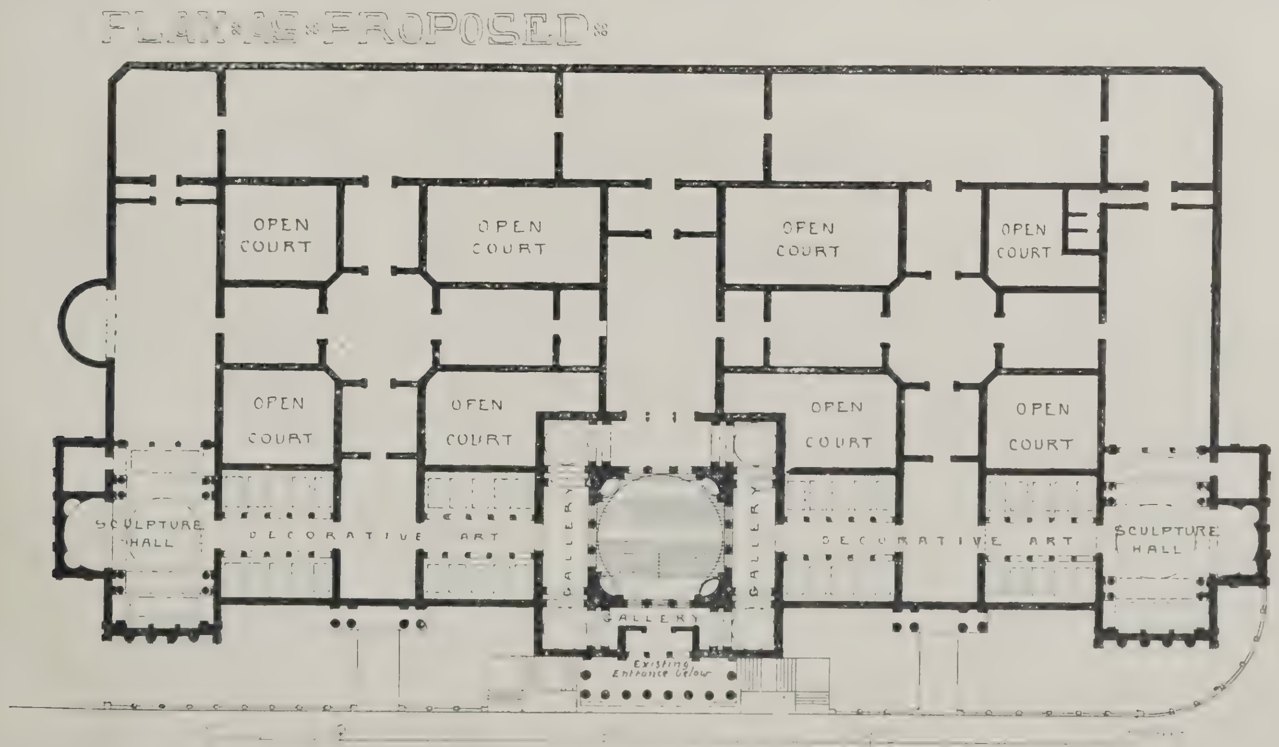
It is a fundamental principle of the law relating to building contracts that the contractor must verify for himself the possibility and feasibility of the works described in the specification. Having made his tender in accordance with the plans, drawings, and specification, he cannot be heard to complain if he finds that his obligations are greater than he at first anticipated. In Thorn v. Mayor of London (1876, L.R., I.A.C., 120), the Corporation of London invited contractors to tender for the execution of certain works for the building of Blackfriars Bridge, according to plans and specifications prepared by the engineer to the Corporation. The specification provided that the contractors were to take out their own quantities, and that the accuracy of the plans was not guaranteed by the Corporation. The contractors were warned particularly that they must satisfy themselves as to the nature of the ground through which the foundations had to be carried. Iron caissons were specified to be used in the construction of the works, but when the contractors whose tender was accepted proceeded to use the caissons as designed, it was found that they would not resist the pressure of the water, and the plan of the work had to be altered, and the use of the caissons abandoned. The contractors claimed for the loss occasioned to them in attempting to use caissons, and contended that the Corporation had warranted, although not expressly, that the work could be done inexpensively by the use of caissons according to the specification. The House of Lords held that no warranty could be implied. The following passage from the judgment of Lord Chelmsford has become historic. He said: "There can be no doubt that the plaintiff, in the exercise of common prudence, before he made his tender, ought to have informed himself of all the particulars connected with the work, and especially as to the practicability of executing every part of the work contained in the specification according to the specified terms and conditions. It is said that it would be very inconvenient to require an intended contractor to make himself thoroughly acquainted with the specification, as it would be necessary upon each occasion for him to have an engineer by his side...But if the contractor ought prudently and properly to have full information of the nature of the work he is preparing to undertake, and the advice of a skilled person is necessary to enable him to understand the specification, is it any reason for not employing such a person that it would add to the expense of the contractor before making his tender? It also said that it is the usage of contractors to rely on the specification, and not to examine it particularly for themselves; if so, it is a usage of blind confidence of the most unreasonable description."

In another case, Tharsis Sulphur and Copper Co., v. McElroy (1878, 3.A.C. 1040), contractors had undertaken to erect certain iron buildings in accordance with a specification. The girders proved too thin. It was held that they were not entitled to charge as an extra cost of providing stronger girders. The principle of the decided cases may be stated by saying that it is no defence to an action for damages for faulty construction or bad foundations that the works so far as they were carried out were constructed in accordance with the specifications. So, where a builder brought an action for a balance due upon a contract for the excavation and masons' and bricklayers' work of certain houses, it was replied that as the houses were set upon insufficient foundation, the builder had not carried out his contract. It was held that the builder was liable for the defects of the soil, and was bound to take usual and proper means for ascertaining the nature of the ground and putting in proper foundations.

In the view of the foregoing principles, and of the fact that many contractors do not examine foundations, etc., for themselves, it is obvious that the architect who desires to avoid future trouble between his employer and the contractor, must observe the greatest care in drawing specifications. In its ultimate result, the error caused by an omission is nearly as important as that caused by an inaccurate table of quantities or an underestimate of the strength of a particular type of girder. As a general rule, the contract between employer and contractor expressly refers to and incorporates the specification as part of it. But it requires no great formality to bring about this result. So if a man engages to do certain work in conformity to drawings and a specification, the offer incorporates the specification and the drawings; and if the specification mentions a time for completion, and the offer is accepted, completion within the time referred to in the specification is a part of the contract.

The result of negligence in drawing a specification may be to impose on the employer a liability greater than that which he was prepared to undertake. For instance, if the architect, owing to a negligent or too hasty survey, fails to perceive and allow for some difficulty, extra work may have to be carried out. In one case, Moneypenny v. Hartland (1828, 2.C. and P., 378), failure on the part of an architect to examine the ground for the foundations of a bridge involved an additional expense of £1,600. It was held that he could not recover his fees: the judge said: "If a surveyor delivers an estimate greatly below the sum at which the work can be done, and thereby induces a private person to undertake what he otherwise would not do, then I think he is not entitled to recover." Not only might an architect lose his fees in such a case, but he might be liable to an action for damages at the suit of his employer.

With reference to our observations on the rebuilding of No. 1, Brick Court, Temple, we are informed that the whole of the facings and rubbers for this work were supplied by Messrs. Thomas Lawrence and Sons, Bracknell, Berks. The general facings are of specially dark, hard-burnt, hand-made, sand-faced bricks, of mixed colours, the quoins and window dressings of bright orange red colour, and the rubber window heads, etc., of a darker or cherry-red shade.



PROPOSAL FOR REMODELLING THE FRONT BLOCK OF THE NATIONAL GALLERY. H. H. STATHAM, ARCHITECT.

(For Elevation, see Centre Plate.)

THE HAGUE PALACE OF PEACE.

The site first proposed for the Palace of Peace lies a mile away from the present site on the other side of The Hague. It forms part of the grounds of the miniature palace which belonged to, and in which died, Princess Anna Paulovna, wife of King William II. and grandmother of the reigning Queen. Passing, in course of time, into the hands of a company, the grounds, to the extent at least of about 16 acres, were acquired by the Government at a cost of over £58,000. The old palace still stands by the gate, and, with its lofty rooms and old-fashioned decorations, forms charming quarters for the architects and their drawing staff. It will, however, be swept away when the time comes for laying out the grounds of the Palace of Peace.

To make room for the great building now in course of construction, a large space had first to be cleared in the thick wood which covers the grounds. The authors of the scheme (says the "Times" special correspondent at The Hague, from whose account this description is condensed) have shown equal wisdom and good taste in setting the building well back from the road. The Palace, built in brick and stone, with roof of blue Welsh slates, of an architecture partly Dutch and partly Flemish in character, has the noble proportions of some of the old town halls of Belgium. The architect is M. L. M. Cordonnier, of Lille, who has associated with him as resident architect, Mr. J. A. G. van der Steur, of Haarlem. His design was selected out of 216 from all countries by a jury composed of six leading architects of Great Britain, Holland, France, Germany, and the United States. M. Cordonnier's original design has, however, been very considerably altered, thereby gaining greatly in compactness of internal arrangement as well as in lightness of external appearance.

The Palace, on which 200 men are at work, and of which the roof was begun last week, is expected to be finished in [illegible]. It consists of a half-basement containing Press rooms, a telegraph and other offices, a heating and lighting plant with 14 boilers, accommodation for the staff of the building, and a spacious restaurant.

The main entrance is approached by curving slopes, not steps. An arcade with balusters in front extends on either side. On the left rises a square tower to a height of about 260ft. At the opposite corner of the façade and in the outer wall of the Great Court is the foundation stone, laid on July 30, 1907, by M. de Nelidoff, president of the second Peace Conference. The Great Court, which is, of course, the inner shrine of this Temple of Peace, is a hall about 70ft. long, 40ft. wide, and 33ft. high. On one side are three large windows, on the other three galleries. At one end is a fourth large window; at the other the daïs for the Tribunal. At the other end of a corridor lined with beautiful Greek and Italian marble, and behind the base of the tower above-mentioned is the Small Court, almost exactly half the size of the Great, and having also three galleries. The ceiling of the Great Court has a barrel-vaulting; that of the Small is flat and heavily moulded. The latter seems likely to produce the better acoustic properties of the two. The remainder of this floor is occupied by reading rooms, a map room, consultation rooms, and other appropriate accommodation for the parties to a case. On the upper floor, approached by a magnificent staircase projecting into the central courtyard, are the rooms of the Administrative Council and other officials of the Permanent Court of Arbitration, and a library capable of containing 200,000 volumes, with a book-lift to the reading-rooms below. The centre of the building is occupied by a courtyard 144ft. long and 111ft. wide, with a fountain in the centre where the air to be breathed in the building will be washed before being filtered and otherwise dealt with by the ventilating apparatus. The whole building is, roughly, 260ft. square.

The laying out of the grounds, which will contribute much to the amenities of the Palace, is, as our readers will remember, in the hands of Mr. Thomas H. Mawson, Hon. A.R.I.B.A.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

The Late J. F. Bentley and the Royal Gold Medal.

SIR,—In the current issue of the "A. and B.J." it is stated that Bentley was the R.I.B.A. Gold Medallist of 1902. This is not quite accurate. Certainly he was nominated for the honour by the Council, and the late King duly approved of the selected, but poor Bentley died before the day on which the presentation was fixed to take place. His late Majesty could not see his way to sanction the presentation of the medal to the widow as an heirloom for the family, on the ground that it would create a precedent; which consideration seemed to suggest the possibility that the custom of dying before the "medal night" could become so popular as to embarrass the Institute. The Council was obliged to cast about for another recipient, much to its regret I believe, as also to that of the profession at large.

F. CHATTERTON.

[We are much obliged for the correction. The error arose through the deletion of the words "nominated as," in condensing. In thanking Mr. Chatterton for his note, may we add the hope that his vacation visit from Cairo may prove very pleasant?—ED.]

The Society of Architects' Travelling Studentship Design.

SIR,—Being the fortunate winner of the above competition, I read Mr. Taliesin Rees's letter, in your issue of June 22nd, with interest; and, being a student, I gladly accept his comments in the spirit in which they are given.

But, in fairness to myself, I would point out to him that the lounge hall which he characterises as "ridiculously large," and the ladies' room, which he says "should not connect directly with the gentlemen's lounge," are conditions laid down by the Society; it being stipulated that the former have an area of 1,000 ft. super; and being intended for ladies and gentlemen, and not gentlemen only. It can hardly be thought to be too large for 175 members.

I cannot agree with him, either, that the lounge is badly lighted or that it would be draughty and cold in winter.

He says there are no urinals. There are five shown in the lavatory, but the dividing lines seem to have been obliterated in the reproduction of the drawings.

He suggests that the drying-room should be separately heated by a stove, an arrangement which is already provided for in the plans, the two flues on the ground plan showing the intention.

D. W. COOMBS.

Licentiate R.I.B.A.

SIR,—I have recently been urged by a friendly F.R.I.B.A., to join the R.I. as a Licentiate.

As I have grown grey in the service of architecture, so far tailless and unashamed, the advantage is not apparent to me, whose years are many and whose buildings are by no means few. Nor am I convinced, despite your leading article in this week's issue, that the addition of the five polytechnic characters imply other than the quite erroneous indication of ability by their possessor to erect a goodly and appropriate building to the satisfaction of all parties concerned. Of your patience and space, therefore, may I be permitted to make a few interrogatory and other remarks on this much debated subject, the most prominent question of which is perhaps the raison d'être of the R.I.B.A.

By those who champion the mighty at 9, Conduit Street, I am told with fine sententiousness that it exists for the good of the public, of architecture, and of the practitioner. Most admirable aims, of course; but what do we find? Acres upon acres of appalling rubbish erected by speculative builders, by auctioneers, house agents, furnishing houses—great and little, by the incompetent and the ignorant, which the Institute makes no great effort to stop. We see quantities of almost equally offensive overloaded work from many members of that body, and tricks of draughtsmanship resulting in the "box-of-bricks and tallow-drip style," which may be architecture as understood at the Institute, but is somewhat startling to those of us who are attempting to vivify in our buildings the great traditions handed down by masters of the past. Domestic architecture has made quite delightful strides within recent years, but the Institute had nothing to do with that movement. Norman Shaw and other men who have consistently held aloof from it are almost entirely responsible. Wren was no sort of Institute man, yet a greater architect never lived than he. Then, do I not remember the unfortunate attitude assumed by the Institute over the recent dry-rot case, the many unreasonable conditions it has allowed to pass as satisfactory in some recent competitions, and the position it took up with regard to the Registration Bill introduced by the Society of Architects? Small wonder the Government ignored it over the Town-planning Bill, and public bodies so frequently visit it with contumely.

Seemingly, by attempting to make the practice of architecture a "Close Borough," and allowing the fetish of examination to cramp a most necessary cosmopolitan breadth of view, the Institute is lowering the status of a distinguished and robust art to the level of a bourgeois and doctrinal profession, a state of things advantageous, I admit, to the man who poses as an expert at the Law Courts, but doing insidious harm to the great calling in which I have the honour to practice.

Fortunately faint indications are apparent that the mild form of insanity which indissolubly associates success in examinations with untold excellence is passing and the more rational view, that a man shall stand by his aptitude and work, and not by the outpouring of ephemeral knowledge crammed in for a special occasion, too often at the instance of money and mediocrity, is taking its place.

The remedy is difficult, yet possible, but it needs high courage in many ways, particularly to withstand the clamour of the younger professional element of the Institute, whose swollen tails as frequently puff the head, as wag the common body.

That an Alma Mater is necessary to protect the children of architecture and elevate them to manhood of quality is sufficiently obvious, but I am afraid it is equally clear the Institute are incapable of rising to the necessary height, but will regrettably remain a superior, if unrecognised trade union.

Therefore, Sir, do I not unhappily remain.

TAILLESS AND UNASHAMED.

London, E.C.

[It is perhaps unnecessary to draw special attention to the notice at the head of this section.—ED.].

CHESTER HISTORICAL PAGEANT.

As the National Federation of Master Builders will hold their half-yearly meeting at Chester in the last week in July, and as the Chester Historical Pageant is to be held from the 18th to the 23rd of the same month, no doubt many members of the Federation will avail themselves of the opportunities thus afforded of rendering doubly memorable their visit to the ancient city.

For the following description of the pageant, and for the loan of the accompanying illustrations, showing respectively the cathedral, the water tower, and St. John's ruins, we are indebted to Miss Agnes Haynes, the pageant Press representative.

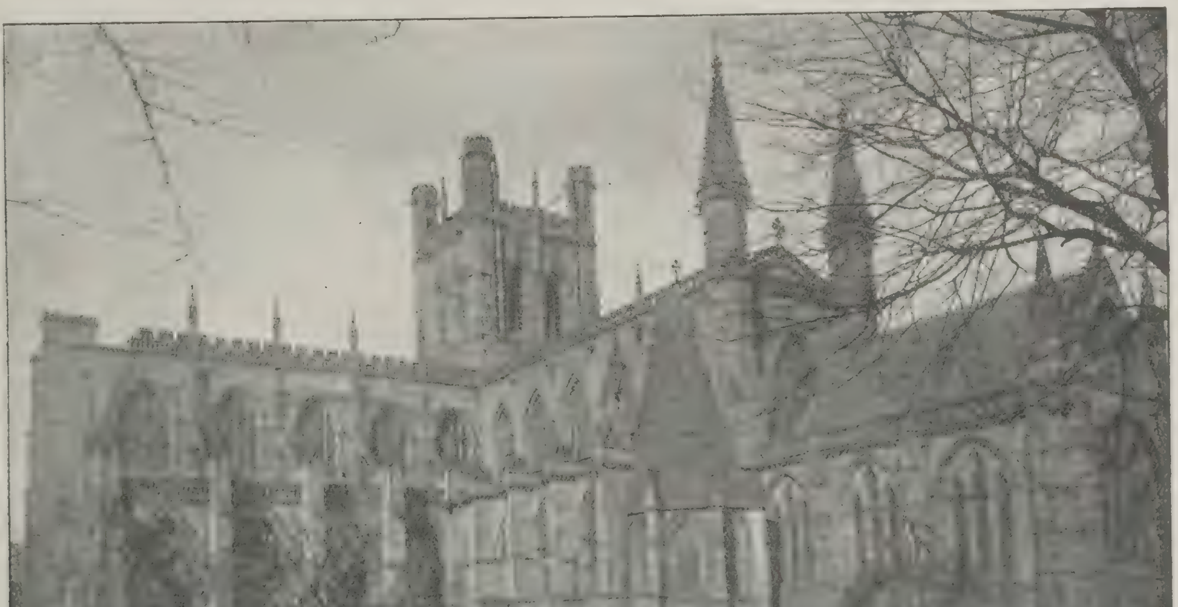
The Chester Historical Pageant is not a thing of mushroom growth. More than a year elapsed in evolving the general plans to make the scheme feasible before any attempt was made towards more material progress. Since then many months have been allotted to the actual building of the pageant, the work being subdivided under responsible heads and committees, under whom over a thousand helpers are voluntarily labouring.

By permission of His Grace the Duke of Westminster, the site of the display will be Eaton Park, than which no more lovely or suitable setting could be found. Scenery will not be used, for the trees and the meadowlands, aided by imagination, will supply all that is desired. A grand-stand for the spectators, from the design of Mr. R. Cecil Davies will give accommodation to 4,000 spectators. The roof will be flat, and so arranged that the Master of the Pageant, Mr. G. P Hawtrey, can direct and command the performance from it, between 3,000 and 4,000 performers being under his control.

The Pageant is divided into 8 episodes and an introduction.

The episodes are spread over many centuries. Episode I., Agricola returns to Deva after defeating the Ordovices, A.D. 78. This gives a scene in the Roman camp. Episode II., King Edgar on his imperial progress, with Queen Elfrida, receives the homage of the Eight Tributary Princes, A.D. 973, reproducing the subjection of these princes to "The Peacegiver," as Edgar was called, because of the cessation of war during his reign. Episode III., Hugh Lupus, with St. Anselm, founds the Abbey of St. Werburgh, A.D. 1093, placing before us the reason why Chester to-day is a cathedral city, with St. Werburgh for its patroness. She was enshrined in what is now the cathedral. To Hugh Lupus, the first Earl of Chester, the present Duke of Westminster traces his ancestry. The earldom became a royal prerogative in the thirteenth century. Episode IV., Archbishop Baldwin preaches the Crusade at Chester, A.D. 1189; giving the scene at the Market Cross during the preaching of the third Crusade, in which Richard Cœur-de-Lion took part. Episode V., Prince Edward, first Royal Earl of Chester, and Princess Eleanor, visit Chester, A.D. 1256, expressing the resentment of the Welsh against the usurpation of the earldom. Episode VI., Richard II. is brought a prisoner to Chester by Henry Bolingbroke, A.D. 1399; placing the King's humiliation before us after his betrayal at Flint. Episode VII., King James visits Chester; the Midsummer Revels, is a double episode. It reproduces the visit of King James, A.D. [illegible], and afterwards the revels that for many centuries were the great festivities upheld by the City Guilds. Here the maypole, morris, and other typical dances will make a truly gay and merry scene. Episode VIII., the siege of Chester and visit of King Charles I., deals with the last war with which Chester was closely associated. The battle will not be shown; but the scene will suggest its progress and the defeat of the too tardy king. Following this will be a great gathering of all the performers, and a tableau, during which the chorus of 250 voices will sing the "Ode to Chester," for which Dr. Bridge, as Master of the Music, has composed the score.

Like the cathedrals of Worcester and Gloucester, Chester Cathedral possesses only one tower. Its height, however, is only 127ft., whereas Worcester is 196ft., and Gloucester 225ft. It was probably the intention to complete the Chester tower by adding a tall spire. Sir Gilbert Scott made an elaborate design for such a spire, and was deeply disappointed at having no opportunity of putting it into execution. The old collegiate church of St. John the Baptist, of which the ruins are illustrated on p. 44, is said to have been built by Ethelred, King of Mercia (A.D. 674--704), but may possibly date no further back than the first decade of the tenth century. The Water Tower shown on p. 48 stands at the north-west angle of the city walls, and derives its name from the fact that the tide formerly washed its sides. It is circular in plan, 32ft. in diameter, and 72ft. high, and was built by one Helpstone for £100 in the year 1322. These and many other interesting illustrations and particulars are contained in the admirable guide to the city which is issued by Chester Corporation.



CHESTER CATHEDRAL.

(From the Corporation Guide to Chester.)

NEWS IN BRIEF.

It is announced by cablegram from Berlin that the second series of the Bagdad Railway Loan, amounting to £4,312,300, has been oversubscribed.

* * *

The Development Commissioners under the Development and Road Improvement Funds Acts, 1909 and 1910, have made the following apointments as from July 1st 1910: Mr. Harold Edward Dale to be Secretary to the Commissioners. Lord Basil Temple Blackwood and Mr. George Haw, F.S.S., to be Assistant Secretaries.

* * *

A meeting has been held in Birmingham in support of the establishment of a municipal natural history museum for the city. A committee was appointed to obtain promises towards the formation of the collection, the Corporation undertaking to find accommodation for it.

* * *

The Royal Doulton Pottery, Burslem, has just discovered the original pattern books of the famous old Leeds factory. These books show all the original designs for old Leeds ware in their colours, as well as the prices paid to the workmen for producing the patterns.

* * *

Mr. H. Inigo Triggs, taking part in a discussion on "Women in Horticulture," at a sitting of the Women's Congress at the Japan-British Exhibition, contended that the true art of gardening was to make the garden harmonise with the house standing in it, and that for this purpose it was most desirable that ladies should have some knowledge of architecture.

* * *

The question of restriction of the height of buildings was discussed at a meeting of Treasurer's Committee of the Edinburgh Town Council, in connection with the matter of feuing the larger portion of the Gorgie estate not required for the markets scheme. They considered whether the area should be laid out in square blocks or otherwise, the width of the roads, and the height of the buildings, and a long discussion took place over the question whether there should be a restriction as regarded the height of the buildings. It was moved that the buildings should be restricted to three storeys in height; but a further motion, to the effect that along the outside frontages of the wide streets four storeys might be allowed, and three storeys for the streets inside the area, was carried by a large majority. It seems that a firm of builders have offered to erect tenements, but, of course, nothing could be done until the height of the tenements had been settled.

* * *

Dr. Hoyle, director of the National Museum of Wales, has applied to the Cardiff Property and Markets Committee for permission to extend the south-east corner of the museum 5ft. beyond the original building line into Park Place, instead of 15ft., as applied for at a previous meeting. He explained that the plans had been amended on the east side, a projection having been added to the building equidistant from the curb in Museum Avenue, with the projection on the City Hall, and the additional space thus obtained enabled the museum council to be satisfied with an extra 5ft. instead of 15ft. in Park Place. The committee decided to recommend the city council to grant the application.

The Mayor of Exeter has just set going in Exeter Cathedral an astronomical clock which has been erected on a stand of oak in the Speke Chantry of the cathedral. This ancient timepiece, parts of which were made in 1317, has been for many years a conspicuous feature of the north transept. It was probably erected in Bishop Stapledon's time, and was originally in the nave. The use of the clock, as of other similar clocks at Wimborne, Wells, and Glastonbury, was to regulate the times of the various services, and for this purpose it was kept under the observation of watchers day and night. This clock is claimed to be the oldest astro-horological example in England. Before being removed to its new quarters in the Chantry, the ancient timepiece was renovated by Mr. Hall, the well-known authority on clocks.

"Rates: Being the revenue and expenditure of boroughs and urban district councils of ten thousand or more inhabitants (England and Wales) analysed and compared," by C. Ashmore Baker, A.M.I.E.E. (2s. 6d. net; P. S. King and Son, Orchard House, Westminster), has been produced with the object of facilitating comparisons of municipal expenditure as between town and town. The wide variations from type, the author points out, are not to be accounted for solely by mere differences in locality and population. Some measure of standardisation is required, and this Mr. Baker has endeavoured to supply in a well-conceived digest of Local Government Board returns. The analysis is valuable in revealing the true position of affairs as nearly as figures can show it, and the publication seems to be quite capable of realising its author's hope that it may, "by enabling the various authorities to compare notes and exchange information, influence the standard of municipal work both in regard to efficiency and economy."

In giving evidence before a House of Commons Committee last week, relative to the Gas Companies (Standard Burner) No. 1 Bill the object of which is to authorise the use by the promoting companies of the Metropolitan No. 2 Argand as the burner for the gas supplied by them, Professor Vivian Lewes, Chief Superintending Gas Examiner to the Corporation of the City of London, said uniformity in the method of testing gas would be secured if the use of the No. 2 Argand became universal as the testing burner. One advantage of this uniformity would be that it would enable manufacturers to standardize such gas apparatus as stoves, cookers, burners, and other fittings. The result of standardization would be to cheapen the cost of the apparatus, and this, of course, would be greatly to the benefit of the consumers of gas. The change of burner would make practically no difference to the consumers of gas through the incandescent mantle or for cooking or power purposes. There would be a certain loss of light to the user of the flat-flame burner, but the difference would be very slight.

The old Collegiate Church of St. John the Baptist has been assigned to the seventh century, but is more probably of the tenth century

ST. JOHN'S RUINS, CHESTER. *(From the Corporation Guide to Chester.)*

At a full meeting of the York City Council, resolutions were read from the Society of Antiquaries (London), the Yorkshire Architectural Society, the Yorkshire Archæological Society, the National Trust for the Preservation of Places of Historical Interest, and from the Yorkshire Philosophical Society, regretting that the parish authorities of Christ Church, York, proposed to hand over the church to the Corporation for the purpose of pulling down, also that the Corporation had undertaken its destruction, and protesting against the demolition of the Church, and hoping that the Council would reconsider its decision. Other protests were recorded, and after discussion, it was resolved that the minutes of the Council, proposed the pulling down of the Church should be rescinded. The picturesque old Church is therefore saved.

* * *

A sum of about £20,500 has already been subscribed towards the cost of the school which it is proposed to erect at Hawarden as a memorial of the late Canon Harry Drew, who was at the time of his death rector of Hawarden, having at a previous period been one of the curates of the parish. The cost of the proposed memorial is expected to be about £3,000.

* * *

Sir J. J. Thomson, F.R.S., Cavendish Professor of Experimental Physics of the University of Cambridge, has been elected President of the Junior Institution of Engineers in succession to Sir Henry J. Oram, K.C.B., Engineer in Chief of the Fleet.

OBITUARY.

MR. W. BANKS GWYTHER.

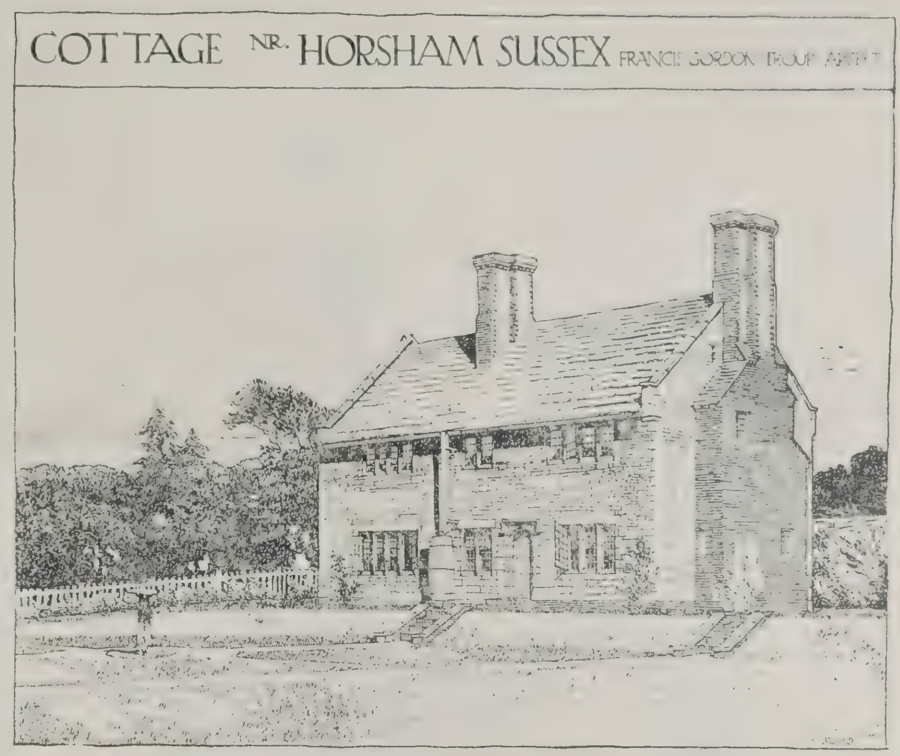
The death has taken place at Shillong of Mr. William Banks Gwyther, A.R.I.B.A., chief engineer to the Eastern Bengal and Assam Government. Mr. Gwyther received his technical training at the Thomason Engineering College, Rorkee, and entered the Bengal Public Works Department in 1876. He rose to be executive engineer, and was appointed Under-Secretary to the Government in 1892, reaching the rank of Superintending Engineer in 1903. He has left memorials of his architectural skill in Calcutta in the Military Secretariat, Writers' Buildings, and other public offices. When the new province was formed Mr. Gwyther was selected to be Chief Engineer to the Administration; and in this capacity heavy responsibility devolved upon his in the provision of secretariat accommodation and otherwise adapting Dacca to the new rôle of a provincial capital.

MR. HENRY SPALDING.

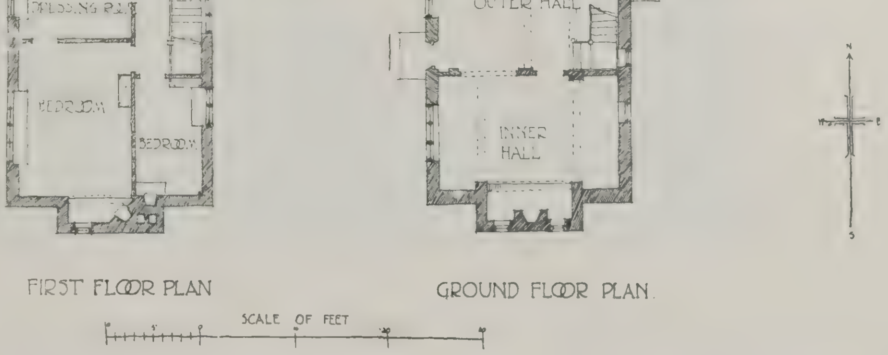
Mr. Henry Spalding, F.R.I.B.A., died at his residence in Hampstead on June 25th, after a few days' illness, from acute pneumonia. He was in the 72nd year of his age, and had been in practice over 40 years, joining the Royal Institute of British Architects in 1873. Among the many public buildings carried out in conjunction with his partners may be mentioned the following: The Municipal School of Technology, Manchester; the Workmen's Dwellings, Manchester; Public Baths at Hampstead, Dulwich, Camberwell, Wandsworth, Westminster, Shoreditch, Coventry, etc. Schools at Berkhamsted, Luton, Stockport, etc. The Village Homes for Boys, Swanley, and additions to the Homes at Farningham. Offices for the London Missionary Society; the London City Mission; the Imperial Tobacco Co., and other private firms. Churches and Schools at Hampstead, West Hampstead, Cricklewood, Harlesden, East Finchley, Barnet, Hither Green. Residences at Hampstead for the late Judge Waddy, the late Judge Bompas, and many others. Eleven years ago he took into partnership his son, Mr. Reginald H. Spalding, A.R.I.B.A., who will continue to carry on the practice.

MR. GEORGE CHATTERTON.

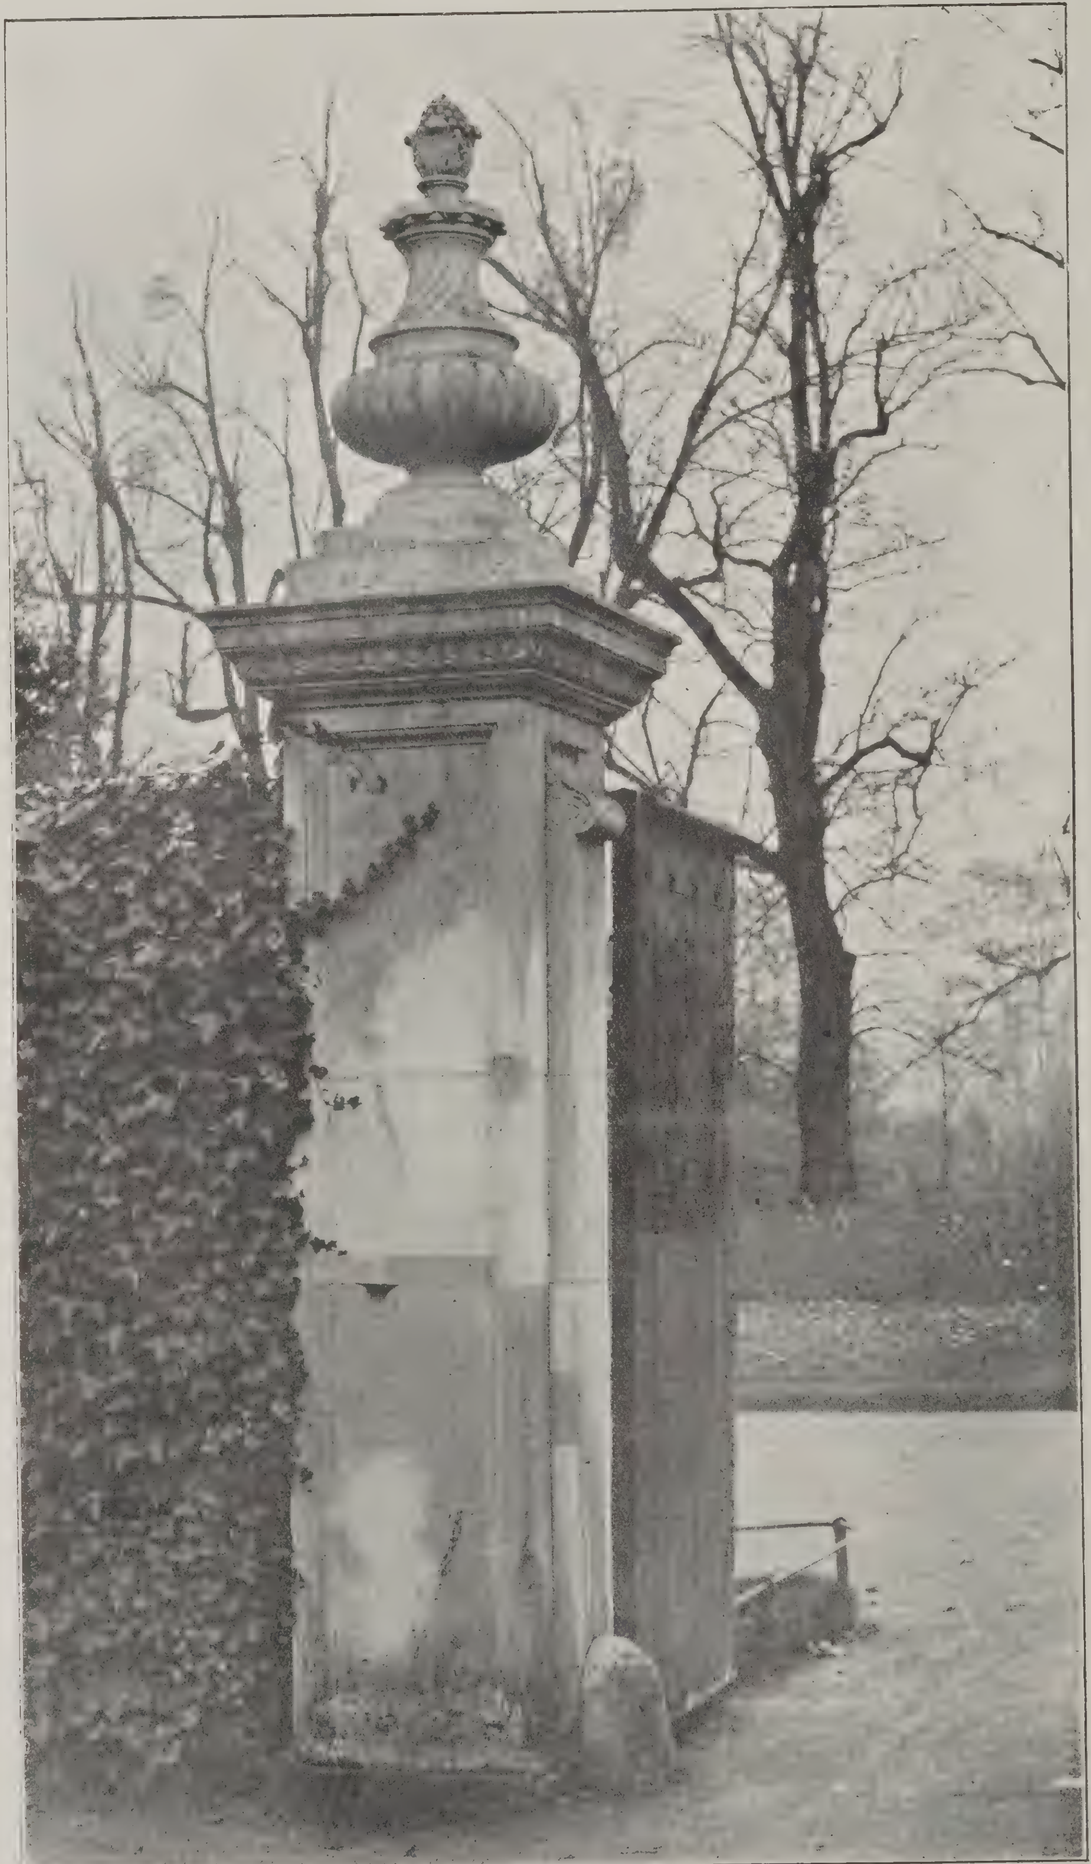
Following a severe operation, Mr. George Chatterton, M.A., M.Inst.C.E., died at his residence at Wimbledon. He was the son of George Chatterton, J.P., of Cork; was born in 1853, and was educated at Trinity College, Dublin, B.A., 1873, B.A.I. 1875, M.A. 1879, being Senior Moderator and Gold Medallist in experimental science. He began his engineering work under the late Sir Joseph Bazalgette, and subsequently acquired a large practice in municipal engineering and as a witness before Parliamentary committees. He was a member of the first County Council in Surrey, and sat on that body till the present year. He was a Justice of the Peace for the county of Surrey. He married in 1878 a daughter of the late Sir Joseph Bazalgette, and leaves a widow and seven children.



This cottage is situated about a mile and a half from Horsham, Sussex. Its walls are of Swanage stone, with local hand-made red bricks for chimney stacks and Gloucestershire stone tiles to the roof. The casements are of wrought iron, with leaded lights, and the joinery is of oak.

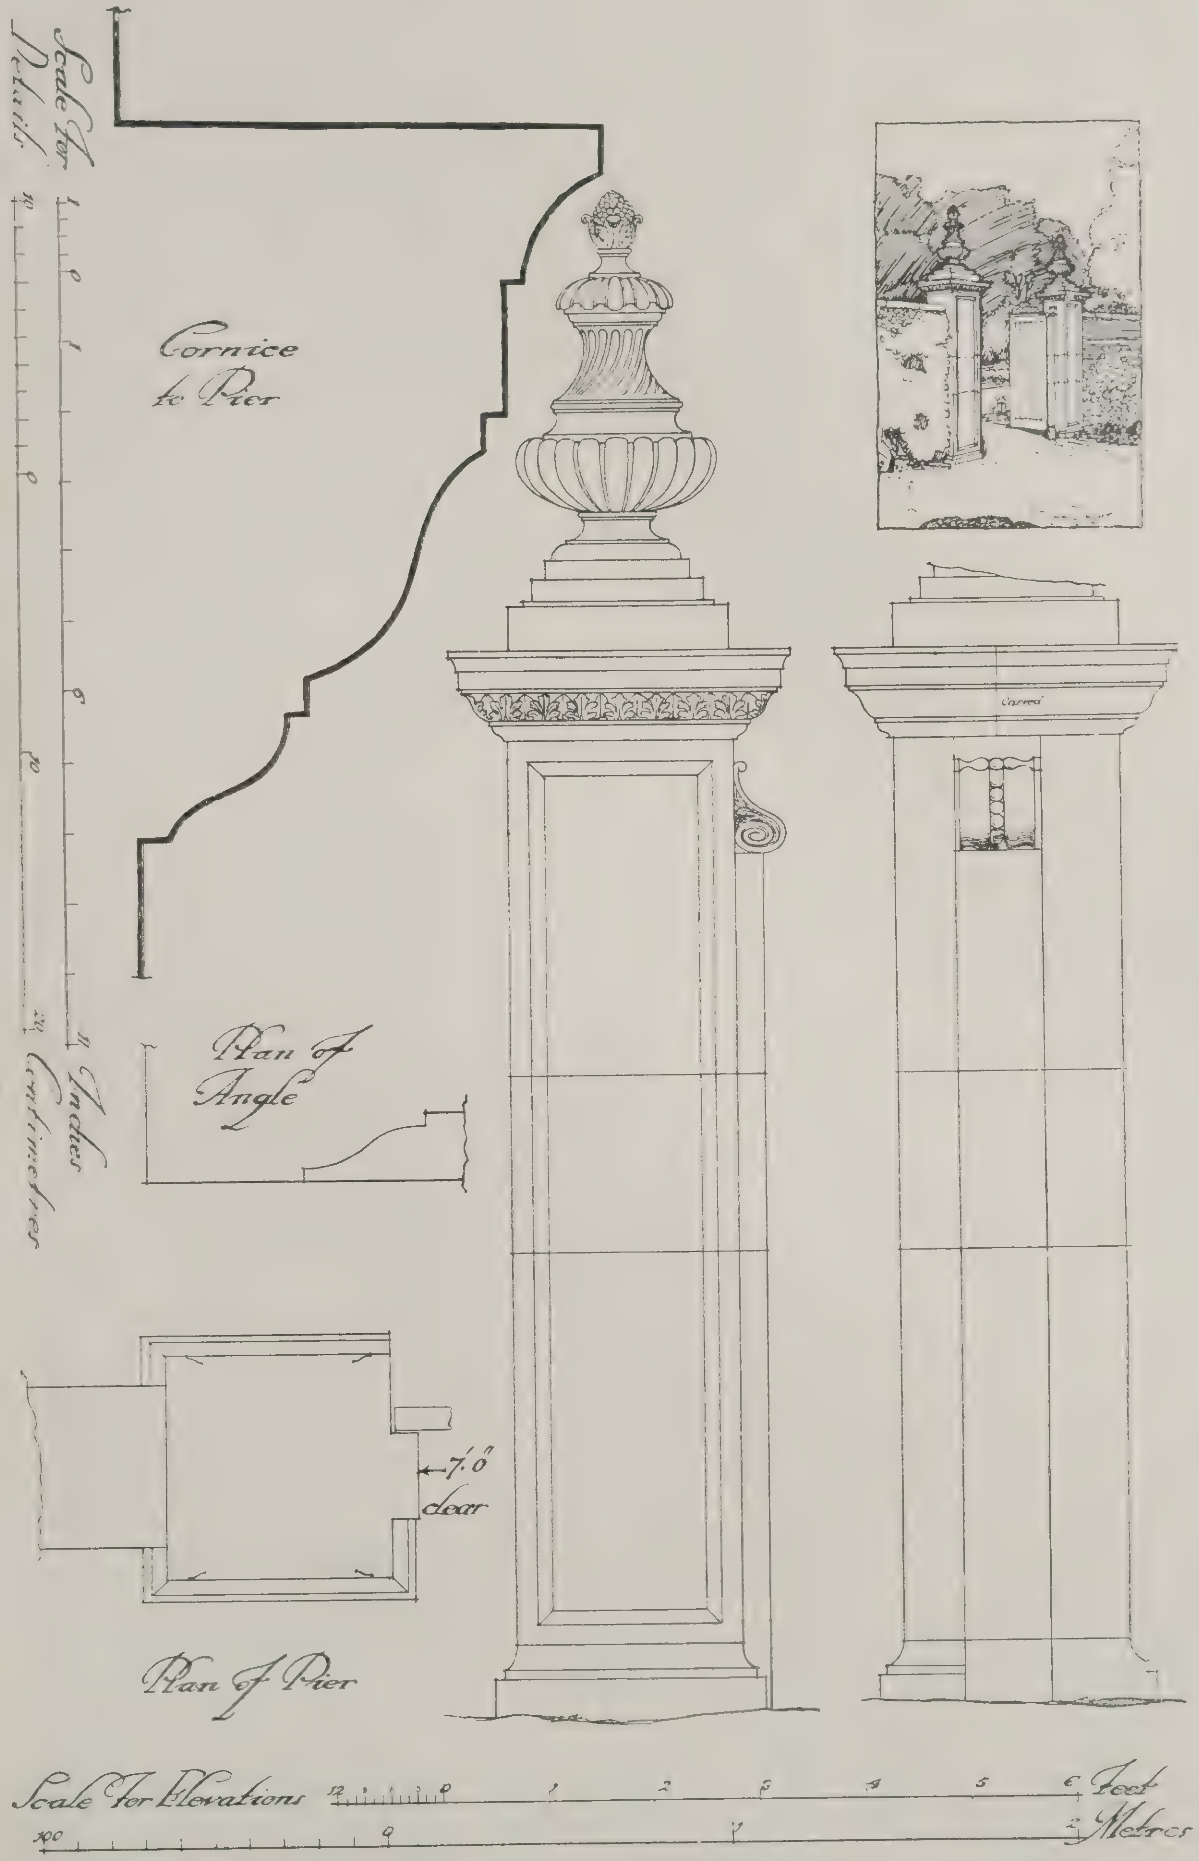


COTTAGE NEAR HORSHAM, SUSSEX. FRANCIS GORDON TROUP, ARCHITECT.



This is one of the finest of the gate piers at Hampton Court Palace, the ornament being appropriate and well placed, while the profile of the vase is particularly graceful. The pier is of Portland stone.

GATE PIER IN THE "WILDERNESS," HAMPTON COURT PALACE.
SIR CHRISTOPHER WREN, ARCHITECT.



GATE PIER IN "THE WILDERNESS," HAMPTON COURT PALACE. SIR CHRISTOPHER WREN, ARCHITECT.

PICTURE EXHIBITIONS.

Society of Fine Arts.

At the Society of Fine Arts Gallery, there is a really fine collection of architectural drawings and etchings. In the first place, there is a collection of pencil drawings by Mr. Axel Haig. It may not be the usual opinion, but we prefer Mr. Haig's pencil drawings to his etchings; the latter are, to our thinking, too highly worked and finished for etching, which ought to be an art of free and unfettered line, not with any resemblance to engraving. The pencil drawings here exhibited are, as architectural drawings, perfect in style and execution; thoroughly accurate in drawing and not over-finished. They include drawings of a number of celebrated buildings; several of the interior of Burgos; one very interesting one of the Classic arcaded screen in St. Remi, Rheims; among other interesting ones are the cloisters at Tuy, and an unusual view of "Assisi from the Hotel, Subasio." There are sixty-nine drawings in all. In the inner room is a collection of etchings by several artists. Mr. Percival Gaskell's are landscapes, with a good deal of tint work about them, which is not the purest form of etching, but they are effective little pictures. There are two sets of architectural etchings by Mr. Mortimer Menpes; these are conscientious line etchings, rather heavily worked, and consequently somewhat black in effect, but they are all well drawn; a view of St. Paul's taken from over the roofs of the houses westward of the Cathedral is very good, and shows that the author knows how to put a dome into perspective; St. Paul's dome has in this particular received much maltreatment from painters. The few works by Mr. David Law and Mr. C. O. Murray belong to the category of what we call etched engravings, showing a great deal of work, but with a rather tame result. With Mr. Cameron's work, we come more into the region of etching properly so called. His "Coldstream," "Old Whitby Bridge," "The North Porch, Chartres" (seen from inside), and "Le Pont Neuf, Paris," are all excellent examples of what etching can do, and what it should leave out. By Mr. Edward Slocombe, there is a collection of six very fine etchings in a larger and bolder style; five of them of cathedrals (Rouen, York, Antwerp, Malines, Amiens), and one of an old street in York, "The Shambles." With the works of Sir Seymour Haden, we come to the poetry of etching; these are not mostly architectural, though buildings come into them, as in "Greenwich" and "Whistler's House at Old Chelsea"; they represent general effects translated into etched line. Among them is the impression of the grand etching "The Agamemnon," one of his most famous works. These, and those by Mr. Frank Short, are typical examples of the qualities which distinguish etching from every other branch of art, and show what can be done with line alone, and what is the value of blank space in contrast. There are other works by Mr. Brangwyn (rather overloaded and heavy), Mr. W. Monk, and Mr. Alfred Hartley. Altogether a rather remarkable exhibition.

Mr. Lance Thackeray's water-colours of "The People of Egypt," in another room, are good sketches of types of the populace, but more interesting as illustrations than as art.

Maclean's Gallery.

At Maclean's Gallery in the Haymarket there is a collection of oil paintings of Spanish life and Spanish scenes by Miss M. Cameron which show a good deal of power in the painting of figure groups, some of them life size. Miss Cameron has, with her study of Spanish figures and subjects, adopted (consciously or otherwise) somewhat of a Spanish manner of painting, which goes well with the subjects; "Maximino de Segovia," a portrait of a cloaked man riding a donkey, looks as if it might have been by a Spanish artist. The collection shows a good deal of artistic power, though not of the first order. The flower paintings by Mdlle. Mathilde Sée, at the same gallery, are fine as flower paintings, especially in the fact that her water-colours convey not only the colour but the softness of texture and fragility of flowers; it has become rather a modern custom to paint flowers in too heavy and solid a manner. But we do not care very much for what are called "Flower-pieces"; and seventy of them at a time is a good deal too much.

The Carfax Gallery.

We are not quite able to see why there should be a collective exhibition of Sir W. Eden's water colours. They are good amateur work, but hardly better than those of a good many other amateurs. The still-life subjects are the best.

ART ITEMS.

"In honour of and in friendship to art," the Lord Mayor and Lady Mayoress of London held a reception at the Mansion House last week, when the guests made a large and distinguished assembly, including Sir Lawrence Alma-Tadema, Sir Hubert von Herkomer, Mr. E. A. Abbey, Mr. G. Clausen, Mr. Frank Dicksee, Sir George Frampton, Mr. Goscombe John, Sir Aston Webb, Mr. Alfred East, Mr. E. A. Drury, Mr. Ernest Crofts, Mr. Arthur Hacker, Mr. F. W. Pomeroy, Mr. Derwent Wood, Mr. Hamo Thornycroft, Mr. Bruce Joy, Mr. J. H. Lorimer, Mr. Ernest George, Mr. T. G. Jackson, and many others.

* * *

Some very fine and rare Greek coins were sold last week by Messrs. Sotheby, 134 lots realizing £2,644 19s. 1d. The more important were :—Argos, silver coin with head of Hera to right, crowned with hoop-shaped stephanos—£76; Delphoi, silver coin with lyre of primitive form, furnished with seven cords, the only specimen known—£51; another, with head of Amphictyonic Demeter of Anthela to left, crowned with corn leaves, and veiled, one of the finest known examples of this beautiful coin—£315; Eretria, silver coin, with head of Gorgon facing, of very high rarity—£275; Kyzikos, gold coin, with Laureate head of Apollo to right, unpublished and exceedingly rare — £100; Lampsakos, gold coin, with head of Aktaion to left, a rare and beautiful coin—£226; another with the Laureate head of Zeus to left—£109; Syrakousai, medallion by Euainetos, Head of Persephone to left—£150; and another—£131.

THE WATER TOWER ON CHESTER WALLS. *(From the Corporation Guide to Chester.)*

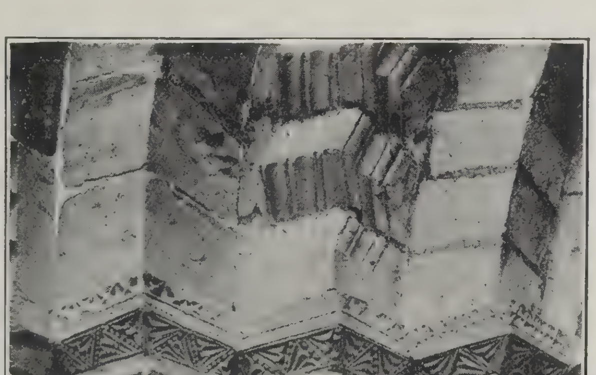
An exhibition of Canadian art which has been opened at Liverpool, in the Walker Art Gallery, is mainly prolific of landscapes, particularly of those depicting the wonderful autumnal and winter effects peculiar to the country. The exhibition remains open until July 23rd.

* * *

The Waldeck-Rousseau monument in the gardens of the Tuileries was unveiled on July 6th, by the President of the French Republic, M. Fallières. The bust of white marble is affixed to the central panel of a kind of marble triptych, with Corinthian columns, and each of the leaves of the triptych bears in golden letters the titles of the principal legislative measures associated with the statesman's name, or a quotation from his speeches. There are life-size marble figures of two workmen, and a female figure emblematic of democracy.

ROMANESQUE CAPITALS FROM LEOMINSTER.

Leominster Church, in Herefordshire, is, architecturally and historically, one of the most interesting in England. It perhaps occupies the site of a minster founded by Merewald, King of Mercia. The eastern limb is attributed to Prince Kenelm, who died in 1060, and the transepts, central tower, and nave to Earl Leofric, who died in 1055, and who was the husband of Lady Godiva. The western doorway is particularly interesting. Its inner orders are carved, as well as the outer ones—an unusual and perhaps a rather futile proceeding, since much of the work is wasted on a position in which it cannot be well seen. The outer orders are obtusely pointed, the inner orders semicircular. The capitals of this doorway are among the finest Romanesque examples we possess, and are happily, as the illustration shows, in admirable preservation. They can hardly be of earlier date than 1160.



ROMANESQUE CAPITALS FROM LEOMINSTER.

BOOKS.

Belgian Churches.

The Cathedrals and Churches of Belgium. By T. Francis Bumpus. London: T. Werner Laurie; 1910.

This is essentially the production of an amateur author for amateur readers, as is sufficiently evident at once by the mere fact that there is not a single plan of a church to be found in it. Such an omission, of course, very much discounts the value of the book, even considered as merely a book for the general reader; for though it may be true enough that the general reader and purchaser is not attracted by plans, he ought nevertheless to have them given to him, and the relation of plan to design pointed out, as a certain proportion of readers might at all events learn something by this means, even insensibly. A book of architecture without plans, on the other hand, is actually misleading, as it is leading the reader to suppose that churches and cathedrals are only arbitrary forms of architecture built up at pleasure, without relation to the limitations of plan and construction.

Such a book as this is in reality a kind of handbook for holiday-makers in the country of which it treats, with historical notes on the churches, and descriptions of their contents, and a series of small photographs of the principal churches. As the author writes clearly and with some knowledge of architectural style and history, it is good as a handbook, pointing out what to see and what to look for. The churches described are those of Tournai, Courtrai, Ypres, Bruges, Ghent, Malines, Brussels, Antwerp, Louvain, and some others. As a matter of convenience, it would have been better if the pages had been headed with the name of the church under discussion, instead of merely a continuous repetition of the general title of the book. As it is, the matter is so massed together and so little divided up by headings, that it is difficult to find out what building is being discussed on any particular page. There should, at least, have been a cross-heading marking the point where the description of any special church commences.

The book concludes with a chapter giving a list of the most remarkable pictures to be seen in the various Belgian churches, which is a useful addition for those who may be looking after pictures rather than architecture.

Garden Planning.

Garden Planning. By W. S. Rogers; with 15 illustrations by the author. London: T. Fisher Unwin; 1910.

This is essentially a gardener's book; although the author takes into account to some extent the relation of the garden to the house, his main object in writing is to recommend, in reference to small gardens especially, the treatment of garden design as governed by aspect—"the true key to the best results, whether in the direction of successful flower culture or of picturesque *ensemble*"; which seems a very reasonable position. Accordingly, all his garden plans are provided with a compass, and are to be judged in reference to their aspect. The character of the plans given shows that the author is alive to the importance of definite plan in a garden, and of preserving in it a reference to the lines of the house. The choice, however, of strong black to mark the portions given up to flower beds, gives the plans a rather unsightly appearance on paper.

In the earlier part of the book is a chapter in favour of "the rectilinear principle," in which the author points out the futility of gardeners making winding paths and sinuous edges to their borders, in order to escape the rectangularity which is, after all, enforced upon them by the straight lines of the boundary. He adopts, for gardens within rectangular boundaries (as nearly all small gardens are), the principle of straight lines and right angles, but without bilateral symmetry. This, however, depends rather on the effect aimed at. The same plot might be treated both ways with good effect, though the effects would be different in character. But, on the whole, rectangularity without absolute symmetry seems a good programme for the small garden. A diagonal path is condemned as out of keeping with the problem; and with this also we are disposed to agree. We do not, however, at all agree in the recommendation that curved walks, when introduced in gardens of greater extent, should be irregular or (in drawing on the plan) free-hand curves. There we come to the futilities of the "landscape-gardener," whose ideal it is to try to make artificial things look as if they were natural. A curved drive should be on a geometrical curve, set out as part of a systematic design.

"Shapes of beds" tend to become too elaborate and fanciful; they are better kept to simple and unpretentious forms; it is, after all, the flowers that we want to look at rather than the shape of the beds. We recommend attention to the excellent practical remarks (pages 66-77) on the materials and construction of paths.

The ideas for fences and hedges are good; that of the water-garden, with its irregular wriggling ponds, we cannot accept, and it is at variance with the author's condemnation of sinuous walks. Among the "Garden Accessories" the ideas for summer-houses are not very good, and as the author rightly condemns what are called "rustic" designs in rough, unbarked poles, which are an absurd pretence of being natural, why does he show a bridge, a seat, and a summer-house, made in that manner? The formal designs for seats are good, and have the solidity of style which ought to belong to a garden seat; it is also good advice to provide brick platforms for wooden seats.

In the main this is a most sensible book, by a writer who practically understands his subject.

NEW MUNICIPAL WORKS.

The Local Government Board has decided to hold (or has recently held, as the dates may indicate) inquiries into proposed expenditure by public bodies as follows:—Water Supply.—Swavesey Rural District Council, £1,680 (July 12); Kiveton Park Rural District Council, £13,566, including two reservoirs of 150,000 gallons each (July 15); Derby Borough Council, £1,376 (July 12). Sewerage, etc.—Birmingham City Council, £9,800 (July 13); Norman Cross Rural District for Overton Longville, no amount stated (July 13). Street improvements, etc.—Scarborough Borough Council, £2,625 (July 15); Egham Urban District Council, £1,000 (July 11); Plymouth Borough Council, no amount stated (July 13); Handsworth Urban District Coucil, £3,065 (July 12); Bushire County Council, £60,000 (July 14); Newcastle-upon-Tyne Borough Council, £1,100 (July 12); Birmingham City Council, £29,988 (July 13). Various.—Devonport Borough Council, £6,000, for gas undertaking (July 15); Stretford Urban District Council, £2,411, for Town's Yard, and £2,000 for plant at electricity generating station (July 13).

NEW BUILDINGS.

PROPOSED.

Blackpool.—The Building Plans Committee has approved the following plans:—Two houses, Saville Road; two semi-detached houses in St. Stephen's Avenue; seventeen houses in West Cliffe Drive; pair of houses in Highbury Avenue; two houses in Brooklyn Avenue; pair of houses in Norwood Avenue; two houses off Breck Road; 43 houses in Cunliffe Road; house and motor house in Manchester Road; two bungalows in 7th Avenue; one house in Stanhope Road; two houses in Brooklyn Avenue; detached house in Highbury Avenue; two semi-detached houses in Mere Road; two houses in Breck Road; two houses in Breck Road; two houses in Vernon Avenue; one house in Vernon Avenue; ten houses in Bela Grove; one house, Gynn Estate; three houses in Abbey Road; four houses in Lincoln Road; motor garage, Wilton Parade; 9-in. sewer, off Central Drive; alterations and additions, Central Road; motor house, Burlington Road; alterations at rear of Clifton Hotel.

Bournemouth.—The Town Council has decided to carry out an extension of the Undercliff Drive to Boscombe, and to provide sites for bathing stations and additional shelters on the East Cliff. The cost of the whole scheme will be about £45,000.

Bradford.—The Local Government Board has sanctioned a loan of £1,300 to the Bradford Education Department for the purchase of a site for day school extensions at Lidget Green.

Cockerham (Lancs).—It has been decided to rebuild the parish church of Cockerham, the nave and chancel of which were rebuilt as lately as 1814, and traces of an older building are still to be seen in the masonry on the east face of the tower. Even 25 years ago the building on inspection was declared to be unsafe. The fabric has gradually been deteriorating since then, and grave fears are now entertained as to its condition. The new church will cost £4,350, and provide accommodation for 370 persons.

Dundee.—The School Board has resolved to embark on a scheme for a new secondary school in the west end of Dundee at a cost of £30,000, and to convert the Harris Academy to a supplementary school.

Lancaster.—The Town Council has approved the following plans:—Bathroom at No. 31, West Road; one detached dwelling-house at Eden Park; two semi-detached dwelling-houses at Eden Park, off Scotforth Road; additions to outbuildings at Edenbreck Farm, Sunnyside Lane.

Margate.—At a recent meeting of the Town Council a resolution was unanimously agreed to "that the scheme for a proposed pavilion and winter garden on the Fort, in accordance with the model prepared by the borough surveyor, be approved, and that he be instructed to prepare the necessary plans, specifications, and estimate."

Pudsey.—The Corporation have adopted a scheme for the alteration and enlargement of the Town Hall, which occupies a central site in the town. Several architects have been asked to submit plans for doing this, and that of Messrs. Jowett, Kendall, and Sons, has been accepted. It is estimated that the entire cost of the Town Hall will not be more than £15,000, probably less.

IN PROGRESS AND COMPLETED.

Bargoed (Cardiff).—A new parish hall for Bargoed, in connection with St. Gwladys Church is in course of erection, at a cost of £1,300, and the foundation-stone was recently laid. The hall, which is in the Gothic style, is of brick, with Portland stone dressings, and will accommodate about 500 persons. Mr. G. Kenshole is the architect, and the contractor is Mr. James Morris, Cardiff.

Barnsley.—The foundation-stone has been laid of that portion of St. Peter's Church which comprises the nave, aisles, and west gallery. Accommodation will thus be provided for 800 people, when the work is completed, and an expenditure of about £6,000 will be involved. Mr. Temple Moore, F.R.I.B.A., London, is the architect, and the contractors are Messrs. Wright, of Leeds.

Birkby (Huddersfield).—The new Baptist Church, erected at a cost of about £5,000, has been opened and will provide seating accommodation for 400 persons. Messrs. Garside and Rennington, of Castleford and Pontefract, were the architects, the building being Late Gothic in design. The contractors were Messrs. T. Bottomley and Sons, Lindley, masons; Wood Bros., Huddersfield, internal joinery work; Milnes and Garside, Huddersfield, plumbers; Thealruld and Sons, Bradford, plasterers; T. B. Tunnicliffe and Son, Huddersfield, slaters; G. Moxon and Sons, painters; W. H. Heap and Son, heating engineers; T. Broadbent and Son, electric engineers.

Brooke (Norwich).—The foundation-stone has been laid of the new infants' school, which is in course of erection at a cost of £1,000, from the designs of Messrs. Lacey and Upcher, of Norwich, Mr. Redgrave being the contractor.

Felstead (Chelmsford).—The new "Crignon" hall in connection with Felstead school, has been opened by the Earl of Warwick, and is part of a scheme which involves an expenditure of £8,000. The building is in the Tudor style, 84ft. long by 32ft. in width, with oak panelling round the sides; at the back of the platform, and at one end, there is an oak gallery. The architects were Sir A. Blomfield and Sons, of London.

Harrogate.—The enlargement of the Royal Baths has been formally opened by the Mayor of Harrogate. About £230,000 have been spent on the wells and baths, and to bring them thoroughly up to date a further sum of £10,000 has been expended on the enlargement.

Sidcup (Kent).—A local syndicate has purchased the Bearsted Lodge and Linden Lodge site in the High Street, Sidcup, on which it is proposed to erect a public hall, from the designs of Mr. F. T. W. Goldsmith, F.R.I.B.A. The scheme includes a main hall capable of seating (including the gallery) nearly 700 people, and two smaller halls, which can, if necessary, be incorporated with the larger one. In front of the existing villas on the site which are to be structurally altered internally and included in the scheme, three shops are to be erected—two commodious corner premises, and a smaller one in between. This portion of the work is now proceeding, Messrs. W. F. Blay, of Dartford, being the contractors.

Southwell.—The new Trebeck Hall, situate in Halam Road, has been opened by the Bishop of Southwell, and is of brick covered with rough-cast, with a roof of red tiles. The hall is 60ft. long by 25ft. broad, providing accommodation for about 250 people, and was erected from the designs of Mr. W. D. Caroe, F.S.A., the builder being Mr. Lee, of Southwell.

York.—Mr. Rowntree, M.P., has opened the new premises of the City of York Central Mission in Swinegate, which consist of a large central hall 67ft. 6in. long by 47ft. wide, providing accommodation for about 1,000 persons. A lecture hall is provided on the ground floor to accommodate over 200 persons, and another hall on the floor above to accommodate a similar number, with four classrooms to accommodate 290. The architect was Mr. C. H. Channon, F.R.I.B.A., of Malton, and the building contractor Mr. C. Martin, of York.

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

JULY 18. ECCLES. Applications from architects residing in or having a permanent place of business in Manchester, Salford, or Eccles, willing to submit competitive designs for the extension of the Public Baths in Cromwell Road, Patricroft. Premiums, £20, £10, £5. Applications to be endorsed "Architect" to Edwin Parkes, Town Clerk, Town Hall, Eccles, not later than 10 a.m. on the 18th inst.

JULY 20 YSTRADGYNLAIS SEWERAGE SCHEME. **The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.**

JULY 25. NEW ELEMENTARY SCHOOL, WINCHESTER. Designs are invited from Hampshire Architects for Elementary School Buildings to accommodate 330 children. Particulars of Thomas Holt, Town Clerk, Town Hall, Winchester.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. **Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.**

SEPT. 5. THE QUEEN'S UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to Architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

COMING EVENTS.

Saturday, July 16.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Sketching Club.

Tuesday, July 19.

ROYAL ARCHÆOLOGICAL INSTITUTE.—Annual Meeting at Oxford commences and continues till July 28th.

Wednesday, July 20.

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Excursion to Rievaulx and Byland Abbeys.

Monday, July 25th.

INSTITUTION OF MECHANICAL ENGINEERS.—Summer meeting commences at Birmingham and continues till Friday, July 29.

L.C.C. HALL FOUNDATION RELICS.

The remains of an ancient boat, which, as noticed in the account of the foundation works for the new London County Council Hall given in our issue of May 25th, p. 515 (when we were probably first to publish the announcement), have been discovered on the site of the new hall of the London County Council, have now been examined. The report of the Local Government, Records, and Museums Committee of the London County Council contains the following statement:—

In the course of excavations on the site of the new County Hall a discovery has been made, the importance of which, from an historical and archæological point of view, can hardly be over-estimated. The principal feature of the discovery consists of a Roman boat. As this is a unique example of such a find in Britain it is of greater interest even than the clinker-built boat of King Alfred's time, discovered at Walthamstow a few years ago, and of other Viking boats found in various parts of the Kingdom. A considerable portion of the vessel, which is of oak, is still covered, and until the earth is removed it will not be possible to ascertain its exact size, but, so far as can be judged, the vessel would seem to be about 50ft. long and 16ft. beam. Several articles were found in the boat, comprising some sherds of Roman pottery, bones, iron nails, glass gaming buttons, iron-studded soles of footwear, a coin of Tetricus in Gaul (268-273), a coin of Carausius in Britain (286-293), which is stated by the Keeper of Coins at the British Museum to be of date 290 or 291, and a coin of Allectus in Britain (293-296), and these objects are stated by the authorities of the Geological Museum to be the safest evidence as to the age of the boat, which may therefore be assigned to the end of the third or beginning of the fourth century A.D. Dr. C. H. Read, Keeper of the Department of British and Medieval Antiquities at the British Museum, who has examined the boat, points out that the discovery is of special interest and value as having been made on the Council's own property on what must have been the bank of the river in Roman times, and expresses the opinion that the vessel is capable of preservation.

We are strongly of opinion that this interesting and valuable relic of a former period of London history should be carefully preserved as an important item of London antiquities. The boat, if preserved in a suitable position for exhibition, will prove a valuable acquisition for London, and the example which the Council is enabled to set will probably not be lost upon other authorities.

We are advised that the relic should be housed in a building of the Dutch barn type, since the open air will be the best situation for it, and that a screen of wire-netting should be placed round the exhibit to prevent damage by relic hunters. We are of opinion that eventually the boat should be housed on a site in the vicinity of the new County Hall, but for the next few years a suitable site can be found for it, either in the open space behind the Horniman Museum, or in the Horniman gardens, where it will attract the attention of visitors and form an exhibit of the highest value.

We regret to see the announcement of the death of Mr. A. Hessell Tiltman, F.R.I.B.A., the well-known expert in the design of public baths and washhouses, etc.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries embodying questions which have been set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor, will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Practical Notes.

"CALEDONIA" (AYR, N.B) writes: "Kindly let me know if 'Practical Notes for Architectural Draughtsmen,' which appeared in the Journal some time ago, can be obtained as a separate publication."

—The series extended over the following issues:—September 19th, 22nd, October 24th, November 7th, 21st, December, 12th, 1906, January 16th, February 6th, 20th, and March 27th, 1907, and has since been republished in the form of handsome portfolio, at 12s. nett, post free.

Sanitary Science Examination.

C. W. M. (LONDON, W.) writes: "I should be glad if you could recommend me suitable books for membership examination (sanitary science, etc.) of the Royal Sanitary Institute."

—There are, of course, a large number of text-books dealing with the subjects, but the following lists are those most frequently referred to by students reading in the Royal Sanitary Institute Library, and may be of some guidance to you:—Balfour Stewart's "Physics," Moore's "Sanitary Engineering," Wood's "Sanitary Engineering," Notter and Firth's "Hygiene," Parkes and Kenwood's "Hygiene," Roscoe's "Chemistry," Rideal's "Water Supply," Thresh's "Water Supply," Greenwell's and Curry's "Rural Water Supply," Fletcher's "Architectural Hygiene," Herring-Shaw's "Elementary Science applied to Sanitary and Plumber's Work."

R. S. I.

Practising Within the Twenty-mile Radius.

S. S. (OXFORD) writes: "About 19 years ago I paid an architect £500 for a term of partnership for 10 years, and he persuaded me to sign a deed of partnership with a radius clause of 20 miles from his town in event of dissolution. I objected, but his reply was: 'You might quarrel with me after, say, 2 years, start next door, and take half my practice.' As I did not mean ever to touch his clients I signed the deed. He died three years ago, and his son has taken on his practice, and, because I happen to be doing work for an old family friend within 10 miles of his town, writes that I have no right to do so, as at end of the partnership deed it has the usual clause that the above shall be binding on the heir's assignees administrating it. It would be a farce if this radius clause were to continue on after the death of the one I made it with, and it was never intended, otherwise it would apply to children of either partner yet unborn. If I really am tied by the 20 miles, it would be unfair restriction of trade, as this radius comes within 3 miles of the town where I started with the consent of my late partner, and I was still his partner for two years after I came here. He would never have objected to my doing work for my friends anywhere."

—The question propounded is not easy to answer. It is clear, of course, that if the original partner was still living he could restrain our correspondent from practising within the radius, and the limit of twenty miles does not appear to be unreasonable. The fact that our correspondent did not *intend* to bind himself not to practise in competition with assignees, etc., does not affect the legal position. The only chance of escape is to contend that in point of fact the covenant was personal to the two partners. The law is thus stated in Mathews on Restraint of Trade, p. 125: "A covenant not to set up business in competition with the covenantee, not limited as to time, is *primâ facie* understood to remain in operation during the whole life of the covenantor, and is not limited in its duration to the life of the covenantee, or to the period during which he carries on the trade or business for the protection of which the covenant was entered into." But it may be personal to the continuing partners, and, if so, it cannot be enforced by their assignees. For instance, in *Davies v. Davies*, 36 ch. D. 359, a covenant by a retiring partner "not to trade, act, or deal in any way so as directly or indirectly to affect the continuing partners" was held to be personal to the continuing partners, so that it could not be sued upon by their assignees. In that case, however, the words administrators or assigns do not appear to have been inserted in the covenant. It would be wise for our correspondent to see his solicitor before he ventures to practise within the twenty-mile radius.

B.

Government Surveyor.

T. M. G. (SOUTHPORT) writes: "What is the procedure to get under Government as a surveyor? Please say what examinations have to be passed, what salaries are paid, and any other particulars. Can architects get under Government? If so, please give particulars. There are a lot of vacancies to be filled shortly."

—The Government vacancies which are now occurring are in the Valuation Department of the Inland Revenue Office, and you can obtain particulars by application to the Chief Valuer at Somerset House, London, W.C. I believe that all the London appointments are already filled, but that there will probably be a great many country valuers selected shortly. The qualifications for these posts are, of course, those which show knowledge and experience in valuation work; and probably the best credential one can show in this respect is membership (by examination) of the Surveyors' Institution, or of the Auctioneers' Institute.

F. S. I.

Refusal of Council to Pass Plans.

W. R. (GLOUCESTER) writes: "The owner of the premises marked 'X' on the accompanying plan [not reproduced] desires to make use of the existing yard, at the rear of which is a better business thoroughfare, by erecting a shop with a flat roof, and forming existing shop into a lock-up one. The width of the road in front is about 30ft., beyond which is a green in front of a public building (giving a total of about 100ft. of open space), whilst at the rear the street is about 36ft. wide. In the basement, 8ft. high, of the existing shop would be a w.c. for use of the lock-up shop, and also a coal and other store for the new shop, under which would be a shallow store, about 6ft. high, all properly lighted and ventilated. On the first floor would be the living-room, kitchen-scullery, and larder, with two bedrooms, bathroom, and w.c. above. All the requirements of the by-laws are dealt with except as to the air space at rear, about which the surveyor raises no serious objection (how can he when the flat roof of the new shop gives more space than in the present yard, the air space for the domestic part now being taken on the first-floor level, and being at the roof level of the new shop?). The council object to the plans, but give no reason, nor state which by-law, if any, they contravene. The only reason (unofficially given) is that the servant will have to live in the basement. This is absurd. They at first refused to return the plans, but have done so, as they could find no by-law which entitled them to retain them. Must the council state reasons for disapproving plans, naming the by-laws contravened, and can they dictate the manner in which the premises are to be used? Can the owner proceed with the work, and risk any action taken by the council under the above conditions, i.e., no reason given for disapproving the plans? What action can the council take if he does proceed, under the above conditions?"

—Not knowing the powers under which the council make the by-laws, it is impossible to say whether this particular by-law can be enforced or not, and without seeing the by-laws themselves it is difficult to say whether there has been a breach. Sufficient air space in rooms which may be used as dwelling rooms is often provided for. While a council is generally under no obligation to state reasons for refusing to pass by-laws, their refusal to do so is most unreasonable. If there was a prosecution for failure to comply with by-laws, it is very likely that, even if the council were successful, it would be deprived of costs if the defendant were not told which by-law he infringed. A solicitor should be consulted. B.

Books for F.S.I. Final Examination.

"SUBSCRIBER" (HULL) writes: "I should be glad if you would inform me of the best books to obtain for the F.S.I. final exam. in roadmaking, building estates (development of), laws of arbitrations, iron and timber roofs, Public Health Acts."

—The text books which we recommend for the F.S.I. examination in the following subjects are: Road Making by Law, Clarke, and Wallis-Taylor, published by Crosby Lockwood, price 6s. 6d.; Building Estates by Maitland, published by Crosby Lockwood, price 1s. 6d.; Arbitrations and Awards by Soper, published by the Estates Gazette, 6s.; Stratton's Public Health Acts, published by Knight, price 7s. 6d.; Roofs, Mitchell's Building Construction, published by Batsford, vols. 1 and 2, price 8s. 6d. the two volumes. P. B. P.

Composition of Concrete.

L. L. J. (CARNARVON) writes: "We are reconstructing a small water reservoir on a hillside. We have taken up the old floor, and have excavated to hard ground or rock throughout, and have thoroughly drained below the proposed new floor. A very substantial pavement of granite about 1 foot deep, well packed and laid, has been put down, some of the slabs being over eight feet super, and it is proposed to finish with an 8-in. thickness of concrete, in which will be embedded ½-in. round bar iron, 2ft. apart each way. The depth of the reservoir varies from 3ft. to a maximum of 9ft. We have specified 6 to 1 concrete, composed of 2 parts 1½-in. broken granite, 2 parts screened ¾-in. and ½-in. granite, 2 parts gravel similar to sample, and 1 part White's Portland cement. A person interested says that the concrete as specified will be weak and porous, no matter how well laid and scoured off. Will you kindly express your opinion on the matter and suggest the best composition and proportion of materials?"

—Though the proportions you proposed using for the concrete would probably be quite sufficient, we think it best to make doubly sure by proportioning your ingredients 1 part 1½-in. broken granite (substitute 1-in. if easily obtainable), 1½ parts screened ¾-in. and ½-in. granite, 2 parts gravel similar to sample sent, and 1 part best Portland cement finely ground. The concrete should be most carefully and thoroughly mixed, first by mixing the cement with the sand or gravel dry, then wetting same and turn again, and finally the stones added and the whole turned again three times. The mixture should not have too much water with it, but should be wet enough to just show the water on the surface when well rammed in position, and to enable the surface to be ruled off. We think it would be best to space the rods closer together, so as to make the work more homogeneous and better resist temperature stresses, and we suggest the use of ⅜-in. diameter round steel rods at 12ins. pitch both ways in as long lengths as can be obtained, and joints overlapped 18ins. The work should be allowed to set for about a month before use, and kept constantly damp up to time of letting the water in reservoir, so as to obviate possible trouble with contraction of the cement concrete setting in dry air. D.

Volume and Speed of Air for Ventilation.

"PERPLEXED" (HEATON CHAPEL) writes: "I was desirous to obtain some details with respect to the ventilation of buildings, and referred to the tables of areas and velocities given in "Specifications." In calculating from these tables I find apparent anomalies of which I give examples, and shall be obliged if you will kindly state whether this system of calculation is correct, and what provision it is necessary to make to meet the requirements of such rooms as are mentioned below. The superficial area for a scholar is given as 10ft. and the cubic space as 200ft., which for ordinary classrooms would mean a height of 20ft., which is not practicable. I have assumed that the height of the rooms is 13ft., and that the air shall be changed four times an hour. Take a room for 40 children at 10 super ft. for each = 400 super ft. 400ft. × 13ft. high = 5,200 cubic ft. To change the air four times an hours means the moving of 20,800 cubic ft. 20,800 cubic ft. per hour = 5 7-9 ft. per second velocity = four miles per hour nearly. By the same cal-culation: In a room for 60 children the air to be moved would be 31,200 cubic ft., equal to 8⅔ per second; velocity 5.9 miles per hour. In a room for 100 children (height 13ft.) the air to be moved would be 52,000 cubic ft., equal to 14½ft. per second; velocity 9.85 miles per hour. It would appear, if these calculations are correct, that the larger the room the fewer times the air must be changed, as with a velocity of nearly 10 miles an hour the draught would be considerable. I have heard of arrangements for the admission of fresh air by which it is claimed the atmosphere of a room can be changed from 15 to 25 times an hour, which appears to be absurd. The theoretical minimum of air for each person in a sedentary occupation is given as 3,600 cubic ft. per hour, or 1 cubic ft. per second. In a room for 40 scholars the theoretical minimum would be 144,000 cubic ft., or about seven times the quantity calculated for above."

—The volume of air per person is the most accurate way of stating the supply of air; and the changing of the air in the room so many times an hour is only used to give an idea of the bulk of air to be removed. I think you have made a mistake that many people make; and this mistake is due to the cubic foot being too small a measure. As a head, a skull will go comfortably into a cubic foot, and as breathing is done at the head the expression of so many cubic feet per head gives one the idea that the air supply is concentrated at the head of the person. This is not the case; the air is spread all over and around. A man or woman can stand on a square yard of ground, and occupies about two cubic yards of space. In the open air a wind of five miles an hour will supply to that person 17,600 cubic yards of air, or more than 237,000 cubic ft. A child occupies about three-quarters of a yard square of ground, and, say, 1.4 yard of height, equal to one cubic yard of space. A five-mile wind will blow nearly 120,000 cubic ft. of air over that child in one hour, of which the child would breathe a very small portion; the rest would remove perspiration. I am unable to fathom your reason for dividing (in your first case a schoolroom for 40 children) 20,800 cubic ft. of air (four changes per hour) by 3,600. If you divide it by 40 (the number of children) you find that each child is allowed 520 cubic feet, or 19.2 cubic yards of air in an hour. If you assume a speed of five miles an hour in the air-outlet shaft (nearly 150 yards a minute) you will need for your 40 children classroom and 20,800 cubic ft. or air, better say 21,600ft., which is 20 cubic yards to each child, in an hour, an outlet flue area of 0.81 sq. ft. By making the inlet to the flue twice the area of the flue, the speed of air current at entrance is reduced to half that in the flue, i.e., 2½ miles an hour. At the temperature usual this would not be felt as a draught. The figure 3,600 can be taken to mean either one cubic foot bulk, or one lineal foot of speed, per second throughout one hour; but you do not say where it is to be measured, and it is not to be measured only at the child's head. As to the 20ft. height of room, whilst such rooms are rare, yet many schools with all rooms on the ground floor have ceiling heights of from 14 to 18ft. across three-fifths of their width, as gables are built for the windows. Greater heights may be customary in the future. INGENIOR.

SOCIETIES' REPORTS.

Edinburgh Architectural Association.

For the annual excursion of the Edinburgh Architectural Association, a large party of the members and friends visited Kelso. Mr. H. J. Blanc, R.S.A., acted as leader of the company. Arriving in Kelso by the midday train, the party were conducted to the ancient abbey, the architectural features of which were explained by Mr. Blanc, who also touched upon the historical associations of the ruined pile. Kelso Abbey was founded by King David I. It was built to accommodate a colony of Tironensian monks founded at Selkirk in 1113, and the colony was transferred to Kelso in 1128, when the Abbey received its first confirmation from Pope Innocent II. Thereafter luncheon was partaken of at the Queen's Head Hotel, and then the company drove to Floors Castle, the seat of the Duchess of Roxburghe. They were shown through some of the principal apartments of the mansion, and they also visited the gardens and greenhouses. Before leaving for Edinburgh, the visitors enjoyed a short walk by the side of the Tweed, where they inspected the bridge designed by Rennie, the architect of the Waterloo Bridge, London.

Manchester Society of Architects.

The third Saturday visit of the summer session of Manchester Society of Architects was to Shrewsbury, under the leadership of Mr. H. B. Laycock. In a single day, one can do little more than glance at the multitude of interesting buildings in Shrewsbury. If one is to pay anything more than passing attention to the wealth of Georgian work, one must leave the churches for another day (unless one is content with mere jottings), for the splendid Norman and later work at Holy Cross Abbey and St. Mary's Church will absorb all the time. The Georgian houses in Belmont were very much admired, and there were, besides, many fine half-timber houses of earlier date, of which the New Ship Inn is a delightful example.—A large party of members have visited Mr. Temple Moore's recently built church of St. Anne at Royton, near Oldham, the Vicar, the Rev. J. T. Ormerod, very courteously conducting the party over the building. A timber barrel roof runs right through the nave and chancel, over an arcade of four great arches with wide soffits and square arrises, and a narrower transept arch on each side. Passage aisles are cut through the piers suppporting the arcade, and the outer aisle walls contain traceried windows, there being no clerestory.

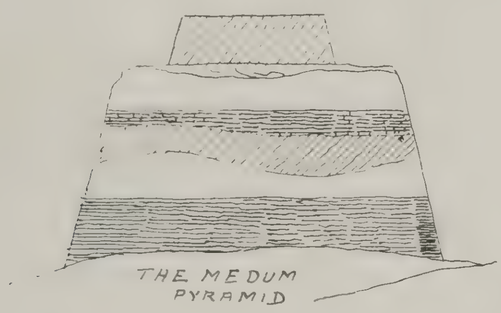
Things of Egypt.

THERE are two exhibitions open at present of relics of ancient Egyptian work; that of Professor Flinders Petrie at University College, and that of the Institute of Archæology of the University of Liverpool, at the rooms of the Society of Antiquaries. The first-named represents the discoveries of Professor Petrie and his students during the past year, in the neighbourhood of Memphis and Medum, some forty miles up the Nile from Cairo; the exhibition at the Society of Antiquaries illustrates work of a later date, found at Meroë, some nine hundred miles south of Cairo.

As a French architectural historian has observed, in ascending the Nile we descend the stream of time, so far at least as the architectural monuments are concerned. Medum is one of the oldest Egyptian sites, and the tombs which have recently been explored by Professor Petrie are adjoining and more or less related, topographically, to the Medum Pyramid. About this pyramid, the centre of the exploring ground, a word may be said. It is not nearly so familiar in people's knowledge as the Great Pyramid, but it is a work of greater antiquity, and is probably the oldest pyramid in existence except that of Sakkâra, near Memphis. Both the Sakkâra and Medum Pyramids are of peculiar construction. That of Sakkâra is built in a stepped form, in four or five stages, and was probably intended to be seen as such. But the construction of the pyramid at Medum is more peculiar; it has been built on successive thicknesses, added from time to time in successive layers outside of an initial pyramid a great deal smaller. It now presents the appearance shown in the accompanying sketch, the lower portion at the sides representing the latest layer added, and the higher part an older portion in the centre. This construction so much impressed Lepsius and some other Egyptologists, that they adopted the theory that all the pyramids were built on this principle; that a small pyramid was built at once for a new king, so that if he died prematurely he should at least have his pyramid-tomb ready; and that as his reign progressed, new layers were added to it. As far as the Great Pyramid is concerned, however, this conclusion is falsified by the continuous nature of the sloping passages from the exterior to the centre, which could hardly have been formed in that way except on a complete plan carried out from the first. But the Medum pyramid is a very interesting curiosity, at all events, in early pyramid building.



THE MEDUM PYRAMID

The objects exhibited have less of special architectural interest than in some former years. The largest section of them consists of wall-paintings or wall-sculptures, whichever we are to call them. There are a number of figure subjects, men and animals, which are formed by first incising the stone to the depth of about half an inch, in the shape of the figure, and then filling it in with a red composition of which the surface is worked up to a slight relief above the face of the stone. Some of the figures thus formed are still complete; in others the filling-in composition has dropped out, enabling one to see the whole process. But of the tombs around the pyramid, models of two are given. Fig. 1 is a sketch of one of these models, that of the largest one, which has been numbered "17," and is built of immense blocks of limestone, some of the roofing slabs being 40 tons in weight. The partially unroofed model enables us to see the plan of the tomb, in which, as usual, in these early Egyptian tombs, the object seems to have been to keep the actual burial recess as remote and difficult of access as possible. Fig. 2 is a sketch of the section model of another tomb, showing the sloping passage down into it, and the manner in which this passage was blocked by the insertion of a great squared block of stone.

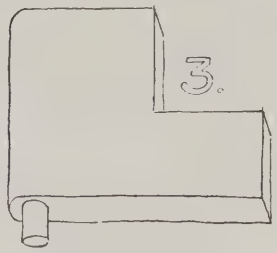
2. SECTION OF A TOMB
SHEWING CLOSING BLOCK

A great number of vases, ornaments, small figures, and pieces of painted pottery are exhibited. Among the things discovered at or near Memphis is the bronze angle-piece of a

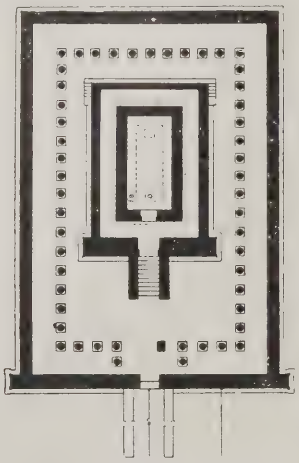
3. BRONZE ANGLE OF DOOR



4. GOLD EAR RING – PTOLEMAIC PERIOD

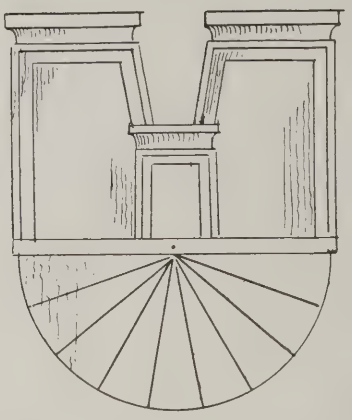
door (Fig. 3), with the tenon at the bottom of it which was sunk into the sill, and on which the door turned as on a hinge. This and many of the other articles from Memphis appear to be from tombs of a comparatively late date. There are three or four fine gold ear-rings of the Ptolemaic period (Fig. 4), which look ponderous in outward shape, but, as in Greek work, the metal is beaten out as thin as paper. Both the Greeks and the Egyptians knew better than to treat gold as bullion, as if it were of value for its mass and weight. That perverted taste was left for the modern jeweller.

Meroë, in Egyptian chronology, is comparatively modern; nothing seems to date earlier than 600 B.C., and much of the work recovered is a good deal later than that. But the remains of some interesting small temples have been found there. We reproduce from the illustrated description that of the one called "Temple of the Sun," and believed to date from the third century B.C. The temple was surrounded by a *temenos* wall (not given in the illustration). The plan seems to combine in a rather curious way the characteristics of the Egyptian and of the Greek temple plan. We have the small, dark central cell of the Egyptian temple, while the surrounding colonnade has more the spacing and proportions of the peristyle of a Greek temple.



PLAN OF SUN TEMPLE. MEROË

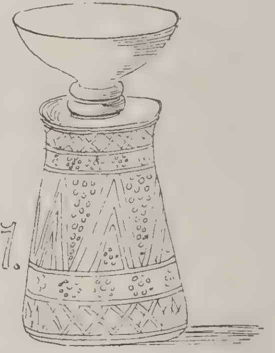
The collection of objects found includes a great number of fine earthenware jars of large size and in perfect condition; but they all resemble each other very much, and there is nothing of special interest in their form. These large jars are all perfectly unornamented. We have sketched two or three of the objects which have some special interest. One of these is very curious, as showing how old is the taste for using imitations of architecture on a small scale in decorative work. This is a movable sundial (Fig. 5), for hanging up, carved in wood in the likeness of the pylons and entrance of an Egyptian temple, with the hours marked off on the semicircular piece at the bottom. It is a small thing, not much larger than the cut here given, and is complete except for a slight breakage at the corner of one of the mimic pylons. The gnomon, of course, would have been fixed in the centre of the bottom bar, above the semicircle. Fig. 6 is a sketch of one of the examples of a thin delicate type of ware, which has rather a Roman character, and is believed to have been due to Roman influence. It dates, or is supposed to date, from about 100 A.D. Fig. 7 is a sketch of a vase from among a set of examples of older pottery of a rougher type, ascribed to about 400 B.C. It is of interest from its peculiar design, which reminds one of the metal spouts used in modern days for decanting wine. It is all in one piece, however, and there seems no practical reason for its peculiar shape. There are several other examples of the same type. The ornament, very roughly drawn, is in white bars and spots on a red ground.



5. MOVEABLE SUNDIAL IN WOOD.

6.

7.



Though there is not much in these two collections which is directly architectural, there is a great deal of interesting detail, bringing us into touch with the habits and handiwork of craftsmen of a far distant period.

The Disfigurement of Paris.

THE one-time familiar and hackneyed old tag, "They do these things much better in France," seems to have lost not only its vogue, but its justification. In Paris, at any rate, the superior deftness and dexterity with which public improvements were effected without interference with the public convenience, or disturbing the marvellous *netteté* for which the people are distinguished, seems for the moment to have forsaken them to such an extent that the "Disfigurement of Paris" is a frequent heading to indignant complaints from visitors to the once delectable city as well as from inhabitants, and the agitation has reached its climax in a "Times" leading article. The case, as stated by the writer of that article, is that the Place de l'Opéra has long been defaced, and partly blocked, by unsightly erections concealing the operations of a tube railway company. "The point is that the delay in completing the work has passed all bounds." The plans have been varied while the work was in progress, so that three electric railways are now being made instead of the one originally intended; and disputes and labour troubles have greatly increased the delay. But, allowing for all untoward circumstances, it is contended that the care of the city has sadly slackened since the brave days of Baron Haussmann, when M. Alphand, "a man with a real genius for the beautifying of open spaces," was in power. Our contemporary thinks it curious that while Paris is retrograde, London has gone forward, and he dwells "with some satisfaction on the great skill, and the very little disturbance of traffic," with which, in our case, the tube railways have been constructed.

The Hellenic Society.

THE annual meeting of the Hellenic Society was held at the rooms of the Society of Antiquaries, on Tuesday, the 28th ult., Professor Percy Gardner in the chair. The annual report, which was in print, but of which extracts were read by the Hon. Secretary, Mr. G. A. Macmillan, was formally adopted. The principal points touched on were the formation of the Society's new premises at 19, Bloomsbury Square, where the rearrangement and cataloguing of the library is in active progress; and the formation of the new Society for the Promotion of Roman Studies, which was originated at the suggestion of the Hellenic Society, after taking the opinion by circular of its members, from whom between four hundred and five hundred favourable answers were received. Provision had been made for the conduct of the periodicals controlled by the bodies interested as friendly and allied publications normally occupying distinct provisions of learning; for reciprocity with the Hellenic Society in respect of library, collection of lantern-slides, and the like; and for the establishment of such further co-operation between the Societies as may seem desirable and possible. Professor Gardner, in a short address, mentioned that it had been considered whether the new scheme for Roman studies should be taken up by the Hellenic Society itself, but it was felt that the sphere of Roman study was so extensive that it could not be taken up by the Hellenic Society without an entire departure from its original objects and constitution. He also referred to the regrettable delay in the publication of the official report of the results of the French excavations at Delphi. The delay, we may say, is only in accordance with the common practice of French archæologists and official departments in these matters, who seem to regard punctuality in publication as of no consequence. After the chairman's address, Mr. A. H. Smith, keeper of Greek and Roman antiquities at the British Museum, gave an explanation, with the help of lantern illustrations, of the rearrangement of the Parthenon pediment sculptures at the British Museum, by which the torso called Niké, or Isis, before classed as part of the east pediment, was now placed among the sculptures of the west pediment, to which, owing to fresh evidence, it was now believed to belong.

Fair Wages and Fair Contracts—Important Movement.

FOR a long time past the operative unions have been pressing upon the Government, and upon municipal and other public authorities, the need there is for "fair wage clauses" to be inserted in contracts, involving the payment of wages to operatives, in order to prevent the importation of work from underpaid districts, and with such success that their attention is now turning in other directions. Through the National Board of Conciliation a joint committee of employers and operatives has been appointed to study the subject, and suggest measures of relief. The operatives claim that the better class of employers, who pay fair wages, and have their work executed under fair conditions, are unfairly handicapped owing to the competition of work from districts where low wages and unfair conditions still exist. It is alleged, and instances are quoted, that the local conditions in these underpaid districts foster the growth of so-called specialist firms who tout for work from architects, and that their success is indicated by the ever-growing practice of inserting provisional sums for internal and other finishings in building contracts. When it is realised that the wage rates for skilled labour in fair wage districts range 50 per cent. to 75 per cent. above those in the lowest paid districts, it is obvious that there may be a good deal of truth in the statements of the operatives. It is also alleged that there is arising a class of contractors who sub-let every branch, and do not hesitate to employ sub-contractors from districts where sweated rates prevail, and these statements again are supported by actual instances. The State and public bodies having set an example by adopting the principle of providing in the conditions of contract that work, supplied to or for them, shall be executed under fair conditions, and at fair rates of pay, wherever it comes from, it is urged that private persons might now be asked to follow their example. When the committee completes its investigation, we hope to return to this question, and to give the suggestions which may be made for remedying what may well be properly remediable abuses of unrestricted competition. Civilised nations have come to realise that they cannot permit the unrestricted ingress of low-priced labour accustomed to exist under a low standard of life, lest their civilisation should have its standard levelled down instead of up. It would seem to be equally necessary for such nations to see that a levelling down process is not permitted to be set up from within themselves by this very trouble of the importation of work from underpaid districts. It may be mentioned that in South Africa employers themselves are insisting upon the adoption of fair-wage clauses in building contracts wherever practicable.

Operative Plumbers and the Heating Engineers.

THE Sheffield Conference between plumbers and heating engineers, as reported in this journal a week or two ago, was held with the object of determining whether or not the plumbers were, as they claimed, exclusively entitled to lay all pipes and fix all sanitary appliances and fittings in buildings. This claim has been made so often, and with so little show of reason, that architects and builders are becoming rather tired of it, especially because the refusal to recognise it has given rise to many strikes on the part of the dissatisfied operatives. In order to substantiate their claim to the exclusive right to such work, the plumbers must set out a much more cogent case than that which they presented at Sheffield, where the heating engineers seemed to have much the better of the arguments. Certainly it would require very strong data, and very skilful arguing, to substantiate so bold a claim as that the plumbers alone are entitled to do work that, on the face of it, might, with at least equal propriety, be claimed by the heating engineers; who do not, however, retaliate by claiming a monopoly of such work, nor do they dispute the plumbers' claim to the monopoly of leadwork. With regard to the engineers, indeed, it may be said that theirs is the magnanimity of the strong, for at Sheffield recently, as at Leicester in 1909, they not only made out an almost unanswerable case, but they stated it with admirable good temper and moderation. They complained, however, of being repeatedly compelled to defend their interests in a matter which they had some reason to regard as settled, and they urged that the guerilla warfare to which they were being subjected should be brought to an end, and the dispute settled once for all on a national basis. Architects and builders will, we feel sure, heartily support this plea; for the aggressiveness of the plumbers—their inconvenient habit of striking on this perpetual pretext—has become a perennial nuisance, and is doing no good to the plumbers themselves. Surely they must see that mere assertion of prescriptive right will not serve them; the work they claim will naturally gravitate towards those who are considered to be most competent to do it. It is surely kindest to them to say bluntly that this is the fact that they have to face; and we cannot help thinking that there are better ways of meeting it than any that they have hitherto adopted.

NOTES AND NEWS.

The Evolution of Hospital Design.

This is the title of a pamphlet by Mr. Keith D. Young,* a reprint of a paper read by him at the Hospital Officers' Association in March last. A considerable portion of it is taken up with a sketch of ancient records as to hospitals, which, in some form or other, were recognised at an earlier date than is commonly supposed. There were the *Iatreia* of ancient Greece, in some cases private hospitals, in some cases the property of the town, established in houses carefully constructed to admit abundance of light and air, while protected from sun and wind. It should seem therefore that the Greeks understood the value of thorough ventilation in a hospital better than it has been understood in some very recent times. Mr. Young adduces an instance in the siege of Paris last century, when two buildings, a church and a slaughter-house, were utilised as supplementary hospitals. The church was by much the more spacious, allowing far more cubic contents per bed, but hospital disease prevailed to a terrible extent, while the occupants of the slaughter-house did well. The walls of the slaughter-house were formed of open louvres, so that it was thoroughly ventilated. As Mr. Young remarks, there could not be a better instance of the futility of relying on cubic space alone, without regard to other conditions. The Mahommedan rulers seem to have attached much importance to hospitals, as there were forty in Cordova under their rule; and Bagdad, in the eighth century, had both hospitals and a medical school. The mediæval hospitals of France and England, a plan of one of which, at Tonnerre, is given, were in the nature of hotels as well as hospitals; the hospital portions were arranged and planned without the slightest regard to what would now be considered necessary conditions of health. In the eighteenth century very large wards were the dominant idea, and John Howard notes in one instance (at Valetta) the noisome state of the atmosphere in the ward. It is not so very long since, however, that Netley Hospital was built with large wards and long continuous corridors, in spite of the protests of the few who then knew better. The disconnected ward system was inaugurated by the Herbert Military Hospital at Woolwich, after the Crimean war. Mr. Young traces the recent progress of, and improvements in, this system. For the one-storey ward Mr. Young has nothing to say; he regards it as costly, with no corresponding advantage. It is costly, no doubt, but we do not feel sure that it is not the ideal system after all; it allows complete circulation of air all round every ward. We observe that while Mr. Young speaks so strongly as to ventilation being all-important, he does not express any opinion as to the principle and method of ventilation which is to be preferred; but this is surely a very important point.

Architectural Discoveries at Glastonbury.

Some very interesting discoveries are recorded from Glastonbury, where Mr. Bligh Bond, F.R.I.B.A., diocesan architect for Bath and Wells, representing the Somerset Archæological Society, has been for some time engaged in superintending excavations that have yielded an unusually prolific reward for the labour, many of the results being of architectural as well as of archæological value. A trench cut southwards in continuation of the line of the south transept has laid bare nearly the whole of the wall which bounded the cloister on the east side, and much of it is "in an unexpectedly good state." Of a crypt, which is in fact the sub-vault of the refectory, the entire east wall of the vault has been exposed, and is in some places six or seven feet high. The springers of three vaulting ribs have been assumed to indicate with tolerable certainty the form of the original roof; and all down the centre of the vault, from east to west, a series of moulded bases which once supported the central columns carrying the vaulted roof and floor of the refectory above have been revealed, four of them having been exposed, while four or five others, it is anticipated, will eventually be uncovered. Of the architectural detail, enough remains to afford a fair idea of the date of the various parts of the fabric. Some of the detail is Early English, as, for instance, the responds, which take the form of small double shafts engaged with the masonry of the walls of the larger vault. The isolated bases of the central piers, however, which are situated at intervals of about 11ft. 6in. down the centre of the area, look like fourteenth-century work, and the detail of the lesser vault at the east end is also mainly of fourteenth-century character, although some of it apparently dates from the end of the twelfth century. Fragments of window tracery, wall-panelling, and cornice work (some of the last-named being enriched with a very beautiful ornament of Tudor roses connected with a winding stem) perhaps came from the cloisters, which were built about the year 1400. Abundant remains of encaustic tiles and of stained glass have also been discovered, as well as some mutilated statuary. A full account of the work appears in the "Times" of July 13th.

The National Federation Summer Meetings.

The National Federation of Building Trades Employers of Great Britain and Ireland holds its summer meetings on July 26th and 27th, at Chester, and on the 28th there will probably be an excursion to some place in North Wales. The Council meeting of the Federation will be held on Tuesday, the 26th, at 2.30 p.m., in the Assembly Room of the Town Hall, kindly lent by the Mayor of Chester. The general meeting will be held at the same place on the following day at 10 a.m., when the Mayor (Alderman D. L. Hewitt) will welcome the members. In each case the agenda is of more than usual interest, and should attract an attendance larger than the average of such meetings. To this end also the intrinsic interest of the quaint old city should serve. Its extraordinary wealth of historical traditions was indicated in the account we gave in last week's issue of the episodes in the pageant that is being held there during the present week, from the 18th to the 23rd; while the illustrations we then showed will have served to whet the appetite for the rare architectural interest of the town. Among the subjects to be dealt with at the general meeting are: Recommendations of certain amendments to the National Board of Conciliation rules; the question of appeal in the case of Wallace v. Douglass, in which a decision as to lump-sum contracts is felt to be adverse to the interests of builders; recommendations of amendments to the Agreed Form of Contract; and discussion of various matters of trade importance, such as "The principles underlying the present practice in regard to provisional sums in quantities and contracts" (opener, Mr. Stephen Easten, Newcastle), "Are architects justified in endeavouring to force the literal interpretation of obsolete specification descriptions in respect to materials?" (Mr. F. Higgs, London), and "The desirability of applying on a wider scale methods of recording reference information in use at Liverpool" (Mr. R. Arthur Costain, President of the Liverpool Association).

The Royal Academy of Music.

The foundation stone of the new building, in the Marylebone Road, for the Royal Academy of Music, was laid last Thursday by the Right Hon. Lord Strathcona and Mount Royal. The new building, the design of Messrs. Ernest George and Yeates, the drawing of which is now in the Royal Academy Exhibition, will consist of a central block with two wings. The right hand wing will contain the concert hall, 122ft. long by 45ft. wide, with its entrances and exits on the main road and on the side street, communicating internally with the building on the ground and first floors. The concert-room will be provided with an organ by Messrs. Norman and Beard, the gift of Mrs. Threlfall, in memory of her husband, the late Mr. Thomas Threlfall, for many years chairman of the committee of management. On the ground floor will be rooms of the principal, Sir Alexander

UNIVERSITY OF ILLINOIS

Mackenzie, the secretary and the staff, as well as the hall, waiting-rooms, etc. The contractors for this building are Messrs. G. E. Wallis and Sons, of Maidstone, who have engaged to finish their work by June 30, 1911.

NEW TURNER WING AT THE TATE GALLERY.

The new wing at the National Gallery of British Art for the Turner collection, the gift of the late Sir J. J. Duveen, from the designs of the architect chosen by him, Mr. W. H. Romaine-Walker, contains five galleries (Nos. VI. to X.) on the main floor and 4 on the ground floor (Nos. XI. to XIV.), a special staircase having been built to connect them.

In Gallieries No. VI. and VIII. contain principal paintings are hung. Nos. X. to VIII. contain studiorum drawings and water colours (in chronological order), including the drawings for the *Liber Studiorum*. The lower galleries contain sketches, studies, and unfinished oil pictures, hitherto unexhibited, and a few finished oils. The architectural finishings of these two galleries are executed in Verde-Antico marble dressings, the pilasters to the main doorways having ormolu caps and bases. A similar marble is used for the border to enclose the solid parquet floor. The ceilings are in enriched fibrous plaster, painted and gilded. The walls are covered with a rich venetian red silk brocade, probably the colour Turner himself used in his own gallery (he had some material used for decorations in Westminster Abbey at the Coronation of Queen Victoria). A departure has been made in designing the roofs by constructing the skylights in such a manner that they carry through the lines of the ceiling. The glazing is on a modern system without putty, and moulded ribs are fixed under each glazing bar to carry the blinds so that when they are drawn the contour of the lights remains unbroken. The blind cords in all cases are carried down in a tube behind the wall boarding to a box sunk in the skirting, thus avoiding the hanging cords which are such an eyesore in most galleries. These have been kept smaller and lower purposely to be more in scale with the small water colour drawings. The same marble is used throughout, but the boarding has been hung with gold canvas. The seats in the galleries and the picture cases in the water colour rooms are in Italian walnut. These cases are so constructed that they can be unlocked and the pictures in their frames can be withdrawn and replaced by others. A staircase on which is hung the portrait of the deceased donor leads out of the end of Gallery X. down to the lower floor where are situated Galleries XI. to XIV. approached by a wide Terrazzo paved corridor. They all have ceilings divided into bays with block modillion cornices, the walls being covered with gold canvas, the doorways and other finishings painted white. The wing throughout has been wired for electric light, heated by hot water (the lower floor being on an electrically pumped circulation), and ventilated by fresh air inlets and ducts delivering the air under radiators, these latter in the galleries being enclosed in steel cases lined with uralite and surrounded by the seats or cases so that the hot air is delivered above the floor level. There are two independent systems of foul air extraction, the air being drawn out during the summer through openings in the ceilings, and during the winter through gratings in the skirtings. The construction is fireproof throughout, the floors and roofs being of steel embedded in concrete, while the roof coverings are asphalte. Owing to the sudden death of Sir J. J. Duveen shortly after the commencement of the buildings, the decision as to the decoration and fitting up of the galleries has devolved upon the eldest son, Mr. Joseph Duveen, and it is greatly owing to the generous manner in which he has *viewed his trust* that the scheme has been so fully carried out. Mr. Duveen has further, at his own cost, erected the staircase and completed, decorated and furnished the well-lit galleries on the lower floor, and has thus furnished accommodation for hundreds of minor works of great interest to the artist and student, for which there would be no room upstairs. Messrs. Patman and Fotheringham, Ltd., were the general contractors, and the following other firms were engaged:—Messrs. Geo. Jackson and Sons, Ltd., for the fibrous plaster work, painting and gilding; Messrs. Litchfield and Co. for the wall hangings, seats and stands; Messrs. H. T. Jenkins and Son for the marble work; the Art Pavements and Decorations, Ltd., for the parquet, wood block, and terrazzo flooring; Messrs. Helliwell and Co., glazing of skylights; and Messrs. Dent and Hellyer, the drainage.

W. H. ROMAINE-WALKER, ARCHITECT.

A NEW ROYAL PALACE IN LONDON.

OPINIONS OF EMINENT ARCHITECTS.

The statement in a London daily paper recently that the question of rebuilding Buckingham Palace is being seriously entertained in official circles gave a fillip to the scheme which, as our readers are aware, we have supported since it was first suggested by a correspondent in the "Times." Quite apart from the question of the unworthiness of the east front to form a background to the Queen Victoria Memorial, now approaching completion, the Palace, as a whole, is said to be badly planned for a Royal dwelling, and on the occasion of State ceremonials, such as the coronation or funeral of a monarch, the accommodation is inadequate to house the numerous foreign royalties and potentates who may happen to be the guests of the King and Nation. Though the opinion has been expressed by more than one architect that we have no living artist sufficiently versed in the planning of palaces to design a new Buckingham Palace, we are far from supporting such a pessimistic opinion. We have little doubt that when the hour arrives the man will also be found to fit it. We doubt if Continental architects of the present day have had much more experience in this direction than men of our own race; and though the Continent can furnish many fine examples of palace design, we question whether these buildings are entirely suitable, considered in the light of modern requirements.

It must not be forgotten that, to-day, the ideas of monarchs regarding the surroundings of their private lives do not differ materially from those of the higher ranks of their own subjects. It is no longer the custom for a king to sleep in a great State bed with an elaborate canopy or hangings, or to take his meals in an immense State dining-room. On the contrary, we are told that the private apartments of many of the living European monarchs are quite Spartan in their simplicity, and it is known that alterations made at Buckingham Palace by the late King, on his accession, were designed to bring the rooms more into consonance with his ideas as to the housing of a private English gentleman.

A modern Royal palace would seem therefore to comprise two very distinct parts, one containing the private residential quarters of the Monarch, his family, and guests, and the other part containing the important halls and apartments for State functions. The point in design would be to combine these two distinct parts in one homogeneous structure.

Mr. Lewis Harcourt, replying on the 11th inst. to a question of Mr. Horatio Bottomley, asking whether the Government would consider the propriety of either rebuilding Buckingham Palace or otherwise providing a suitable Royal residence, stated that the present Palace was not internally unsuitable for its purpose, but that he would be glad if he had the opportunity and the money to reface it with stone on its eastern front, in place of the present covering of stucco and paint.

There seem to be various discrepancies on important points in this controversy. Mr. Lewis Harcourt states that the residence "is not internally unsuitable for its purpose," and probably his dictum is more to be trusted than that of many critics who have had no first-hand opportunities for investigating this point. The idea has arisen, no doubt, that owing to the various alterations and additions that have been made from time to time, the planning cannot now be direct or well arranged. Then there seems to be considerable doubt about the nature of the material used for the eastern front. Mr. Harcourt says painted stucco, and this agrees with the belief of many. But many critics believe the front to be of Bath stone, and urge that the paint be cleaned off and the stone surface left exposed. Others, again, while agreeing that this would be an æsthetic improvement, say that the Bath stone would not stand the London atmosphere, and that a harder stone must be substituted. A correspondent in "The Morning Leader" of July 12th declares, not very positively, however, that the stone of this front is Caen.

As to the design of the Palace generally, opinions differ greatly. Many condemn it utterly, but others, mindful of its piecemeal erection, declare it to be, like the curate's egg, good in parts. In particular, the garden or west front is held to be quite good. In endeavouring to sift opinion to ascertain what is possible or probable in regard to rebuilding, it would seem that, generally speaking, rebuilding of the whole is not generally demanded or considered necessary; nor is it likely that the Government would find the million of money that would be required for it. The idea of raising money by public subscription to carry out the work as a memorial to the late King has also been mooted; we associate ourselves with those who oppose this idea as not being worthy of the object. It is the business of the nation, through the Government of the day, to provide a proper house for the King; and if Buckingham Palace is not suitable for that purpose, it should be rebuilt or put right at the charge of the National purse, and not out of funds elicited by the admiration and affection of the people for King Edward VII.

Mr. Harcourt's reply to Mr. Bottomley is not as hopeful as earlier rumours led us to expect. We believe some £150,000 would be required to rebuild the eastern front, and it should surely be possible to get a vote for this amount passed through Parliament. But in rebuilding the disposition of this front would have to be considerably altered. The Victoria Memorial introduces a new factor in the scheme, and some design with projecting end wings and the main part of the front recessed would appear to be necessary.

Some interesting opinions of leading architects have been collected by "The Observer," which commenced a controversy in its pages by a contribution from Mr. William Woodward, F.R.I.B.A., who is an advocate for rebuilding.

Mr. Leonard Stokes regards Buckingham Palace "as a wretchedly poor specimen of palatial architecture. The laying out of the Mall was a masterly idea, and the completion of the Victoria monument will carry it a step further. The problem of the Palace, however, will help to determine how far we have advanced in the direction of being able to think of big things in a big way. We have grown so accustomed to faltering at the crucial moment that we do not compare favourably with other nations in respect to really magnificent architectural schemes. Whether we shall let the Mall, in its uncompleted state, further emphasise our weakness remains to be seen. . . . The selection of a suitable design is not an easy task. I am not keen on competitions. To my mind they are a waste of time, and it cannot be said that the process of selection by this form of rivalry has been an unmixed success. On the other hand, if you do away with open competition and form your judgment on the work of those who have made reputations, you necessarily leave young men out of the running. There is, of course, the question, how far you would be justified in relying on a young and comparatively inexperienced man to design a Royal palace. But, while the selection of a suitable design is of great importance, it is of still greater importance to get the country to see that the existing Palace is quite inadequate."

Professor Reginald Blomfield thinks "the façade unworthy of its purpose and its commanding position. It was built at one of the worst periods of modern architecture, by an architect who, to say the least of it, was no master of classic design, and shows a deplorable falling off from the high standard of the eighteenth century, both in England and on the Continent. . . . . There is probably no competent judge who would not agree that the façade is inadequate and ought to be replaced by a design which would fitly complete the great scheme of the Victoria Memorial."

Professor Beresford Pite thinks that we have "no school of architects in this country trained to cope with the characteristic art and special features of Royal palaces. Our most distinguished architects have had no experience whatever of this class of work. But there are plenty of young men in the country, and the possibility of making a front—a magnificent front—to Buckingham Palace would probably emanate from some unknown genius when the opportunity presents itself. . . . The present façade of Buckingham Palace is paltry, and the only time it looks presentable is after a coat of paint, which costs £3,000."

Mr. T. E. Collcutt. "I don't think it possible to get this or any other Government to take an Imperial view of what is due to the King in the way of a palace in the capital. The secret of it is that the public generally lack artistic temperament. Do you think the people of the country generally have concerned themselves how his Majesty is housed? They know that he lives at Buckingham Palace, and that is about all. . . . When once the country fully realises how contemptible is the present appearance of Buckingham Palace, they will call out for its removal. The Mall will some day be one of the attractions of London, and it will be to our discredit if we suffer it to be disfigured by a structure like Buckingham Palace, the front elevation of which is beneath contempt."

Mr. J. S. Gibson is convinced "that the only thing to do with Buckingham Palace is to pull it down. No finer opportunity than the present has ever offered itself. Next year will be Coronation year, and the nation would enthusiastically welcome a chance of showing their devotion to the Crown by making a present to the King. I am sure the suggestion would be most heartily acclaimed if public sentiment could be sounded. It is worse than useless to tinker with the existing Palace. I cannot believe that any architect would willingly undertake the impossible task of trying to make a presentable palace out of a structure overloaded with architectural and other defects. As an addition to the notable buildings in London, a new Royal palace would be a sound investment. Indeed, it would almost pay London to undertake the work single-handed.”

Mr. Henry T. Hare. “As Buckingham Palace now stands it is much too near the Victoria Monument, and the addition of either wings or another storey would make the west end of the Mall look more crowded than ever. If the Office of Works would recommend that it was time the country had a Royal palace in keeping with the dignity of the Crown, the new building could be set back far enough to secure a really imposing entrance. One always foresaw that the Victoria Monument would make the palace look ridiculous. It puts the building entirely out of scale. When you think of the Royal palaces in Spain, Germany, Austria, and Russia, Buckingham Palace becomes mean in the extreme.”

Mr. E. Guy Dawber. “The place is composed of architectural patches, and its faults can only be remedied by being removed. As a matter of fact, the place was never intended to be a palace. When the grant was made by Parliament the idea was to repair and enlarge Buckingham House, and therefore the old site, height, and dimensions were retained, probably because it was known that Parliament would not vote sufficient money for an entirely new palace. The circumstance that the building is not constructed on fire-proof principles is itself almost sufficient to raise the question of the wisdom of tolerating Buckingham Palace any longer. I do not think any good can be accomplished by tampering with the building. The only solution, to my mind, is to make arrangements for a new palace, which will do justice to the Crown and the country. Let there be a competition open to British architects, both at home and in the overseas dominions. A competition open to the world would be useless, as everyone knows that a Government would not face the odium in such a case of giving the award to a foreigner. There are excellent architects in the Colonies, and the endeavour to achieve fame as the designer of the King's Palace would produce work worthy of the occasion.”

In addition to these opinions we have received the following from other well-known architects :—

Mr. W. D. Caröe. “I cannot conceive a better memorial to King Edward VII. than the improvement of the front of Buckingham Palace. The recent improvements in the Mall, in connection with the memorial to Queen Victoria, were I believe entered upon largely in accordance with his wishes, but their value and effect are seriously diminished by the miserable effect of the Palace up to which they lead. I should not favour any reconstruction of the earlier portions of the Palace, which are quite good of their kind, nor do I think that the reconstruction of the front would be the best solution externally. A courtyard originally faced the Mall, and to this courtyard I would return, connecting the wings with a one-storeyed open screen, and if necessary reconstructing the ends of the wings. Such an arrangement would have a much finer effect in connection with Mr. Brock's work than any reconstruction of the front. Of course, it might be difficult to encroach upon the plan of the Palace, but possibly a practical addition to the plan elsewhere might conveniently be made to supply the deficiency caused by pulling down the Prince Consort's frontage.”

Mr. Alfred W. S. Cross. “Whilst I fully recognise the desirability of replacing the present undignified structure by a stately palatial building, yet I do not think the proposal that the national memorial to the late King Edward VII. should take the form of a new, or an improved Buckingham Palace can be considered worthy of the object its supporters have in view. Any memorial of the kind under discussion should be one of a nature likely to perpetuate the memory of the illustrious monarch to whom it is erected, and as such the personal element should predominate in the design, and give it a sufficiently distinctive character to enable it to proclaim, for all time, the reason of its erection. It is scarcely probable that a new palace, however architecturally worthy of its object as a permanent memorial, would be associated in the minds of future generations with the life and self-denying labours of our late King, and for that reason I should be sorry to see the memorial assume the form which has been suggested.”

Mr. Halsey Ricardo. “I should suggest as a preliminary before any thing constructional is attempted, the front of Buckingham Palace should be colour washed—say in ivory white—and, whilst the scaffolding is up for the painters' use, the opportunity might be taken of removing much of the pie-crust ornamentation. It might prove that a clean front to the Palace was sufficiently satisfactory.”

Mr. W. H. Seth-Smith. “With reference to the proposal to improve or rebuild Buckingham Palace as a national memorial to the late King, it would be interesting to know what his late Majesty's views were on the subject. As regards rebuilding, assuming that the original plan as given in Leeds's ‘Illustrations of the Public Buildings of London,’ 1838, has not been materially altered, it would seem unnecessary, and therefore a thousand pities, to destroy the State apartments forming the western frontage, which possess such rich historical associations. This western front, moreover, is by far the best part of the elevational design. As for the north, south, and east sides of the quadrangle, I advocate entire reconstruction on a plan which would provide as many important rooms as possible with a sunny aspect, and with really fine frontages towards the Mall towards Constitution Hill; a design in scale with the Victoria Memorial and its new approaches. Leeds remarks, in respect to the site and views from the east and west windows, ‘the Palace has no cause to envy any other building of the kind in any European capital.’ It certainly could not occupy a more favourable position in London. It is equally interesting to read Leeds's and Britton's caustic condemnation of Nash's design in general, which is seen from the Park, and before the eastern range of rooms was erected between the north and south wings must have been far meaner than it appears now. Britton says that ‘excepting Windsor Castle, the Royal palaces are a reproach to the monarchy and to the nation,’ and, further, that ‘if the metropolitan parks had a Royal palace adequate to their scenic character and to the wealth and genius of the kingdom, we should not shrink from a comparison with any capital in the world.’ These early critics end by expressing the hope that the public will philosophically conclude that ‘half a loaf is better than no bread.’ Perhaps we can afford, seventy-five years later, a whole loaf. In the hands of an able architect, this scheme might be very satisfactorily accomplished, and, if so, would seem to me to be a very appropriate memorial to his late Majesty, more particularly as being in conjunction with that of his Royal mother.”

Prof. Stanley D. Adshead. “To rebuild Buckingham Palace as a national memorial to the late King strikes me as inappropriate and somewhat outside the mark. To my mind, a memorial to King Edward VII. should take the form of an equestrian statue in the first place, and of a public building in the second place, and preferably a public building which would further those interests which the late King had at heart. I would suggest a national theatre or charitable institution of some sort; preferably the former, as being more of a monument. Why associate the rebuilding of Buckingham Palace with King Edward VII.? That Buckingham Palace needs rebuilding no one will deny; but why not rebuild it and present it to King George V. as a coronation send-off, and as an expression of good-will on the part of the people at the commencement of the new reign? It is an easy matter to decide to rebuild Buckingham Palace, but it is not such an easy matter to get a good enough design. In my opinion a competition promoted at the present moment in the usual way, and open only to competitors who were British subjects, would under the present conditions of monumental art in this country be foredoomed to failure. The present generation of practising architects have in this country either been educated in a very irregular way or have never been educated at all. Still, there would seem to be no way of finding the unsuspected genius except by competition, and my suggestion would be the preliminary submission of a portfolio as in the case of the Liverpool Cathedral competition, and after half a dozen competitors had been chosen, the greatest care being taken as to their appreciation of purity in style, that then a pretty lengthy period be allowed to elapse for the definite study of the subject before expecting them to submit a final design. Bad as the present elevation may be, still in my opinion if cleaned up it could give points to many important modern buildings of a similar scale.”

Mr. W. A. Pite. “(1) The rebuilding of Buckingham Palace does not commend itself to my mind as being in any way appropriate to the never-dying memory of King Edward VII. That a new palace commensurate with the greatness of the Empire is necessary, nobody will deny. This is, however, entirely a question for the Government and Parliament to supply, and not for public subscription, however munificent. If a rebuilding should take place, I am of opinion that the Palace should be pushed considerably back, or the façade be concave in plan with angle pavilions, it being too near the Victoria Memorial. (2) The idea of tacking a new front on to the present Palace is too ridiculous to contemplate seriously, beside being a patchwork; there could be no successful design on such a basis.”

MAGAZINES AND REVIEWS.

The "Art Journal" commences a series of articles on "Embroidery and Needlework," concerning which there does not seem to be a sufficient line drawn between the classes of subjects which are or are not suited for tapestry. For instance, on one page there are two subjects designed by Burne-Jones for tapestry-figure subjects in foreground planes, which are very good for the purpose; below these is a tapestry reproduction of his picture "The Mill," which is totally unsuited for tapestry; but no distinction is drawn between the two. A paper on "Orchids and Butterflies" may have some suggestions for decorative artists.

The "Architectural Record" (New York) contains an article entitled "Specifications for the working out of Landscape Gardening," which, however, is neither a specification nor an art article, but is, in fact, a description of the practical treatment of soil and of roadmaking. Whether any English practitioners would be interested in learning the views and experience of an American gardener on the subject, we know not; in roadmaking, at all events, the Americans have nothing to teach us, but (apparently) a great deal to learn; the United States having the reputation of having the worst made roads of any civilised country in the world; though we believe they are waking up a little on the subject now. Nothing is said in the article as to the design of gardening. "Additions to Chicago's Skyline" are illustrated by representations of some of the new high buildings there—hotels and office buildings. Such structures might be made very impressive, but these are not very successful. In the best of them, The La Salle Hotel, what might have been a good design is completely spoiled by an enormous mansard attic, in which the dormer windows are completely out of scale with all the rest of the openings, and seem as if they belonged to another building. The McCormick office is the most extraordinary piece of grid-iron we ever saw; the two fronts shown in the perspective view contain together 468 nearly square windows of the same size and space, without the slightest attempt at grouping or variety of any kind. The result is almost ludicrous.

The "National Review" contains an article on Sir William Chambers by Mr. Austin Dobson, whose appearance as a writer on architecture is rather a surprise. The article gives a good account of the principal incidents in the life of Chambers, his visit to China, and his subsequent taste for "chinoiseries" which broke out from time to time throughout his life; and his carrying out of Somerset House, a building which deserves far more praise than it usually gets. Mr. Dobson is rather lukewarm about it; and it certainly was not worth while to quote Taine's abuse of it, which is simply stupid—the writing of a Frenchman anxious to have a rap at English architecture.

In the "Fortnightly Review" "Some Thoughts on old Japanese Art," by Mr. Yoshio Markino, is an article which is of considerable interest, as giving the Japanese view of the objects of art. Western art, according to them, is scientific and objective; a landscape must be complete, with the background and everything else. The western artists paint everything as it looks to them; therefore, they must study about light and shadow and perspective, *i.e.*, the Japanese artist, by Mr. Markino's statement, desires to enter into the life of something—a flower or a bird—to paint it as if he were painting himself. When that is done, the picture is finished; he does not want realistic accessories. That may be a new view of the subject to many English critics or students of Japanese art.

The "Contemporary Review" contains a very good article by L. March Phillips, under the title "Greek Sculpture," in part a review of a recent book of Professor Gardner's. The reviewer's main point is that we should consider sculpture in connection with the life and character of the people who produced it. In this light is contrasted the rigid conservatism of Egyptian art with the awaking of archaic Greek art to the perfection of the real forms of life, to be perfected in the great period of their art. It is said truly that the Greek intellect, in its desire for definiteness and clearness of expression, was exactly prepared to make the most of such an art as sculpture, the art above all others of definite form. But both the Greek mind and Greek art, perfect within their own limits, have their limitations of feeling and expression. As exemplified well in speaking of the Greek tombstone reliefs—"That we must part; that separation is bitter; that it is to be borne with fortitude—this reason and intellect affirm, and this only; thus much, therefore, carve, and carve no more." There is no spiritual consolation in the Greek tomb relief, because no such thing existed in the Greek mind. It is the sculpture of a noble and dignified stoicism.

UNIVERSITY OF LIVERPOOL SCHOOL OF ARCHITECTURE.

ANNUAL EXHIBITION: LIBERTY BUILDINGS.

Yearly the task of reviewing the Liverpool School exhibition becomes a more difficult one. On this occasion the amount of work shown is nearly double that on view last July, and as the quantity increases, so apparently does the quality rise in equal ratio.

We can remember—it was only a very few years ago—when the bulk of the students were drawn from the offices of Liverpool practitioners. Now the local sections are considerably outnumbered by those coming from other towns, both in the north and south, and from places outside the Kingdom. With this extension of the school's popularity the task of the critic becomes more complicated and uncertain. To attempt a separate criticism of each student's work would scarcely be possible. We must therefore content ourselves with a very limited selection.

In that portion of the exhibition devoted to the work of old students we observe several designs by Mr. Adrian Berrington (who, it will be remembered, was on three successive occasions placed second in the competition for the Soane medallion). There is a peculiarly individual quality in all Mr. Berrington's work, partly due to his manner as a draughtsman, and partly the result of his intellectual point of view. He draws extremely well, and in a technique which leaves no margin for blunders successfully carries through the most risky perspectives. His colouring is always clever and a trifle bizarre. He has the knack of obtaining a sort of footlight atmosphere—generally where it is most difficult to obtain. And as an architect, notwithstanding his predilection for mistaken detail and sinuous masses, he handles his subjects with considerable breadth and distinction of idea.

Several of the travelling scholars for the last session submit sets of measured drawings. Those by Mr. Hampshire, chiefly wall monuments from Italian churches, are remarkable for their delicacy. His detail of the Campo Santo at Genoa, showing the Rotunda and portico, is more strongly drawn, and makes the most effective sheet of the series. Mr. H. A. Dod, who presents a number of studies of the Palazzo Pandolfini, is an altogether less careful draughtsman than Mr. Hampshire, but his style has more assurance and competence. He has a better knowledge of motives, and does not seem to concern himself with the attainment of superficial neatness. His rendering of the main front of the Pandolfini in the American fashion is an excellent performance. Mr. Budden also shows rendered drawings of the Museo Barracco, Rome, one of the latest products of the Greek Revival in Italy. The building—an Ionic composition of charming freshness—is elaborately coloured and enriched, and must have been somewhat difficult to measure.

Of the degree students whose course finishes this year, Mr. E. Prestwich (B.A., 1st class hons.) is undoubtedly the most accomplished. He has won, in prizes and scholarships, during the past session, £195 (Lever prizes £120, Ronald P. Jones Scholarship £50, British School at Rome Scholarship £25), and we understand proposes to spend the coming winter studying in Rome. A thorough knowledge of Cockerill's work—Mr. Prestwich has measured the Taylorian Institute at Oxford, the Bank of England, Manchester, and other buildings by the great artist—has sensibly refined the detail of his designs, the main lines of which, however, are American in conception. His treatment of the final examination subject, a casino on the shore-front of a fashionable watering-place, is an admirable solution of the problem. All Mr. Prestwich's work gains greatly from the beautiful manner in which it is drawn and rendered. His half-inch details of the Taylorian Institute are, from the point of view of pure draughtsmanship, amongst the best pieces in the whole exhibition.

Mr. W. R. Owens (Bachelor of Architecture course) appears to have completed a vast amount of measured work in his first two years. By devoting himself to Greek buildings alone, he has acquired some insight into the revival as an artistic movement. Under the conditions of his course, he has still two years to run before obtaining a degree. These two years are divided between practical work in some office approved by the Board of Studies and academic work in the school studio. As Mr. Owens has already won one of the smaller Lever prizes (£10) he may be expected to achieve further distinctions in the near future. Mr. Ernest Gee (certificate student, 1st class, Holt Travelling Scholarship, £50) has accomplished the *tour-de-force* of measuring both the interior and exterior of St. George's Hall. Mr. Gee draws strongly, and his designs are usually thought out in a forceful kind of Doric.

Other 1st class certificate students whose attainment calls for special notice are:—Mr. P. C. Harris (Lever prizeman), for his excellent domestic work; Mr. W. Allan, for his construction sheets and surveys; Mr. D. M. Griffin, for his studies from life and modelling; Mr. C. A. Harrington, for his measured drawings. Highly finished sets of steel diagrams, etc., are also submitted by Messrs. Preston, Wills, Scott, Stephen, and Caldwell.

Taking a general estimate of the work on view, and comparing it with that presented last year, when the school was still in its old quarters in the Victoria Building, one must inevitably be impressed with the unqualified success of the system in force.

NEWS IN BRIEF.

The new thoroughfare from the Mall to Charing Cross, through the triple arch designed by Sir Aston Webb, will, it is expected, be opened about a month hence. Once opened, it is imperative that it should not be broken up for any purpose. The Gas Light and Coke Company have recognised this, and they have removed the old gas main, extending from St. James's Park to the London County Council hall, which was liable to leakage, and have substituted a 46in. steel tube, laid in a concrete bed about 12ft. below the surface level, so that leakage is impossible. The left wing of the arch, from the park side, which is allocated to the First Lord of the Admiralty, has been occupied by several inland branches of the Department. It was intended that the First Lord of the Admiralty should occupy the right wing, but he preferred to remain in the old official residence, with its time-honoured associations. A handsome Portland stone parapet round the building is almost completed, and a flight of steps has been erected from the park into Spring Gardens, where the roadway has been considerably widened.

* * *

The members of the South-Eastern District of the Institution of Municipal Engineers have elected Mr. Henry C. Adams, consulting municipal engineer, of 60, Queen Victoria Street, London, E.C., as their chairman for the second year in succession.

* * *

Messrs. Rickman and Burn, FF.S.I., have removed their offices from 8, Montagu Street, Russell Square, to 5, Queen Square, Bloomsbury, W.C. Telephone No. (Gerrard 6326) remains unchanged.

* * *

The Local Legislation Committee of the House of Commons had under consideration last week the Bill promoted by the Warrington Corporation having for its chief object the reconstruction of the Warrington Bridge over the Mersey. It was proposed to increase the width of the bridge from 28ft. to 80ft., so as to provide for the increased traffic, which had grown out of proportion to the existing bridge, especially since tramways were laid, and to substitute a bridge of one span of 134ft. for the existing bridge, which was supported by two piers. The change would improve the navigation of the river. Sir George Nares, Acting Conservator of the Mersey, objected to the proposal relating to the bridge on the ground that the maximum capacity of the river for tidal and navigation purposes had not been sufficiently considered. The improvements were mainly for road purposes. The portion of the river above Warrington Bridge acted as a reservoir for tidal and flood purposes, and he objected to its capacity being lessened, as he understood it would be. In his opinion the width of the bridge should be to the present abutment walls. Mr. W. H. Hunter, chief engineer to the Manchester Ship Canal Company, said that if the width of the arch were extended from 134ft. to 150ft. the difficulties of the company would be greatly increased. It would obviously reduce the velocity of the water under the bridge. The wider the bridge the more unstable would be the channel. The committee announced that they were satisfied as to the necessity of widening the bridge, for the general benefit of the public, and that the bridge would be, if anything, an improvement to the flow of the stream. They thought the promoters were allowing ample width for the purpose of carrying the water.

Arrangements have now been completed for the establishment of a Professorship of Coal Gas and Fuel Industries at the University of Leeds, as a memorial to the late Sir George Livesey, upwards of £10,500 having been subscribed to the fund initiated for the purpose by the Institution of Gas Engineers. In connection with the work to be carried out by the Professor, an Advisory Committee has been formed, consisting of the Pro-Chancellor (Mr. A. G. Lupton, LL.D.); the Vice-Chancellor (Sir N. Bodington, Litt.D.); Professor Arthur Smithells, F.R.S.; Messrs. J. W. Bray, J. W. Cobb, W. E. Garforth, J. E. Stead, F.R.S., Alderman C. F. Tetley, M.A., and Dr. M. G. Christie, representing the University; Messrs. Edward Allen (Liverpool), J. Ferguson Bell (Derby), John Bond (Southport), Charles Carpenter (London), James W. Helps (Croydon), Charles Hunt (London), J. W. Morrison (Sheffield), Alexander Wilson (Glasgow), Charles Wood (Bradford), Corbet Woodall (Westminster), representing the Institution; and Messrs. Thomas S. Clapham (Keighley), Dugald Clerk, F.R.S. (London), F. J. West (Manchester), H. J. Yates (Birmingham), representing the Society of British Gas Industries.

* * *

The opening ceremony of Christ Church, New Southgate, took place on Wednesday, July 6th. The buildings are faced externally with red Leicester bricks with Bath stone freely used in the dressings. The present portion of the scheme is complete, comprising church with bold square tower, church parlour, and three vestries, but provision has been made for a future institutional block of buildings. The work has been carried out by Mr. Jas. W. Jerram, of Crown Works, East Ham, E., under contract for £4,597, from the design and under the superintendence of Messrs. George Baines and Son, 5, Clements Inn, Strand, W.C.

* * *

The Superior Jury of the Japan-British Exhibition have given the highest award in its class (the gold medal) to the Saxon Portland Cement Co., Ltd., Cambridge, for their exhibits relating to the manufacture, testing, and uses of Saxon Brand Portland Cement.

* * *

Mr. Henry James Wise, A.R.I.B.A., has moved his offices from 7, Great James Street, Bedford Row, to 64, South Molton Street, W. Telephone: Mayfair, 4331.

* * *

The next session of the Department of Architecture at the University of Sheffield commences on October 5th. The lecturer will be present at the University on October 3rd and 4th, from 9.30 a.m. to 12.30 noon to see intending students. The department provides (1) a preliminary year course, meeting the requirements of the R.I.B.A. preliminary and the matriculation examinations. (2) A two years' day certificate course. (3) An advanced course for diploma; part day, part evening. (4) Courses in surveying. The lecturer is Mr. W. S. Purchon, A.R.I.B.A. Sir Aston Webb, R.A., and Mr. Halsey Ricardo have been appointed by the Board of Architectural Education to act as visitors. Mr. A. C. C. John, A.R.C.A., and staff of the Technical School of Art, are in charge of the course on architectural ornament, and the following are honorary lecturers for evening courses: *Design*, Mr. E. M. Gibbs, F.R.I.B.A. *English Architecture*, Mr. C. F. Innocent, A.R.I.B.A., and Mr. J. B. Mitchell-Withers, A.R.I.B.A. *Italian Architecture*, Mr. H. L. Paterson, A.R.I.B.A. The prospectus can be obtained from Mr. W. M. Gibbons, Registrar, The University Sheffield.

* * *

Messrs. Simplex Conduits, Limited, London and Birmingham, have issued a supplementary list of Simplex fans and small motors, in which the range of fans shown is sufficiently wide to cover average requirements, while special types and designs can be quoted for upon receipt of particulars. A page of this supplementary list is devoted to small motors for driving sewing machines, and polishing motors. These vary from 1/16-1/3rd h.p., and the latter are supplied with either pedestal or standard form of base. Suitable starting resistances and switches are also listed.

* * *

It has been decided to raise a memorial to King Edward for East Sussex at a cost of about £30,000. The Hastings and East Sussex Hospital is to be removed from its present unsuitable site on the Hastings sea front to high ground.

* * *

Important works are already in progress, and still more important ones are shortly to be undertaken, for the improvement and enlargement of the port of Bordeaux. The problem of developing this port, which extends along the left bank of the river Garonne about 90km. from its mouth, is a double one—to improve the existing works and to provide for the safe navigation of large vessels down to the mouth of the river. The total cost of these new works is estimated at 53,573,000f. In addition, 1,000,000f. will be required for miscellaneous purposes, so that the whole expenditure on improvements at the port may be put at 60,000,000f.

* * *

In the course of excavations on the summit of Dinas Emrys, Beddgelert, the ruins have been found of a building 32ft. long and 23ft. wide. The walls are evenly and substantially built, and mortar was used in their erection. There is also a well-defined bonding course round the building. Among the articles found in the material excavated are several bronze stud nails with the rivets attached to them, a number of small artificially polished stones, and a large quantity of calcined bones. All the soil is strongly impregnated with charcoal. From the surface to the rock foundation is a depth of about 6ft. The excavations are being supervised by Mr. Charles E. Breese, a member of the Cambrian Archæological Society, and have been arranged by Mr. T. E. Roberts, Plasybryn, Carnarvon, the owner of Dinas Emrys. There are abundant traces of its having been a Roman-British stronghold, and Mr. Breese believes it to belong to the third century.

* * *

"The oldest antiquarian society in England," known as the Spalding Gentlemen's Society, is celebrating the bicentenary of its existence, and erecting a memorial to its founder, Maurice Johnson, the antiquary, by building a new museum and library in Bridge Street, Spalding. The foundation stones were laid last week.

* * *

Tenders submitted for the cleaning, painting, and repair of Darenth Asylum range from £465 to £1,480. The engineer's estimate is £670. The discrepancy is thought to "break the record," but we seem to remember even more remarkable instances of wildly erratic tendering.

It is stated that Mr. Oscar Hammerstein, the American impresario, has determinued to build a grand opera house in London. A site, "One of the best in the West End," has been secured.

* * *

Dr. Johnson's house, No. 17, Gough Square, Fleet Street, is now being repaired. Some alarm has been occasioned by the presence of workmen, but it is satisfactory to learn that the old building is being preserved.

COMPETITIONS.

Usher Hall, Edinburgh.

About 100 sets of plans have been received. Sir Aston Webb, R.A., and Mr. Williamson, the city architect, commenced their inspection on Wednesday last, and the result will be known almost immediately. It has been arranged to display the plans in the large hall of the New Corn Exchange at Gorgie, which, both as regards light and accommodation, is admirably suited for the purpose. The plans and drawings will be displayed on stands specially designed by Mr. Williamson, and erected in the Exchange, and the arrangements will be superintended by Mr. Williamson and also probably by the town clerk. The plans will be numbered according to the order of their delivery, and at the conclusion of the work the doors of the Exchange will be locked and a watch will be set over the premises.

Elementary School, Pontefract.

The Pontefract Education Committee have received the award of Mr. Sydney D. Kitson, of Leeds, the assessor appointed to adjudicate upon the nineteen sets of competitive plans sent in by Yorkshire architects for the proposed new elementary school for Pontefract borough, to accommodate 750 children, at an estimated cost of £9,000. After hearing Mr. Kitson, the Committee accepted his award, which was found to be as follows:—1, Messrs. Tennant and Collins, Pontefract; 2, Mr. James Forbes, Middlesbrough; 3, Messrs. W. H. Thorpe and Son, Leeds.

LIST OF COMPETITIONS OPEN.

JULY 25. NEW ELEMENTARY SCHOOL WINCHESTER. Designs are invited from Hampshire Architects for Elementary School Buildings to accommodate 330 children. Particulars of Thomas Holt, Town Clerk, Town Hall, Winchester.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

SEPT. 5. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to Architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

AUG. 3. PEMBROKE (COUNTY DUBLIN). Tenders are invited by the Pembroke U.D. Council from competent persons for the execution of certain works in connection with the laying-out of Herbert Park, Ballsbridge, Pembroke, Co. Dublin, in keeping with designs, plans, drawings, and specifications, copies of which can be obtained here on or after Saturday, 16th inst, on payment of twenty shillings for each section, which will not be returned. (J. C. Manly, Clerk to the Council, Town Hall, Ballsbridge, Pembroke, Co. Dublin.)

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglican Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. The competition will be confined to architects having an office or residing in the areas of the following education authorities: Cambridgeshire, Isle of Ely, Lowestoft, Norfolk, Norwich, East Suffolk, and Great Yarmouth. Copies of the instructions to architects will be sent to any architect within the prescribed areas upon the receipt of a remittance for 10s., which will be returned when the design is presented, or if the instructions are returned within 14 days of the date of postage. D. O. Holme, clerk of the Governors, Castle Chambers, Norwich.

L.C.C. ARTS AND CRAFTS EXHIBITION.

The exhibition of examples of work submitted for the London County Council's scholarships and exhibitions for students of the arts and crafts, which was opened last Thursday at the Central School of Arts and Crafts in Southampton Row, Holborn, affords, on the whole, very gratifying testimony as to the quality of the work that is being done by the Council in fostering and encouraging taste, talent, and craftsmanship.

The specimens of wood carving are fairly numerous, and only fairly good. With the exception of a carved and pierced panel, in which foliage is gracefully disposed and boldly cut, the work is mostly feeble and timid in design and niggling in execution. In various applications there is a great deal of lettering in the exhibition—incised in stone, painted on signboards, written on paper or vellum, stamped on book-covers, or in the form of letterpress printing; and it is all exceedingly good. There is, however, too much sameness about it; as if there were only one good model in this kind, and as if to get away from the eighteenth century were an artistic crime.

The plaster work is unambitious, but probably all the better for that reason. There are a few panelled ceilings with the usual conventional flowers and cherubim, a few panels in low relief, and all singularly lacking in vigour; a few statuettes and masks, and a model or two—a well-proportioned niche and a classical portico of considerable elegance and symmetry. Among the specimens of stone-carving, special merit is shown in a copy of an Early English capital, in which the texture is somewhat too refined, suggesting the effete file-and-sandpaper finish of less artistic days; and symbols of the four Evangelists for decoration of a font, which, while carefully cut, show no originality of conception or treatment. A quite dignified, altogether graceful, and not entirely conventional piece of modelling has for its subject a sarcophagus for a President of the R.I.B.A. The effigy is finely and feelingly done, but perhaps the figures at each end—representing, respectively, design and construction—are rather disproportionately large, although certainly they are thrown into very graceful attitudes. On one side of the sarcophagus are the heraldic bearings of the person, and on the other the seal of the R.I.B.A., which, while it is a sufficiently decorative object, is of very doubtful propriety in such an application. It is surely more tasteful and tactful to deal in generalities—an observation that perhaps applies with even greater force to the whole model.

The architectural drawings are very few, nor are they at all striking. The design for a picture gallery, museum, and public library comprises a very creditable series of drawings as regards the mere act of putting them on paper; but the design reveals amenity to discipline rather than individuality of conception. This, however, is what one would expect, and even desire, in the work of a student; who, however, has handicapped himself somewhat severely by yielding—quite gratuitously, it would seem—to the modern demand for buildings of mixed functions. We do not contend that a picture-gallery, a museum, and a public library are "irreconcilable antagonisms," but their combination does not make for the highest type of building, and, except under compulsion, they should be kept separate.

The pictures are, both in number and quality, the most considerable section of the exhibition. They are, on the whole, of surprising excellence. One set, by a boy of fourteen, seem to show a dawning talent of great rarity, his massing, grouping, and colouring being, without exaggeration of terms, amazing for so young an artist.

On the whole, it is a most interesting exhibition, and would almost seem to be, indeed, the herald and harbinger of a brighter day for the arts and crafts in this country.

TOWN PLANNING.

Stoke Garden Village. The Earl and Countess of Harrowby last week paid a visit to the garden village estate at Penkhull, and expressed surprise at the progress made since the ceremony of cutting the first sod was performed by her ladyship in April last. On a clear day, Mow Cop, the Wrekin, Stafford Castle, and Cannock Chase may all be seen, but perhaps the greatest pleasure is afforded by the contemplation of the nearer perspective, which includes the well-wooded districts of Keele, Clayton, Hanchurch, and Trentham. Building operations are being furthered with all speed. Plans have been approved by the local committee for about 50 houses, the accommodation and design of which are well varied. The society from the outset have decided that not more than ten houses, on the average, should be built to the acre, and that a generous proportion of the estate should be reserved for open spaces and games. In the Penkhull estate, definite garden boundaries will be given by lines of blossoms or bushes, or some similar means quite in keeping with the spirit of horticulture. Wherever practicable, the houses will be built with a southern aspect, and as far as possible the construction of outbuildings (which results in the formation of narrow enclosed yards) will be avoided. The most convenient facilities of electric light, gas for heating and cooking, and a good water supply are secured, and every house and cottage will have its bath.

Town Planning Conference, October 10-15, 1910. The Exhibition Committee would be glad if architects and others possessing drawings or models illustrating town planning design, which they would be willing to lend for exhibition, would send particulars thereof to Mr. John W. Simpson, secretary-general of the Conference, 9, Conduit Street, Regent Street W., at as early a date as possible. The space at the disposal of the committee being limited, they are unable to accept illustrations of buildings other than such as have a definite connection with the subject of town planning.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

Licentiate R.I.B.A.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Mr. A. N. W. Hodgson's letter on p. 650 of your issue of June 22nd is very refreshing. Mr. Hodgson says that this is a time when reform in the architectural profession is badly needed, and, as all members of the profession, except perhaps an elevated and very small minority, are agreed upon this points the apathy with which this subject is being treated only demonstrates the necessity for reform of some kind.

The letters which you have recently published indicate that the lack of interest shown is certainly not due to the unanimity of the profession in support of the policy of the R.I.B.A. in creating a Licentiate Class (on the existing terms) as a preliminary to the Registration Bill at present being considered by the Council. May I suggest that the apathy is due to a great extent to the opinion that the R.I.B.A. does not intend to produce a Bill for Registration in its usually accepted sense. Registration can only be beneficial to the profession and the art which it professes, if under registration admission to the profession is managed from one central body, and there is no alternative to the R.I.B.A., unless a somewhat cumbersome Central Council is formed, representative of the R.I.B.A. and all other societies, whether at present allied to the R.I.B.A. or not.

The architectural profession has the advantage of observing in the other registered professions certain anomalies which should be avoided, particularly in the medical profession; and in the Registration of Architects, the ideal that no other society should have independent powers of examination for admission to the profession should be adopted if the desire for a really well-organised profession is to be realised.

If Mr. Hodgson's opinion that, "All ideas of personal advertisement and private gain, or petty jealously ought by associates and members of the Institute to be subordinated to the greatest good," is possible of realisation, then a measure of Registration worthy of a great profession is also possible of realisation; but I am afraid that this is quite beyond your A.R.I.B.A. correspondents, on whose lap the gods sleep.

May I point out to Mr. Hodgson that there is no necessity for discussing whether Licentiates of the Institute will write "Licentiate, R.I.B.A." after their names or not. They must write either that in full or nothing, as a reference to the Supplemental Charter as distinguished from the former Charter will show.

H. G. T.

PROPOSED INDIAN MEMORIAL MUSEUM.

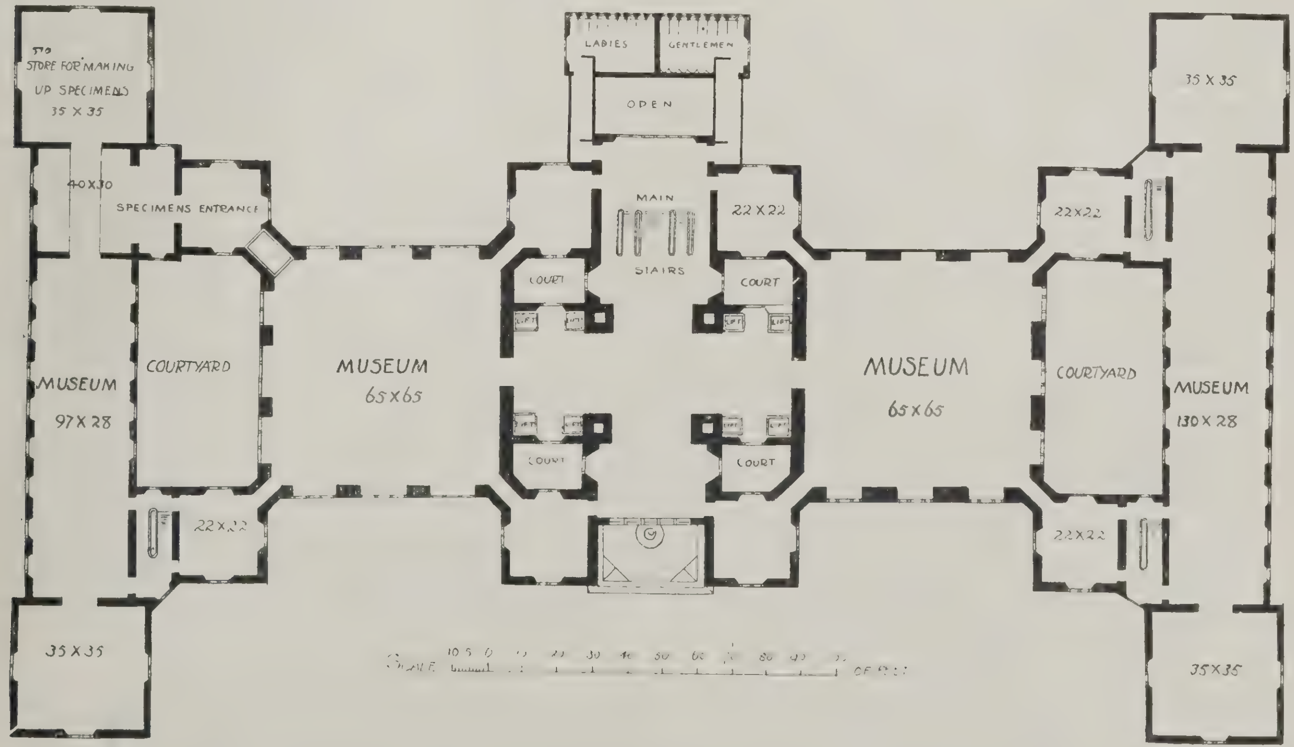
The Indian Memorial Museum which this week forms the subject of our centre plate, is designed as a memorial to King Edward VII. It would occupy the site on which the East India Stores building now stands. A good idea of its extent and appearance may be gained by standing near the statue of Queen Boadicea at the north-eastern corner of Westminster Bridge, and, looking at these stores, imagine a building about one-fourth longer and generally twice the height. The main axis of the structure at right angles to the main axis of the London County Council Hall will face the public garden grounds, which it is proposed to lay out between the two buildings.

The main entrance to the Museum, centrally situated, will have a carriage covered way on the ground floor, and open terraces and steps descending to the grounds from the first floor. A lofty tower rises from the centre of the group containing a capacious exhaust shaft connected by ducts with all parts of the interior. The exhaust will be effected by a large electrically driven fan at the top of the shaft. The warming and ventilating arrangements will make it possible to regulate the temperature of every room.

Centrally situated will be the main stairs with eight passenger lifts working in pairs. The two reception halls, about 64ft. sq. each, with lecture rooms, reading rooms, etc., find place on either side, while beyond and above will be the museum. No part of the building is designed for external show. The domes lighted at the apex will be kitchens and serving rooms for refreshment halls immediately below. Round the central shaft of the tower will be record chambers reached by stairs and lifts, while the entire basement will be given up to the preparation of exhibits, storerooms, and machinery. The building as designed contains nearly 200,000 sup. ft. of floor space, about three-fourths of which will be retained for museum exhibits.

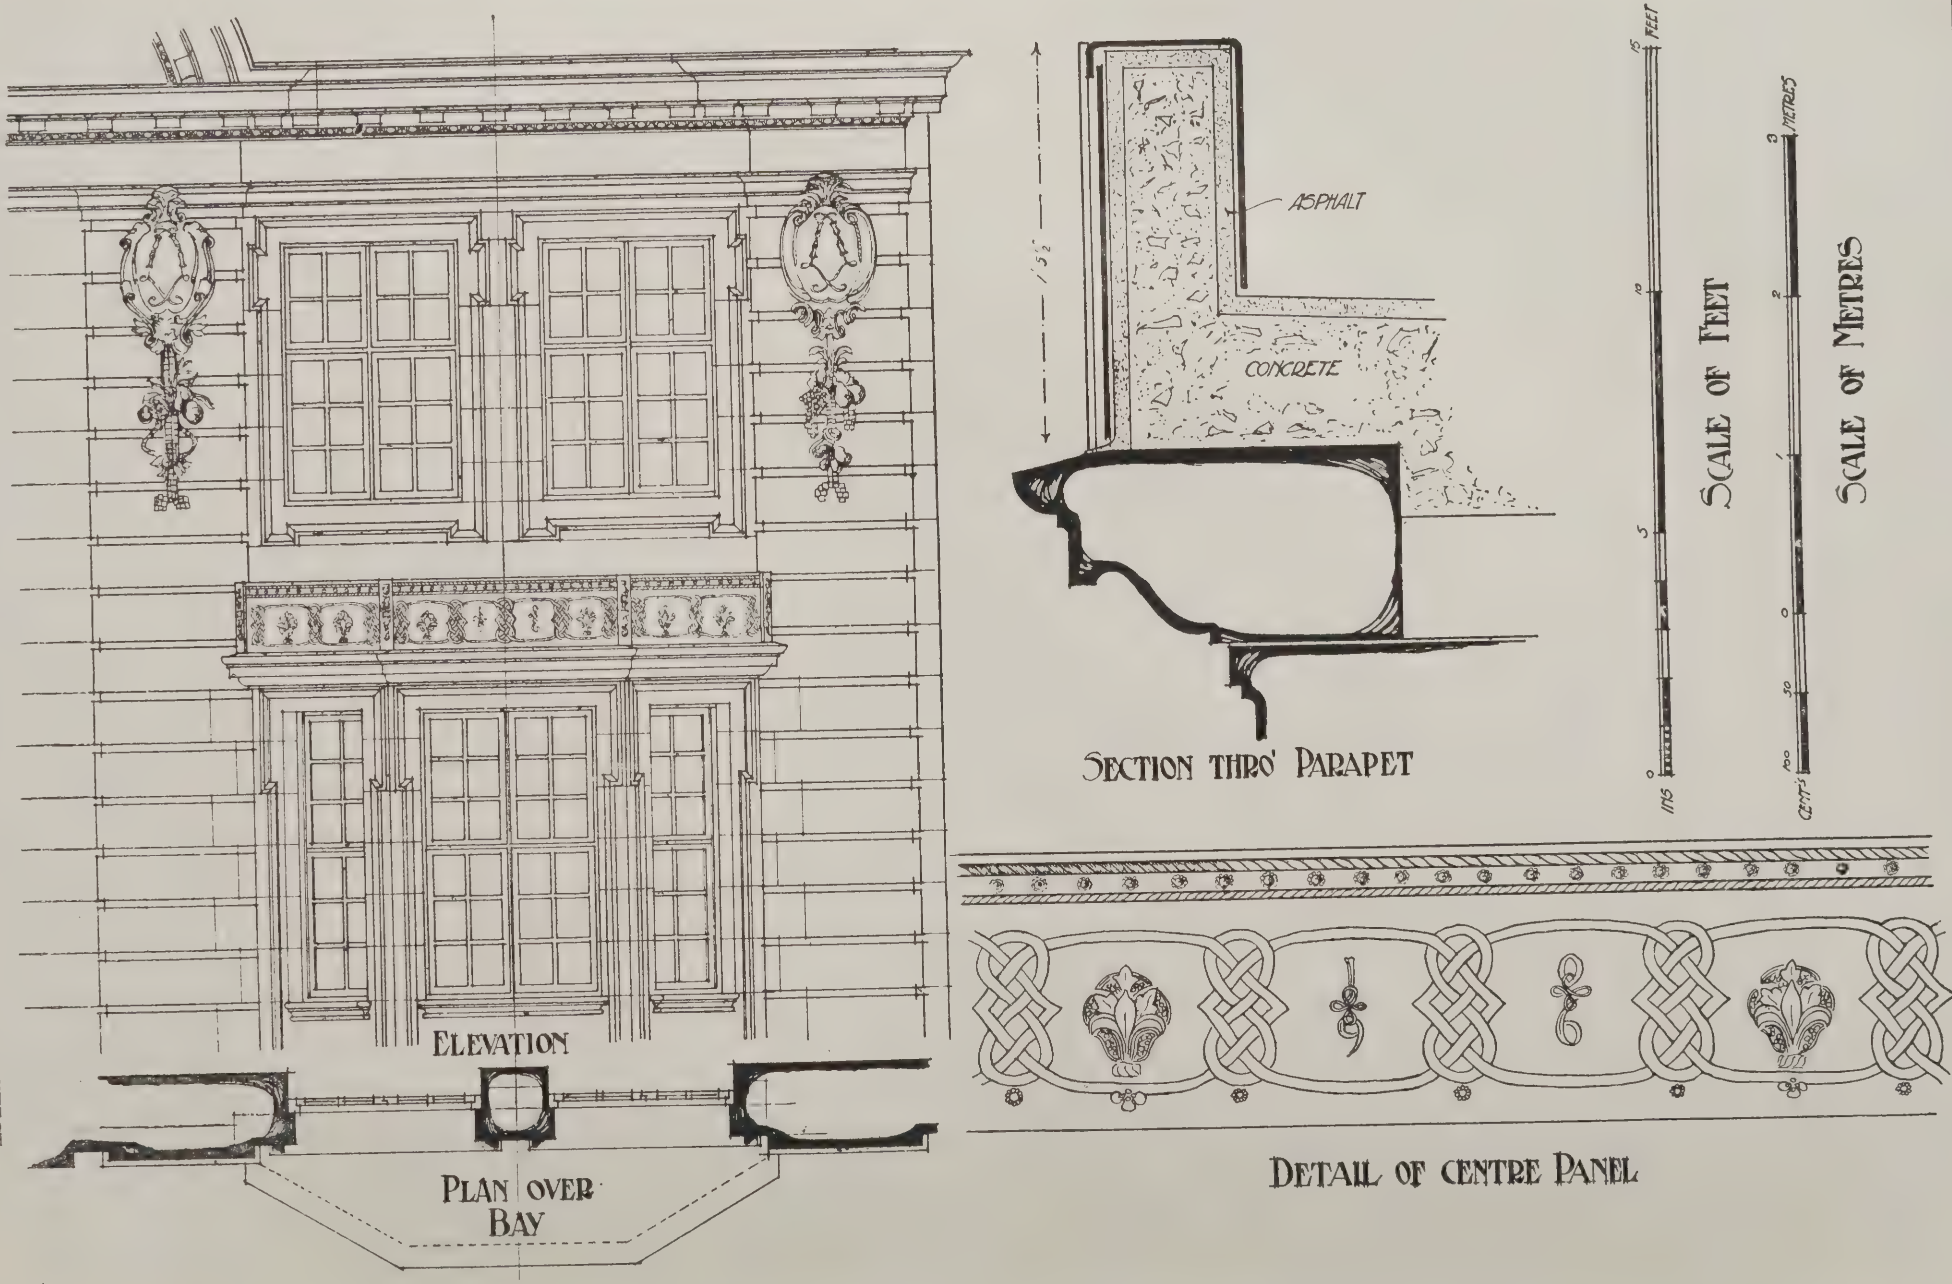
In connection with the existing dock, a powerful lift and cranes for raising museum specimens will communicate with every floor, so that all the heavier goods can be raised at once from river craft.

After the shell of the building is finished in reinforced concrete, it will be entirely covered with ceramic ware, executed by Indian workmen in India, and put together by Indian workmen in England, after the manner of work still to be found in fragments at Gwalior, Dattia, and other places. This work differs from the later tile painting. Doubtless concessions will have to be made both in colour and hardness of gloss to meet the taste of northern folk, and the peculiarities of our more rigorous climate. The colour key would be lapis lazuli and golden brown, on a pale maize ground, heightened with touches of gold, crimson, and green. Such a building could be cleaned once a year with a wet sponge.

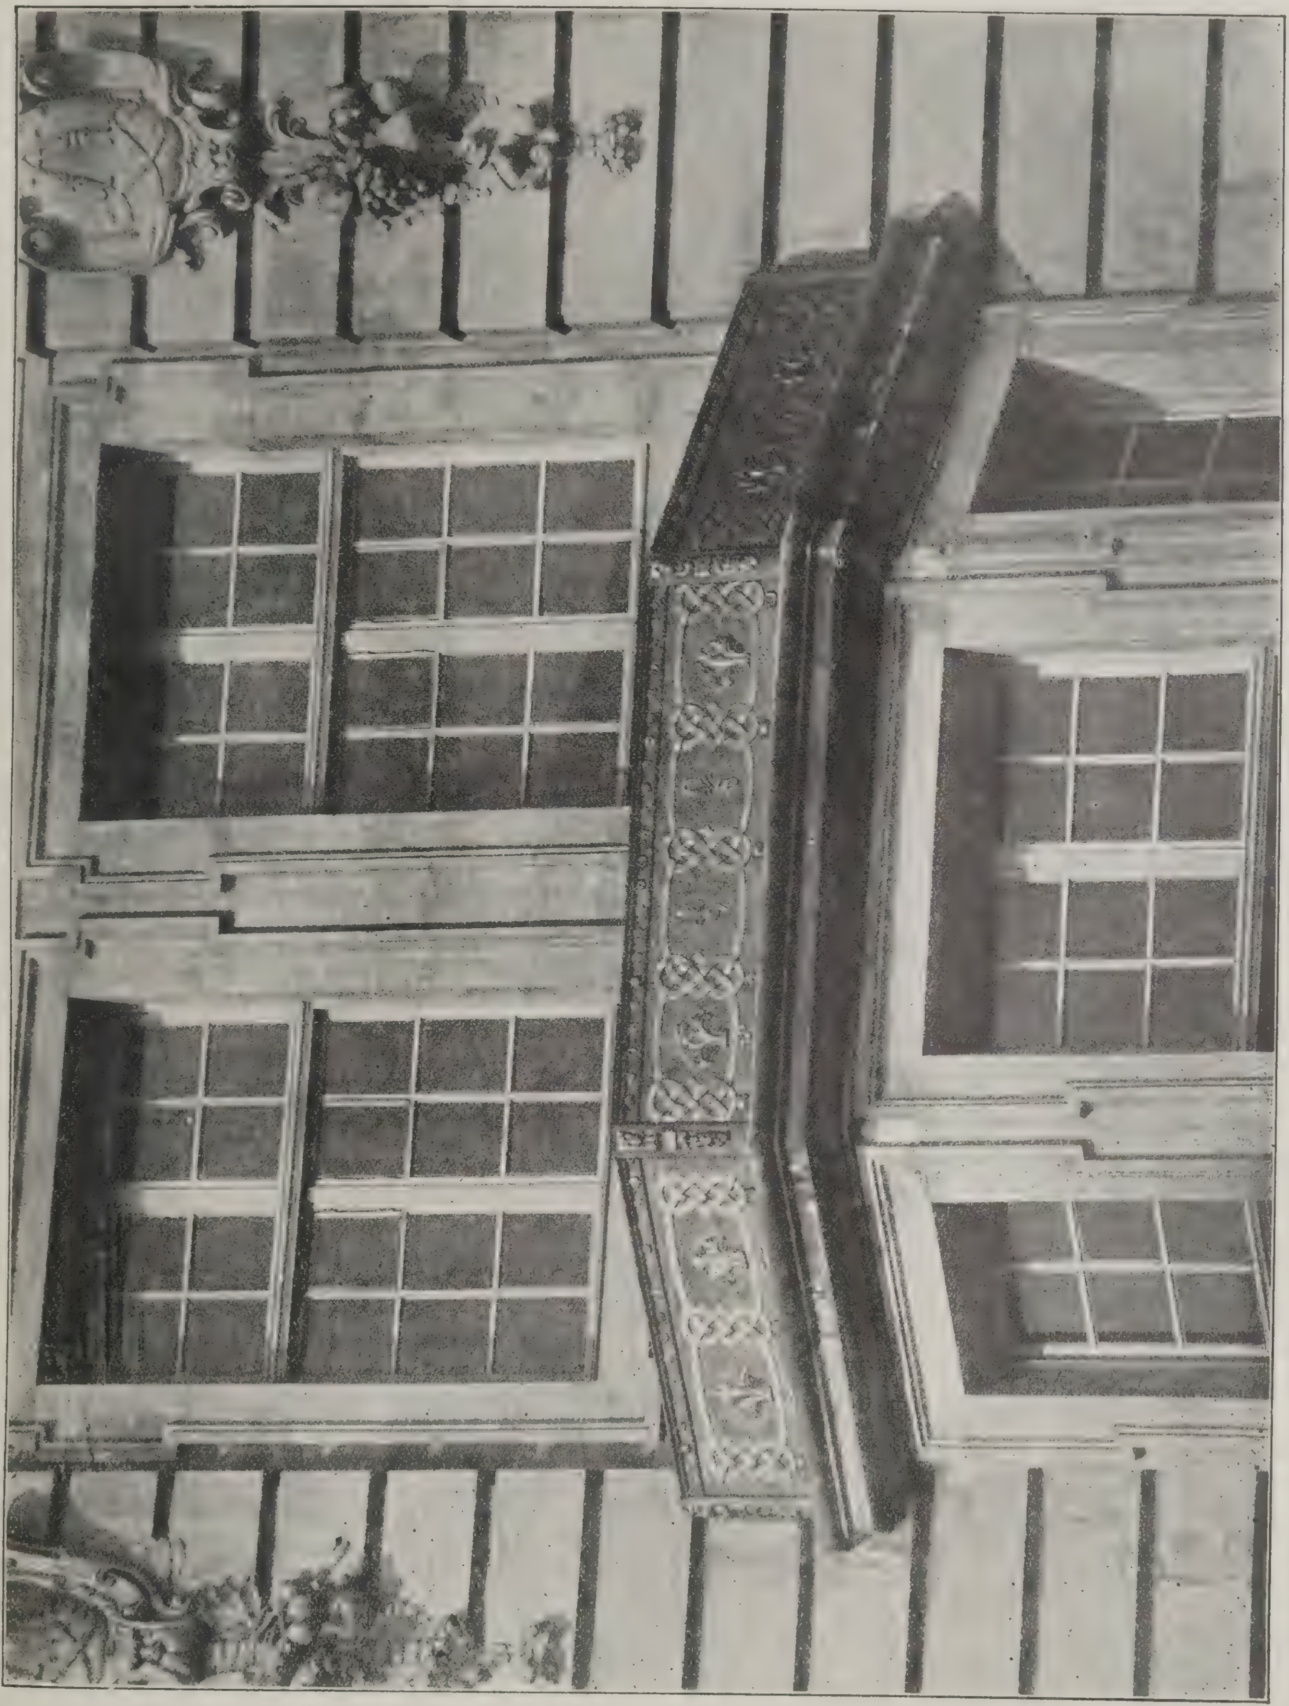


THE PROPOSED INDIA MUSEUM IN LONDON: SKETCH PLAN. ROBERT F. CHISHOLM, F.R.I.B.A., F.S.A., ARCHITECT.

(See Centre Plate.)



LEADWORK ON BAY, PALL MALL, LONDON. E. GUY DAWBER, F.R.I.B.A., ARCHITECT.



This leadwork is on the new building which has been erected for the London and Lancashire Fire Insurance Co., opposite Marlborough House gates. It was executed by Mr. Geo. P. Bankart. The relief is gilded, and thus there is bright a touch of colour which greatly enhances the effect of the work. From the drawing reproduced on the opposite page it will be seen that the lead is laid on a concrete core, with a seating of asphalt.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Safe Stress and Factor of Safety. There is a good deal of confusion accidentally and purposely introduced into practice as regards what is exactly meant by "factor of safety" in the design of structural members. The architect seems quite satisfied as a rule to ask for what he calls a "factor of safety of four." He seems to think that is a very reasonable and proper requirement, and that the factor should be neither less nor more than four. This figure seems to have been established by general practice among engineers. He thinks so, and he adopts it. But he knows neither whether he gets it nor how it is arrived at. Now this, though it may sound very reasonable, is not sufficiently definite—it may or may not give sufficient security, and in general it does not.

The Elastic Limit. We should clearly understand what we really mean by a factor of safety. We could not work up to the ultimate strength, and we must work within the elastic limit, too; for if that is customarily exceeded, the material will gradually be depleted of its strength. In statically loaded structures, as long as we are within the elastic limit of a material, we are safe; but where shock or vibratory loading is to be sustained, then the safe stress is still less. But with brittle materials such as concrete, the elastic limit is not very clearly defined, and approaches closely the ultimate strength, being about three-quarters the latter. Steel, on the other hand, has an elastic limit of about half the ultimate strength. Thus we see that the factor of four reduces to three on concrete and two on steel, if we pay regard only to the elastic limit.

Variations in Manufacture. But the factor of safety has to allow for variations in manufacture, and these are more serious in concrete than in steel. Consequently we require fully the extra factor for the concrete. Then, again, the factor of safety has to cover errors and variations in workmanship, and in reinforced concrete these may be considerably more than in steelwork. Now, when merely a factor of safety of four is spoken of in connection with reinforced concrete, some specialist firms argue that this means that the ultimate resistance of a member shall be four times what it has normally to sustain. But this will not reduce the stress on the materials to the limits we see ought to be imposed from the foregoing remarks. Concrete has a variable modulus of elasticity, varying roughly with increase of stress, as the ordinates to a parabolic curve. Thus at ultimate loading the inner fibres of a beam are taking more stress proportionately than they would have at a lower stress. Consequently, though it may be correct to adopt a parabolic stress strain curve for the ultimate resistance of a concrete beam, it is not fair to do so for normal safe loading in a structure, where the outer fibres should be loaded only to the low stress we consider only safe to impose. The parabolic theory, it should be explained, gives a higher figure than that obtainable from the straight line theory, and means that under normal stress the outer fibres of the concrete would be strained beyond the limit imposed for safety.

Variation in Workmanship. To allow for errors and variation in workmanship we are acustomed to take the value of the concrete at one month as the basis for determining its safe resistance, using a factor of four on the ultimate strength, knowing that as concrete goes on hardening with age we have a factor of five or six at three months. For columns, however, usually a lower limit is taken. For the steel, custom seems to think four on the ultimate sufficient factor. But the taking of a factor of four on the ultimate strength is susceptible of a very reprehensible evasion of the real wishes, though inadequately expressed, of the architect. The load on a structure is made up of its own dead load and the superimposed load. Now, the superimposed load is the only one which can vary; consequently the specious argument is: "Let us take once the dead load and four times the live load, and make the ultimate resistance equal thereto." But if the live load (2w) is, say, twice the dead load (w), we thereby obtain a total load of only 9w, as against 12w, which we should obtain by multiplying the dead and live loads combined by four; or, again, if the dead load should equal the live load, we obtain only 5w as against 8w. We see that in this subtle way the stress on the material in practice is far too high. Therefore, architects and others should be careful to specify exactly what they mean by "factor of safety," namely, by specifying the maximum stresses on the concrete and the steel, and state the "straight line theory" is to be used in calculations. The R.I.B.A. Committee's report on the subject is the best ruling in this country.

BOOKS ON CONCRETE.

Two Books on Reinforced Concrete.

Mr. Middleton's book is ostensibly written for the rudimentary student, and only claims to be introductory to the subject of reinforced concrete. It assumes a knowledge of the elementary principles of statics as applied to the determination of stresses in girders, cantilevers, and roofs. Its form is very suitable to its object, but we do not think the author has succeeded in producing a work that is beyond criticism. His method is to proceed on the usual lines, but he adopts 10 as the ratio of the moduli of elasticity of steel and concrete, and the parabolic distribution for his stress-strain diagrams, which consequently place his treatment out of agreement with generally accepted practice and with most authorities on the subject. He makes various statements which he appears to think practice dictates, whereas they are only blemishes in what might have been a useful introduction to the subject if pure theory only had been attempted. For instance, he says in reference to beams: "It is consequently of little importance where the maximum B.M. occurs, so long as its value is known," and "When a girder carries several loads of different values at different points, it is easier to determine the B.M. graphically than by calculation." Again he obtains a value for the critical percentage of steel on rectangular beams, which, when correctly obtained, also happens to coincide with the economical percentage, and yet says that "Practically so small a proportion is rarely used. It would not be economical." Though the author says: "So far, all has been plane [*sic*] sailing," he seems to get off the course. The author's treatment of shear stresses is inadequate. The treatment of doubly reinforced rectangular beams is incorrect, as the author assumes the steel in compression can be stressed to $7\frac{1}{2}$ tons per sq in. Also the treatment of column footings with a square meshwork reinforcement is incorrect. The notes on systems and practice do not strike us as being very suitable for an elementary student.

"The Elements of Reinforced Concrete Building." By G. A. T. Middleton, A.R.I.B.A. London: Francis Griffiths, 34, Maiden Lane, Strand, W.C. Price 4s nett.

Captain J. G. Fleming's book is an attempt to condense into a convenient compass a mass of practical information and theory. The author acknowledges his indebtedness to Mr. William Dunn, F.R.I.B.A., for much assistance. The book is a very useful summary of the subject, and it should be of real service to the Royal Engineers, for whom, apparently, it was primarily written. Lieut.-Col. J. Winn, who published the first work on the subject of reinforced concrete in this country, issued by the same publishers as this book, contributes a preface. In such a short treatment of the subject, considering the multiplicity of systems, it would have been well to avoid reference to particular systems, and to deal only with the theory and practice in a general way. The author does injustice in omitting, perforce, many other systems of merit. He should have dealt with all or none. We are surprised that, whereas the Concrete Institute is referred to in the preface, the author did not adopt its standard notation, which would certainly have made things more intelligible. The method of calculating deflections given in the book may be practically fairly new, but it embraces the fundamental error of equating the moments of the total compression and total tension about the neutral axis instead of the total compression to the total tension. The book is certainly a useful summary of data, and may be studied with advantage by students beginning the subject, as well as by those who have advanced some way.

"Reinforced Concrete," by Captain J. Gibson Fleming, R.E. Chatham: The Royal Engineers' Institute. Price 3s. 6d. nett.

A Specification for Reinforced Concrete.

Messrs. Edmond Coignet, Ltd., have issued in pamphlet form a standard specification for the execution of works in reinforced concrete on the Coignet system. The proportion of cement is specified by weight, which is preferable to specifying it by volume; the sand and stone are, however, stated in volumes. Another clause to be noted is the provision for the use of emergency props during tests to prevent any excessive deflections which may be due to bad workmanship or other causes.

THE ROYAL LIVER BUILDING, LIVERPOOL.

[The following details of one of the largest office buildings in the United Kingdom, constructed of reinforced concrete and presenting many special points of design, particularly in the carrying of very heavy concentrated loads, will be of special interest to readers of this section.]

AMONG the many works executed in reinforced concrete in England during the last few years, one of the most interesting is undoubtedly the Royal Liver Building, Liverpool, now practically completed. This building takes its name, as does Liverpool, from the word Liver, which is the name of a mythological bird which was supposed to have haunted the pools in the district now known as Liverpool. The building is bounded at the back by the Strand, on one side by Water Street, on the other side by St. Nicholas Place, and in front by the space known as Pierhead. The structure is entirely of reinforced concrete, with the exception of the exterior curtain walls, which are of granite.

The building is a monolithic reinforced concrete skeleton frame, the columns, beams, arches, and floors all being carried out in that material and bonded together. Light in the interior is secured by two spacious wells, 58ft. square. Stairways are provided, and intercommunication between the floors is secured by an installation of 14 passenger lifts and two goods lifts. Roomy shafts have been built for pipes and electric cables, for ventilation and for reception of the boiler chimney. Interior partition walls in most cases have been omitted, as partitions will be erected to suit tenants.

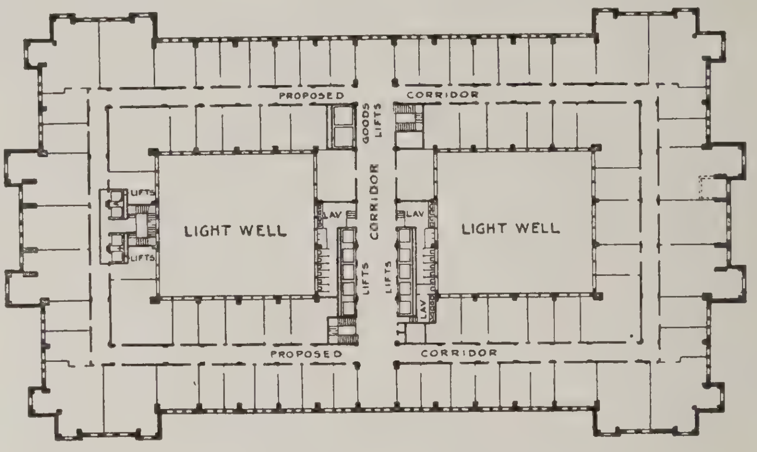

Fig. 2.—Typical Floor Plan.

The structure is designed as an office building, and is owned by the Royal Liver Friendly Society, who are sub-letting some portions of it. In plan, the building is 310ft. by 178ft., while the height to the main roof is 170ft. The domes of the two main towers are 290ft. above pavement level, while the total height is 320ft. from the basement floor level to the top of the towers, and about 360ft. from the bottom of the foundations to the top of the Liver bird which is to adorn the towers. There are 11 storeys below the main roof, and 6 storeys in the towers, making a total of 17 storeys. It has thus justly been termed the first English skyscraper, and standing as it does close to the Mersey in the vicinity of Prince's Landing Stage, a full view of the building is obtained from the river, presenting to arriving Americans a suitable reminder of their country—the land of skyscrapers.

It stands in a position formerly occupied by the St. George's Dock; and as the made ground was absolutely incapable of supporting the enormous loads, concrete foundation piers were sunk down to the old red sandstone 32 to 47ft. below the normal surface level. The total amount of excavation taken out for the basement was about 50,000 cubic yards.

As evidence of the quickness with which reinforced concrete work can be carried out, it may be mentioned that a whole floor, including 130 columns and 3,800 square yards of flooring, were completed in 17 days. The whole building was commenced in May, 1908, and the reinforced concrete work finished by the end of 1909. The architect was Mr. W. Aubrey Thomas, and the contractors were Messrs. Edmund Nuttall and Co., of Manchester, authorised contractors for the reinforced concrete work on the Hennebique system.

As regards the illustrations given, the frontispiece to this issue is a general view of the building from the architect's perspective drawing. Fig. 1 is a cross-sectional elevation, showing the heights of the various floors, etc. Fig. 2 shows a typical floor plan with the position of lifts and office space, etc. Fig. 3 is a section of the retaining wall. This wall involved some considerable thought. The ground was quite unfit to sustain the weight of concrete walls built in the ordinary way.

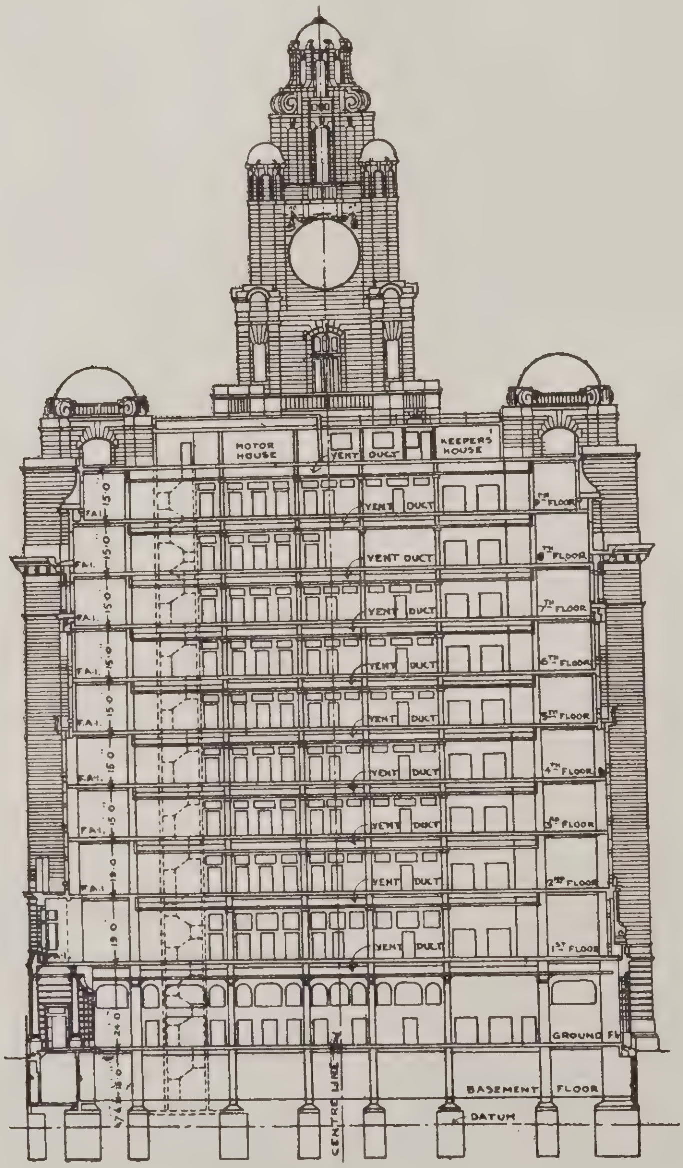

Fig. 1—Sectional Elevation.

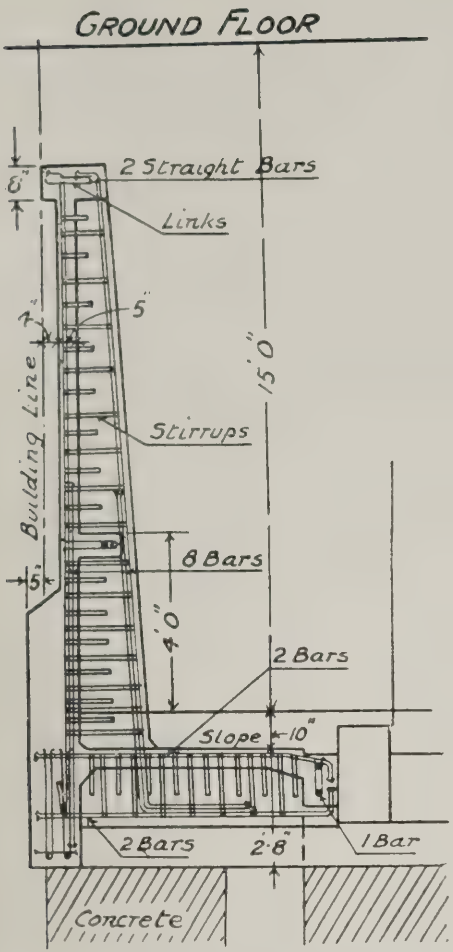

Fig. 3.—Section of Retaining Wall.

It was decided therefore to construct reinforced concrete beams between the outer row of foundation piers, these beams being incorporated with the retaining walls and supporting them. Where at certain points there were no piers available to carry these beams, cantilevers were put in, extending some 11ft. from the main columns, sufficiently strong to act as intermediate supports to the beam carrying the retaining walls. These cantilevers also support the basement flooring.

The retaining walls and the connecting basement floor being completed, the entire site was converted into an immense watertight compartment, this being particularly necessary as the ground water level frequently rises to a height of 10ft. above the basement floor.

The double-page reproduction of the ground floor plan shows the general disposition of the building, the masonry curtain walls being blocked in and the reinforced concrete shown hatched. The main supports are clearly seen on this plan. A section showing the system of reinforcement is given in Fig. 11. This particular support being one of those that sustain one of the main towers, carries a total load of 1,500 tons. These main columns vary in cross section from 3ft. square (where the load is 900 tons) to 3ft. by 8ft. at the basement floor level (load, 1,500 tons). The outer row of supports carry the beams with the granite curtain walls, as well as part of the floor loads. At the top their dimensions are 12in. by 14in., increasing to 1ft. 9in. by 8ft. at the base, where the load is over 750 tons on each.

Figs. 4, 5, and 6 are fully described under the illustrations.

Beam D (Fig. 5) abuts at this point. X

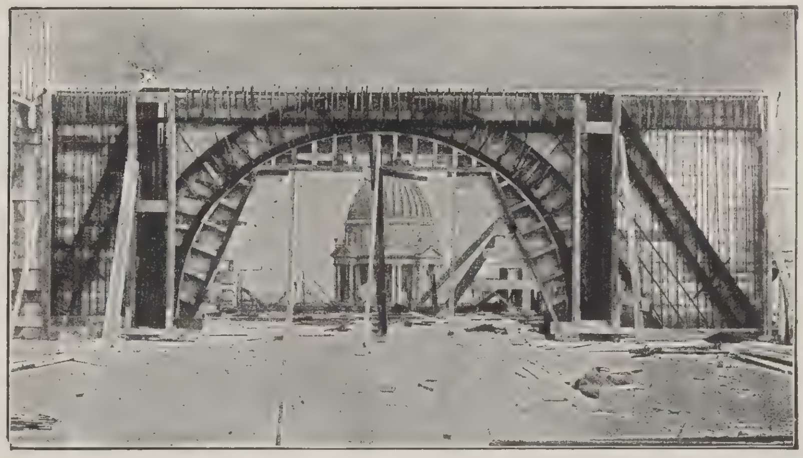

Fig. 4.—This illustrates beam E, which carries a portion of the loads of beam D (see Fig. 5) and other concentrated loads, making a total of 290 tons.

The arches (type "L"), one of which is shown in Fig. 7, are employed to carry the main towers. A considerable proportion of the column weight is carried by arches of this type, of which details are given under the diagram. They have a clean span of 58ft., and a rise of 32ft., a height covering the 9th to the 11th storeys. They support several beams in addition to six concentrated column loads, amounting in all to the immense total of 1,480 tons per arch.

The corner domes (23ft. in diameter) are carried by a frame cased in granite. They are of reinforced concrete, varying in thickness from 6in. at the base to 4in. at the crown. The domes will be covered with copper.

Fig. 8 shows the arrangement of beam and cantilevers carrying the exterior main cornice, which extends right round the building at the eighth floor level.

A typical floor beam is shown in Fig. 9. Most of these main floor beams are constructed with parallel sides, the concrete being reinforced by bars and stirrups arranged as customary in this principle of reinforcement.

Beams of type K, one of which is shown in Fig. 10, are 51ft. long, with a clear space of 41ft. 3ins. between supports, and a cantilever projection of 3ft. 9in. at one end. A load of 1,480 tons is concentrated at two points on each beam of this type, which carry distributed loading, in addition, of 100 tons, this very considerable load being transmitted by means of the main columns to the foundations.

Fig. 12 shows a general view of the foundation works, and the form work for the main supports.

Fig. 13 shows the completed reinforced concrete skeleton before the building of the granite curtain walls.

Fig. 14 is a view of the building as it appeared on April 28th, 1910. It will be noted that the curtain walls have been carried up to the 8th floor level, just below the cornice. Owing to the reinforced concrete structure being, like a skeleton steel frame, independent of the curtain walls which are carried by it, the walls were started on three different levels at once—the ground, third, and seventh floors.

The whole of the granite facings have been fixed by Messrs. A. and F. Manuelle, of London. The granite is cut to take the concrete work, and is tied by metal cramps. The amount of granite employed is, of course, enormous, there being some 300,000 cubic feet, weighing, approximately, 25,000 tons. The small amount in the basement is Dalbeattie; the main bulk is Norwegian, with a little Aberdeen. The dressings are graduated from fine axed on the lower floors to rough-picked faces for the top portions of the towers. The carved work, all in Norwegian, comprises cartouches at first floor level above the portico on the river front, the central feature over the Water Street entrance and key stones to the main windows on the ground floor. There is a good deal of carved work, also, around the clock faces. The building is being installed by Messrs. R. Crittall and Co. with their new patent panel system of heating.

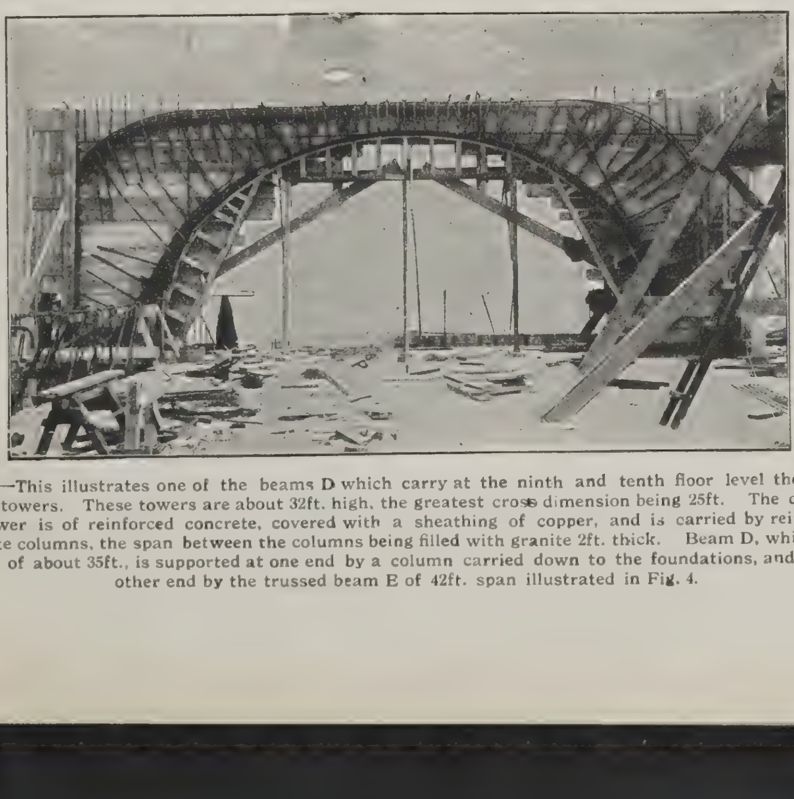

Fig. 5.—This illustrates one of the beams D which carry at the ninth and tenth floor level the small corner towers. These towers are about 32ft. high, the greatest cross dimension being 25ft. The dome of the tower is of reinforced concrete, covered with a sheathing of copper, and is carried by reinforced concrete columns, the span between the columns being filled with granite 2ft. thick. Beam D, which has a span of about 35ft., is supported at one end by a column carried down to the foundations, and at the other end by the trussed beam E of 42ft. span illustrated in Fig. 4.

ROYAL LIVER BU

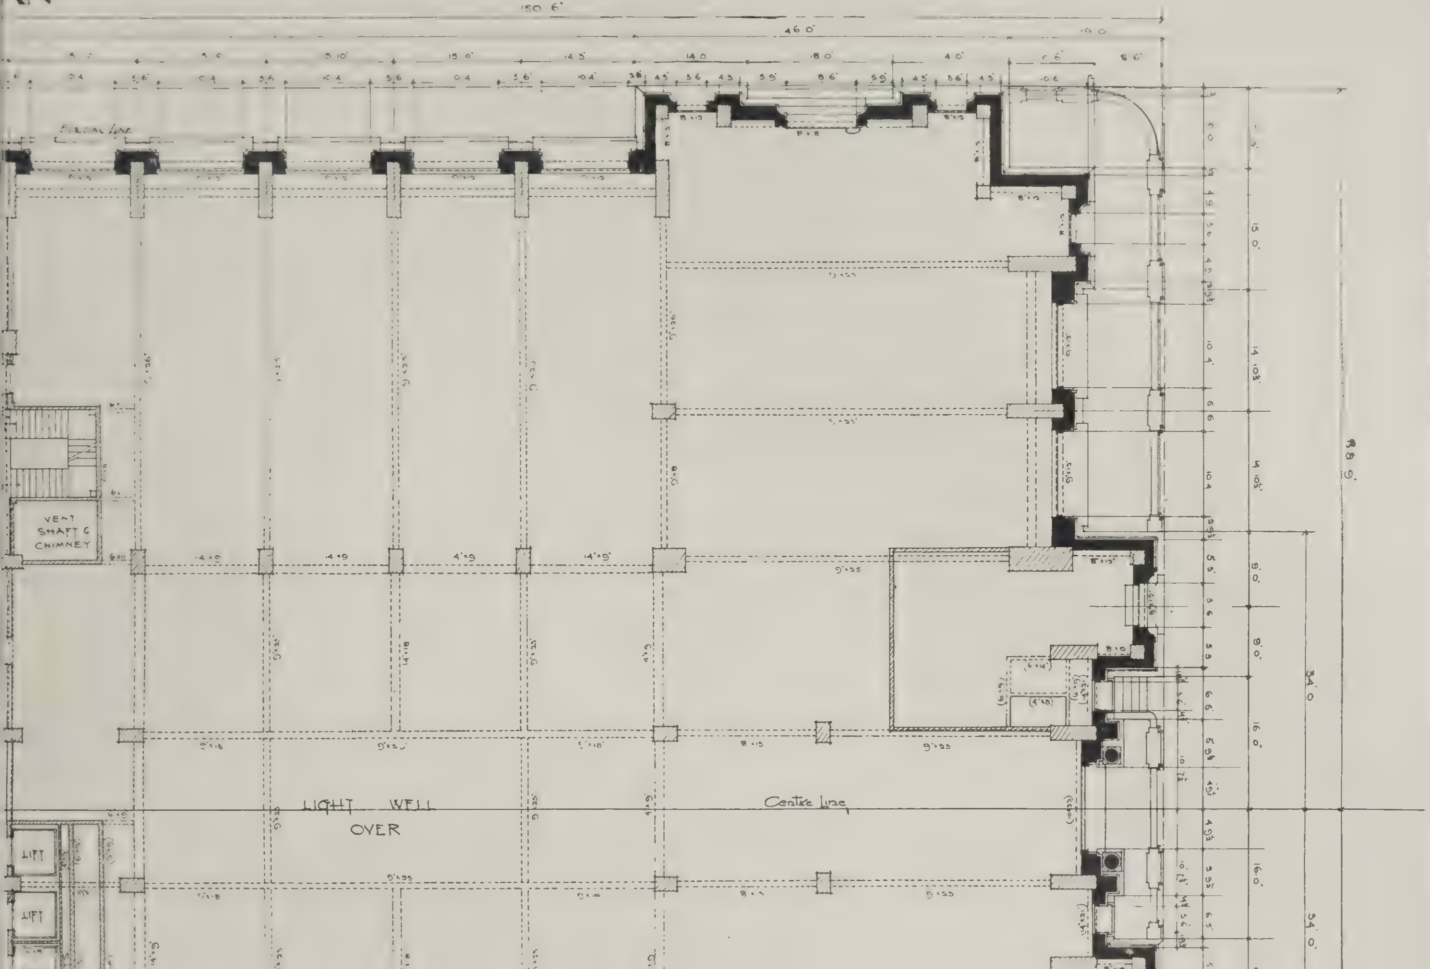
AN



W. AUBREY THOMAS. ARCHITECT

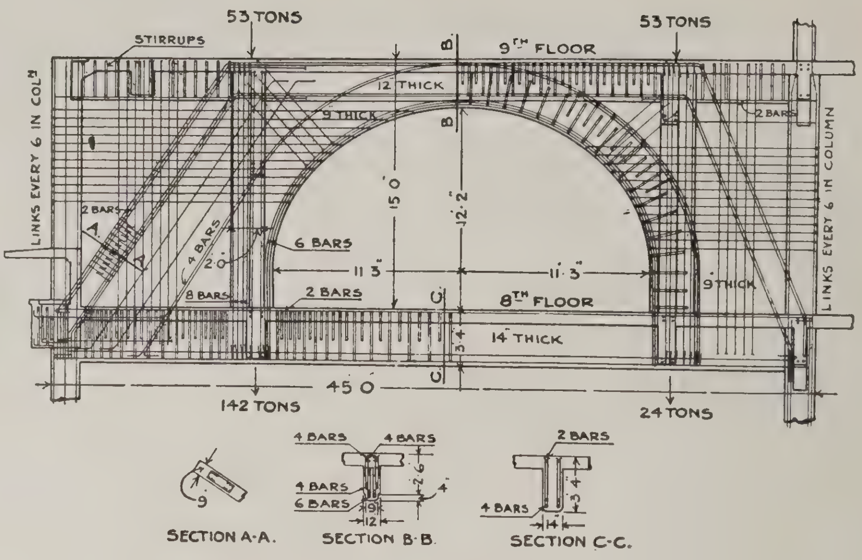


Fig. 6.—This illustrates design of beam E mentioned in Fig. 4.

THE ROYAL LIVER BUILDING, LIVERPOOL.

THE CONCRETE INSTITUTE.

Visit to Chingford Reservoir.

By the courtesy of Mr. William B. Bryan, M.Inst.C.E., Chief Engineer of the Metropolitan Water Board, the members of the Concrete Institute visited the new Chingford Reservoir Works on Wednesday, June 29th. The members assembled at Enfield Lock Station at 10.45 a.m. sharp, when the party were conducted over the Works by Mr. Charles F. Marsh, M.Inst.C.E., and Mr. T. C. Deverell, M.Inst.C.E., resident engineer.

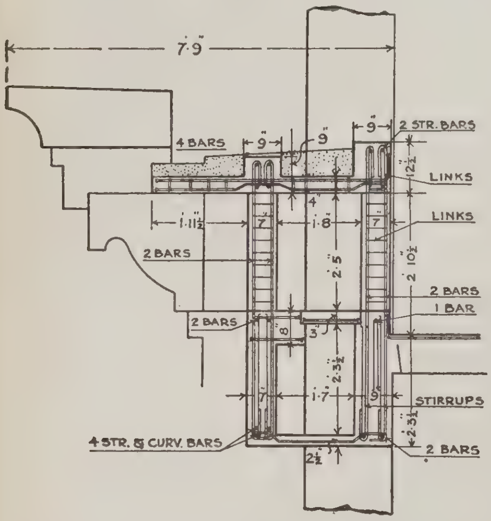

Fig. 8.—This section gives details of the reinforced concrete beams and cantilevers forming the backbone of the main cornice running round the building at the eighth floor level. Projecting more than 6ft. beyond the exterior face of the walls, the cornice consists of a reinforced concrete framework, with cantilever slabs, between which are inserted stone dentils at distances of 18in. apart, and upon them are carried the upper blocks of the cornice proper.

THE ROYAL LIVER BUILDING, LIVERPOOL.

The reservoir having been visited, lunch was served at about 1 p.m. at the Fountain Inn, and afterwards the party viewed the river diversion works, returning from Angel Road Station on the conclusion of their visit. Chingford Reservoir will contain about 3,000 million gallons. The water area is 416 acres, and the length of embankment about 4½ miles. The embankment is being formed of material excavated from within the reservoir. The top portion of the inner slope will be lined with concrete, and this for a distance of 4ft. below top water will be faced with brickwork. The lining will consist of a brick-faced vertical wall 3ft. high, with concrete coping, which will be rounded off at the bottom to meet the lower portion of the lining which is formed on the slope. The water will be pumped into the reservoir from the River Lea and River Lea Navigation at the north end through five lines of 48in. cast-iron pipes passing up the outer slope and discharging into a chamber at the top of the embankment. From this chamber the water will pass over a long granite sill down an inclined slope into a stepped channel. The outlet from the reservoir will be at the south-east corner. The valve houses on the outlet shafts will be constructed of concrete and have domed roofs. The inner shaft will be connected to the reservoir embankment by a reinforced concrete bridge 6ft. wide between parapets, and 20ft. span. The parapets of this bridge will be reinforced to act as girders supporting the decking. From the outer shaft the water will pass through a line of 36in. pipes to a chamber controlled by an automatic valve on the south side of Marsh Lane. From this chamber an outlet channel conducts the water for a distance of about 2 miles to an existing basin, whence it can be passed to the other reservoirs of the Metropolitan Water Board's Eastern District and thence to the filter beds at Lea Bridge. From the outer shaft of the reservoir there will be a further line of 36in. scour pipes discharging into the River Lea Diversion.

The construction of the reservoir necessitates several considerable subservient works. The River Lea has been diverted for a distance of 3 miles through a channel 55ft. wide with side walls of concrete faced with Kentish rag stone and coped with concrete blocks. Intake channels are also in course of construction from the River Lea and River Lea Navigation to the site of the pumping station at the northern end of the reservoir. A channel 3½ miles long has been constructed along the eastern side of the works to divert the contaminated water from the hillside, and discharge this below Flanders' Weir into the old river channel. An overflow weir has been constructed to pass flood waters from the Lea Navigation discharging into the old River Lea below the reservoir. The public road crosses this channel on a concrete bridge. The towing-path crosses the overflow weir on a reinforced concrete bridge; it also crosses the weir supplying water to the pumps from the Lea Navigation by a similar bridge. The Lea Valley road has been diverted for a length of 1,000 yards, the surface of the diverted portion being of tar-macadam.

The intake channel from the River Lea and the River Lea Diversion are crossed by five reinforced concrete arched bridges, one of which—that carrying the public road over the Lea Diversion—has three spans of 27½ft. with 5ft. rise, and will be on the skew. The other bridges have single spans, one of 50ft. and the other three of 51ft., the rise in all cases being 5½ft. The width of the public road bridge will be 40ft. between parapets, and that of the other bridges 12ft. between parapets. One

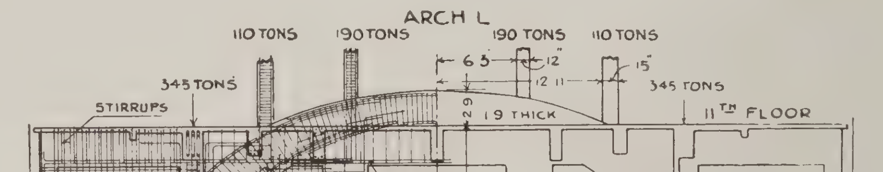

Fig. 7.—There are five floors above the main roof in each of the corner towers, and as the cross section downwards of these increases from floor to floor it was necessary to carry separately the loads from each floor by beams resting on columns, which in turn transmit the load to the floor beams immediately below, and so on down to the ninth floor level, where the total load due to the granite walls, reinforced concrete framing, reinforced concrete floors and wind pressure is equivalent to 3,200 tons. At this level there are four columns, which transmit the load to the basement. To support this load (i.e., 3,200 tons) at the ninth floor there are for each tower two arches L, of about 60ft. span, whose rise (32ft.) is the height between ninth and eleventh floor levels, supported by two beams K, with a span of about 46ft. This figure illustrates design adopted for one of the arches L. This arch, as will be seen, supports the enormous weight of 1,480 tons (all concentrated loads).

THE ROYAL LIVER BUILDING, LIVERPOOL.

of the 55ft. span bridges is for foot traffic only, being of a different design and only 6ft. wide between parapets.

The British Aluminium Company's Works.

A meeting of the Concrete Institute was held at the Royal United Service Institution, Whitehall, London, S.W., on June 30th, at 8 p.m., Mr. H. D. Searles-Wood, F.R.I.B.A., M.C.I., in the chair.

After Mr. Herbert E. Steinberg, Assoc. M.Inst.C.E., and Mr. Louis Tebbutt had been elected members of the Concrete Institute, Mr. A. Alban H. Scott, M.S.A., M.C.I., read a paper entitled "The British Aluminium Company's Works at Kinlochleven," which was profusely illustrated by lantern slides. The following is an abstract of the paper:—

Aluminium, the author stated, was now obtained electrolytically from bauxite, a clay containing a high percentage of aluminium oxide. The British Aluminium Company were now producing metal containing 97·3 per cent. pure aluminium. They had extensive bauxite mines in France and at Larne. The alumina was extracted from the bauxite at Larne, and from there sent to Foyers and Kinlochleven to be made into the commercial form of metal. The Company had also extensive works at Stangfjord in Norway, Orsières in Switzerland, and at Greenock, and their rolling mills were situated at Milton in Staffordshire. The total waterpower at the various works exceeded 60,000 h.p.

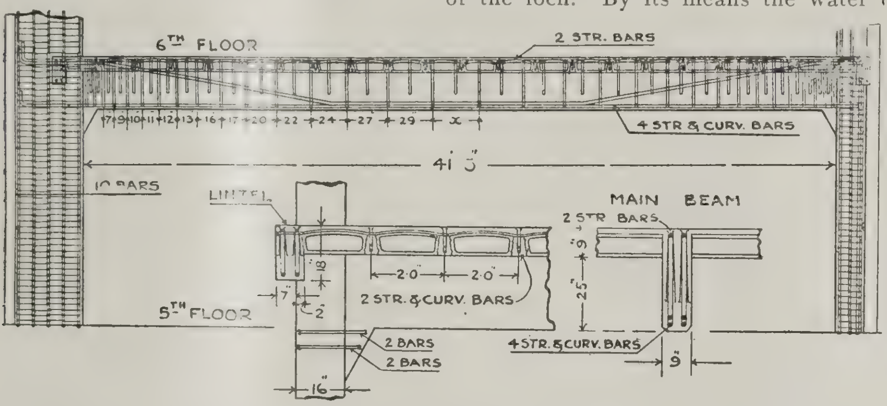

Fig. 9.—This beam with parallel sides is adopted for most of the floors. This particular example is at the sixth floor level. Its dimensions are 41ft. 3in. between supports, 9in. wide and 34in. deep, including thickness of floor.

THE ROYAL LIVER BUILDING, LIVERPOOL.

Kinlochleven is situated on the west coast of Argyllshire, and is separated from the county of Inverness by the Loch and river Leven, access being gained to the works by train so far as Ballachulish and Glencoe, thence by steamer up the Loch Leven, for a distance of about 9 miles, the new village and works being situated, as the name implies, at the top of Loch Leven. This district is one of the most rugged in the Highlands, and is noted for its magnificent scenery. The only road leading into Kinlochleven is from Fort William, a distance of 24 miles, and this road is not available for heavy traffic, nor was it available for use as access to the site during the course of construction of the works.

Kinlochleven works were started early in 1905, and the work was rapidly carried through, an average of about three thousand men being employed on the works continuously, and during the finer months of the year over five thousand were engaged upon the work.

Consultants and Contractors.

The consulting engineers for the dam, hydraulic works, and wharves were Messrs. P. W. and C. S. Meik; for the electrical work, Sir Alexander Kennedy and J. W. Jenkins. The contractors of the dam and hydraulic work were Messrs. Sir John Jackson and Sons; for turbines, etc., Messrs. Jens Orten Boving and Co.; for the generators, Messrs. Dick, Kerr, and Co.; for the telephones and street lighting, Messrs. Johnson and Phillips; for the switchboard, control panels, and motors for No. 2 Factory, Messrs. Siemens Brothers; for the village, power-house, No. 1 Factory, and staff houses, Messrs. McLaughlin and Harvey; and for No. 2 Factory, Messrs. McAlpine and Sons.

The author of the paper had the honour of being architect for the factory buildings and for the village, staff houses, etc. Mr. W. Murray Morrison, M.Inst.C.E., was the general manager of the Company, under whose direction the whole of the work was carried out.

The systems of reinforced concrete used were Hennebique, Coignet, and Expanded Metal. The cement used was supplied by the Associated Portland Cement Manufacturers (1900), Ltd.

The Dam.

The dam has been constructed at a distance of about 5½ miles from the head of the loch. By its means the water of three existing lochs was thrown into one. The top of the dam is 1,068ft. above the sea-level, the level of the three original lochs being 992ft., 1,022ft., and 1,028ft. respectively. The catchment area formed by their unification is from 50 to 60 sq. miles, and as the rainfall is about 100in. per annum in that part of Scotland, the possibility of a shortage of water, and its harmful consequences, is very remote. This gives the Kinlochleven works an advantage over a great many other hydro-electric stations, which are liable to run dry in summer.

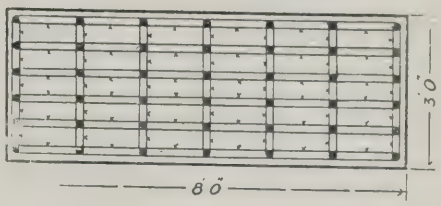

Fig. 11.—Plan showing reinforcement of main supports.

THE ROYAL LIVER BUILDING, LIVERPOOL.

The dam is about three-quarters of a mile long and 86ft. high in the centre, the width at the bottom being 63ft. and the width at the top 10ft. The whole of the dam is constructed of concrete. The foundations are sunk 5ft. 6in. into the solid rock. The dam is surmounted by a tower, from which the valves at the outgoing conduit are controlled.

The water is conveyed from the dam along the mountain-side for a distance of about 3¾ miles in a reinforced concrete conduit, the inside section being 8ft. by 8ft., and the conduit has a steady fall of 1ft. in 1,000ft. Along the length of the conduit the various side streams from the mountains are picked up so as to take advantage of all the water available; the main penstock chamber is at the junction of the concrete conduit, and the six 39in. diameter iron pipes form the main pipe line. Here the main control of the water supply is operated.

The pipe line, which is about 1¼ miles in length, conveys the water down to the main distributing valves, which are placed immediately above the entrance of the water to the power-house, the water passing through these valves to the bus pipes and thence to the distribution pipes (which are below the general level of the floor of the power-house) direct to the nine high-pressure turbines (Pelton wheel type) of over 3,000 h.p. each, and two 930 h.p. turbines. An output of 20,000 kw. at 250 to 275 v. is secured by means of 18 generators, each capable of running at full load

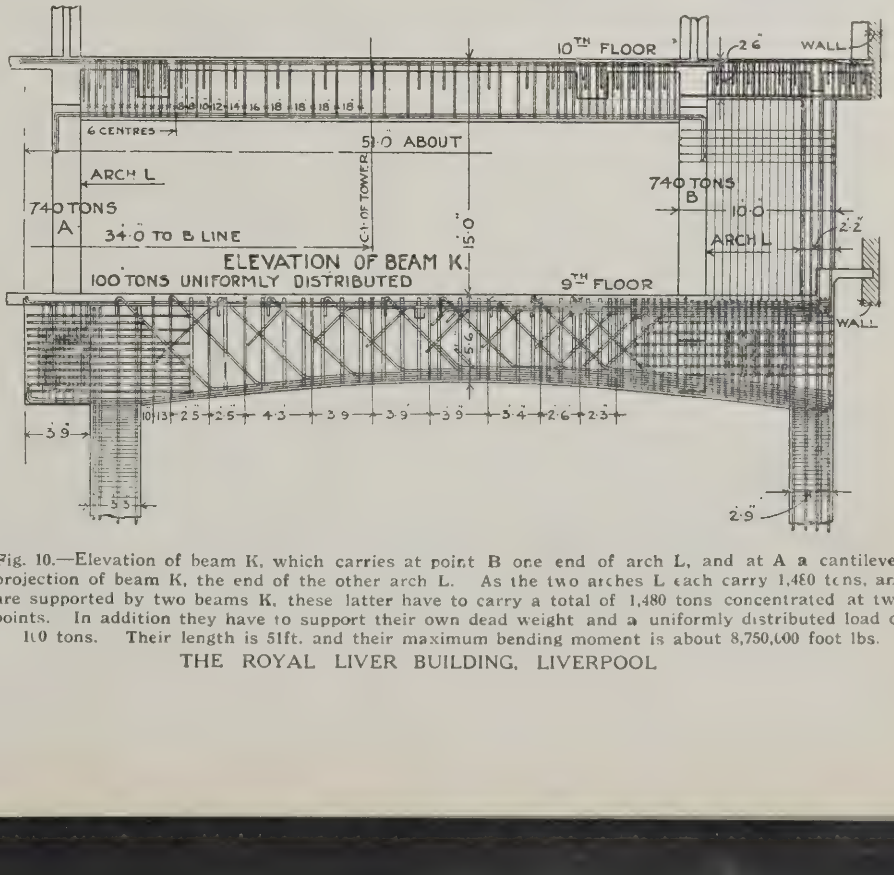

Fig. 10.—Elevation of beam K, which carries at point B one end of arch L, and at A a cantilever projection of beam K, the end of the other arch L. As the two arches L each carry 1,480 tons, and are supported by two beams K, these latter have to carry a total of 1,480 tons concentrated at two points. In addition they have to support their own dead weight and a uniformly distributed load of 100 tons. Their length is 51ft. and their maximum bending moment is about 8,750,000 foot lbs.

THE ROYAL LIVER BUILDING, LIVERPOOL

day and night continuously for months at a time, at a normal speed of 300 r.p.m.

Site, Power House, and No. 1 Factory.

The site before any works were commenced was simply in the usual condition of the uninhabited Highlands. The ground was very varied and treacherous, large tracts of peat overlying portions of the site. The levels also were extremely awkward for aranging the railway, village, and factories on convenient sites, and a very large amount of excavating, not only in soft material, but also in some of the very hardest stone, had to be carried out.

The foundations of the power-house are constructed of ordinary plain concrete, and in these foundations are provided the busbar chase, tail-race, and subways for the pipe connections. The floor of the power-house is tiled with red Cheshire tiles and and Hawkesley's treads. A powerful electric crane is installed here, so that any part of the machinery can be moved by the crane. The roof is formed of steel trusses, steel and wood purlins, roof-boarding, felted and slated with Ballachulish slates. The main outside walls are constructed of local stone, the dressings being of Kintallen granite and artificial stone made with the local rock.

No. 1 Factory, which contains all the electrical furnaces, is built of similar materials, and covers a very extensive floor area. The workshops are arranged along one side of No. 1 Factory, and abut on to and have access from the power-house and furnace-room. The main stores will be built on the south side.

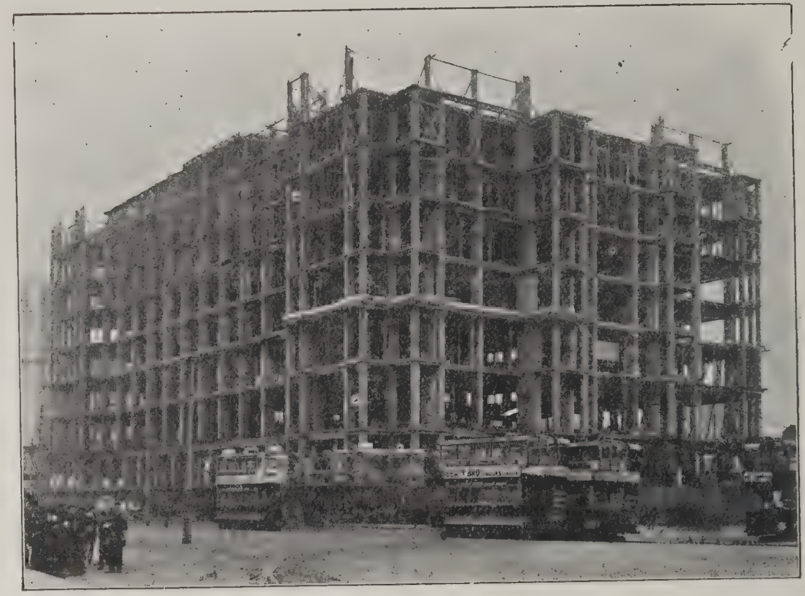

Fig. 13.—The reinforced concrete skeleton before the building of the granite curtain walls.
THE ROYAL LIVER BUILDING, LIVERPOOL.

The Carbon Factory.

The process for manufacturing aluminium requires a great amount of carbon, and in order that a plentiful supply of electrodes may be always to hand, the British Aluminium Company have erected a carbon factory for its manufacture at Kinlochleven. In constructing this building a very treacherous subsoil was come upon, which resulted in part of the foundations having to go about 55ft. below the general floor-level. The whole of the foundations are formed of reinforced concrete on the principle of spread foundation slabs stiffened by cross and longitudinal beams. The columns are carried from the foundation slabs up to the underside of the top beams, these beams carrying the very heavy stone walling; the columns carry

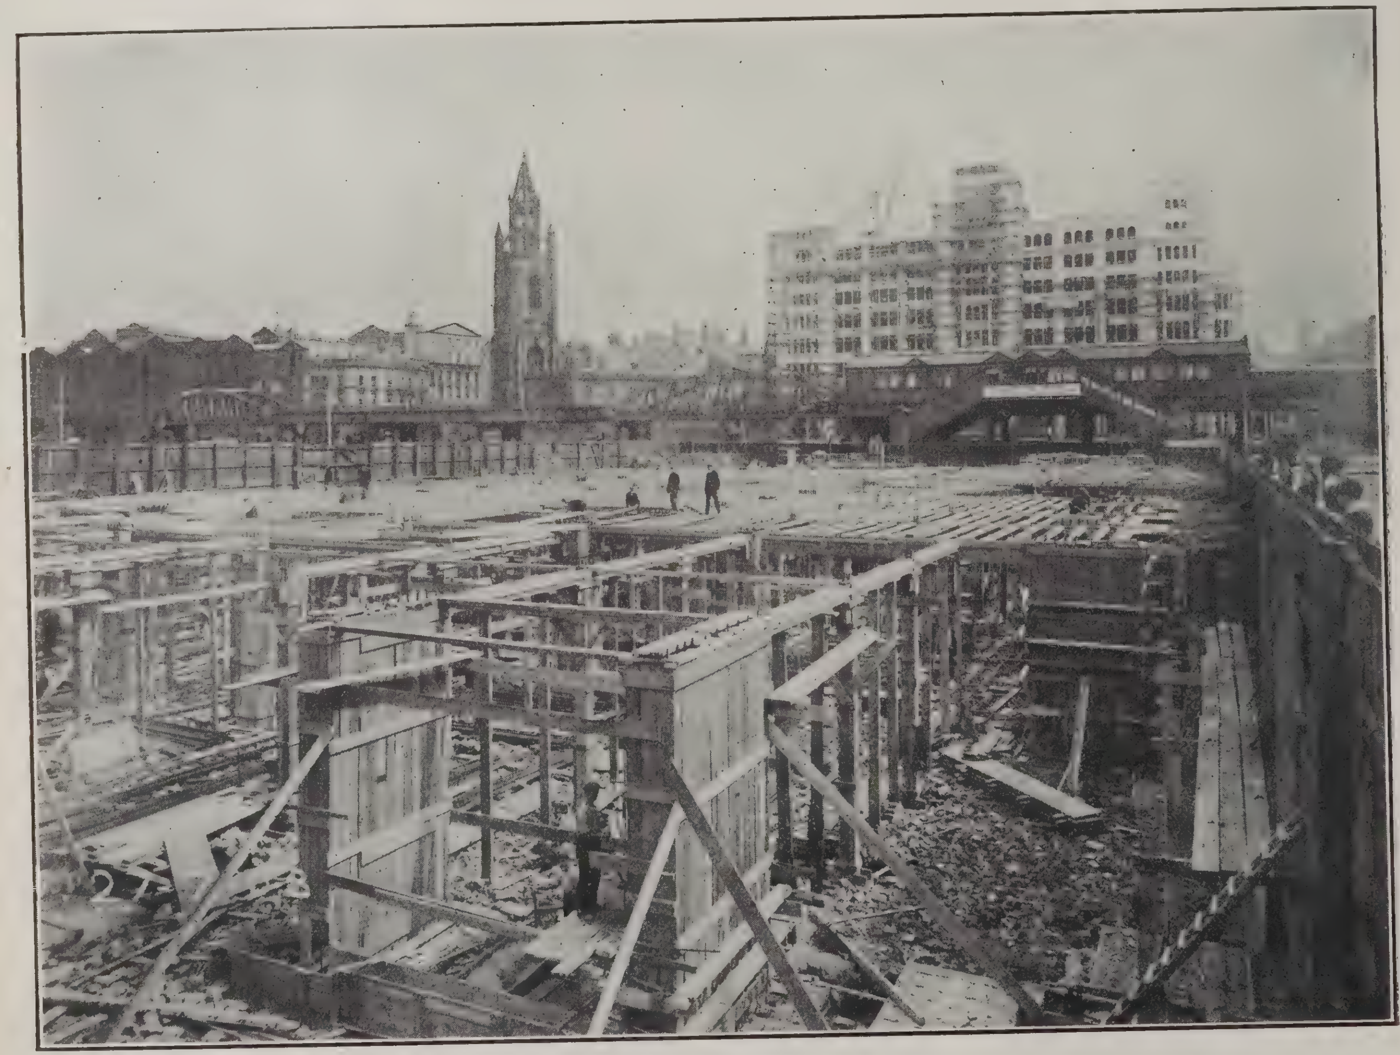

Fig. 12.—The foundations, showing form work for main supports.
THE ROYAL LIVER BUILDING, LIVERPOOL.

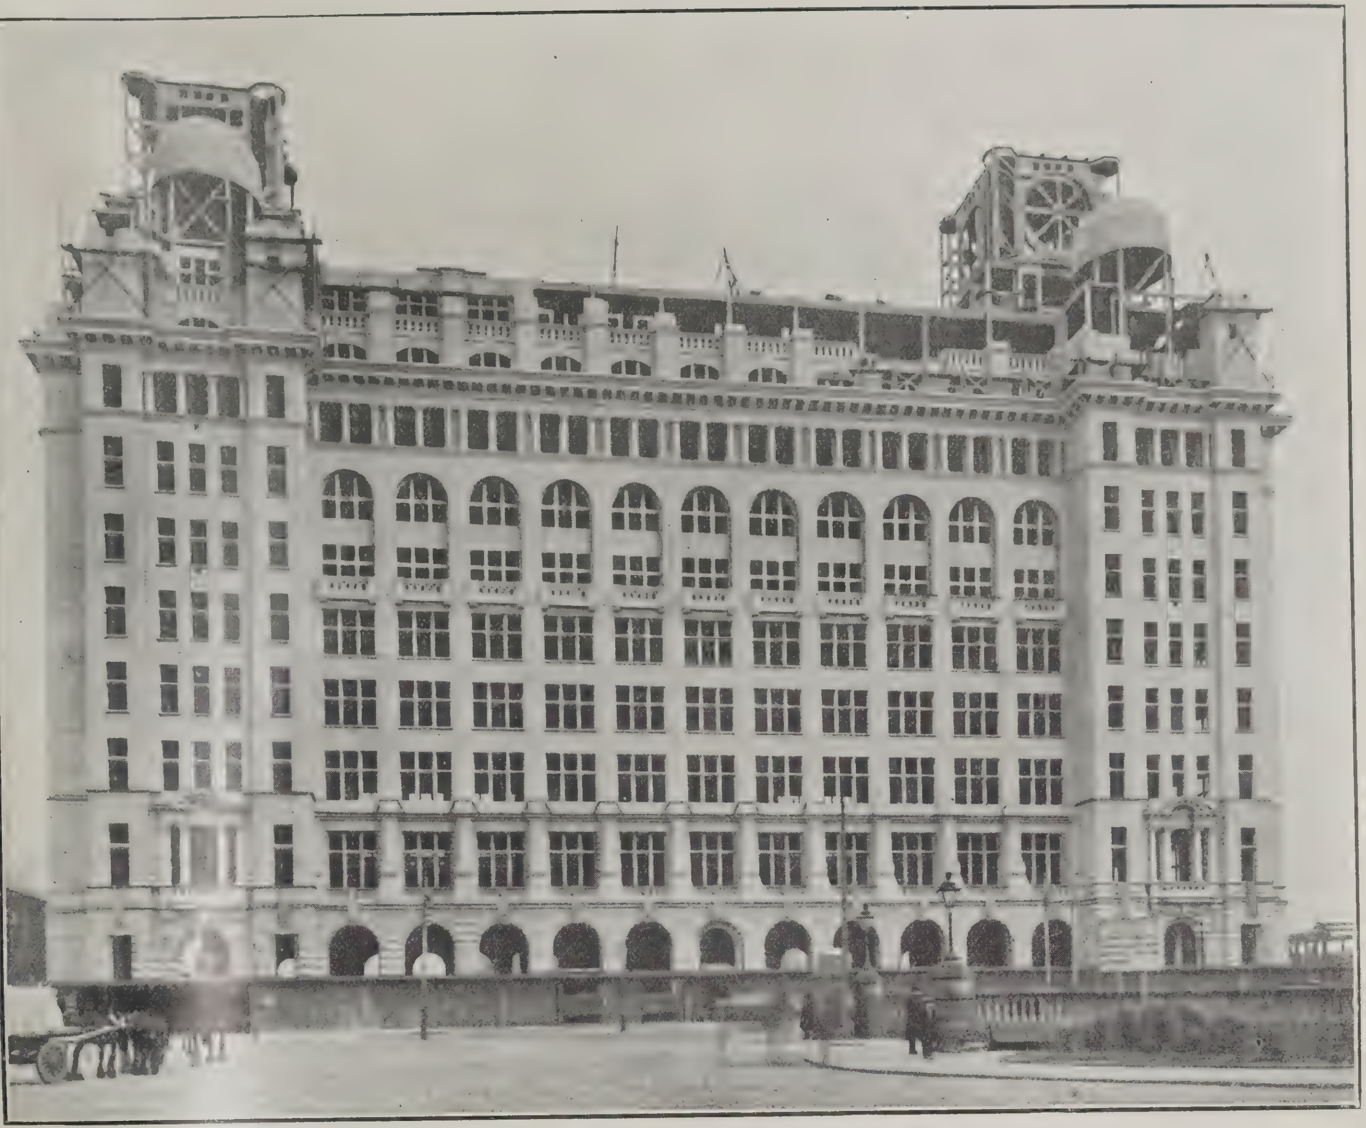

Fig. 14.—The building on April 28, 1910, showing the progress of the granite curtain walls.

THE ROYAL LIVER BUILDING, LIVERPOOL.

the walling and roof, and also in some cases the bunkers and contents. Some of the columns take over 250 tons. The upper reinforced concrete floors are constructed to carry from 8 to 20 cwts. per ft. super and concentrated heavy machinery, such as motors, etc.

The walls, with the exception of those which are made temporary for the purpose of future extensions, are constructed of coursed random rubble built in cement, the stone being local rock, and the walls vary in thickness from 15in. to 36in., many of them going to a considerable height. The roofs generally have steel trusses of various spans with steel and wood purlins; in some cases the roofs are boarded to receive the Ballachulish slates, and in some of the rooms the slating has been fixed direct on small steel purlins without any woodwork at all. Two large flats are constructed of reinforced concrete, and it is interesting to note that these flats are quite watertight, although no roof covering has been put on.

In this factory overhead reinforced concrete bunkers are constructed to carry 4 tons, 10 tons, 60 tons, 140 tons, 350 tons, and 2,000 tons, the latter being carried on 16 reinforced concrete columns each 2ft. 3in. square. The design and work of these are of a very complicated nature, and the author believed the 2,000-ton bin is the largest bunker constructed entirely of reinforced concrete without the aid of R.S.J.'s.

Roads, Lighting, Sewerage, and Water Supply.

Very extensive roads have been laid out and constructed.

The whole of the factories, streets, houses, cottages, and other buildings are lit by electric light.

The general drainage of the village is carried on with 3in. to 18in. diameter stoneware and iron pipes. The surface water has a separate system of large culverts. Septic tanks will deal with the sewage at the outfall, the surface-water outfalls discharging direct into the river. The surface-water culverts are constructed in various ways, some being open with the sides formed of rubble masonry, others being open reinforced concrete culverts, whilst there are also circular and square forms in reinforced concrete.

The water supply for the village is obtained from the catchment area of Corriemora. A comparatively small dam has been constructed, so that the reservoir will contain when completed sufficient water for a population of over 6,000. Iron pipes have been used throughout the whole of the domestic supplies.

Staff Houses, Offices, Laboratory, etc.

The staff houses naturally vary in size and accommodation, but they have generally been constructed with ordinary concrete foundations and 6in. concrete over the area of the site, the walls being of rough rubble of varying thickness, from 15in. to 22in. The walls are in some cases coated with cement rough-cast, and the inside of all external walls battened and lathed and plastered. The interior walls are formed of brickwork in cement, the floors being as usually constructed in the South. The roofs, however, are considerably stronger than usual, and have boarding and felt, and are slated with Ballachulish slates, which are very thick and heavy. These slates give an excellent appearance to the roofs. The slates are fixed in diminishing courses, which again helps the appearance, and this district having such a little sun, the thick and rugged slates give a greater relief than the thin and even slates. The Ballachulish slates seem to be particularly adaptable and serviceable for that part of the country, as they withstand the very severe weather.

The offices and laboratory are constructed of similar material to the staff houses. In all these buildings the lintels are of reinforced concrete, and the upper floor of the offices is also of this material.

Cottages, Cottage Flats, Single Men's Quarters, Shops, Administration Block.

The housing accommodation for the general employees consists of various classes of buildings, which can be generally divided as follows:—

(a) Self-contained cottages.
(b) Cottage flats.
(c) Single men's quarters.

Permanent shops have been erected, including the necessary bakehouses, stores, etc.

The earliest forms of houses were constructed of two ½-brick walls from the ground line right up to the eaves, with 2¼in. cavity between, and were rough-cast on the outside and plastered direct on to the brick walls inside.

The lower cottage flats and single men's quarters and administration block are built on quite a new method, the whole of the main constructional work being of reinforced concrete, the walls being formed of reinforced concrete posts and beams, and the panels thus formed by the posts and beams being filled in with two 1½in. slabs with 2in. cavity between, and the whole face cement rough-casted.

This form of construction had, the author thought, to a very great extent solved the difficulty of obtaining well-built, solid, and efficient houses at such a low cost that it was possible for the lowest paid class of labourer to be housed in a more decent manner with a lower rent than had hitherto been the case.

WATERPROOFING BUILDINGS.

It is sometimes necessary to apply waterproofing to concrete and other materials not in themselves quite impervious to water, and this is done by the application of various substances to the interior or exterior surfaces of walls, etc. The matter was brought forward by Mr. Myson H. Lewis in a paper read before the municipal engineers of the city of New York. The author classes all the methods of waterproofing in use under three heads: (1) Bituminous shields or membranes, including all the processes in which the structure is surrounded by an external shield or membrane. (2) The integral method, by which is meant making the concrete or masonry itself impermeable, or using a waterproof cement coating. This is termed the "rigid" method, in distinction to the "elastic," or bituminous.

The third method is that in which the waterproofing is applied to the surface of the structure, but not as cement, as in case 1. By adopting any of these methods, according to circumstances, it is maintained that, with thorough investigation, correct design, and suitable materials, structures can be waterproofed with as much certainty, and as permanently, as it is possible to expect. The effects of variations of temperature must be carefully guarded against, a fact which will perhaps be more readily appreciated when we state that in the case of plaster there is, for a difference of 100 deg. Fahr., an increase or decrease of 2.7 cubic feet in a 10ft. cube. The range in other materials is not so great, but it has, nevertheless, to be considered. In neat cement it is 1.8 cubic feet in a 10ft. cube, and in concrete 0.4 cubic foot in a 10ft. cube.

In using membranous waterproofing, one of the chief considerations is to have a good surface on which to apply the material. It must not be too ragged nor yet too smooth. The surface must also be clean and dry. In the integral method, the chief point of importance is the elimination of all voids in the concrete. The impermeability of the mass may also be assisted by the incorporation of some waterproofing compound, such as solutions of chloride of lime or sulphate of aluminium, added to the cement, and Sylvester soap or alum mixtures, as well as hydrated lime and metallic stearites. The author, however, points out that the effect of none of these compounds has been tested by time. Metallic stearites appear to be most in favour at the present time.

With regard to surface coatings, the most permanent of these is hot paraffin injected into the pores of the surface, but it is necessary that the paraffin should be a specially hard kind. It is rather an expensive method, but the results seem to justify it. The Sylvester method of alum and soap is much in use, but it requires a larger number of coats than in the case of paraffin, and is quite as expensive, while it is no more permanent. Linseed oil should not be used, as it is an unstable compound and produces a soap upon coming in contact with the alkali in cement, and soon washes off. Included in the paper is a very useful diagram for determining the dimensions and the cost (in the United States) of reinforced concrete floors subjected to external hydrostatic pressure. This is intended for use when designing floors that have to be waterproofed in deep basements, and where it is important to guard against the cracking of the floors.

QUANTITIES FOR REINFORCED CONCRETE WORK.

By CHARLES O. MOURANT.

The continued adoption of reinforced concrete as a building and engineering material and its rapid development by contractors, engineers, architects, and others necessitates careful and systematic estimating on the part of the contractor.

To enable the contractor to give a fair tender for proposed works, it is desirable that several points should have careful consideration.

(1) The design of the structure must be such that it will withstand the various loads which are likely to be placed upon it.

(2) The quantities should be very carefully and accurately taken out.

(3) Prices should be obtained for materials such as ballast, broken stone, sand, cement, etc., from reliable firms in the locality of job.

(4) The contractor should inspect samples of these materials before using the prices for estimating purposes, so as to be sure they satisfy the conditions of the specification.

The first item does not affect the general contractor, this being for the architect and consulting engineer to decide.

The present article is intended to deal more particularly with quantities and quantity taking. It is to be regretted that the majority of engineers do not realise the importance, for estimating purposes, of a good set of quantities, that is, quantities with the various items of work and various trades kept separate. The ordinary form of engineer's quantities wherein the concrete and centering are lumped together, such as "500 yards cube concrete in beams, columns, floor slabs, etc., including all centering, forms, etc.," is very unsatisfactory. With such description, no estimator can hope to give a fair price for the work.

As everyone knows, who is at all acquainted (even most remotely) with the labours involved in reinforced concrete work, the cost of the centering bears a very large proportion of the cost of the whole job; and the ratio between the cost of the centering and the cost of concrete in, say, a 4in. slab, is far higher than that between centering and concrete in, say, a 12in. slab. And similarly in a beam, say, 12in. by 6in. we get 2.5ft. super. of centering for every ft. lineal, and 0.5ft. cube concrete; whilst in a 24in. by 12in. beam we get 5ft. super. centering and 2ft. cube concrete, so that by increasing the quantitity of concrete four times we do not increase the centering by the same amount.

(a) Now it must follow that if we price the 4in. floor slab first—

1ft. super centering	2d.
4-12ft. cube concrete at 9d. ...	3d.
Per ft. cuper 4in. thick...	5d.

or 1s. 3d. per ft. cube concrete and centering.

(b) Then taking 12in. slab—

1ft. super. of centering	2d.
1ft. cube concrete	9d.
Per ft. cube ...	11d.

which is 26 per cent. cheaper than 4in. slab.

(c) Then, taking a 12in. by 6in. beam, we get per foot lineal—

2.5ft. super centering at 2½d. ...	5d.
0.5ft. cube concrete at 9d. ...	4½d.
	9½d.

or 1s. 3d. per ft. cube concrete and centering.

(d) Taking a 24in. by 12in. beam—

5ft. super. centering	1s. 0d.
2ft. cube concrete	1s. 6d.
	2s. 6d.

or 1s. 3d. per ft. cube concrete and centering.

In order to emphasise the error, let us consider 50 yards cube of each item instead of 1ft. cube.

(a) 50 yards cube	£84	7	6
(b) 50 yards cube	61	17	6
(c) 50 yards cube	106	17	6
(d) 50 yards cube	84	7	6

From a comparison of these figures it will readily be seen that if the contractor prices his concrete and centering together at a certain uniform price per yard cube, he will be too high on some items and too low on others.

The cost of hoisting materials to the various floors is very heavy, and varies with the height of the floors, hence the quantities of concrete, centering, and steel for various floors should be kept separate. The usual practice is to divide the building up as follows:—

1. Basement and ground floors.
2. First, second, and third floors.
3. Fourth and fifth floors.
4. Roof.

Reinforcing steel for floor slabs should be kept separate from the steel in beams and columns. There is usually more labour on the steel in the beams than in the slabs or columns, and more in the steel in columns than in slabs.

But these items greatly depend upon the engineer's design, and no hard and fast rules can be laid down. For the reinforcement of floor slabs the most economical method is to put in straight lengths of rods between the beams and over the beams to lay short lengths of the same size rod as top reinforcement to take the reverse bending moment. The length of these top rods and the spacing of same depends upon the span between beams, and must be executed according to the engineer's drawings and details.

The finishing surface to floors should be measured at per yard super. or per square super., the plastering to soffit of floors measured per yard super., plastering to beams per ft. super. plastering to columns per ft. super (these should be itemised separately); angles and arris to beams per ft. run, chamfers per ft. run, stops numbered, cornices per ft. run, mitres numbered.

The writer has seen items in a bill of quantities by an eminent engineer which were described in the following ambiguous manner:—

"100yds. cube concrete as specified in floor slabs, beams, columns, etc., including all centering and forms, the top surface of floors finished with 1in. granite chippings and cement, the soffit of floors and all beams and columns finished in sirafite plastering, two coats, including angles and arrises to beams and columns."

Pricing such an item as this is mere guesswork; the quantities should have been in the following form:—

Yds. Cube Concrete in beams, Ground Floor.
,, ,, ,, beams, First, Second, and Third Floor.
,, ,, ,, beams, Fourth and Fifth Floors.
,, ,, ,, beams, Roof.
,, ,, ,, columns, Basement to Ground Floor.
,, ,, ,, columns, Ground to Second Floor.
,, ,, ,, columns, Second to Fourth Floors.
,, ,, ,, columns, Fourth Floor to Roof.
Yds. Super. Floor slab, 4in. thick, Ground Floor.
,, Floor slab 6in. thick, Ground Floor.
,, and Floor slab for each floor.
,, Centering to floor slabs.
,, ,, to roof.
,, ,, to beams.
,, ,, to columns.
,, 1in. Granite Chippings and Cement to floors.
,, Sirapite Plastering to soffits of concrete floors.
Feet ,, ,, ,, beams.
,, ,, ,, ,, to columns.
Feet run Angles and arris to beams.
,, ,, ,, to columns.

The writer, after several years' experience as a quantity surveyor, and lately being especially interested in reinforced concrete, has arranged a system of "column" quantity taking for this class of work, which will greatly reduce the labour involved in taking off quantities for reinforced concrete work. By adopting this method the time employed in abstracting the various items is entirely saved. No abstracting is necessary: the quantities can be billed direct from the taking-off sheets.

The accompanying tables indicate the method to be employed—

Sheet A for beams.
Sheet B for columns.
Sheet C for floor slabs and walls.

TRADE AND CRAFT.

Messrs. G. Jackson and Sons, Ltd., of 49, Rathbone Place, W., and Mr. G. P. Bankart, of Baldwin's Gardens, Gray's Inn Road, E.C., have recently arranged an amalgamation of their businesses. The respective workshops and offices remain exactly as heretofore, Mr. Bankart's business being under his sole personal direction and control at Baldwin's Gardens, whilst his services as designer and adviser of work at 49, Rathbone Place are also secured. In addition to modelled plasterwork, leadwork, etc., they are conjointly undertaking decorative work in gesso, also egg-tempera painting, and carving in wood and stone; and with the new financial arrangements, increased workshop accommodation, and greater facilities, they will be able to carry out orders expeditiously, and at the same time to do the best possible work.

Poilite Roofing Tiles and Slabs.

The manufacture of asbestos cement tiles and sheets has now assumed the dimensions of a great industry. Within the past ten years, factories have been opened in Austria, Hungary, Germany, France, Belgium, Switzerland, and the United States of America. For many years, Messrs. Bell's United Asbestos Co., Ltd., Southwark Street, London, S.E., have specialised in this class of material for building construction, and their "Poilite" Asbestos Cement Tile and Sheet Works have been specially equipped for the increasing demands of the home, colonial, and foreign trade.

For Poilite roofing tiles, many advantages over ordinary natural slate are claimed. The manufactured article does not change colour under exposure to the weather; it is absolutely fireproof; it does not crack or split when trampled on or when exposed to heat; it does not deteriorate under rapid and extreme variations of climatic conditions; it does not split or crack round the nail-hole; and the roof formed of these tiles is of superior appearance.

In the process of manufacture, the Poilite shingles are subjected to enormous pressure. When fresh, they absorb only about four or five per cent. of their weight in water; and the hydration and crystallisation which ensue on their exposure to the atmosphere render them absolutely waterproof, and of extreme durability. Superior economy, rendering any trifling increase of first cost over that of inferior roofing quite negligible, is consequent on the extreme lightness of weight of Poilite, enabling the use of smaller scantlings for the framework of the roof, as compared with those that are necessary for carrying slates; and the durability, ease of maintenance, fireproof quality, and other advantages, are all in favour of real economy.

In appearance and to the touch, the Poilite asbestos tiles resemble high-quality slates, but, as already noted, they are not nearly so heavy, while they are nevertheless of much greater tensile strength. The surface is uniform, smooth, and non-flaking, and the tiles can be cut, shaped, and drilled, with the utmost facility. From the smoothness of the surface and the accuracy with which the edges are cut, it would seem impossible for moisture, rain, wind, or snow to get between the laps. The Poilite tiles are made in grey, blue, and terra-cotta, and these tints are warranted to be unfading. The average weight is about 21lb. per square yard, allowing for 2¾in. lap, compared with 67lb. for Welsh slate, and 160lb. for red roof tiles. Poilite is on the authorised Admiralty and War Office lists. Its lightness, imperviousness, and immunity from the effects of climatic extremes. render it a most valuable material for use in tropical countries, where, as at home, it is in great demand not only for roofs, but also for walls, dadoes, and ceilings. It is largely employed in British India, where its quality as an absolute non-conductor of heat, its defiance of the ravages of the white ant, and its non-combustibility are among the qualities that have brought it into high favour.

FEDERATION NEWS.

Lancashire, Cheshire, and North Wales Federation.

The Finance Sub-Committee of this Federation met at the Boardroom, Blackfriars Street, Manchester, on Thursday, June 30th, when the president, Mr. Frank Woods, Bolton, occupied the chair.

The annual meetings of the Painters', Slaters', Stonemasons', Bricklayers' and Plumbers' Trade Committees have been held during the month, the special business before each being the election of the branch chairman for the ensuing year, who shall sit ex-officio on the Administrative Committee.

The following are the elections:—Painters, Mr. W. Croasdale, Preston; slaters, Mr. J. B. Johnson, Liverpool; stonemasons, Mr. Samuel Smith, Burnley; bricklayers, Mr. Ben Talbot, Bolton; plumbers, Mr. Thomas Rowbotham, Manchester.

The Painters' Trade Committee also had before them the question of demanding medical certificates from workmen before giving them employment, and the following resolution was adopted:—"That it be a recommendation from this committee to the master painters throughout the Federation to use their influence wherever possible for the substitution of other suitable materials for 'lead,' with a view to removing the serious risk of lead poisoning." It was agreed that this resolution should be sent on to the various local associations. Some discussion also took place at this meeting regarding the strike of painters in progress at Leigh, but no resolution was passed thereon.

The stonemasons held their meeting at Blackpool, and one very important matter under consideration was the question of deleting or amending the worked stone rule. After considerable discussion the following resolution was adopted:—"That this meeting recommend to the Administrative Committee of the Federation that the worked stone rule be deleted, and that the following be substituted in place thereof:—"That no worked stone shall come into this town except sawn stone, which shall be exempt from this rule."

It was agreed to hold the next meeting at Burnley.

Attention was also called to the charges made by railway companies for the use of hand cranes, and one of the members of the committee stated that he had had this matter recently before the various railway companies. It was agreed that the chairman should bring the same before the notice of the Administrative Committee, with a view to their taking the matter up.

At the Plumbers' Trade Committee meeting, the question of plumbers' discount on sanitary fittings was discussed at very considerable length, and complaints were laid against two firms of manufacturers and dealers on the methods adopted by them in quoting net prices to architects and proprietors. The secretary was instructed to write the two firms complained of calling their attention to the matter, and asking them in future to quote prices which would carry the usual trade discount to the master plumber.

The arrangements for entertaining the National Federation of Building Trade Employers at Chester for the summer meetings are now near completion, particulars of which it is expected will be circulated within the next few days.—John Tomlison, Secretary.

Yorkshire Federation.

The monthly meeting of the Executive Council of the Yorkshire Federation was held at Powolny's Grand Café, King Edward Street, Hull, on June 30th, when Councillor W. G. England, J.P. (president) occupied the chair, and 42 delegates were present from the Federated Associations.

Vote of Condolence—Mr. A. Mastin, Sheffield.—The President referred to the death of Mr. A. Mastin, of Sheffield. On his motion, seconded by Mr. A. J. Forsdike, the Federation resolved to tender to Mrs. Mastin and family their profound sympathy and sincere condolence in the great loss they have sustained, and warmly acknowledge the loyal and valuable services of Mr. Mastin in the interests of the Federation, and in furthering the welfare of building trade employers.

A letter was read from Mr. George Macfarlane, J.P., acknowledging receipt of the Federation's resolution of congratulation.

Malton Post Office.—A letter was read from the H.M. Office of Works stating that the accepted tender for alteration at Malton Post Office was based upon the same plans, specification, and bills of quantities as were the original tenders.

Post Office Contracts.—The President reported that the Finance and Emergency Committee had carefully considered the replies from contractors giving their observations and experience in connection with Post Office contracts. A draft letter had been prepared, and was laid before the Federation for their consideration. The draft letter was generally approved for transmission to H.M. Office of Works. The president, vice-presidents, and secretary were appointed a deputation to interview H.M. Office of Works, and place before the officials a digest of the experience and observations, in order to substantiate the statements contained in the letter.

Circular to Architects on Trade Matters.—It was reported that the National Administrative Committee had approved of the principle of the Federation's issuing, under their auspices, a circular letter to Yorkshire architects, but recommended that the preamble should be revised. The President reported that the Finance and Emergency Committee would bring forward a recommendation at the next meeting.

Register of Accidents.—The President reported that a Conference of Secretaries had been held on June 9th, when it was unanimously agreed, as an experiment, to ask members to fill up and return once a quarter particulars of the accidents which had arisen during the period, with a special note of all cases suspected of malingering. The information would then be duplicated, and a copy furnished to each local association secretary for the information of the Federated members.

National Federation Rules.—A proposal to alter the National rules so as to provide that ex-presidents of the Federation shall hold office ex-officio on the National Committee for at least two years after the expiration of their term of office, was considered. The Federation empowered their representatives to support the amendment when it comes forward for consideration at the National meeting.

West Riding County Council — Fair Wages Clause.—A report was presented of the action of the West Riding County Council in seeking to enforce on a contractor in the Bingley district the rates of wages and conditions of labour applicable to the Keighley district. The action of the West Riding Education Committee was largely due to the initiative of a local labour member, and a resolution of the Keighley Operative Joiners' Society that Bingley was within their district and subject to their jurisdiction. The secretary reported that he had, with the contractor, had an interview with Mr. W. Vibart Dixon, the Deputy Clerk of the County Council, and stated that the principle raised was of vital importance to all building trade employers. It was pointed out to Mr. Dixon that the Federation could not for one moment sanction the position taken up by the operatives' society, neither were the County Council justified in imposing what was known as trade union rate of wages and conditions, as distinct from the wages "generally accepted as current and actually in operation in the trade or respective trade for competent workmen in the district." Attention was also drawn to the fact that only a short time ago Bingley was claimed as within the district of the Bradford branch of the joiners' society, and that the change had obviously been made in order to bolster up a case against a contractor who was working in Bingley district. Mr. Dixon ultimately agreed that the Federation was right in contending that the contractor was complying with their fair wages clause if he was paying the rate of wages "accepted as current and actually in operation" in Bingley, but stated that he would obtain independent evidence on this point. The Federation Secretary requested that the claims of the operatives might be heard in the presence of the contractor, thus affording an opportunity for rebutting evidence being given. The contractor estimated, if the request of the County Council was enforced, that it would mean a difference in wages of about £130. It was resolved to inform the West Riding County Council that the Federation unanimously endorsed the action of their secretary as embodying the use and custom of the trade throughout the country; and to request, if further action is contemplated or explanations are necessary, that the Federation might be given an opportunity of expressing their views either at an official inquiry or by means of a deputation.

National Administrative Committee.—Mr. Sinclair reported upon a meeting of the National Administrative Committee, that had been held on June 21st.

National Conciliation Board.—A recommendation was considered from the National Conciliation Board "that members of the various Conciliation Boards who may be members of any Board having considered a case shall not sit personally on any subsequent hearing of the said case, but shall send a substitute." The consideration of the recommendation was deferred to a further meeting.

Leeds—Bricklayers' and Labourers' Winter Working Hours.—Mr. W. T. Ledgard, on behalf of the Leeds Association, reported that the bricklayers and labourers had not assented to the proposal for alteration of the winter working hours. The notice provided that, for a period of fifteen weeks, work should commence at 8 a.m., and that no breakfast time should be allowed. The proposed reduction in hours would make a difference of 28½ hours during the winter. Several members expressed the opinion that the Leeds Association should bring the proposals before the Local Government Board.

Hull and Plasterers' Joint Committee.—Mr. E. Quibell reported that the Hull Association had invited the Hull Operative Plasterers to appoint representatives on the Committee of Appeal provided for in the revised agreement with the plasterers. After the request, a question had been raised, and the operative plasterers were delaying the appointment of their representatives until the point in negotiation had been settled. The Hull Association are strongly of opinion that the operatives are taking undue advantage of the position. The Federation secretary reported that he had requested the National secretary to ask the National secretary of the N.A.O.P. to use his best services with the Hull branch to get the Committee appointed, in order that the matter which had been raised might be dealt with by such committee as soon as it is formally constituted.

July Meeting.—On the motion of Mr. A. J. Forsdike, seconded by Mr. J. Dawson, it was decided not to hold a meeting in July, unless necessity arises, but that the members be urged to attend the National half-yearly meetings at Chester, on Wednesday, July 27th.

August Meeting.—Mr. A. W. Sinclair, on behalf of the Scarborough Association, invited the Federation to hold the August meeting in that town. The invitation was cordially accepted, and the date fixed for Friday, August 19th.—J. Davidson, Secretary.

The Artillery War Memorial.

MR. SPEAIGHT is not always right in his suggestions about the arrangement of public places and monuments in London, but he is certainly right in his strictures in regard to the placing (or rather misplacing) of the Artillery South African War Memorial. The memorial faces the Duke of York's Column, on a site opposite the steps; the site relation between the two is emphasised by the line of pavement which stretches across from the foot of the steps axially with the column; and in spite of this the war memorial has been deliberately placed two or three feet out of axis with the column. It is a blunder that would seem almost incredible were it not unfortunately the fact that we are always making blunders of this kind in London. We presume this is the wisdom of the Office of Works. Imagine such a thing being done by any official architectural authority in Paris! They would never hear the last of it. The sole reason for doing this seems to have been to keep the end of the monument to the line of the park railings. Surely the railings are movable, and their line could have been altered for so important a purpose as the proper axial placing of the monument. In matters of this kind we seem in London to be really hopeless. For the monument itself, the group of the figure and the horse at the top is a fine and effective one; the horse seems to owe something to Watts's horse in the "Physical Energy" group; it is none the worse for that. But we should like to know whether Mr. Colton put the architectural details into the hands of any architect. We suspect not; we have not seen any architect's name mentioned, and we do not think the mouldings and the outline of the pedestal by any means good. Nor was it a very happy thought to place the bronze plates with the names of the men commemorated in the pavement. They are likely soon to be more or less obliterated in such a position. The sculpture group and the bas-reliefs are the only really satisfactory part of the monument.

The Addition to the Tate Gallery.

WHAT is called "the new Turner Wing" in the Tate Gallery is an excellent piece of work, both in regard to the architectural treatment of the rooms and the arrangement and exhibition of the pictures contained in it. The two larger of the new rooms, in which the Turner oil-paintings are hung, have curved ceilings, that in No. VI. semicircular in section, that in No. VII. segmental, the skylights following the curve of the ceiling and carrying through its lines. The lighting is through a single surface of glass, which always gives a better light than the practice, carried out in the older rooms at the National Gallery, of having a glazed flat ceiling and a raking skylight above it. On Monday last the lighting in Gallery VI. was, even so, hardly adequate, but this seemed to be owing to too many of the blinds being drawn. In Gallery VII. the light was quite satisfactory, as also in the three smaller ground floor rooms devoted to water-colours, which have been kept lower so as to be more in scale with the pictures. The verde-antique marble used for the architectural framing of the doorways and for the plinths of the rooms goes very well with the red silk brocade lining of the walls in the two large galleries; it does not go quite so well with the gold canvas of the smaller rooms. The seats in the rooms are of fine solid design, very well carried out in Italian walnut. We must praise also the arrangement by which the cords for working the blinds to the skylights are carried down in concealed tubes, so as to avoid an unsightly appearance in the rooms. In the basement rooms, where a number of minor works and studies by Turner are collected, a remarkable success in lighting has been achieved by admitting the light through large canted windows of rough plate glass, which, in spite of there being no top-light and only windows at the end, seem to fill the room with light.

A good many paintings of Turner's, formerly familiar favourites at the National Gallery, are now to be found here; on what principle they are transferred from the National Gallery we do not know, nor is it of very much consequence; it is a matter of administration merely, we presume; at all events, they are as well seen here as they were at Trafalgar Square. Among the many smaller works now first exhibited, there are some, of Turner's latest period, which have been much over-praised in the papers, and are more eccentric than satisfactory. "Interior at Petworth," for instance, in which a quantity of overturned articles from a table are dimly discerned amid a puzzle of prismatic colours, is really absurd; and the same might be said of some others. On the other hand, we come across hitherto unknown works of rare poetic beauty; none more remarkable in this sense, perhaps, than "The Evening Star," one of the finest pictures of a dark sea seen from the beach in twilight that have ever been painted. "Norham Castle, Sunrise," too, a late work, is a wonderful effect of sunlight. There are numberless things of interest among the sketches and studies.

The nation is much indebted to the late Sir J. Duveen for his liberality in thus providing adequate galleries for the exhibition of Turner's works, and to Mr. Duveen for having liberally carried out and added to his father's bequest. And we have every praise to give to the manner in which the work has been carried out by Mr. Romaine-Walker, the architect appointed by the donor. But without making any reflection on the present architect, we cannot quit the subject without expressing the opinion that Mr. Sydney Smith, the original architect, should have been allowed the opportunity of completing his own building. This was pointed out to the donor at the time, but he seems to have been possessed with the characteristically British idea that the gift of money carries with it the right to settle everything else in connection with art. It was in deference to this insular idea that Lord Grimthorpe, because he found the money, was allowed the claim to do what he pleased to St. Alban's Abbey (as it then was). We do not suggest that there is any other parallelism between the two cases. The addition has been as well done, architecturally, as it could have been done. But, nevertheless, we consider that the original architect has every right to claim a grievance at the completion of his building being put into the hands of another architect, and that the donor was distinctly wrong in thinking that his offer of money entitled him to do exactly as he pleased. The matter is an accomplished fact now, but we comment on it in view of future possibilities of the same kind. Donors of money for buildings or other artistic objects ought to understand that in such cases the gift of money does not purchase (or ought not to purchase) the right to dogmatise on questions of architectural and professional rights.

Road Maintenance.

AT a meeting of the Executive Committee of the County Councils Association, held at the Guildhall, Westminster, last week, Lord Belper presiding, the following resolution, brought forward by the East Sussex County Council, was considered: "That in the opinion of the County Council the time has arrived when a substantial grant should be made from the Imperial Exchequer towards the growing cost of maintenance of main roads, owing to the great increase in the motor traffic; and that a copy of the resolution be sent to the President of the Local Government Board, the Chancellor of the Exchequer, and the County Councils Association." After discussion at the Guildhall meeting, it was resolved: "That the committee sympathises with the grievance mentioned in the resolution of the East Sussex County Council, and recommends that the attention of the Parliamentary Committee be specially drawn to this matter in connection with their consideration of the future relations between Imperial and local taxation." The divided, and subdivided, responsibility for road maintenance, leading as it does to ludicrous anomalies, and occasionally imposing intolerable burdens on small communities that are not only unable but ought never to have been expected to bear them, is a public grievance that is over-ripe for attention. We have always regarded road maintenance as being logically and expediently a matter of national concern; as any change of policy on this question has a more or less direct bearing on street architecture and other building interests, the subject is one upon which architects and builders may appropriately keep a watchful eye.

The Importance of the Corporation Seal.

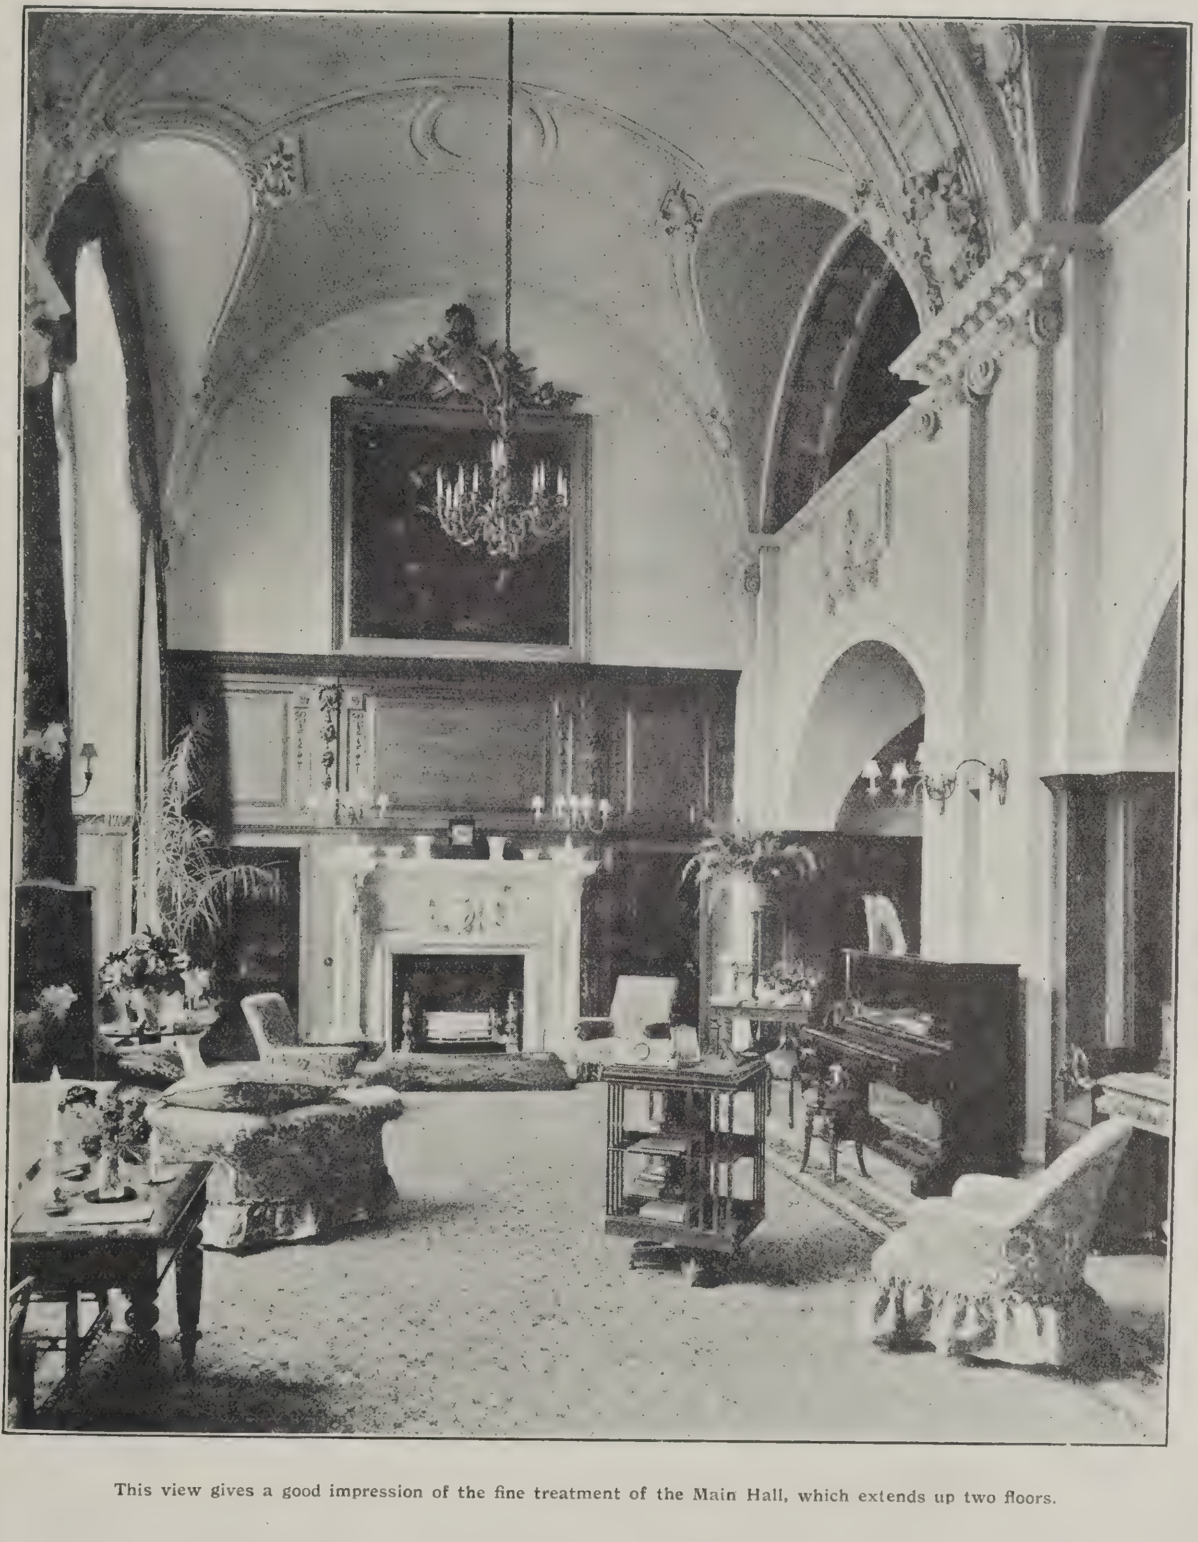
AN action last week in the King's Bench Division, in which an architect sued a corporation for wrongful dismissal, affords yet another example of the interminable struggle between technicality and common sense. The main defence set up was that the plaintiff could recover nothing under a contract which did not bear the council's seal. It was admitted that the work had been ordered; and the attempt to ride off on a mere technicality did not altogether prevail, either with the jury at the Derby Assizes, who had found that the plaintiff was entitled to £230, or with the judge to whom the point of law was referred, who gave judgment for that sum, with costs. It is most important to observe, however, that the judge expressly said "that as the resolution employing the plaintiff was not under seal, the plaintiff could not succeed in an action directly based on it for breach of contract or wrongful dismissal." The recovery was on *quantum meruit;* the ruling in "Lawford v. Billericay Rural District Council" (1903, 1 K.B., 772) applying to corporations the law applicable to other persons, "that they could not take the benefit of work, in an employment within the scope of their authority and for the purposes for which they were created, and refuse to pay for it." From this it seems apparent that it would probably be in vain to seek damages from a corporation for mere breach of contract where the contract does not bear the corporation seal; the award in this case being for services actually rendered. The plain moral is: Insist on the seal: it is an indispensable talisman, without which no corporation contract can be guaranteed to be genuine. (See p. 93.)

Architectural Association Students' Work.

THE drawings of the students in the Architectural Association schools, which have been on view at Tufton Street for some days, give evidence of the good work which is being done there. The work of the first year students in the evening classes is in the first place directed towards teaching them to draw, or obtaining practical evidence as to their powers of drawing, first in the shape of details drawn in outline; secondly in drawing from casts and shading the drawings. Much of the work done by these beginners is very good. In the second year work we have studies of the Doric order, and then of its application in designs for an Agora in the Doric style, to show the application of the order in an original study for a building. There were also some interesting designs for a village church to seat 200 persons. Among the third year work were designs for a sculpture gallery, and others for a park entrance—mostly classic, though a Gothic design appeared among them. The students were also encouraged to work out their ideas of the metal gateways for the park entrance to a larger scale, in order to give them some practice in the study of the treatment of metal. In the fourth year work one of the prominent subjects was a Valhalla, treated for the most part as classic designs with a dome. The objection to these dome designs was that in many—if not most—of them there was a lofty outer dome covering a great amount of useless empty space above the dome which could be actually seen from the interior. The tendency to this kind of treatment of the dome, as a useless feature for external appearance only, was very largely illustrated in the recent competition for the London County Hall, where there were domes of immense size to be seen, which were only exterior embellishments covering so much empty space, entirely separated from the actual internal architecture. It is very desirable that students should be taught to treat domes with reference both to their interior and exterior effect, instead of practically making two domes—one for internal and the other for external show. The reconciling of the interior and exterior design of a dome is no doubt a very difficult problem, but that is the more reason why it should be forced on the attention of students. Of all the designs of the more mature students, the most interesting were those for a brick Custom House, to be erected on the centre of a bridge. Some of the designs were very good, and the thorough manner in which the details of foundations and piling were worked out says much for the nature of the practical instruction in building given in the Association schools.

The Leaning Tower of Pisa.

IT appears that the celebrated leaning tower at Pisa is believed to have been leaning more during the last half-century. If this goes on it will soon, no doubt, lean over for good and all. The evidence as to its increased leaning depends a good deal on the acceptance of the accuracy of the measurements of its inclination made by Taylor and Cresy in 1829. They are said to have made it out to be 86.5 millimetres in every metre; it is to-day 92 millimetres. We should say that Taylor and Cresy were people who would probably make accurate measurements. It is rather amusing to find the "Times" correspondent at Rome forwarding a serious enquiry as to who these obscure Englishmen, Taylor and Cresy, were, and what were their attainments. Of course, a tower already built leaning is more likely to feel any movement of the foundations than one that has been built perpendicular. But the idea that because the foundations are settling now, therefore the original lean was due to a settlement, is illogical if not absurd. Bologna has two leaning towers, erected early in the twelfth century. Sixty years afterwards a town seventy miles off starts another leaning tower; and we are asked to believe that all this is the result of accidental coincidence. The idea is absurd; of course the experiments were intentional, and the towers at Bologna having no doubt attracted a great deal of attention, Pisa determined to rival them.



This view gives a good impression of the fine treatment of the Main Hall, which extends up two floors.

MINTERNE HOUSE, CERNE ABBAS, DORSET. LEONARD STOKES, P.R.I.B.A., ARCHITECT.

NOTES AND NEWS.

Windsor Castle as a Royal Residence.

In stating that before King George and Queen Mary take up their residence at Windsor Castle certain alterations and rearrangements of the apartments will be necessary, a correspondent remarks that, all things considered, the Castle is probably one of the best Royal residences in Europe. There are 17 State apartments, 48 rooms, comprising the spacious kitchen, pantry, confectionery, vegetable, and other store rooms, 79 bedrooms, 65 sitting rooms, and rooms containing 231 beds for servants. The length of passages is about 1,700 yards. The private apartments include the Queen's boudoir, the private audience chamber, the oak room, the tapestry room, the white, green, and crimson drawing rooms, the State dining room, the armoury, and the gold pantry, which contains a collection of gold plate valued at £1,800,000. It seems that very few structural alterations will be required.

A Proposed New Bridge at Twickenham.

A proposal is on foot to build another bridge across the Thames at Twickenham. The idea is set forth in "The Richmond and Twickenham Times," and, needless to say, the proposed bridge is to cross the river at Eel Pie Island. This would mean the destruction of much of the beauty of this reach, and it might be well to consider what this means in other ways. It would have a disastrous effect on both Richmond and Twickenham as residential places, since the majority of the inhabitants value the reach for its natural amenities; it would be disastrous for the boatmen at both places; and also, we imagine, for the Island Hotel. The famous Twickenham Ferry would doubtless be abolished. By the way, our contemporary ought to know that it is only necessary to pay a penny to cross the river, though if one crosses to the island, and again from the island to the further shore, the use of the two ferries will, of course, double the cost. The scheme is devised for the future welfare of Twickenham, we are told. On the Surrey side is a large tract of undeveloped land on the Dysart Estate. It is not by any means certain that the Earl of Dysart would welcome a new town in close proximity to Ham House. But supposing this land is developed, are the people of Twickenham so sure that it will benefit them? Twickenham has hundreds of houses and scores of shops empty. A row of the latter in the high road we have in mind which are being offered without much success at ridiculously low rents. We are informed on good authority that the major part of the more recent speculative property is in the hands of mortgagees and is not returning them even a fair interest. How the development of another district in another county is going to benefit Twickenham, therefore, is not made precisely clear. The bridge would cost a good deal of money, and the benefits would largely accrue to Ham. Also the rates in Twickenham work out now to 7-17ths—nearly half the rent—and there is very little to show for it.

The Advertisement Nuisance.

Travellers by the railway have long been annoyed by the system of placing quack advertisements of a huge size in the fields bordering the line of rail, often in an almost unbroken series for miles together, and it will be a long time before there is any chance of this kind of display being checked by the new Advertisement Regulation Act, which is directed more to securing the streets and suburbs of towns from disfigurement. But it is rather alarming to learn that in addition to the railway line advertisements, the growth of motoring is leading to a similar planting up of the ordinary high roads with advertisement boards, apparently chiefly directed to the supposed wants of the motorist, who does not wish to have his drives disfigured in this way. Some of the owners of motors are proposing to refuse to deal with any motor manufacturer who plants advertisements along the road-side; a policy which, if pursued, would no doubt soon put a stop to the practice.

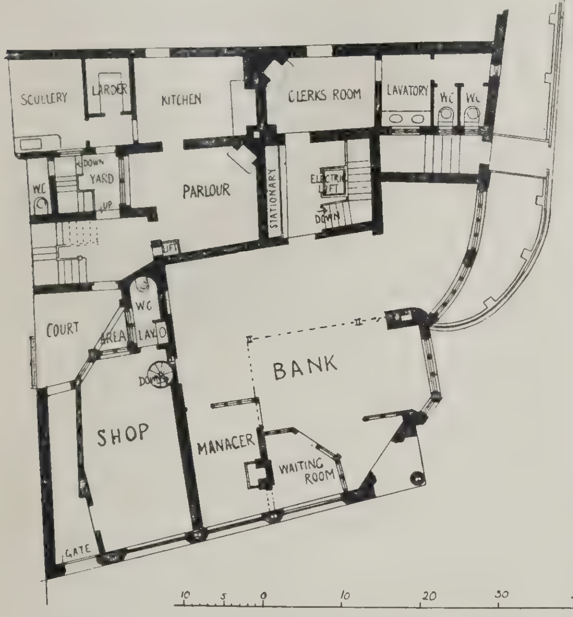
The Usher Hall Competition : Awards.

Sir Aston Webb, R.A., the assessor in the competition for the new City Hall for Edinburgh—the Usher Hall—has made the following awards: 1, Messrs. Stockdale, Harrison and Sons, and Howard H. Thomson, F.R.I.B.A., 7, St. Martin's East, Leicester (joint architects); 2 (with premium of £250), Frank Worthington Symon, F.R.I.B.A., Dorset House, East Grinstead, Sussex; 3 (with premium of £150), Henry Edward Clifford, 225, St. Vincent Street, Glasgow; 4 (with premium of £100), William Haywood, 245, Bristol Road, Birmingham. There were 133 competitors, and it was stipulated that the complete cost should not exceed £65,000.

The accepted design is that of a hall of moderate height seated for 3,500 people—area, grand tier, top gallery, and on the platform. A large circular dome surmounts the hall. The central entrance is from Cambridge Street, and there are other entrances in Grindlay Street, and in the lane to the rear of the buildings. Corridors, nine feet wide, run completely round the public portion of the hall on the ground and grand tier floors. The approach to the grand tier is by two marble staircases off the central floor marble crush hall, each staircase being 6ft. 6in. wide. They lead to a crush hall and two foyers. There are four staircases to the top gallery, each 4ft. 6in. wide, two from Grindlay Street and two from the Lane, all leading into commodious crush halls round the back of the gallery. Separate entrances and assembly rooms are provided for artistes. Ornament has been sparingly used externally, and the treatment is simple and dignified. The external walls are faced with stone, while the internal walls will be of brick, and the building will be fireproof throughout. The galleries are carried on steel cantilevers; there are no column supports. Heating and ventilating of the hall to be on the "Plenum" system; and the corridors, crush halls, foyers, and artistes' rooms will be warmed by radiators. The estimated cost is £61,784. Mr. Symon, who is a native of Edinburgh, has set his building, which is in the French Renaissance style, with the platform or orchestra end towards Lothian Road, in order to have the music between the noise of the traffic and the audience. His elevation has a dignified and monumental aspect. The other two premiated plans are of classic design. Among the other designs submitted were many of merit, but Sir Aston Webb stated that the estimated cost of some of these was quite inadequate for the building proposed.

The Decline of Technical Education.

What is wrong with technical education? The young artisans for whose benefit it is provided seem to be growing tired of it. At a recent meeting of Sedgley District Council, the report presented by the Education Committee contained an expression of regret that although a building construction class had been provided in a district where there were a large number of bricklayers and carpenters, the number of students attending was miserably small, and, the expenses incurred being heavy, it had been decided to discontinue it. In course of the discussion on the subject, the hope was expressed that employers would take the matter up, and urge the young people in their employment to attend the classes. It was stated that "in many districts in South Staffordshire difficulty was experienced in persuading the young people to acquire technical knowledge." This difficulty is presumably universal, but we are unaware whether elsewhere it has had the extreme effect of causing the classes to close down. At any rate, it is sufficiently obvious that technical education in this country is badly in need of popularising, and some systematic means of setting forth its advantages to employer and employed, and its vital importance to the welfare of the nation, should be instituted without delay, unless we are prepared to see a rapid decadence in craftsmanship, and consequent national degeneracy that may turn out to be absolutely disastrous to the country. It can hardly be said that employers are sufficiently exerting themselves for the prevention of this threatened calamity. They leave the matter too much in the hands of professional educationists, and manifest too little personal interest in the young men whom they employ as apprentices or improvers. Nor do they, as a rule, adequately reward or encourage those young craftsmen who study hard to make themselves proficient. To be frank, there is considerable shortsighted selfishness on both sides. The employer will not take the trouble to look beyond his own immediate interests, and the young workman cannot conceive that it is worth while to labour hard at self-improvement for what he believes to be the sole benefit of his employer. Hence we have arrived at an *impasse*, and the great need of the present moment seems to be a sounder conception and a larger and a more enlightened view of the whole subject of technical education—a judicious stirring of the embers of the enthusiasm for it which seems to have died down in sympathy with the depression of trade. We repeat the suggestion that we have made more than once before, that the National Federation of Building Trades Employers might accomplish a grand and truly patriotic work if they, as the chief employers of skilled labour in this country, took this matter seriously in hand, and set it on a rational and national basis.



The ground floor has accommodation for the bank and shop. Above are rooms for undergraduates.

UNION OF LONDON AND SMITH'S BANK, TRINITY STREET, CAMBRIDGE. W. D. CARÖE, M.A., F.R.I.B.A., F.S.A., ARCHITECT.

(See Centre Plate.)

St. Paul's Bridge.

We are glad to learn, on the authority of the "City Press," which is usually very well informed on such matters, that the statement to the effect that a hitch had occurred between the Corporation and the London County Council with regard to the building of St. Paul's Bridge is entirely devoid of foundation. "No hitch has occurred, and there is no abandonment of the scheme." It is nevertheless acknowledged that for the moment the Corporation has not accepted the contribution towards the cost of the bridge approaches that the Council has offered; but our city contemporary has no doubt that this question will be easily arranged, and we trust that this optimistic forecast may be justified. Also it is reassuring to learn that the Corporation certainly does not contemplate "driving a tunnel for tramway purposes, to the detriment of the cathedral or its foundations." All this is very comforting as far as it goes; but it does not relieve one's special anxiety as to whether St. Paul's Bridge is to be architecturally a glory or unarchitecturally a disgrace to London.

Payment for Unadopted Plans.

An interesting but by no means a novel point of law arose in an action brought at Perth last week by a Forfar firm of architects. They claimed £20 as a fee for preparing plans for a villa. The plans were not used, and the defence was that therefore there was no liability; but, "without prejudice," the sum of four guineas was tendered. Sheriff Sym held that the invitation to the architects imported that if he (defendant) built, and made them architects, "they would be paid by architects' usual commission; but if he did not make them architects, they would nevertheless be remunerated for their trouble." The Sheriff repelled the contention that the remuneration was to be a voluntary payment at the defendant's pleasure, and referred the matter to an independent architect to assess the value of the plans. The assessor thought that a fee of thirteen guineas would be fair remuneration, and the Sheriff allowed plaintiffs that sum, plus expenses of the legal proceedings. This case is typical rather than extraordinary. It is almost an everyday occurrence that architects are asked to prepare plans which the client wishes to regard tentatively; and if, on seeing them, he decides not to adopt them, he is apt to feel aggrieved at having to pay for them. In his view they are so much wastepaper, valuable only as affording the architect an agreeable opportunity for the exercise of his natural functions. A lawyer may charge for merely writing a short letter, and his client pays for it without a murmur; but an architect may spend days and weeks in the preparation of plans, and ought to rest satisfied with the enjoyment of the creative act! In such cases the architect owes it not only to himself, but to his profession to do what he can to disabuse the public mind of this curious fallacy.

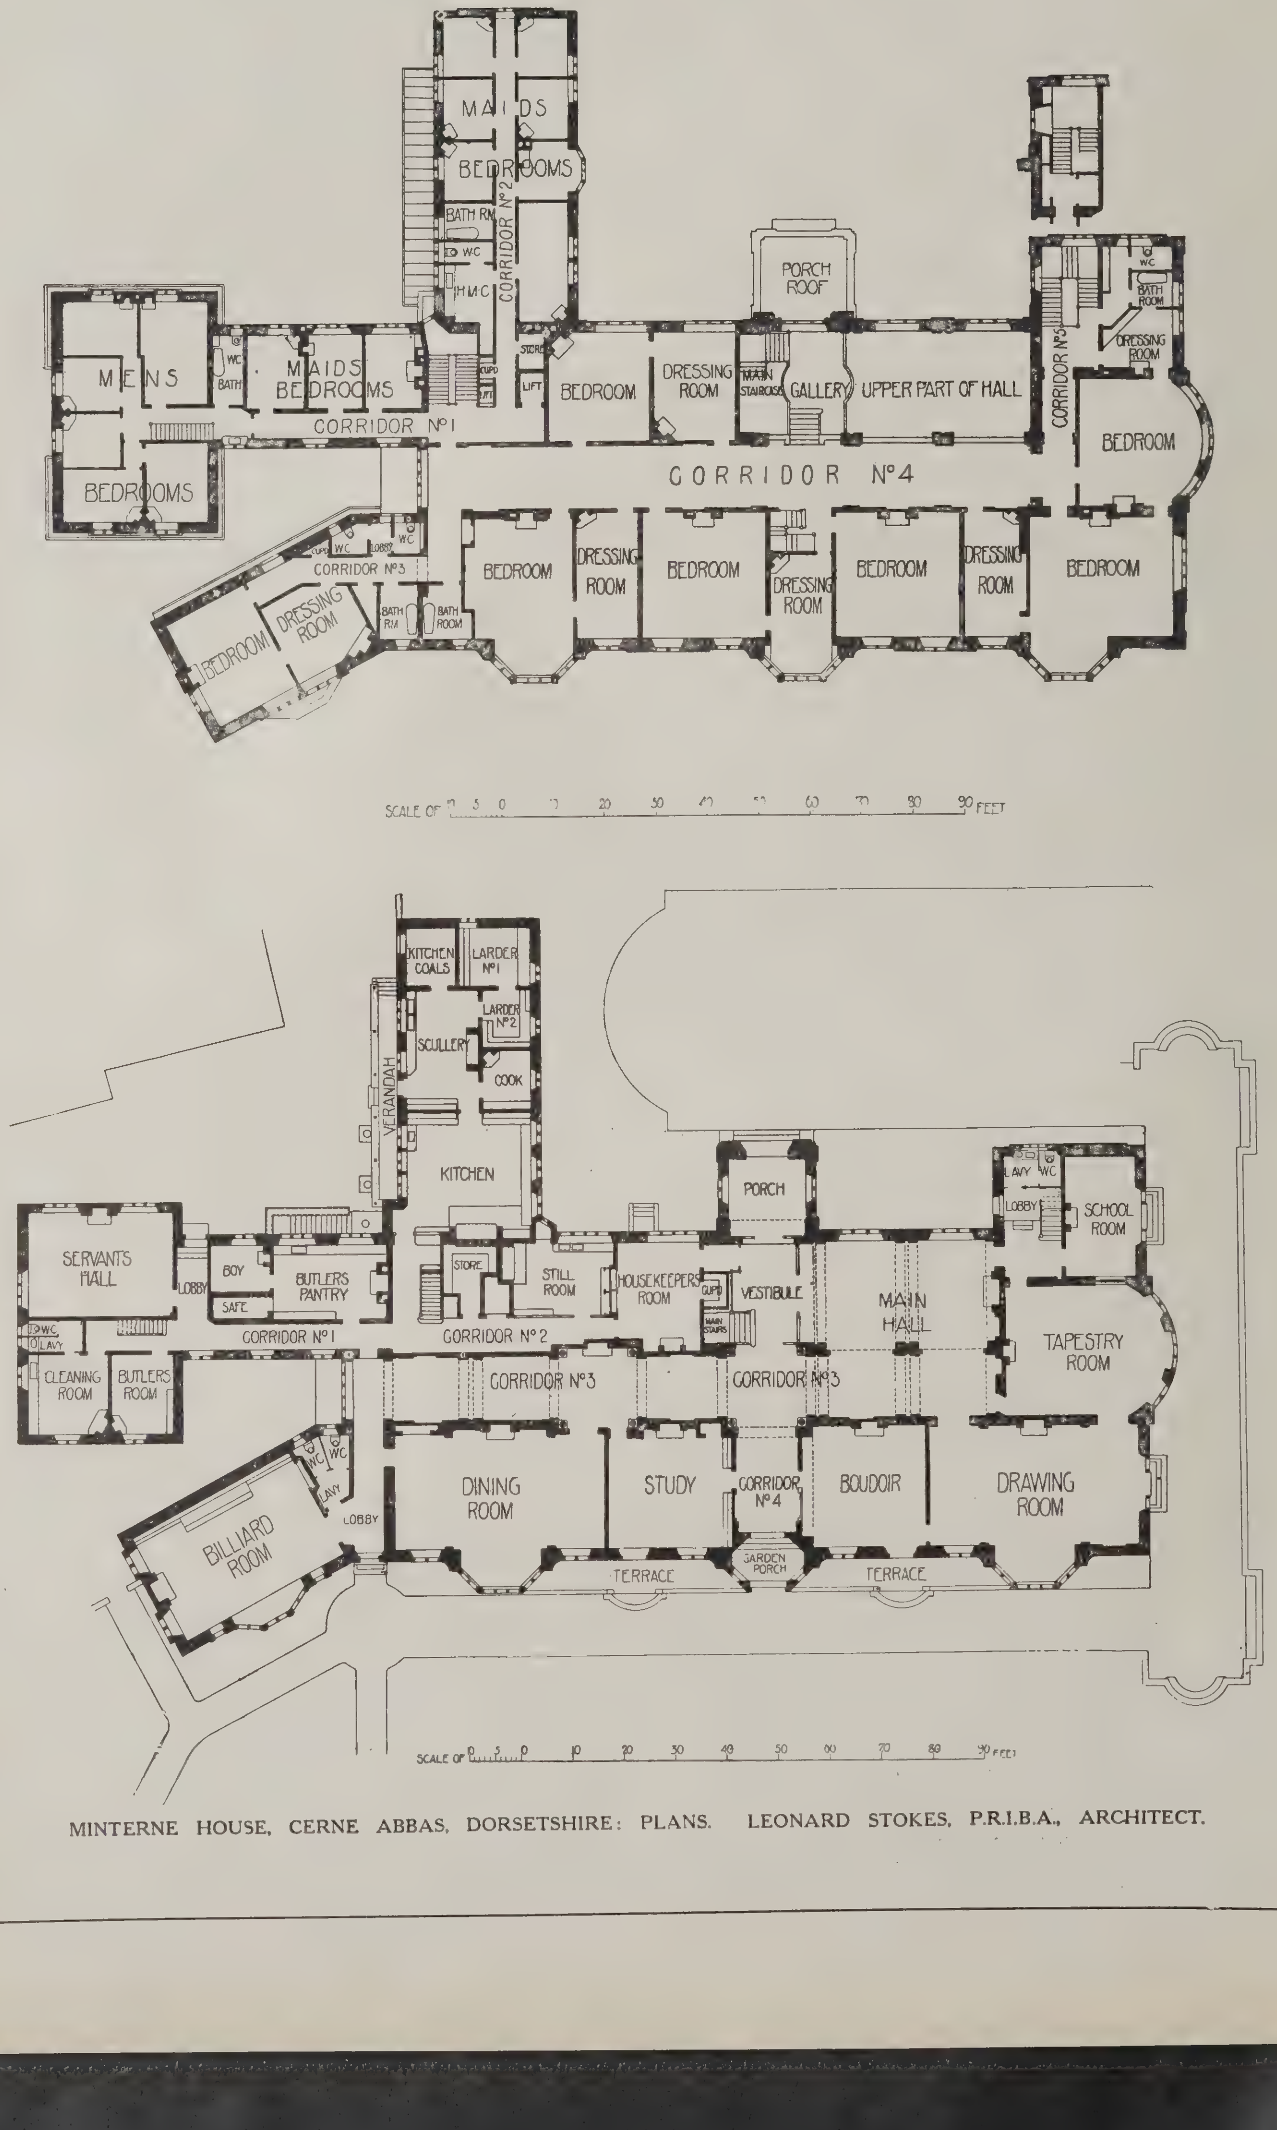
Minterne House, Cerne Abbas, Dorset.

(See pp. 84, 87.)

Minterne House, Cerne Abbas, near Dorchester, designed by Mr. Leonard Stokes, P.R.I.B.A., for Lord Digby, is situated on a level site at the end of a valley some 600ft. above the sea, with a south-east aspect, and is built of Ham Hill stone; the dressings to window and door openings, etc., as well as the mouldings, being finished with a dragged face. The bands are finished with a neat vertical tooled face, and the remaining stone, mainly consisting of ashlar, shows a hammer-dressed face, in courses about 3in. or 4in. high. The stone carving was executed by Mr. M. Murphy, of Chelsea. The internal walls are of brick, with occasional Mack partitions. Messrs. Davies's Precelly rustic random slates, from Gilfach Quarries, cover the roof. The chimney caps of terrace wall are of Doulting stone from the Chelynch bed. All the stonework, amounting to about 30,000 cubic feet, was prepared by the Ham Hill and Doulting Stone Company, Ltd., at their quarries, and was fixed and cleaned down by their men. The electric light installation was supplied by Drake and Gorham, Ltd., London, S.W.

The heating arrangements were carried out by Edward P. Milne, of the Strand, W.C. The system installed for the heating and hot-water services to the baths, lavatories, and sinks is Milne's duplex system of heating and hot-water supply. The water in the domestic service is heated by the water which supplies heat to the radiators, but the two waters are absolutely separate, and do not mix, and there is no incrustation from the hardness of the water in the district. The heating mains are under separate control, and can be shut off in the summer time. One boiler works both systems instead of two as in the ordinary arrangement, effecting economy in fuel and attention. The radiators in the corridors and the principal rooms are encased by wood panelling with metal grilles, most of them having fresh-air inlets.

The general contractors were John Mowlem and Co., of Westminster; and among the sub-contractors were the following: Fire-resisting construction, Potter and Co., Victoria Street, Westminster; casements and casement fittings, Henry Hope and Sons, Birmingham; stoves, grates, etc., Bratt Colbran and Co., London, W.; and Longden and Co., London, W.; plumbing and sanitary work and fittings, Dent and Hellyer, London, W.C.



MINTERNE HOUSE, CERNE ABBAS, DORSETSHIRE: PLANS. LEONARD STOKES, P.R.I.B.A., ARCHITECT.

The foundation stone of the new building in Leeds for the Pearl Life Assurance Co., Ltd., was laid on the 14th inst., by the President and Founder of the Company. The total cost of the land and building will exceed £60,000. The work is being carried out from the design and under the superintendence of William Bakewell, F.R.I.B.A., architect.

* * *

Mr. A. H. Dykes, of 1, Victoria Street, Westminster, S.W., has been appointed honorary secretary of the newly formed Association of Consulting Engineers.

* * *

The summer meeting of the Royal Archæological Institute of Great Britain and Ireland was opened at Oxford last week. The members were welcomed by the Mayor, Mr. J. E. Salter, and the Corporation in the Municipal Buildings. Professor W. Boyd Dawkins, in the absence through illness of the President (Sir Henry H. Howorth), acknowledged the welcome, and mentioned that it was sixty years since the Institute's previous visit to Oxford. The number attending this year was unparalleled. At the Sheldonian Theatre the members were welcomed by Sir John Rhys, Principal of Jesus College, Pro-Vice-Chancellor, on behalf of the University. He remarked that the Welsh Monuments Commission had been the means of making him realise the unsatisfactory state of the law of this country as regarded the preservation of ancient monuments. It was practically a dead letter, and he suggested that the Royal Archæological Institute should appoint a committee to prepare a statement which should serve as the basis of a new law.

* * *

The funeral took place at Overstone Church recently of Mr. Josiah Mander, of Overstone Park, who died at Bournemouth, where he had gone to recruit his health. He was for a period of 44 years resident architect and surveyor for the estates of the late Lord Overstone and his daughter, the Baroness Wantage, in the Counties of Northants, Cambs., Bucks, Leicester, and Berks, in which counties many new buildings and improvements have been designed and carried out by him, including restorations of Sywell, Overstone, and other churches, and new schools at Overstone and elsewhere. In addition to the work on the above estates, he has designed and carried out numerous buildings, principally in the County of Northants, for other noblemen and gentlemen, including the Rt. Hon. Earl Spencer, Rt. Hon. Earl Carysfort, Viscount Melville, Lady Dorothy Fitzwilliam, Sir A. de Capel Brook, Mr. D. C. Guthrie, Rev. J. White, and Mr. A. R. Steele, etc., etc.

* * *

A gruesome variant on the many legends of the divining rod is going the rounds. The story is to the effect that among the visitors to Bangor Cathedral a few days ago there was a clergyman who asked the verger whether there were many interments within the building, and produced a simple-looking brass instrument composed of wires which converged into a point and were held by two handles. This instrument, he explained, would indicate the presence of graves. He walked about the Cathedral with it in his hands, and every time he crossed a gravestone the instrument made a downward movement. Prodigious!

The following paragraph appeared in the "Daily Telegraph" of last Friday: "A correspondent writes: I notice in your report of a boating accident at Twickenham, when several people were thrown into the river, that although the name of the boat and owner are given, the name of the pedestrians who went to the assistance of the party is not mentioned, nor that of a gentleman who dived from the motor-launch 'Alsatia.' It may interest some of your readers to know that the 'pedestrian' is Mr. Frank Regan, son of the Mr. James Regan, of Victoria Park, who has himself rescued more than 100 persons from drowning." It may interest some of *our* readers to know that the Mr. F. Regan who performed this gallant act is a member of the advertising department of this journal.

AGREEMENTS FOR BUILDING CONTRACTS.

Under the above title a paper was read in February last before the American Society of Civil Engineers by one of its associate members, Mr. Wm. B. Bamford, and was followed by a full and interesting discussion, in which engineers, architects, lawyers, and contractors joined.

The lecturer said his paper had been limited to agreements for the construction of buildings, because he had given this type special study, and because he felt that the principles underlying such agreements are readily adaptable to those for other construction, and that many of the vital questions at issue can be brought out more effectively by taking a concrete case rather than by dealing in generalities. After pointing out that, from the practical standpoint of the building agreement, it matters little whether the person who planned the building and will have charge of it until completion is called an engineer or an architect, he goes on to say that his paper is not a defence of the contractor as against the engineer or architect, but is simply one advocating justice and equity to all parties to a contract. Then follows an historical summary, from which it appears that the American Institute of Architects, in co-operation with the National Association of Builders, adopted, a number of years ago, the "Uniform Contract" which, without material changes, remains in force up to the present time, but is admittedly defective. The lecturer having heard of the contract issued by the R.I.B.A. in agreement with the Institute of Builders and the National Federation of Building Trades Employers, and finding it almost unknown in America, carefully examined the British form, and remarks: "The more closely the writer analysed his own work and ideas and compared them with those of the R.I.B.A., the more firmly convinced he became of the excellence of the latter's work." Consequently he decided "to sink personal consideration and frankly undertake to revise a most excellent document to meet American conditions."

Systems of Contracting.

"At present the systems of contracting used in building work may be divided into two general classes, the lump-sum system and the various percentage systems. They are often designated by the manner in which the work is paid for, as (1) Lump sum; (2) cost, plus a percentage; (3) cost, plus a percentage where the general contractor takes estimates for sub-branches of work, and makes lump-sum contracts, with the engineer's approval; (4) cost, plus a percentage, with guaranteed limit; (5) cost, plus a fixed sum; (6) cost, plus a fixed sum, with a bonus if cost is less than a fixed sum, and a penalty if it exceeds such sum."

Of these the lump-sum system is the most usual, and is, the author considers, the best, as more truly fostering fair and open competition, and, as experience has demonstrated, it is more economical. Nevertheless, the author considers the other systems will eventually supersede the lump-sum system, unless more care is taken to make contracts complete and accurate in all details forming the basis of the contracts.

Quantities too Cumbersome.

It is curious to note that "The English method of quantity surveying is another excellent attempt to overcome the worst objections to the lump-sum system of estimating, but, as at present in use, it would be too cumbersome for American practice." The above statement will provoke a smile over here, for what can be more cumbersome than a system by which any contractor has to take out his own quantities?

Practical and Equitable Contracts.

Some of the admissions are very frank when coming from an engineer. For example, the lecturer remarks: "Many contracts appear to be drawn by the engineer solely on the assumption that the owner's interests must be most carefully guarded against failure by the contractor to fulfil his agreements properly." And, again, "An owner may become very exacting, and may insist on 'strict and literal' compliance with the letter of the specifications and contract, and may place an engineer in a very embarrassing position by referring to and insisting on the literal fulfilment of certain ambiguous conditions, or the 'taking of every pound of flesh' against the engineer's better judgment." Mr. Bamford concludes that: "The value of a just contract to the owner and the engineer is as great as its value to the contractor. A just contract, provided it is accurate and free from ambiguity, cheapens the cost of work by eliminating the necessity for sums to cover possible contingencies; it broadens real competition, and encourages lower estimates. It ensures more rapid erection and also acts as a powerful regulator of the mutual understanding and confidence in the fairness of all parties."

Specification Writing.

Referring to specification writing, Mr. Bamford says it requires "broad knowledge, practical experience, and careful study of the various materials and methods of construction and their costs." Inexperienced writers, he says, are apt to write at unnecessary length on matters with which they are familiar, and cover ignorance of equally important matters by the brief and ambiguous direction that "the work shall be done to the entire satisfaction of the engineer, whose decision is to be final and binding on all parties."

Contractual Referees.

Coming to the question of arbitrators, the lecturer remarks that "Engineers have always claimed to be arbitrators between owner and contractor, and not the representative solely of one party. This position is a proper one [?], but to-day it is more of a myth than a fact." He says this is because the contracts generally used "make it extremely hard, if not almost impossible, for engineers to be fair if they try to conform to the agreement provisions."

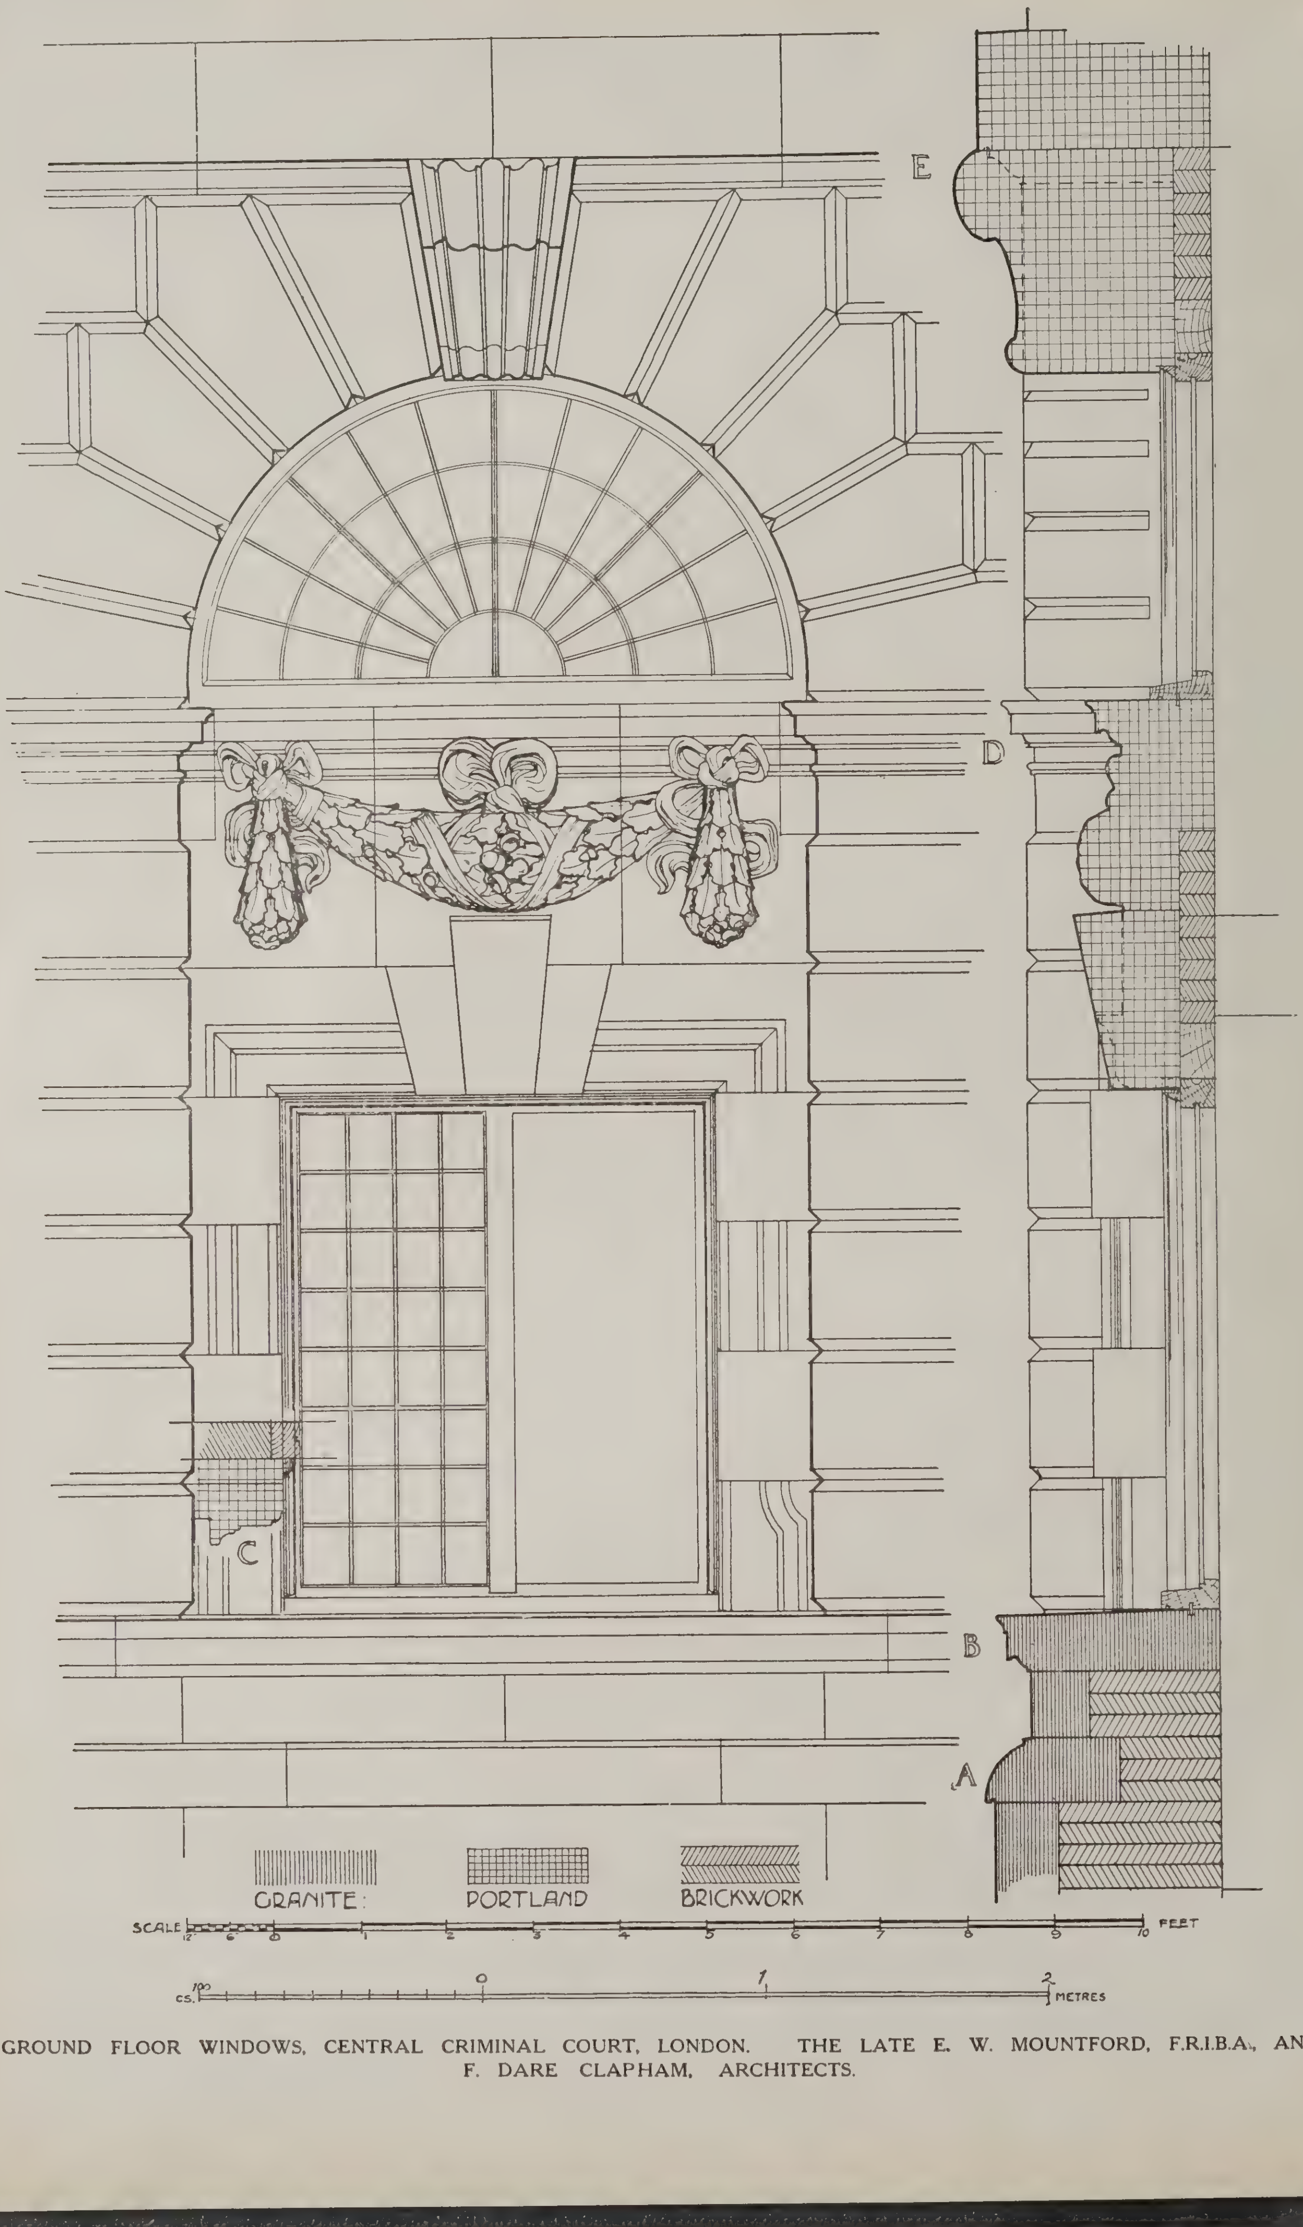
Having shown the real need there is in America for an equitable form of contract, Mr. Bamford proceeded to submit a proposed Agreement and Schedule of Conditions of Contract modified from those adopted by the R.I.B.A. retaining the language of the original wherever possible. In commenting upon the arbitration clause, he says: "Around it centre the much discussed authority of the engineer or architect to settle all matters of every kind and description. Everyone who has exercised such powers must realise that while they are theoretically desirable, their proper curtailment would unravel a very difficult situation, and would permit questions being considered in a more equitable light by all parties."

Points from the Discussion.

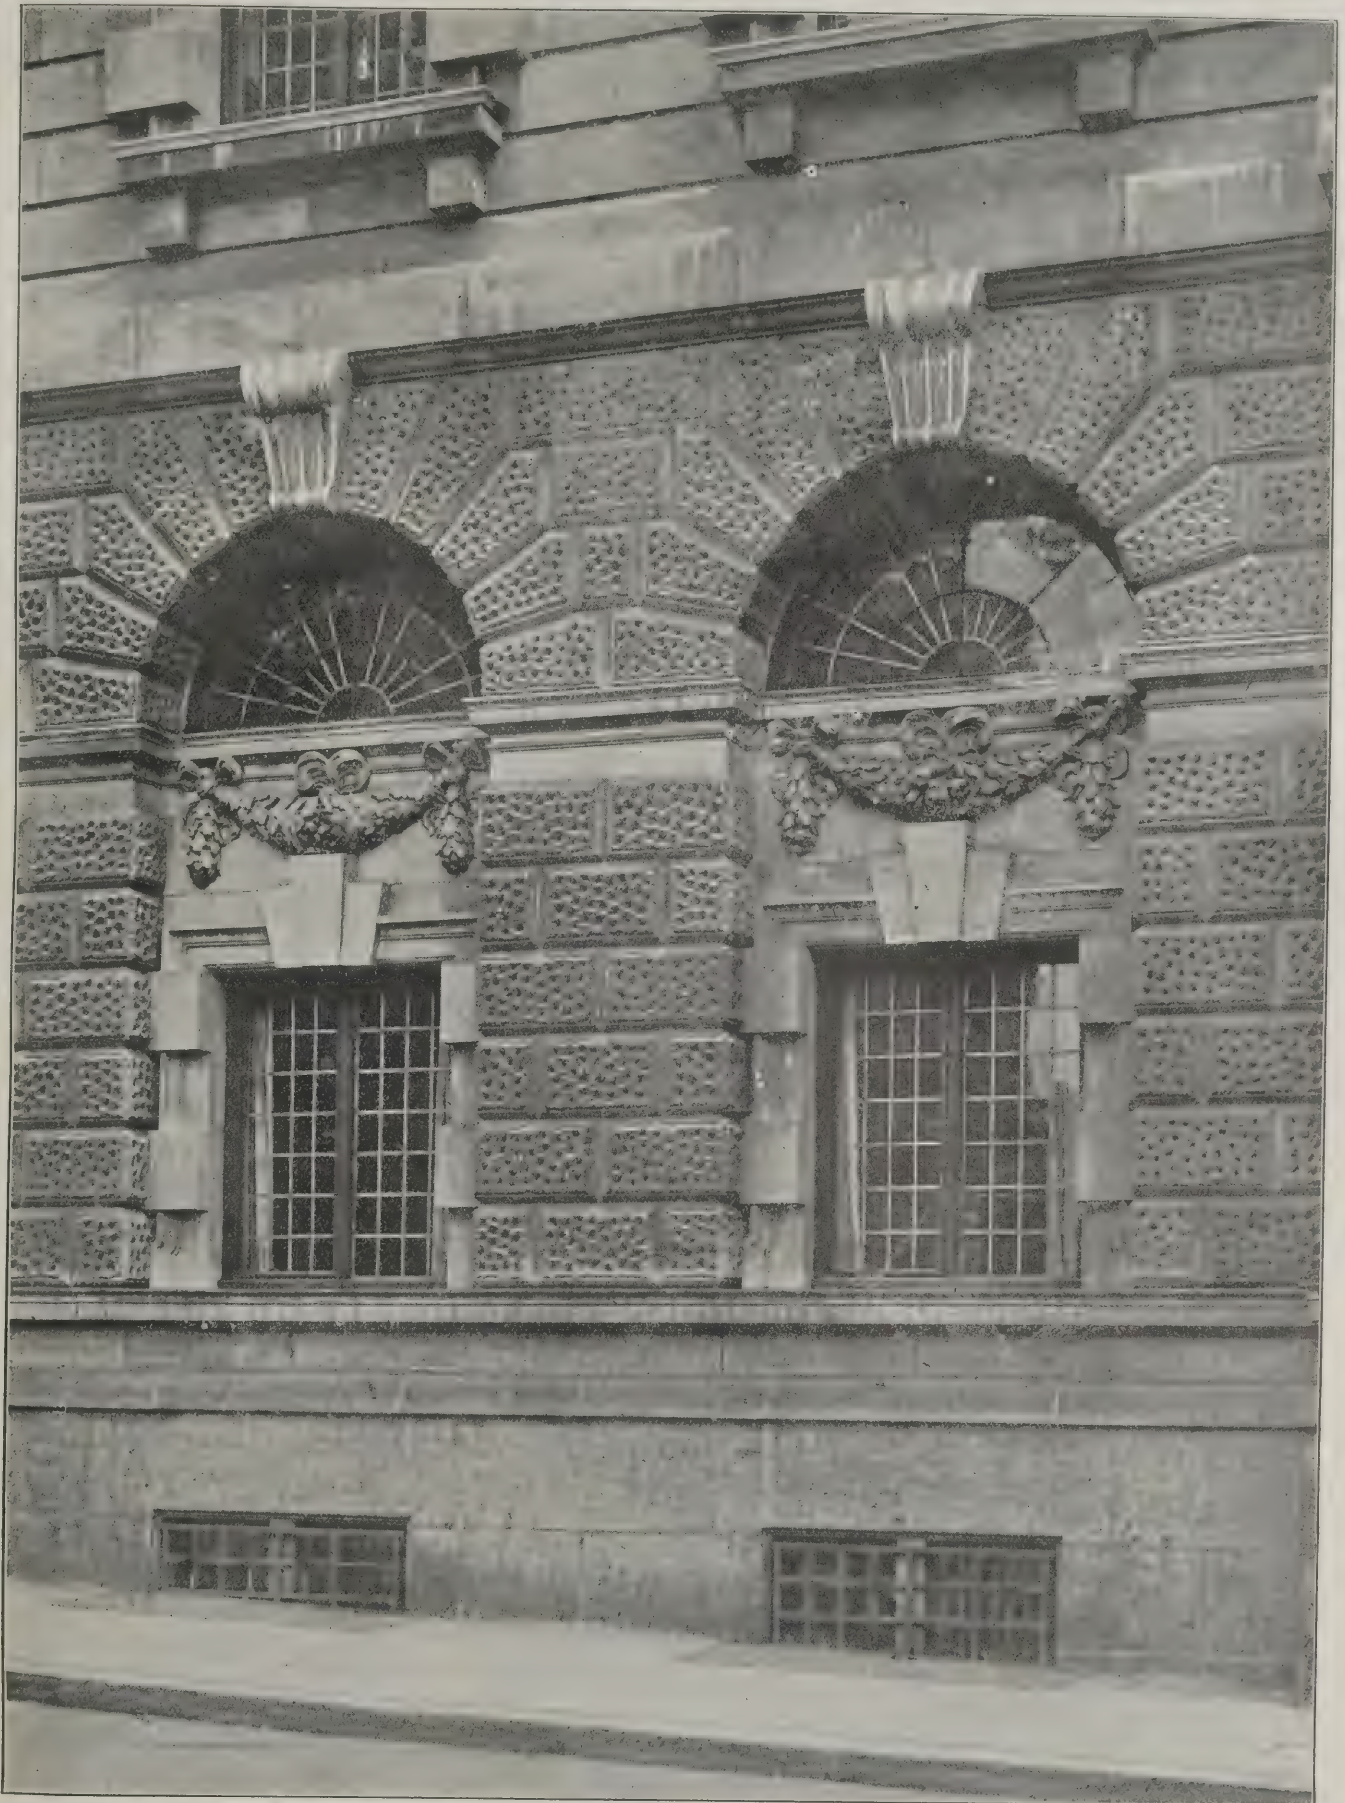
In the course of the discussion which followed, much favour was shown to the "cost plus" contract, on the ground that it unites the clashing interests of owner and contractor, and secures to the former the fullest advantages of the technical skill of the contractor. It was also remarked "It may be accepted as axiomatic that 'unfair conditions breed unfair contractors,' a case of the survival of the fittest." And, again, "It is the duty of engineers to work for all things which make for a more definite and fair relation between the owner, represented by his engineer, and the contractor." Apropos of the type of contractor it is desirable to employ, an architect remarked: "Too often a client makes the mistake of thinking that perfect specifications make a perfect building. He engages his architect, and thinks it does not make much difference who the contractor is, for as long as he has a good plan and specifications, the contract is bound to produce a building as described. The erection of a building is a question between men; on the part of the contractor as to ability and integrity, and on the part of the architect to describe clearly what he intends the building to be." One of the points clearly brought out in the discussion is that owing to there not being in the States any General Arbitration Act, similar to what obtains here, all arbitrations are subject to appeal to the Courts if either party is dissatisfied with the award, and much complaint is made of the consequent expense.

CONTRACT NOT UNDER SEAL.

In the King's Bench Division last week, Mr. Justice A. T. Lawrence heard the case of Hodge v. Urban District Council of Matlock Bath and Scarthin Nick and Nuttall, which was an action by an architect for wrongful dismissal. It appeared that the defendant council passed a verbal resolution that the plaintiff and Mr. Nuttall should be employed as joint architects for the erection of a kursaal, and that the plaintiff prepared plans and for some time did work in pursuance of the resolution. Before the work was finished the plaintiff was dismissed. He brought an action, which was heard at Derby Assizes and in which the jury found a verdict in his favour. The principal defence raised in that action was that the plaintiff could recover nothing, as the contract under which he had been employed had not borne the Council's seal; and the case now came on in London for further consideration of the point of law. For the plaintiff, Mr. Shearman, K.C., submitted that as the work done had been necessary and had been accepted, the council must pay under "Lawford v. Billericay Rural District Council" (1903, 1 K.B., 772), although there had been no seal. Mr. Hugo Young, for the defendants, submitted that this was a contract which required to be under seal. The work was not for the purpose of doing something the council was obliged to do, for the private Act merely said they might, not that they must, erect a kursaal, and if a seal was required, nothing could be recovered on a *quantum meruit.* Mr. Justice Lawrence said that as the resolution employing the plaintiff was not under seal the plaintiff could not succeed in an action directly based on it for breach of contract or wrongful dismissal; but as the defendants had had the benefit of his work he could recover on a *quantum meruit* the sum of £230, which the jury had found he would be entitled to. There must be judgment for the plaintiff for £230, and costs except as to the issue whether the contract was under seal.



GROUND FLOOR WINDOWS, CENTRAL CRIMINAL COURT, LONDON. THE LATE E. W. MOUNTFORD, F.R.I.B.A., AND F. DARE CLAPHAM, ARCHITECTS.



There is a range of these windows on the Old Bailey front, the two here shown being at the Newgate Street end. Up to the level of the main string course the stone of Old Newgate Prison, redressed, has been used, the remainder being in new Portland stone. The plinth up to the window sills is of grey unpolished Cornish granite.

ITALIAN SCAFFOLDING.

FIRST ARTICLE.

BY A. G. H. THATCHER.

Italian scaffolding is mediæval in type, with many details engrafted into its methods due to modern improvements. Its characteristics are worthy of study. It varies from a substantiality which would suit all purposes, to a fragility which is almost ludicrous. Square timbers are used which favour the view that they are permanently erected: in other instances, poles are found, a comparison with which any self-respecting clothes prop would shy at.

Italian engineers are reputedly skilful in dealing with scaffolding, and instances were recently given in this paper of the invention of new types in connection with the Campanile in Venice. Other instances might be mentioned, but although skilful in conceiving, no hesitation is made in adapting forms known and found of merit. It is mentioned that Fontano employed square timbers for the erection of the obelisk in front of S. Peter's Rome, about 1586, A.D., but earlier instances are known of the use of such material, notably during the building of Cologne Cathedral during the thirteenth century

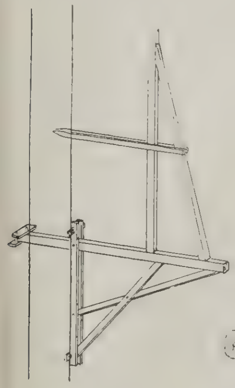

Fig. 1.

Fig 2.

Fig 3.

Pole scaffolding must also have been used by Italian builders from early times. In the atrio of S. Mark's Cathedral, Venice, there are some mosaics, commenced in the thirteenth century, which illustrate the artist's conception of the building of the Tower of Babel. It is probable that the designer showed pictorially the earliest kind of scaffolding of which he had knowledge, perhaps that of a century or so earlier. The details given of the mortar mixing, the head-carried "hod," the iron frame to hold it while being filled, create a curiosity in a subject about which there is no written history.

The mosaic referred to also shows very clearly the run used to form a way and transport material to the heights of the building, a method which the labourer of this country, with electric, gas, and steam powers and many simple machines at his disposal, would find somewhat wearisome, although it still obtains in Italy.

The statement that Italian scaffolding is mediæval in type requires, perhaps, some elucidation. No written history of scaffolding exists, but enquiries made from time to time—for instance those made by the eminent French architect the late M. Viollet-le-Duc—show that flying or needle scaffolding formed a principal means of building from the earliest known ages, and reached, perhaps, its greatest development during the building of the great Continental cathedrals. Needle scaffolding is used to a small extent in this country, but only for repairs where the carcase of the building is *in situ*. The mediæval builders, with greater daring or skill, freely used the needle in new erections. The openings where the needles were fixed can be seen to this day in some important structures.

M. le Duc was of opinion that the usual method of so conducting the works could be illustrated by a sketch, Fig. 1. The ground was used as a base in the lower portions, but the platforms higher were made self-supporting so that the lower timbers could be moved and re-used higher. Such a principle is common in Italy to-day. There is a somewhat weird effect in seeing a scaffold clinging close to the higher portions of a building and the standards hanging pendant wise from the lowest platform, but quite clear of the ground.

The scaffolding of two buildings under erection and repair in Naples, recently seen by the writer, possessed some points of interest. In neither was cordage used in its connection. In fact, throughout Italy the hempen or wire rope is a rarity as a means of construction. The Neapolitan method, and the vogue obtains throughout Central and

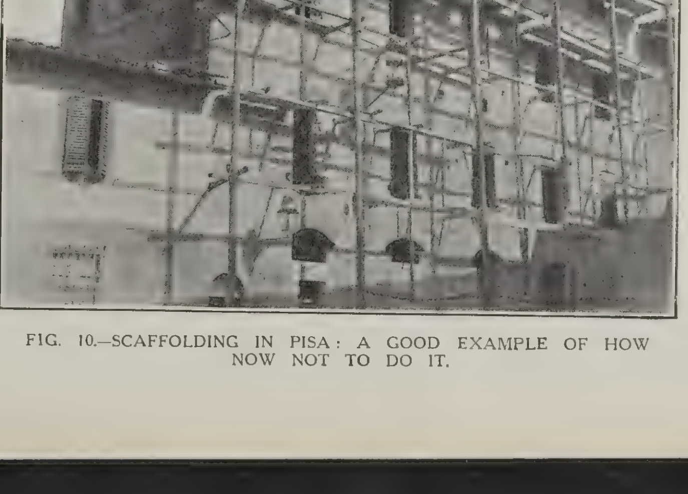

FIG. 10.—SCAFFOLDING IN PISA: A GOOD EXAMPLE OF HOW NOW NOT TO DO IT.

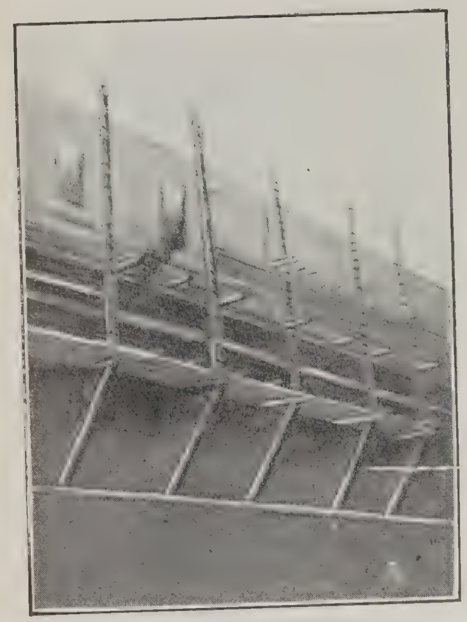

Fig. 11.—Needle scaffolding taken in Rome. The struts to the needles rise from a wall-plate.

Southern Italy, is simplicity itself. Short pieces of wood shaped as Figs. 2 and 3, according to the number of timbers the piece is to cover, are used as connections between the standards, being simply spiked thereto. They are placed comparatively close together, on an average about 18ins. apart, vertically, and both back and front of the poles. They act in like manner as a "dog," and have, of course, the same evil effect upon the timbers. To afford a closer fitting the poles need some preparation. Instead of being barked only, they are squared roughly to the section shown by Fig. 4. Fig. 5 gives a detailed appearance of a short length of double standards so tied. If single standards are used, the rising pole is supported on a cleat, (see Fig. 6). It will be seen from this how necessary are the slightly squared poles which are in general use. The ledgers also rest upon cleats arranged as Fig. 7. The ledgers generally are somewhat promiscuously arranged: continuity and evenness are not considered entirely imperative. This is partly due to the method of fixing and partly to the fact that the scaffolder uses the first timber to his hand. In consequence, he is constantly creating minor difficulties which he overcomes by the exercise of considerable ingenuity. This gives an unpleasing effect to the finished scaffold when examined in detail. A run way is used by the workmen as a means of ascent, and for the transport of material. Ladders are, of course, in use for these purposes, but not more than can be avoided. The slope is erected wherever possible. In common with this scaffolding generally the method is an old one. M. le Duc, in his "Dictionnaire de l'Architecture Française," remarks: "The construction of the Donjon de Coucy, which represents a cylinder of about 196 feet in height, only required a very simple system of scaffolding, and yet one which obviated the slow raising of the building material by machines. One may observe on the exterior of the cylinder a number of small square holes in the masonry, arranged spirally, and, from the magnitude of the diameter of the edifice, forming a helix, which has a very slow or gradual twist. These holes are square and in a double series. By means of horizontal timbers fixed in these holes and supported by struts (Fig. 8 is an illustration of the truss) a spiral roadway was formed along which the workmen could travel or move material."

Long timber shoots fixed down the front of the scaffolding are found useful, as the loose rubbish can be shot from the top of the building. In a country where, owing to the extreme dryness of the climate, dust is particularly light, such a proceeding is no doubt advisable.

There is a great similarity existing in the present-day methods to those of the middle ages. In a case at Naples the scaffolding was erected to modernise an old building. The truss at the second floor level is taking the weight of the whole structure, the standards having been removed from below the balcony to the ground. The putlogs are much more substantial than as used with us. In many cases they are carried into the building to form a tie. So far as is possible they are laid close to the standards, and are therefore rather far apart. This procedure seems somewhat inadequate from the point of strength, especially as the boards are of a common type with no additional carrying power. The ledgers to a great extent serve as connections between the standards only, the putlogs resting on cleats, and instances were seen where they were entirely dispensed with (see Fig. 9). Of course, this is particularly light work, the needles doing all the actual carrying.

Fig. 10 is another scaffold seen in Pisa. Ledgers are here used, but of light timbers. In consequence, the standards being far apart, puncheons were used between the bays. The dangers arising can be seen by the curve described by the bottom ledgers. In this instance also the rising standards are butted to those first erected, and they are kept in place by a short length which is lapped for about 3ft. over each. This is really a good example of how not to do it. More care is apparently taken of the street lamp, over which a basket is seen upturned. The putlogs being few in number, the boards are necessarily lapped, butted boards being unknown.

Fig 11 is a sketch taken from a building in Rome. It exemplifies the details of needle construction on a wall where few openings occur, the struts to the lower needles being carried on a plate spiked to the wall.

In the case of overhanging eaves, the platforms are supported by putlogs until the eaves level is reached. Then needles are used projecting beyond the face of the scaffold as far as is necessary. The method saves an extreme width of platform from the ground upwards, a consideration in narrow streets and pavements. Where more room is available, the standards are laid to a slope, standing well out into the road and leaning against the eaves above. The first platform in this is about 8ft. in width, that close to the eaves being extremely narrow, but to increase the width the putlogs projected sufficiently to carry an extra board. This cannot by any means be considered good construction.

(*To be continued.*)

CORRESPONDENCE.

Art and Building.

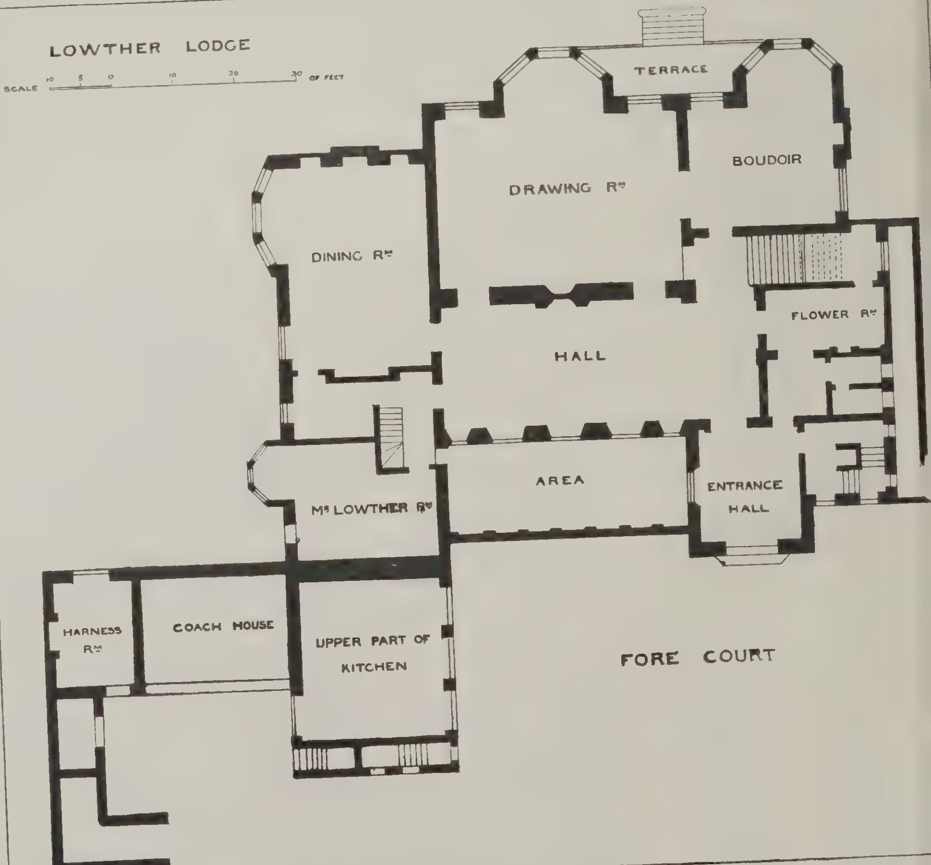
To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—With reference to the note in a recent issue on "Art and Building," I think your paper could be of service in this matter if you invited and published letters from your readers who are interested in the subject. There is no doubt that the purely art side of building is sadly neglected in our technical institutions. For instance, in building construction we have four stages of instruction, with annual examinations, and with subsequent certificate awards for each. Architectural design is confined to one stage, and even this is but little heard of. In fact, I believe there is no syllabus issued in connection with it, so that the subject for design comes to some who are wholly unprepared for it, while others, who have perhaps been executing similar work in the office just previous to the examination, have a distinct and unfair advantage. True, luck plays a part in all exams., but in this case it is quite beyond reason, and such an examination offers but little attraction for students.

D. J. MOSS.

London, S.E.

[We shall be quite happy to receive opinions and suggestions on the subject.—EDITOR].



In point of date Lowther Lodge is one of Mr. Norman Shaw's earlier plans. This well-known fine house at the corner of the Exhibition and Kensington Roads was built in the 'seventies.

GROUND PLAN, LOWTHER LODGE, KENSINGTON. R. NORMAN SHAW R.A., ARCHITECT.

THE DEVELOPMENT OF MODERN ARCHITECTURE.

Abstract of a paper read before the Birmingham Architectural Association by Gerald C. Horsley, F.R.I.B.A. (Concluded from page 19, No. 805.)

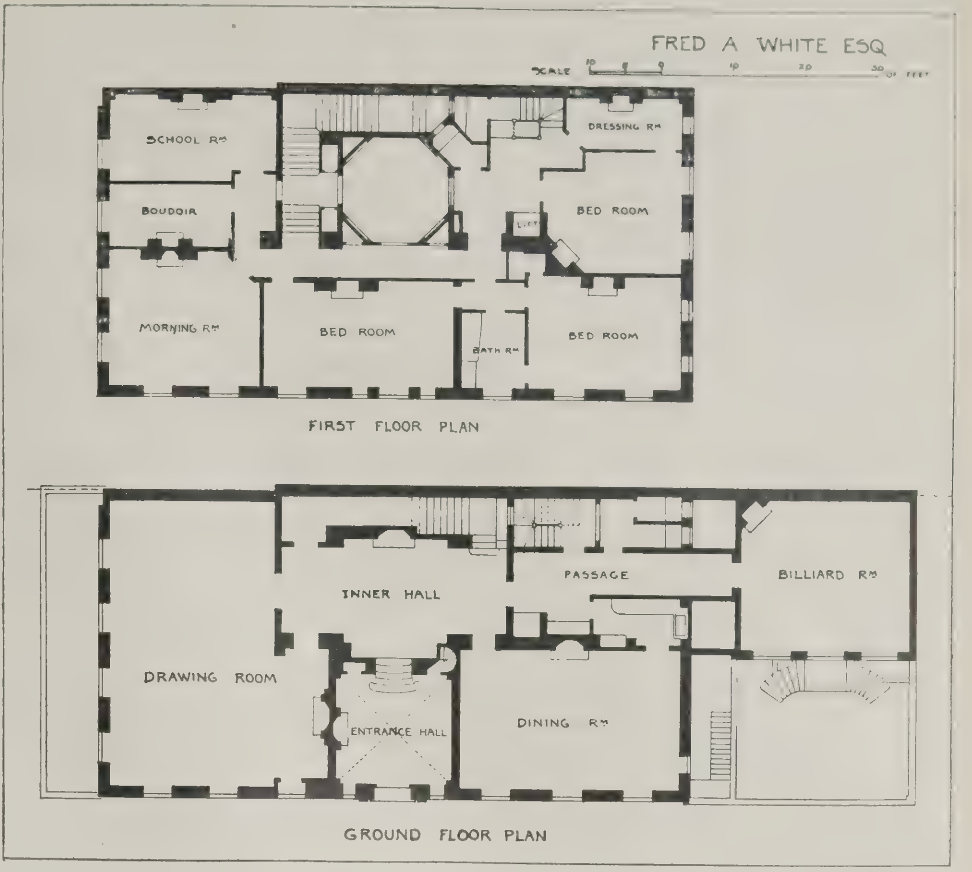
Note.—The author has made one or two quotations in this paper from a paper read by him at the Architectural Association in London in February, 1907, entitled "Some Aspects of Training and Design."

Some of the other modern house work shown on the walls was done by the late W. E. Nesfield, who was a contemporary of Mr. Shaw's early days. There was also recent work by Mr. Ernest Newton, Mr. Reginald Blomfield, Mr. E. J. May, and others, all showing the development of the qualities I have mentioned, and which speak for themselves.

Methods of Education.

The slight sketch I have given you of the development of modern English architecture to the present day will, I hope, make clear the necessity for a thorough strengthening of our existing methods of education. In that lies the best hope of the development of our architecture on right lines, and the ultimate achievement of a real national architecture.

We have in us the same spirit which animated the excellent and wise old Ambassador Sir Henry Wotton, who, in his "Elements of Architecture," published in the year 1624, lays down the dictum that "In Architecture as in all other operative Arts, the end must direct the operation. The end is to build well. Well building hath three Conditions—'Commodite,' Firmnes, and Delight." We shall have no architecture if we do not foster our artistic spirit.



This house was built in the 'eighties. Attention may be called to the able way in which Mr. Shaw has secured a roomy "Inner Hall" lit by a fine domed light.

PLANS, HOUSE FOR MR. F. A. WHITE, QUEEN'S GATE, LONDON, R. NORMAN SHAW, R.A., ARCHITECT.

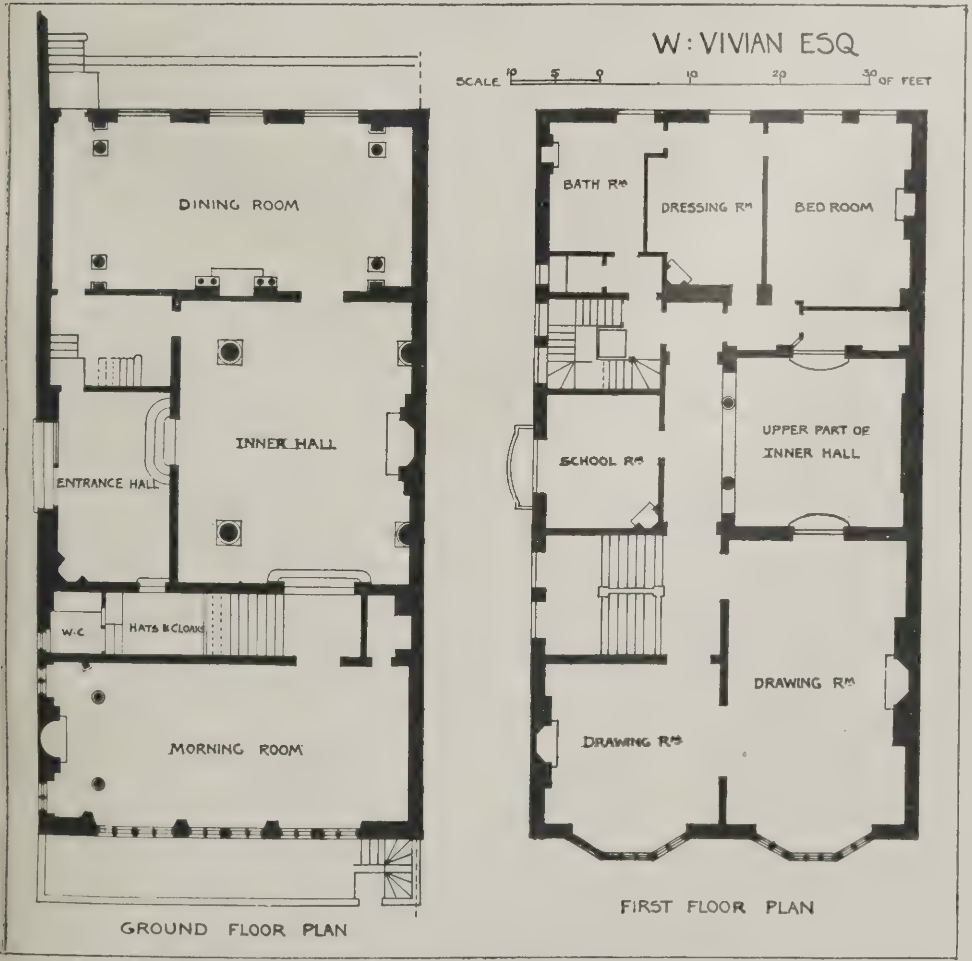
To attain this we need an extension of the training we give our students in our offices and our schools. The Board of Architectural Education, which has done so great a work during the last four or five years, is shortly to be reconstituted. Up till now it has dealt with architectural education on the basis of a four years' studentship, i.e., two years' preliminary work in the school, and two years' work as an articled pupil in an office with school training in the evenings. Very few men can do with only four years' training before practice, most of us by serving as improvers and assistants after pupilage have spent a good ten years in preliminary training.

However, the Board has not in its syllabus prescribed for the full training of architects. It says in that document "The Board desires to point out that its object is to lay a sound foundation on which the student can continue his training in later years. The Board cannot contemplate the complete equipment of an architect as possible in a four years' course. Its object is to start the student on those lines of study which will best enable him to attain to some proficiency in the art and practice of architecture."

The proposals of the Board are therefore incomplete. It makes no suggestion or provision for the training of the student after the four years. It is to be hoped this important matter will be considered, and some suggestion made in a future syllabus issued by the Board.

The Work of the Schools.

In a speech lately made by Sir Aston Webb at the opening meeting of the session at the Architectural Association in London, speaking warmly of the good work done by the schools of the Association, and of other schools in the country, such as that at Liverpool and in your own city, he said he hoped there would be in the future a closer connection between these schools of architecture which have been recognised by the Board of Architectural Education and the architectural school of the Royal Academy of Arts.



This house was also built in the 'eighties, and the same remark as to the planning of the "Inner Hall" applies here as in the case of Mr. White's house.

PLANS, HOUSE FOR MR. W. VIVIAN, QUEEN'S GATE, LONDON. R. NORMAN SHAW, R.A., ARCHITECT.

To my mind the suggestion is a most pregnant one; as it has always appeared to me that, given an extension of the admirable teaching already existing in the Royal Academy, which is the Senior Institution of Artists in this country, and full of artistic associations and of a fine tradition, we should have in it our University of the Fine Arts, our equivalent to the French Ecole des Beaux Arts, without which I do not think we are likely to progress satisfactorily.

I think our architectural schools generally ought to progress more on what I may call Ecole des Beaux-Arts lines. We want more opportunity for our senior students to practise as the French students constantly practise in design. "Projets" and "concours" are some of the chief means in France by which the young architect is trained. We want more of this here; without it, we may secure plenty of that "Commoditie" and "Firmnes" thought so necessary by Sir Henry Wotton, but we shall have but little "Delight."

There are some amongst us who, because all great architecture has been the result of experiment in building, hold the view that we should not trammel the "young idea" with definite instruction in the "orders," or in principles of proportion, but concentrate all our efforts on educating our youth in methods of building, and on so familiarising them with the nature of materials, and with their proper handling and use in accordance with that nature, that they should never be employed in a way unsuitable or unnatural to them. The question of design in each case is left largely to follow on the proper use of the materials employed. This view ignores any systematic training in design, which, in the face of the evidence we have, is a pity.

Experiment in Architecture

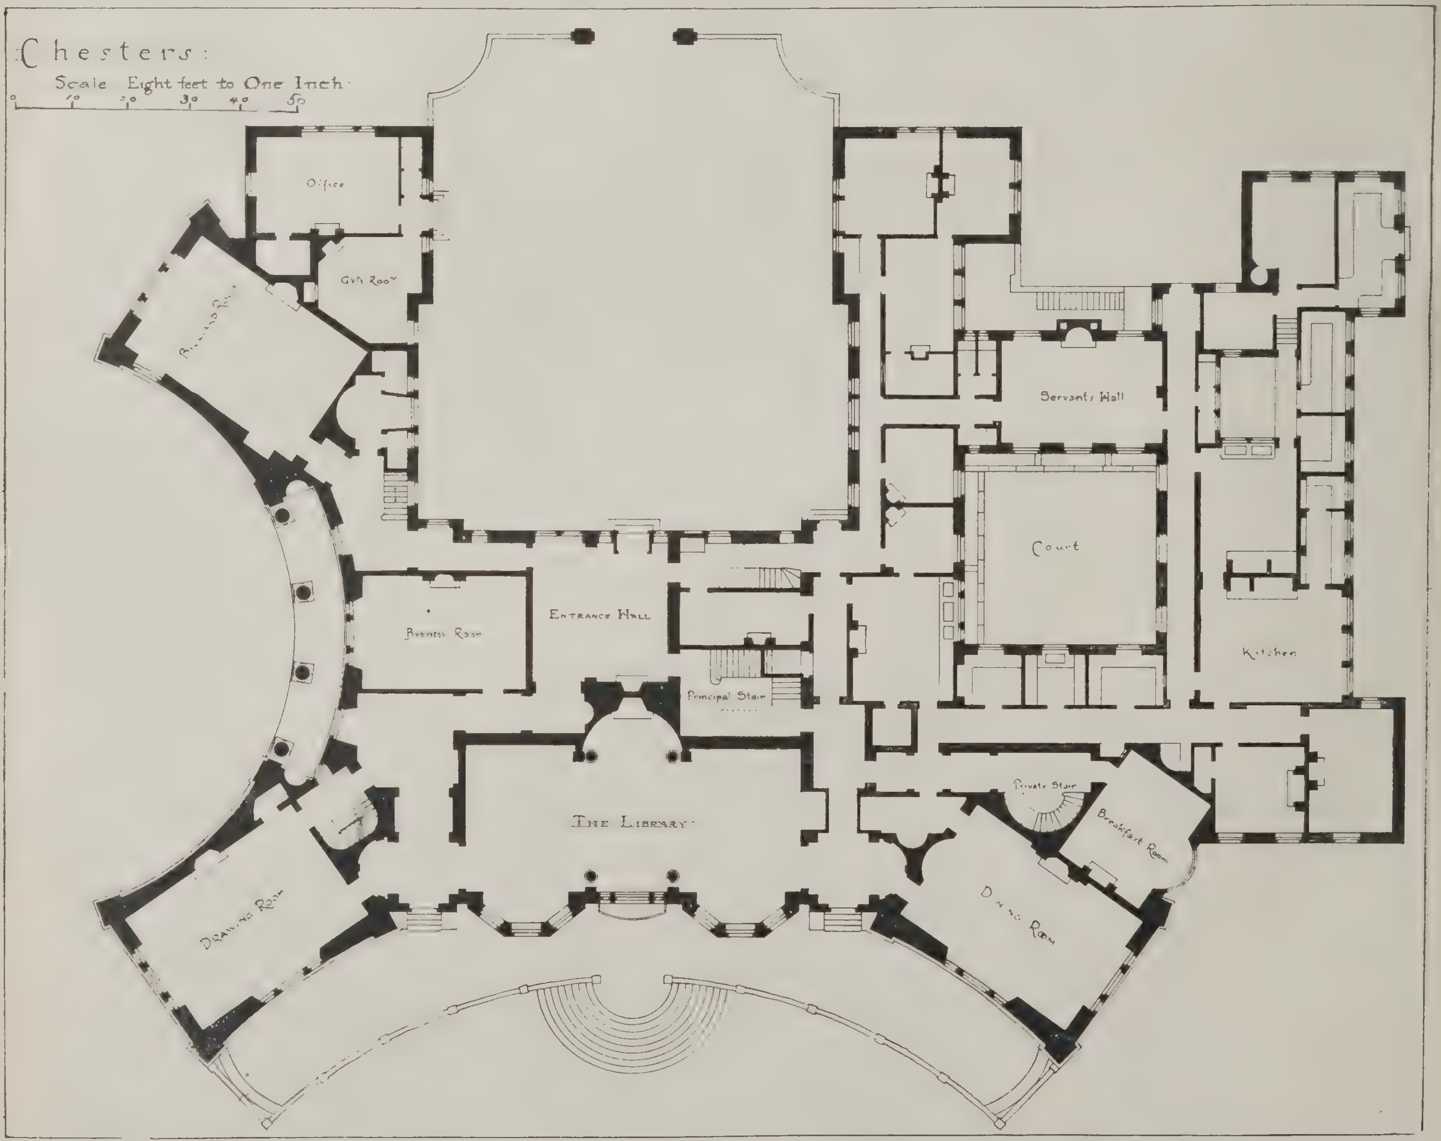
is but another word for the materialisation of ideas in building, and may be a manifestation of genius; on the other hand, it may be something very different, which might have been prevented by fuller training. A French architect has said: "The object of the French training is to render the student receptive, to make him fruitful in design, and imaginative. By making the training very general in character, it hopes to foster that gift with which all artists should be born, namely, the gift of having ideas." Surely, this is what all training ought to do!

We are sometimes told that the great difference between the architecture of the past and the architecture of the present is that the former was the work of people who were naturally all artists, whereas at present work is done by people who are not artistic; that, indeed, frequently the only person engaged upon a building who is an artist is the architect, and that more frequently than not he is not an artist at all.

Canons of Taste.

According to our canons of taste and judgment the artistic gift in the past varied in quantity very considerably. But the fact remains that at the present day we suffer, generally speaking, from living in an inartistic age; and the artists among us have consequently filled the role of prophets, and have had to fight in the execution of their work, for freedom to express their artistic convictions. But this condition of things is becoming better. Our writers and speakers on art have begged for the education of the public as well as for the education of artists, and a great deal is being done. But, as has been truly said, the best instructor of the public is the work of the artist.

[Our readers, we are sure, will share our indebtedness to Mr. Gerald C. Horsley, for the plans by Mr. Norman Shaw, which, by the courtesy of Mr. Horsley, we are enabled to show on pages 98, 99, and 100. The elevations of Mr. Norman Shaw's work are everywhere to be seen and studied and criticised; but his plans are less easy to come by. Yet they are at least equally worthy of attention; for it is not alone on his attractive and individual elevations that Mr. Norman Shaw became the most potently influential designer of modern domestic work. He is consummate master of the rarer art of convenient planning. In particular he seems to revel in the solution of the difficult problems. The more awkward his site, the greater his triumph in the plan evolved. Problems which would daunt and depress most men seem merely to have stimulated and inspired him; and his buildings derive perhaps most of their distinction from the fact that in every case that we can recall the elevation is as it were an organic development of the plan. It is safe to say that all Mr. Norman Shaw's success is based on his fidelity to this fundamental principle. Hence the plans we show are of unusual value and interest.—Ed.]



This, though apparently a complete plan, is an addition to an eighteenth-century small square house, and is quite one of Mr. Shaw's most stately and finest plans. This building was carried out in the 'nineties.

GROUND PLAN, CHESTERS, NORTHUMBERLAND. R. NORMAN SHAW, R.A., ARCHITECT.

SOCIETIES' REPORTS.

Guild of Architects' Assistants.

By kind permission of the architects, Messrs. Lanchester and Rickards, a visit to the Wesleyan Centenary Hall at Westminster took place on Saturday, July 9th, which was greatly appreciated by all who attended. Mr. E. C. Howell, the clerk of works, kindly conducted the party over the works, and gave much interesting and detailed information concerning the reinforced concrete and the general construction of the building. The stonework, its mouldings and carvings, were much admired. The probable omission of the fine towers on the main front, due to a question of light with the Westminster Hospital, was greatly deplored. The great hall, with its balconies and seating tiers in reinforced concrete and hollow brick, caused much interest on account of its novel and ingenious planning. An instructive visit to this fine addition to the monumental structures of modern London concluded with a hearty vote of thanks to Mr. E. C. Howell and Mr. Elliott, who represented Messrs. Dove Bros., the contractors. Mr. E. C. Howell, in reply, said he had always taken a great pleasure in explaining and giving information to all students of architecture, and that the pleasure his visitors had derived was equally shared by himself, and he would be glad to conduct a second visit at a later stage of the work.

Society of Architects.

By invitation of Messrs. Robt. Ingham Clark and Co., a party of members of the Society of Architects visited the works at West Ham on July 7th. The party assembled at Stratford, where they were met by Mr. Clark, and were driven to the works in brakes. Here they were joined by Mr. Wood, and the manager, Mr. Bamford, and were divided into two parties, in charge of the directors and manager, who took the greatest trouble to explain in detail the various processes. After the tour of inspection, the party were invited to take refreshments in a marquee, where Mr. Percy B. Tubbs, F.R.I.B.A., Vice-President, expressed to the directors the thanks of the members for a most interesting and profitable visit. The proceedings concluded with an inspection of the fine staircase and other interior work in the offices.

Society of Engineers.

On Tuesday, July 12th, a party of members of the Society and their friends, by kind permission of Mr. Maurice Fitzmaurice, C.M.G., M.Inst.C.E., Hon.F.S.E., inspected, under the guidance of Mr. J. E. Worth, District Engineer, the works now in progress in connection with the Northern Low Level Sewer No. 2. With the great increase in the population of London, it became clear that Sir Joseph Bazalgette's scheme of intercepting sewers would require extension, therefore the London County Council in 1899 decided to enlarge the main drainage system. The works of extension, which have been completed or are now being carried out under the direction of Mr. Maurice Fitzmaurice, C.M.G., M.Inst.C.E., the Chief Engineer to the Council, include on the north side of the Thames two new outfall sewers, each 9ft. by 9ft., which have been added to the existing lines (three) of outfall sewer, and are now in use; a new Middle Level sewer, No. 2, from Willesden to Old Ford, some 9 miles in length, which is also being used, and a sewer known as the Northern Low Level No. 2, which extends from Hammersmith to Bow, a distance of 12½ miles, parts of which are now under construction. This latter sewer between Hammersmith and Pembroke Gardens, Kensington, is constructed in brickwork, and commencing with a 5ft. barrel, increases in size to 6ft. 6in. diameter at this latter point, from which it is constructed in iron segments as far as Eastfield Street, Stepney. The diameter of the sewer in this section varies from 6ft. 6in. to 8ft. 6in. From Eastfield Street to the pumping station at Abbey Mills the construction is in brick and iron, the diameter increasing from 8ft. 9in. to 10ft. 6in. at the latter place, where the sewage will be lifted about 42ft. into the outfall sewers, along which it will flow to Barking Outfall Works. The depth of this sewer from the surface of the road varies from 20ft. to 70ft., and it lies chiefly in the blue London clay, although here and there water-bearing ballast is encountered. In these water-bearing sections it has been necessary to work with compressed air up to about 8lb. on the square inch. With respect to the construction of the portion of this sewer in iron, the segments are tapered on curves to the correct form, all the faces are machined, and liquid grout is employed under pressure to form a solid backing. The ironwork is lined throughout with 3 to 1 concrete, and the invert from springing to springing with 4½in. blue brick. The work is carried on night and day, and in twenty-four hours the tunnel advances by about eight rings, each ring amounting to 1ft. 9in. of distance. At the Pont Street shaft, where the visit was made, the whole of the work is being carried out under compressed air with a shield.

Builders' Benevolent Institution.

The sixty-third annual general meeting of the Builders' Benevolent Institution was held at 31 and 32, Bedford Street, Strand, W.C., when the president (Mr. Howell J. Williams, J.P., L.C.C.) presided.

In the sixty-third annual report, the Committee of Management deeply regrets the continued depression in the building trade generally, which is reflected in the diminution of contributions to the funds of the Institution. Every effort has been made to meet the emergency, but an additional sum of £500 worth of stock has had to be sold in order to meet the calls upon the Institution funds. Some modifications of pensions have been made in consequence of the introduction of State pensions. The Committee earnestly appeals for a continuance of the generous support upon which depends the entire or partial subsistence of the beneficiaries. The funds are administered with every necessary economy, and all needless expense is avoided. During the past twelve months, four additional pensions have been given, two being granted to the widows of deceased male pensioners. There are now on the list of pensioners thirty men and twenty-three women. One male and six female pensioners died during last year. The Committee thanks, most heartily, Mr. Howell J. Williams for his past valuable services as president and for his generous support; also the trustees (Mr. F. J. Dove, Sir Arthur C. Lucas, Bart., Mr. T. F. Rider, Mr. J. Howard Colls, Mr. T. Stirling and Mr. John T. Bolding, the hon. auditors (Mr. John T. Bolding and Mr. R. J. Ward, F.C.A.): and the dinner stewards. Mr. Wm. Willett has accepted the presidency for the coming year.

The audited accounts for the last twelve months were received and adopted, and the following elections were made: president, Mr. William Willett; treasurer, Mr. J. Howard Colls; hon. auditors, Mr. John T. Bolding and Mr. R. J. Ward, F.C.A. Committee of Management, Mr. J. T. Bolding, Mr. H. Northcroft, Mr. A. Ritchie, Mr. James F. Parker, and Mr. J. W. Chessum were re-elected; and Mr. Howell J. Williams, Mr. Edward Allen, Mr. A. H. Adamson, and Mr. Ben Carter were elected.

London Master Builders' Association: Annual Report.

A Council meeting of this association was held at 31 and 32, Bedford Street, Strand, W.C., at 3 p.m., on Thursday, July 14th, when the president (Mr. Leonard Horner) occupied the chair.

Reports from the Office Premises Committee and the Organisation Committee were received and considered, besides the report of a committee which met the President and Council of the Royal Institute of British Architects in conference.

Arrangements were made for the furnishing of the new offices in Kingsway, which will be entered in September, and new ordinary and associate members were elected.

Several trade matters of interest were discussed—*inter alia*, the Newport Dock strike, an application for a Working Rule Agreement from the Electrical Trade Union, overtime, provincial builders working in London, etc.—T. COSTIGAN, Secretary.

COMPETITIONS.

Police Buildings, Inverness.

For the proposed new police buildings in Inverness, the designs by Mr. R. J. Macbeth have been accepted. The cost of the work is estimated at £4,000.

Northwood Garden City Scheme.

With a view to securing the best possible plan for the proposed new garden city at Northwood and Ruislip, which is being promoted by Garden Estates, Ltd., they are instituting, in co-operation with the Provost and Fellows of King's College, Cambridge, the present owners of the land, a town-planning competition, in which the drawings will be arbitrated upon by Sir Aston Webb and Mr. Raymond Unwin. The plan of the successful competitor will be handed over to the company, and he will be invited to act as consulting architect.

Infectious Diseases Hospital, Dalkeith.

The design of Mr. A. Murray Hardie has been selected for the above building, which is estimated to cost about £4,000.

LIST OF COMPETITIONS OPEN.

AUG. 3. PEMBROKE (COUNTY DUBLIN). Tenders are invited by the Pembroke U.D. Council from competent persons for the execution of certain works in connection with the laying-out of Herbert Park, Ballsbridge, Pembroke, Co. Dublin. (J. C. Manly, Clerk to the Council, Town Hall, Ballsbridge, Pembroke, Co., Dublin.)

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to architects practising in Coventry. Particulars given in our issue of March 16th.

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglican Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. The competition will be confined to architects having an office or residing in the areas of the following education authorities: Cambridgeshire, Isle of Ely, Lowestoft, Norfolk, Norwich, East Suffolk. and Great Yarmouth. D. O. Holme, clerk of the Governors, Castle Chambers, Norwich.

SEPT. 1. CARNEGIE LIBRARY, KINGSTOWN, CO. DUBLIN.—The U.D. Council of Kingstown offer premiums of £50 and £2 respectively for the two best designs for the above to be erected at Lower George's Street. Particulars from Mr. J. Sherlock Vaughan, Town Clerk, Town Hall, Kingstown. Deposit one guinea.

SEPT. 5. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, together with a plan of site and sections at ground level, may be obtained from the engineer and surveyor, Mr. Samuel J. Harpur, Town Hall, Maesteg. Designs must be deposited at my office by noon on Monday next, September 19th. Two premiums are offered, namely, 25 guineas and 10 guineas, as first and second respectively.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

NEW BUILDINGS.

PROPOSED.

Airdrie.—At a recent meeting of Airdrie Town Council, the resolution passed a month ago in favour of proceeding with the erection of a Town Hall for the burgh was unanimously confirmed. A central site has been adopted in Stirling Street at a cost of £1,600. The scheme is for a Town Hall costing, inclusive of site, about £10,000.

Barnet.—The Urban District Council has approved the following plans:—Two semi-detached houses, Ashurst-road; additions to Alpha House; additions to first and sixth houses east side of Bramber Road; motor shed, first house east side of Bramber Road; additions to No. 8, Chandos Avenue; amended plan for portion of Hilton Avenue; alteration to houses, Sutton Road.

Batley.—The Corporation has approved the following plans:—New drying rooms at Healey Lane Mills; house in Byron Street; new streets at Carlton Estate, off Thorncliffe Road; warehouse and offices at Victoria Mills; ten houses in Healey Lane and Upper Croft Road.

Blackpool.—A Local Government Board inquiry has been held at the Blackpool Town Hall, into the Corporation's application for sanction to borrow £3,560 for private street works.

Brighouse.—Plans which have been prepared by Mr. A. E. Kirk, of Leeds, have been received for the erection of a new drill hall at Brighouse, which is to be erected in Wakefield Road, adjacent to the drill field. It is to be a single storey building, 60ft. by 30ft., and besides the large parade hall there will be several smaller rooms, while in the basement will be a rifle range running the whole length of the building.

Cardiff.—It has been decided to rebuild the Windsor Place Presbyterian church, Cardiff, on the exact lines of the fabric destroyed by fire in February last. A cheque for £9,300 has been received from the insurance company.

Derbyshire. — The Derbyshire County Council at a recent quarterly meeting considered plans for the proposed new county offices, which were ultimately approved.

Gillingham (Kent).—The Works Committee of the Gillingham Council has approved the following plans:—Alterations to 88, High Street; five houses, Barnsole Road; sixteen houses, Granville Road; house, Nelson Road; two villas, Barnsole Road; two houses, Shakespeare Road; alterations to Cleveland House; house, Gillingham Road; house, Gordon Road, off Twydale Lane, at Rainham Mark.

Goole.—It has been decided to carry out the scheme for the proposed alterations at Goole Workhouse, which will involve an expenditure of nearly £4,000.

Heaton Moor (Stockport).—Plans and estimates have now been prepared for the decoration and improvement of St. Paul's Church, Heaton Moor, the total cost of which will be about £600, including electricity installation and improved heating apparatus. A reredos has been designed by Mr. R. B. Preston, diocesan architect, and is to be of marble and alabaster, at a cost of £176. The scheme of decoration of the church has been postponed, pending the erection of the reredos. It is hoped to complete the whole of the work by the autumn.

King's Norton (Birmingham).—The King's Norton Urban Council has decided, on the recommendation of the Baths Committee, to build a set of baths at King's Heath, consisting of a large and a small swimming bath, slipper baths, and Russian baths, at a cost of £12,000. The site is in Institute Road.

Liverpool.—The Liverpool City Council has approved a recommendation of the Health Committee that steps be taken for the closing or partial closing of certain highways. The thoroughfare to be entirely stopped is Tobin Street, which extends between Copperas Hill and Brownlow Hill, and the one to be partially closed is Warren Street, running from Tobin Street to Hawke Street. The recommendation is the outcome of proposals which have been embodied in agreements between the Midland Railway Company and the Corporation with respect to Corporation property in the neighbourhood of the Adelphi Hotel, to enable the Midland Railway Company to proceed forthwith with their great scheme of hotel extension.

Liverpool. — The Mersey Docks and Harbour Board scheme for the construction of a new dock at Liverpool, to accommodate vessels of 1,000ft. in length, s approved. The Works Committee, which has had the scheme under consideration, recommended the construction of works estimated to cost £500,000. This recommendation was unanimously adopted. The scheme includes a dock about 1,020ft. long, an entrance 120ft. wide, and a sill laid at a level of 25ft. below the old dock sill and so constructed as to be available, when specially required, as a graving dock. The floor will be laid in concrete at a level of 29ft. below the old dock sill.

London, N.—The following plans have been approved by the Plans Committee of the Hornsey Borough Council:—Alterations and additions to No. 18 Turnpike Lane, North Harringay; conservatory at the rear of "Pinner Cottage," Colney Hatch Lane, Muswell Hill; nine dwelling-houses in Chestnut Avenue, Hornsey; conservatory at the rear of No. 3, Quernmore Road, Stroud Green; alterations in and additions to No. 57, North Hill, Highgate; thirteen domestic buildings, each containing two separate dwelling-houses, in St. James's Lane, Crouch End; alterations in and additions to All Saints' Church House, Highgate; motor garage in Dashwood Road at the rear of No. 67, Ferme Park Road, Stroud Green; dwelling-house in Woodside Avenue, Muswell Hill; schoolroom at the Baptist Church, Archway Road, Highgate; two dwelling-houses in Southwood Lawn Road, Highgate.

London, N.—Mr. T. Harold Gibbons, A.R.I.B.A., has prepared plans for the completion of St. Augustine's Church, Highgate, which will involve an estimated expenditure, including new vestries, of about £8,000. The present portion of the church was erected in the year 1896.

London, S.E.—The London County Council has passed the amended scheme for the building of the new bridge over the railway at Catford, and it is expected that an early start will be made on the structure.

Lostwithiel (Cornwall).—It was decided at a recent meeting of the Town Council to erect a new Town Hall and municipal buildings on the Grammar School site, and to let the present Guildhall.

Lowestoft.—The following plans have been approved by the Rural District Council:—Public-house, Corton Road, Pakefield; two cottages, London Road, Pakefield; house, Grand Avenue, Pakefield; three cottages, Gorleston Lane, Bradwell; dwelling house, Hall Lane, Oulton.

St. Germans (Cornwall).—At a recent meeting of the Town Council the Chairman was authorised to sign plans for a new Town Hall, to be built at St. Germans by Lord St. Germans. The architect is Mr. J. Sansom, of Liskeard, and the contractors are Messrs. Runnalls and Sons, also of Liskeard. The old Town Hall will be demolished, and the site will form part of the site of the new hall. The new building will include a large hall 51ft. by 21ft., and will accommodate 200 people; also a billiard room 18ft. by 24ft., a reading room 14ft. by 21ft., a lobby and retiring room. The building will be of stone and ornamental bricks, and will be heated by hot water.

Rhyl.—Designs have been prepared and a faculty has been obtained for the conversion of the south transept of St. Thomas's Church, Rhyl, into a side chapel. There are also to be built, apart from the church, but connected with it by a cloister, clergy and choir vestries. The proposed buildings have been designed by Mr. Oldrid Scott.

IN PROGRESS AND COMPLETED.

Beverley.—The new Baptist Church, situate in Lord Roberts Road, has been opened on completion, and was erected at an estimated cost of £4,000. The building is of Gothic design, Messrs. Potts and Foley, of Beverley, being the contractors, and Messrs. Garside and Pennington, of Pontefract and Castleford, the architects.

Birmingham.—The City Council have accepted the tender of Messrs. John Dallow and Sons, for the erection of the fire station in Moseley Road at a cost of £10,789, and the work will be proceeded with immediately.

Burton-on-Trent.—The new church of St. Chad, the gift of the late Lord Burton, has been consecrated by the Bishop of Lichfield. The church is of fourteenth-century Gothic architecture, and the general scheme of construction was the erection of a building of red Hollington stone, both inside and out, with carved English oak ceilings, floors, screens, and stalls. The nave is 84ft. long and 48ft. wide, the chancel 46ft. by 22ft., and the morning chapel 56ft. by 15ft. The main entrance is beneath the tower, the nave aisles being of Hopton wood and Portland stone. The total cost of the building, which will seat 700 persons, is between £50,000 and £60,000, and the erection of the superstructure has been in progress some three years. The architects were the late Mr. G. F. Bodley, R.A., and Mr. Cecil G. Hare, the building contractors being Messrs. Willcock and Co., Wolverhampton. The carved woodwork was executed by Messrs. Rattee and Kett, Cambridge, and the carved stonework by Messrs. R. Bridgeman and Co., Lichfield.

Caversham (Reading).—The foundation-stone has been laid of the new church at Caversham, situate on a site at the junction of Harrogate and Albert Roads. The church will consist of chancel, vestries, nave, north and south aisles, and will provide accommodation for about 300, and it has been so proportioned that it can be extended to the west to accommodate another 200. Space has also been left on the south aisle of the chancel for a Lady Chapel. The general design is Perpendicular Gothic. The exterior is to be faced with Bargate stone built in random rubble with Bath stone dressings, the roofs being covered with Westmorland green slates laid in diminishing courses. The interior will have Bath stone arcading and dressings, the remainder of the walls being plastered and finished with a rough surface. The nave arcade, which will consist of octagonal columns with four centred moulded arches, will be carried up to form a clerestorey, and will be finished with a low-pitched ceiling, with roof trusses. Mr. James Haslam, M.S.A., and Mr. Ernest Ravenscroft are the joint architects, and the builders are Messrs. Wheeler Bros., of Caversham Road. It is estimated that the cost of erecting the church will be £5,000.

Lavenham.—For the past twelve months the parish church of St. Peter and St. Paul has been undergoing restoration and repair, under the supervision of Mr. W. D. Caröe, F.R.I.B.A., at a cost of £2,250. The work of restoration has included general repairs to the tower, the relaying and renewing, where necessary, of the lead in the roof, repairs to the carved Oxford parclose, the installation of a heating system, and the erection of a new choir vestry. The heating apparatus was installed by Messrs. Wippell, Bros., and Row, of Exeter, and the other work had been carried out by Messrs. Collins and Godfrey, of Tewkesbury. Extra expense had, however, to be unexpectedly incurred, owing to the discovery of dry-rot in the flooring of the church, and this necessitated, to prevent the dry-rot spreading to other and more important parts of the building, the reflooring of the entire building, at a cost of a further £150.

Lenzie.—The new Academy erected jointly by the School Boards of Kirkintilloch and Cadder at Lenzie, at a cost of about £6,500, has been opened by Dr. Andrew, Chief Inspector of Schools. Only the north wing of the old building has been retained, the rest of the structure being new. The Academy faces Kirkintilloch Road and Fern Avenue, and in it ample provision has been made in accommodation and equipment for an elementary school, higher grade department, and junior student training centre, recognition as such having just been granted by the Department. Mr. Baird, of Glasgow, is the architect.

Liverpool.—A beginning has been made with the building of the Lathom Memorial Chapter House of Liverpool Cathedral, which is to be erected by the West Lancashire Province of Freemasons in memory of the first Earl of Lathom, Grand Master of the Province. The estimated cost is £10,000.

London, N.W.—The foundation-stone of the new Presbyterian Church now in course of erection at Golders Green, has been laid by Lady Shaw, of Dunfermline. The design of the church is in the Perpendicular Gothic style, and provides accommodation for nearly 600 persons, but the two transepts, organ chamber, and various lecture halls, are not included in the portion now building, which consists of the nave, chancel, entrance porches, vestry, and heating chamber. The nave and chancel will be 88ft. long by 38ft. wide between piers. The walls both externally and internally will be faced with the best Suffolk red bricks, with Monks Park stone dressings to the windows and arches of the arcades. The roof will be of steel with a plaster vault, panelled with moulded ribs, and covered externally with sand-faced red tiles. Messrs. Fryer and Co., of Paddington, are the contractors, Mr. T. P. Figgis, F.R.I.B.A., being the architect.

London, S.W.—The new Westminster disinfecting station, which was erected by the City Council at a cost of £9,921, has been opened by the Mayoress of Westminster, and is situated at Grosvenor Canal, close to Chelsea Bridge. Mr. J. Murray, F.R.I.B.A., was the architect, the contractor being Mr. C. F. Kearley, of Great Marlborough Street, W.

London, W.—The foundation-stone of the Ealing Hospital, which is in course of erection in the centre of the district, at a cost of £25,000, was laid by Lord Rothschild on Wednesday, July 6th, 1910. The architects are Messrs. Hall-Jones and Cummings, Parliament Mansions, Victoria Street, S.W. Messrs. Dolby and Williamson, of 8, Princes Street, Westminster, are the consulting engineers for the engineering works. The contract for the heating and hot-water service has been entrusted to Messrs. R. H. and J. Pearson, Ltd., of 145, High Street, Notting Hill Gate, W., and the work is now well in hand. The heating is being carried out by hot water with reinforced circulation, and the hard water supply from the mains will be softened before use.

London E.—Sir George Reid, the High Commissioner for the Australian Commonwealth, has laid the foundation-stone of a new hospital at Dr. Barnardo's Village Homes for Girls at Barkingside, which is in course of erection at a cost of £18,000.

London, E.C.—The first portion of the Embankment tramway shelter is now in position. When complete the cover will be 180ft. long, and will consist of a central portion of 80ft. in length, with a covered queue 50ft. long at each end to regulate the access of the public to the cars. The queue at either end of the refuge will have four divisions, the two queues together providing for eight different car services. This arrangement will provide a length of 180ft. under cover, and will enable three cars to take up passengers opposite the shelter at the same time. The total cost will, it is estimated, be £1,200. The part of the shelter now erected only extends for a distance of 20ft. It is designed as an experiment, and upon its success or failure depends the completion of the work.

London, S.E.—Steady progress is being made in the erection of the new King's College Hospital buildings at Camberwell. The out-patient, casualty, and bathing departments have been finished, except for the interior work now in hand, and the administration block has reached the ground-floor level. Three contracts, therefore, have nearly been fulfilled. The first was for the sum of £65,658, in respect of the out-patient and casualty sections; the second, for the sum of £10,301, was signed for digging the foundations of the whole of the administration block, the chapel, and the central heating station; the third, for the sum of £14,540, was for the work now being effected on the adminstration block. Building operations were started in March, 1908, and it is hoped the new hospital will be ready for completion in about three years from now. Two wards at the rear of the administration block will next be undertaken, and the chief sections then remaining to be dealt with will be seven medical and surgical wards, two special wards, the isolation block, the medical school and pathological department, and the mortuary. Of the £300,000 appealed for to carry out the scheme of removing this hospital from Portugal Street to South London £65,000 is still required.

London, W.C.—The plans for the Palace of French Industries in Aldwych and the Strand have at length been passed by the L.C.C., practically as submitted, and the building work is to be begun next October. It is hoped the palace will be completed early in 1913. The building will cost £800,000 to erect, and its style will be French Renaissance. The palace and the outer buildings connected with the general scheme will occupy 3¼ acres; the main front in Aldwych, with a central dome—will be 450ft. long; on the Strand side it will be 430ft. long; and the average depth will be 300ft. Just under the dome there will be a tympanum, with a bas relief, symbolising the entente cordiale, and showing the historic meeting between King Edward VII. and President Loubet. The palace itself will consist of a central hall, to be used as a permanent exhibition of French arts and industries. This hall will also be used for conferences, banquets, and other public gatherings. The palace building will include, on the west side, a bijou theatre, to seat 800, while on the east side will be a cafe restaurant, to which will be attached a winter garden. Gardens will surround the central building, and in the gardens a patisserie, tea rooms, and open-air café after the Parisian style are to be established. These gardens will separate the palace buildings from the outer structure, in which there will be 800 suites of offices, and all the ground floor will be divided into a hundred shops.

London, N.W.—The Bishop of London has consecrated the new church of St. Michael, Cricklewood, which is in the Decorated Gothic style, and has seating accommodation for 750 persons. It is built of stone, and it is intended to erect a tower and spire rising to a height of 160ft., on the north-west corner of the nave. The total cost is estimated at £11,000.

London, S.W.—The directors of the Anglo-American Oil Co., Ltd., have secured a site at the Corner of Birdcage Walk and Queen Anne's Gate, for their new offices. The building, which is now on a fair way towards completion, is in the style of the English Renaissance, and is eight storeys high in all. The total number of offices and rooms, many of which are extremely large, is well over one hundred. Mr. Ernest Runtz is the architect, Messrs. Holloway Bros., Ltd., are the principal contractors, Messrs. Redpath, Brown, and Co., are carrying out the constructional steelwork, and Messrs. Dent and Hellyer are supplying the sanitary fittings.

Lynton. — The new Wesleyan Church, situate on a site adjoining the Town Hall, has been opened on completion, and was erected at a total cost of £3,300. The church which will seat 300, is of local stone, dressed with Bath stone, the style of architecture being Late Gothic, with traceried windows and an open timbered roof. Messrs. La Trobe and Weston, Bristol, were the architects, and Messrs. Bovey and Sons, Torquay, the contractors.

Lythe.—The work in connection with the restoration of St. Oswald's, the Parish Church at Lythe, is now in progress, and the structure is completely in the hands of the contractors, Messrs. Rudd and Son, Limited, of Grantham, whose contract price is £7,300. The work comprises the pulling down of the well facing the road, and the wall at the west end. The tower, which is situated at the west end of the building, is to be taken down and rebuilt, and a new south aisle is also to be provided. Mr. Walter J. Tapper, London, is the architect.

Mumbles (Glam.) — The new Baptist Church, erected at a cost of £2,000 from the designs of Mr. H. A. Ellis, M.S.A., has been opened Messrs. J. and D. Jones, of Swansea, being the contractors.

Newcastle.—The foundation-stone has been laid of new parochial buildings in connection with St. Mark's, Byker, which are to take the place of the old buildings adjoining the church on Byker Hill. Mr. A. B. Plummer, F.R.I.B.A., architect and diocesan surveyor, has designed the buildings.

Newport.—The new Technical Institute, situate within a short distance of Newport Bridge, is approaching completion, and will probably be opened in September next. The buildings were designed by Mr. Chas. F. Ward, A.R.I.B.A., Newport borough architect, and are being erected by Mr. W. E. Blake, Plymouth, at a cost of £36,130.

Pencader (Carmarthen).—The new chapel which was recently opened, accommodates 450 people, and cost £1,500 inclusive of the site. The building is in the Gothic style of architecture, and was erected by Mr. John Evans, contractor, Llanybyther, from the designs of Mr. A. I. Jones, architect, Carmarthen. It is of local stone, with Bath stone dressings

Pontefract.—The new High School for Girls, which is in course of erection at an estimated cost of £11,000, will provide accommodation for 200 pupils, and the foundation-stones were recently laid. Messrs. Tennant and Collins, Pontefract, are the architects, and the contractors Messrs. Stephen and Thos. Kelsey, Goole.

Ribbleton (Preston).—St. Mary Magdalene's Church Sunday School is in course of erection at a cost of £1,000, Mr. H. D. Hartley being the architect. The contractors are:—Messrs. Croft and Sons, builders; Mr. R. N. Hall, joiner; Messrs. W. Cook and Son, plasterers; and Mr. R. Hodgson, plumber.

Sheffield.—The new Post Office situate in Fitzalan Square has been completed, after three and a half years' work, and is built in the Renaissance style, of stone from the Stancliffe quarries, Darley Dale. Mr. Walter Pott, of H.M. Office of Works, designed the building, which has been erected under the superintendence of Mr. W. T. Bowman. Apart from the cost of the site, the building and furnishing involved an expenditure of £60,000, and the electrical equipment has cost an additional £10,000.

Sunderland.—Lord Barnard has laid the foundation-stone of the new St. Gabriel's Parish Church, which is in course of erection from the designs of Mr. C. A. Clayton Greene. The church is being built in four sections. The first section to be erected consists of chancel and schoolroom to hold 300 underneath the chancel, vestries, transepts—including a morning chapel—two-thirds of the nave with a temporary brick gable at the west end of the church, to hold 650 people, together with seating accommodation, at a cost of £9,800. The completion of the nave and the provision of seating room for 850 people, which constitutes the second section, will entail a cost of £1,600. The third and fourth sections comprise the addition of the narthex and cloakrooms, which will mean a further expenditure of £780, and the erection of the tower to cost about £900. The total cost of the scheme is about £13,000. Mr. W. D. Allison, contractor, Whitburn, is carrying out the present portion of the scheme.

Walton-on-Thames. — The new pumping station of the Metropolitan Water Board at Walton-on-Thames, a short distance below Sunbury Lock, the construction of which was started about two years ago, is now practically completed, and it is expected that it will be in running order at the beginning of September. The station is erected on a site in the Hurst Road, with a frontage of 230ft., and a depth to the river of about 1,800ft. The main building, which has been constructed of red brick and Portland stone, measures 120ft. by 22oft., and comprises engine house, boiler house, and fitting shop. It is 30ft. high to the eaves, and is surmounted by a three-span roof, one span being over the engine house, and two over the boiler house and coal bunkers. The scheme has been executed to designs prepared by Mr. J. W. Restler, the deputy engineer-in-chief to the Metropolitan Water Board, and has involved a total cost of about £140,000. The Thames Ironworks Shipbuilding and Engineering Company (Limited) were the main contractors for the machinery, boilers, etc., and supplied the steam engines from their Greenwich works. The building, chimney, and culvert were constructed by Messrs. Dick, Kerr, and Co. (Limited), the intake and sluices were built by Messrs. John Aird and Sons, the boilers, coaling crane, etc., were provided by Messrs. Babcock and Wilcox, the ropeway by Ropeways (Limited), and the hydraulic turbines by Messrs. Gilbert Gilkes and Co. (Limited).

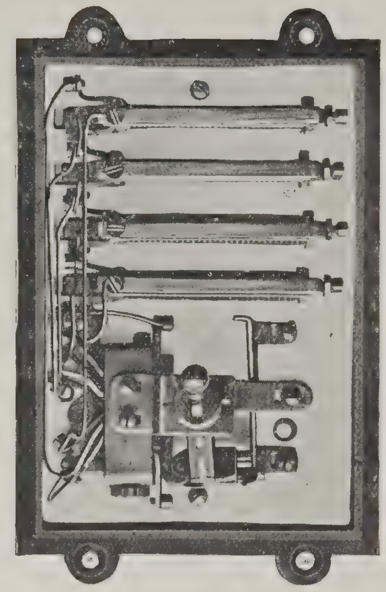
Yaxley (Hunts).—The Bishop of Peterborough has reopened Yaxley Parish Church, Hunts. which has been restored at a cost of nearly £8,000, under the supervision of Mr. Temple Moore, F.R.I.B.A. The restoration included the underpinning of the foundations, the re-roofing of chancel and nave, the repair of tower and spire, and the reglazing of the windows throughout.

Ynyshir (Glam.).—The Moriah Chapel, Ynyshir, which was recently opened is built of local stone with grey Forest of Dean stone dressings, at a cost of £4,000, and is situate on the main road at Ynyshir. It is elevated and set back from the roadway and provides seating accommodation for 750, with a vestry providing seating accommodation for 320. The architect was Mr. R. S. Griffiths, M.S.A., of Tonypandy, and the builder, Mr. David Richards, of Ynyshir.

TRADE AND CRAFT.

A Current-Controlling Switch.

Regulation of the supply of electric current so that it can be as completely under control as that of gas has been for years past a baffling problem, which, however, has now been solved, a switch performing the controlling and current-saving function having been patented, and being now on the market. The Watkin switch, as the instrument is called (it is manufactured by the Adams Watkin Co., Ltd., 36, Victoria Street, London, S.W.), economises electric current used for any purpose, according to the amount of energy required. No less than seven variations in the current-saving capacity of this switch can be obtained; and further variations of energy can be had if specified. Any number of electric lights can be regulated by means of one switch, in precisely the same way that gas is controlled. Electric fans, irons, radiators, cooking utensils, surgical appliances, motors, etc., all are capable of this reduction of current consumption and consequent decrease in the cost of power supply. A Faraday House report upon the switch by the Electrical Standardising and Testing Institution, states that "The switch was connected in series with a bank of lamps on a 210-volt direct-current circuit, the current taken by the lamps being 0.62 ampere. The total watts absorbed by the circuit with the switch on each of the seven stops were measured, and the following table gives the results :—



THE WATKIN SWITCH.

Stop.	Tot. Watts.	Stop.	Tot. Watts
1 ...	27.3	5 ...	92.4
2 ...	40.9	6 ...	114.4
3 ...	60.9	7 ...	130.2
4 ...	77.6		

"An alternating pressure of 1,000 volts was applied between the switch and the frame. This was maintained for 15 minutes without the insulation breaking down."

Carbon filament lamps were used in this test, and the firm claims that the results to be obtained from metallic filament lamps are even more satisfactory. This latter type of lamp has considerably reduced the cost of light; but lamps of a low candle power cannot be made for high voltage. The Watkin switch should prove invaluable as an economiser of current. The full power of a lamp is frequently required for but short periods, and it is impossible to restrict its consumption of current when a more subdued light is desired. It is in this respect, therefore, that the switch will perform admirable service, and effect a saving in current of from 12½ to 80 per cent. The use of the switch considerably prolongs the life of electric lamps. The accompanying illustration shows the switch-box with its construction revealed.

Messrs. Smith, Major, and Stevens, Ltd.

We are informed that Messrs. Smith, Major, and Stevens, Ltd., owing to the rapid increase in their business as lift manufacturers, have for some time past found their Battersea premises very inadequate for their growing needs, and have been compelled to provide new works, which are now in course of erection at Northampton. A spacious plot of land has been secured, affording ample opportunity for farther expansion, and it is intended that the new premises shall embody not only the most modern manufacturing improvements, but shall provide also for the greater comfort and health of the workmen and staff. It is hoped that all will be ready for occupation in the autumn. A portion of the staff and a considerable number of workmen will be retained in London in the interests of the extensive connection possessed by the company in the metropolitan district, where they and their predecessors have been established for 140 years.

Builders' Bookkeeping Standardised.

There is probably no class of business in which constant watchfulness over and close touch with all the details of profit and loss are more imperatively necessary than in that of the builder, who, however, as a rule, has, to his own considerable loss and inconvenience, refrained from availing himself to the full of modern business methods. There can be no doubt that a well-devised standardised system of bookkeeping would be of great advantage to the entire trade. We understand that the Builders' Office Organisation Co., of 15, Seething Lane, E.C., have devised and perfected a scheme which affords the builder an easy and expeditious means of setting his counting-house in order. The system has been exhibited and explained to us by its originator, and it appears to be quite simple and practical, securing clearness and certitude by dispensing with a great deal of clerical work that, in the light of this system, seems to be not only unnecessary, but confusing. The company provide a full working and detailed prospectus, which shows very simply and clearly exactly how entries should be made, so as to show how the business stands at any given moment with regard to labour, expenses, day-work, extras, omissions, merchantages, etc. The company not only supply the materials for carrying out the system, but, for an inclusive fee, give all the help that the subscriber may require in order to become fully competent in its use. Some of the points of value claimed for the standard system are: All totals of Dr. and Cr. are brought to a bulk sum at the end of any financial year without continually having to transfer from one book to another for summary, simplicity, effectiveness, and economy, there being only one posting from the setting-out book; the saving of twenty-five per cent. of clerical labour; several books necessary under other methods are dispensed with, the detail prospectus setting out the key to every item of outlay and income, so that at a glance every penny can be accounted for with the utmost accuracy, the clerk having no fewer than three direct checks in the working of the setting-out key; from this setting-out key there is but one posting first and last, and each week's posting goes to form a part of the grand total required for any financial year-ending. We are informed that the system has been examined by a builder of high standing in the Federation, and approved for adoption in his very extensive business. This gentleman writes: "If your system of bookkeeping were in general use, a very large proportion of builders would find it of immense value to them, both financially and otherwise. For smaller concerns we think it admirable, giving results that everyone ought to keep before him."

COMING EVENTS.

Wednesday, July 27.

Institution of Mechanical Engineers.—Summer meeting at Birmingham continues till Friday, July 29. London meeting at Institution of Civil Engineers, July 29th, 10 a.m.

Manchester Society of Architects.—Visit to the Oaks, Fallowfield. (Messrs. T. Worthington and Son, architects) 5.30 p.m.

Cambridge University Local Lectures.—Summer meeting at York. Revd. W. Marshall on "English Ecclesiastical Architecture. First lecture. 10.30 a.m. Dr. Hodgkin on "The Roman Wall from Tyne to Solway." 12. The Provost of King's College on "Stained Glass." 8.30 p.m.

Royal Sanitary Institute and Parkes Museum.—British Medical Association meeting visit to the New Premises of the Institute, 90, Buckingham Palace Road, S.W. 3-6 p.m.

Thursday, July 28.

Cambridge University Local Lectures.—Summer meeting at York. Revd. W. Marshall on "English Ecclesiastical Architecture." Second lecture. 10.30 a.m.

Friday, July 29.

Cambridge University Local Lectures.—Summer meeting at York. Revd. W. Marshall, on "English Ecclesiastical Architecture." Third lecture. 10.30 a.m.

Junior Institution of Engineers.—Visit to the New Pumping Station of London Hydraulic Power Company, Grosvenor Road, S.W. 6.30 p.m.

Saturday, July 30.

Cambridge University Local Lectures.—Summer meeting at York. Revd. W. Marshall, on "English Ecclesiastical Architecture. Fourth lecture. 10.30 a.m.

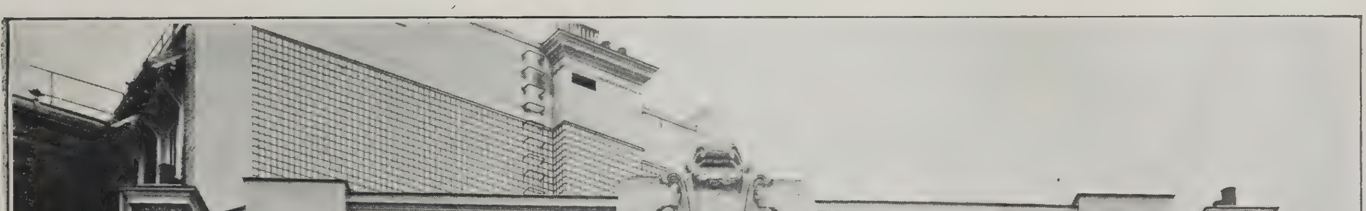
THE ARCHITECTS' & BUILDERS' JOURNAL

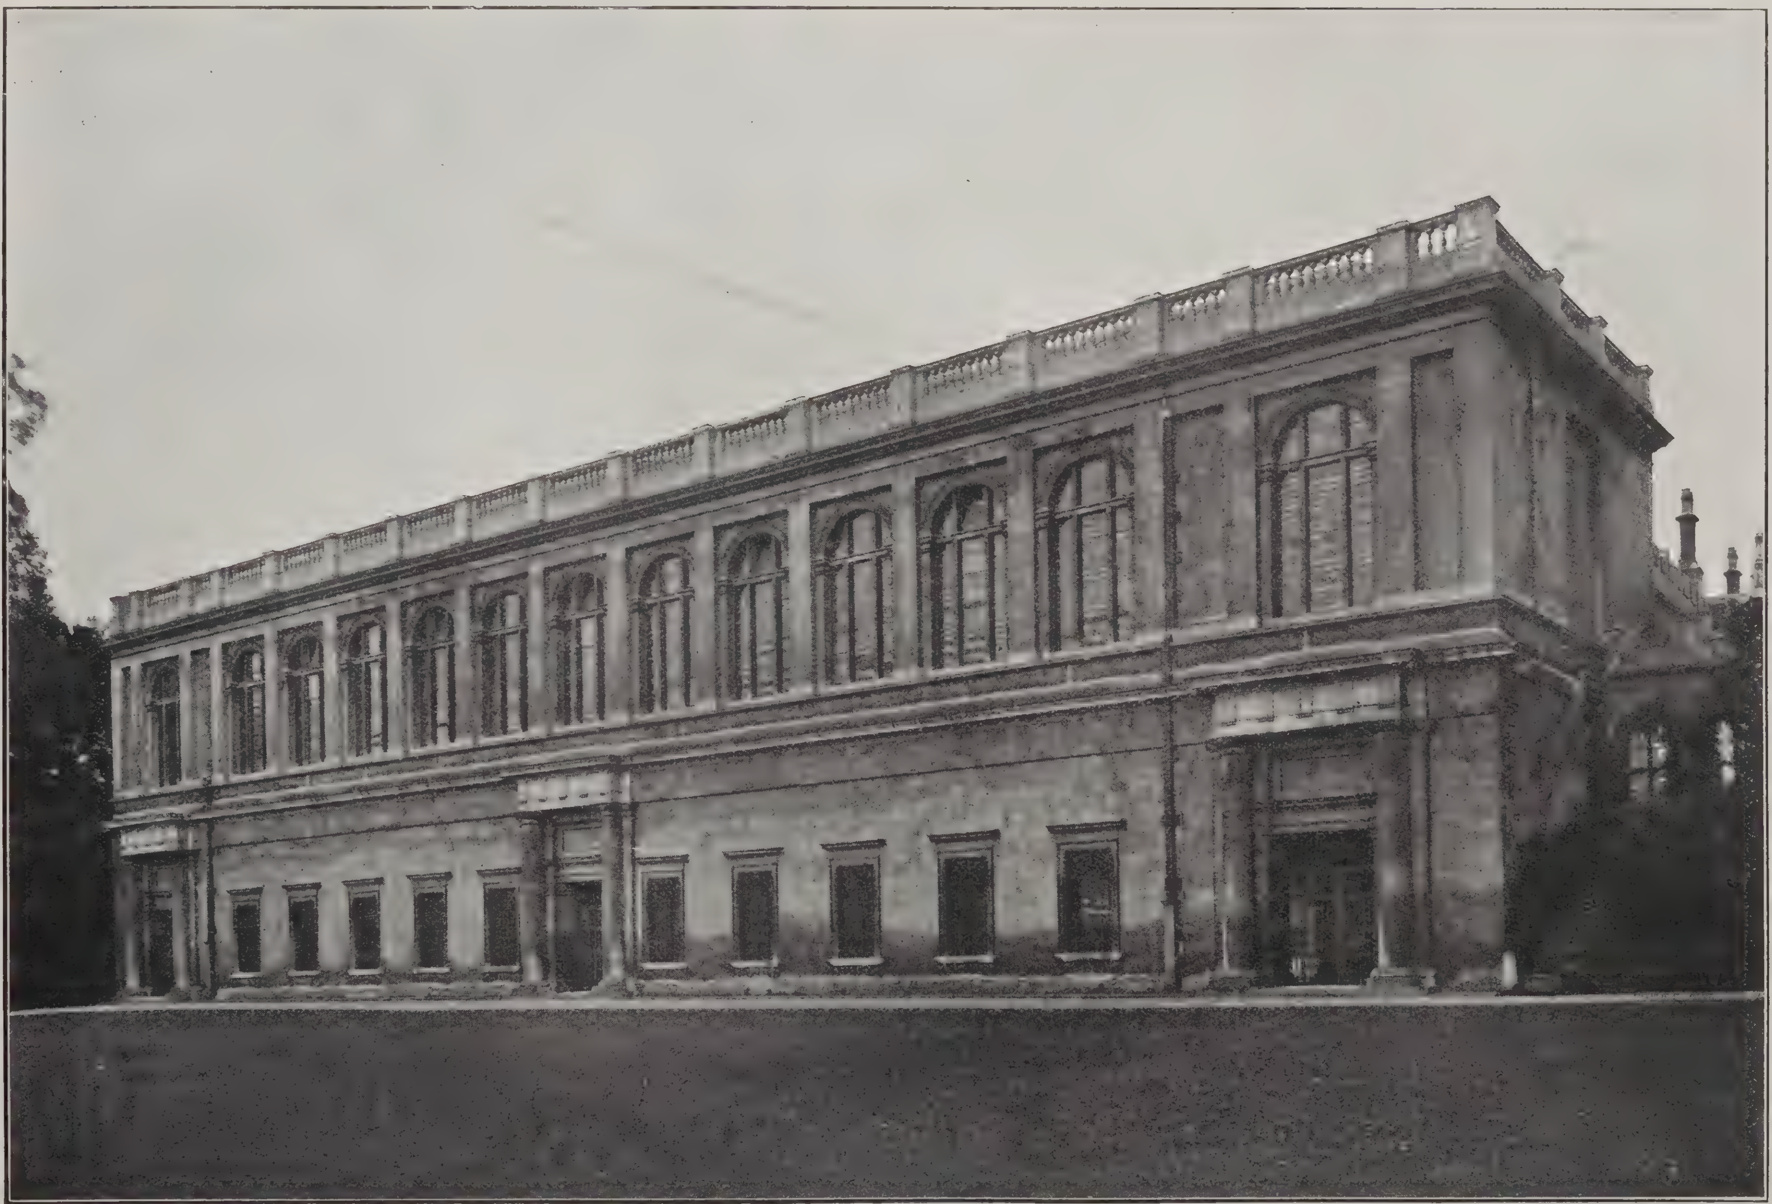
WEDNESDAY,
AUGUST 3rd, 1910.

Volume XXXII. No. 809.



Readers who have seen illustrations in our pages of the work of Messrs. Mewès and Davis, architects of the Ritz Hotel, "Morning Post" Office, Royal Automobile Club, and other prominent London buildings, will be interested in this view of a refined and scholarly piece of work at the house of the famous French actor in Paris.

DETAIL OF THE RESIDENCE OF M. LUCIEN GUITRY, PARIS. CHARLES F. MEWÈS, ARCHITECT.



This is quite an early work of Sir Christopher Wren, and is much superior in the logical qualities of design to the more showy front of Nevile's Court. The exterior here exactly expresses the interior, with the low loggia beneath, the blank space for bookcases, and the great row of windows over the bookcases. The library is built of Ketton stone, which is yellow, with stains of pink, but the crowning balustrade and the entablature to the ground-floor doorways are, for some reason, which it is not easy to perceive, in Portland stone. A view and detail of the wrought-iron gates by Partridge appear on pages 118 and 119.

THE RIVER FRONT OF TRINITY COLLEGE LIBRARY, CAMBRIDGE. SIR CHRISTOPHER WREN, ARCHITECT.

Hints on the Planning of Town Halls.

THE erection of a new town hall is usually considered an opportunity for adding to the architectural beauty and dignity of a city; an end which should always be kept in mind, but which is sometimes too exclusively prominent in the consideration both of the architects and of the townspeople. When there is an exhibition of competitive designs for a town hall, it will generally be found that the spectators who are natives of the town are most attracted by the designs which have the largest towers or domes and the most ornate architectural treatment. Such designs are very often not even the best in architectural appearance; but supposing that they are, there remains the important question whether the building is planned in the manner most convenient for the carrying on of the city business. That is a question which the town councillor or ratepaying spectator seldom puts, because he often cannot realise the practical effect of a plan from the drawing, and it is only after the architecturally effective building has been erected and brought into use that those who use it may discover that they have committee-rooms very inconveniently placed, or a council chamber in which their speeches can only be indistinctly heard.

The departments of a town hall may be classed as (1) those which are for the private conduct of municipal business only; (2) those business departments with which the outside public are concerned; and (3) those which have more or less of a show character, as rooms for public receptions or entertainments.

The first class consists mainly, of course, of the council chamber and the committee rooms, and for all these one great desideratum is quiet. Different sites present different problems, but in almost all cases it will be found that the best place for the council chamber is in the middle of the building. Being necessarily a large and somewhat lofty room, it can be lighted from the top, unless there are lighting courts or areas provided; and in a central position it is both away from noise and may be equally within reach of all the offices with which it may be necessary for the council from time to time to communicate. For the committee rooms quiet is perhaps even more essential than for the council chamber, as they must have side windows; and nothing is more exasperating than to conduct business conversation against the continual noise of traffic outside. If the committee rooms cannot be kept in an inner position, which might be difficult, they must, at all events, face the least noisy side of the site. In regard to the plan of the council chamber itself, there is rather a tendency at present to favour a semicircular plan; there seems a certain practical symmetry in the arrangement of seats so that every member of the council faces the chair, and the distance from the chair is more nearly equalised than in a parallelogram room. But a semicircular room is nearly always bad for speaking in; it promotes echo. Perhaps the best arrangement is a room in which the chairman sits in the centre of one of the longer sides, and the seats are arranged in a segment of a circle, the back wall following the same line. Whether straight or curved, the back wall should be broken on plan, by pilasters or otherwise, to prevent it causing return echoes. A council chamber lighted from the roof or from windows in central areas will always require artificial mechanical ventilation.

The town clerk's public office is one of the most important points in the plan, because it is the principal medium of relation between the outside public and the municipal authorities. It is to that office that the public come to bring communications, or to obtain information. Probably in nineteen out of twenty town halls in this country a stranger to the building, wanting the town clerk's office, has to ask where it is, and will perhaps be sent upstairs, or told it is the third door round the corner of the next corridor. He ought to have no occasion to ask; the town clerk's public office ought to be the first thing he sees on entering the principal public entrance; so far from having to ask his way to it, it ought to be impossible for him to miss it. In how many town halls is this the case? As to the position of the town clerk's private office, that, as we shall see, is a little complicated by other considerations.

The place for the show suite of rooms for receptions should always be the front to the principal street or square adjoining the site; quiet is not so essential here, and the large windows and more sumptuous architectural treatment proper to these rooms are a means of giving external dignity to the principal façade. The mayor's private room should be *en suite* with the entertaining rooms, or at least be connected with one of them by a private lobby. These rooms must, of course, be on the first floor of the building. Now comes one of the little difficulties of arrangement. The town clerk's public office, as we said, must be in a central and conspicuous position on the ground floor. The town clerk must have ready communication with his subordinates, but he must also have easy access to the mayor. The dilemma lies between giving him a ground floor office, and a private staircase to the mayor's room, or an upstairs office (with another room for his confidential clerk), and let the clerks in the public office communicate with him by telephone and by a lift. The former is the best arrangement; the mayor and town clerk could share a private door, lobby, and staircase, using the staircase when they wanted to see each other personally (which might not be very often), and the town clerk would be habitually on the ground floor, near to his public office clerks, and also to any visitors who might have a claim to see him personally.

Every first-class town hall which has a grand suite of entertaining rooms should also have a grand staircase which is not used for the ordinary business of the building, but only for ceremonial occasions. If it is worthy of the ceremonial occasions, it will be too good for the ordinary business traffic, and if used for the latter purpose, it will never be kept in its best condition. In connection with this grand staircase must be ample cloak-room accommodation for ladies and gentlemen, and this must be on the ground floor, and not on the upper floor, so that the company may ascend the staircase in their festive array, and not with their cloaks and hats. And it is essential that the entrance doors to the retiring-rooms for ladies and gentlemen should be well separate from, and if possible out of sight of each other. We have seen many plans for town halls in which this consideration was entirely overlooked, and the rooms placed in a conspicuous proximity which is rather undignified.

The town councillors should have their own entrance and staircase, separate from the public entrances, and their own set of retiring rooms in connection with the council room. It should be provided also that the mayor should have convenient access from his private room to the chair in the council room. The public gallery in the council chamber is better placed at the side than at one end; the public are not so much *en evidence* then, while they can hear the speaking better. There should be a separate staircase to it from the street, as it is often attended by persons who have no business in the other part of the building, and are better out of it.

In regard to some special requirements for special officers of the corporation, their solicitor or legal adviser, if included on the staff, should have his office in contiguity to that of the town clerk, who may often have to confer with him. The borough engineer or borough surveyor, by whichever title he is called, requires a drawing office with a north light (a point often overlooked); and if there is a city conveyancer, or other such official, specially occupied with the sale or purchase of building sites, his office should be near that of the borough surveyor.

Besides the general relation with the public which is maintained through the town clerk's office, there are other offices which have special business with the public of a kind liable to periodical inflation, viz., the rates, gas, and water offices. In a large city there would be a separate office for each of these departments, and at the quarterly periods when the payments become due there is likely for some days to be a considerable influx of ratepayers, many of them of the poorer class. These offices, therefore, should have easy access on the street level, not on the most important side (architecturally) of the building, and should be planned so that the public portion forms in some sort a passage, with one door for entrance and another for egress, so as to avoid crowding and confusion at the doors.

In addition to the placing of the various departments in the most convenient positions in relation to each other and to the public, there is the question of planning the interior lines of communication of the building. These should always be planned so as to combine convenience and directness of route, with some opportunity, if possible, for architectural effect at the main points of meeting or crossing. The corridor plan of a large town hall is a matter of some importance in the convenient use of the building. The following points in regard to it, may, we think, be taken as axioms:

1. Corridor communication should be continuous all round the building. A corridor plan of which a small portion is blocked, say by a room to which it leads up, is both inconvenient and, to visitors who do not know the building, puzzling.

2. Corridors should follow straight lines as far as possible; and if there is a deviation from the straight line, it should be on the basis of an axial and symmetrical arrangement. An unsymmetrical corridor plan is a puzzle-ground to the visitor.

3. Nothing has a more gloomy effect in the interior of a building than corridors lighted by borrowed light through the doors of rooms. The ideal arrangement is to keep the greater part of the corridors along the sides of an open court or lighting area. If that is impossible, there should at least be a sufficient recurrence of spaces for direct lighting; in some cases these can be arranged in connection with staircases.

4. A large window at one end of a long corridor will not really light it efficiently, however it may be assumed to do so on paper.

The British Pavilion at Rome.

FOR the International Exhibition of Fine Arts, to be held in Rome next year, in the grounds of the Villa Borghese, the design for the British Pavilion has already been made, and a rough engraving of it was published in the "Times" of Tuesday last. It is rather a surprise. The idea seems to have been that we should exhibit some reproduction of a masterpiece of English architecture instead of a new English design specially made for the occasion. There is something to be said for the idea, but the result seems to be that not a masterpiece, but a piece of a masterpiece, has been chosen, and that the façade of the English Pavilion is to represent the upper part of the front of St. Paul's Cathedral, except that the columns of the centre portion have become pilasters, with no recess behind them. Mr. Lutyens is named as the architect for the pavilion; we should regret to be in opposition to him, but we must say that we do not think this idea a very happy one, more especially as the merit of St. Paul's façade consists much more in the general effect of the whole than in the details. It seems to be argued also that a piece of English Renaissance like this would be peculiarly in place in Rome, surrounded by so much work of the Italian Renaissance. Perhaps it may only serve to show how timid and restricted was Wren's Renaissance architecture in face of that of some of the great Italians. Altogether, we think the idea is rather unfortunate, and that Mr. Lutyens would in fact have been quite able to produce something as good and more suitable off his own drawing-board.

Ironmongery Specifications.

A SOMEWHAT spirited controversy in recent issues of "The Ironmonger" has turned upon the question of legitimate profits to the builders' merchant and the builder on goods specified by the architect. It is not in the ironmongery trade alone that the question of "prime cost" is rousing aggrieved feelings. We have touched upon this subject in regard to other trades more than once in the last few months. One correspondent states the case very fairly by saying "that the architect, to maintain his reputation, is anxious to secure for his client the best that a fixed sum can purchase, and it is clear that the choice of goods in the way of inside fittings is practically impossible until the client is consulted." Still he maintains it is a fair question whether the architect, "from a legitimate trading point of view, has the right to obtain discounts to the advantage of his client at the expense of the builder or tradesman who justly claims his provided profit. I am aware of the stipulation 'add profit, carriage, and fixing,' but apart from the clause, trade preference must be considered, and the trade discounts should not be made public, as, under the present system, is done. List prices are useless; net trade terms are wanted, and the builder's profit becomes limited to his customer's consideration." No doubt this constitutes a real grievance, though the practical omission of profit on prime cost or provided sums might be remedied by builders agreeing among themselves to charge a certain percentage of profit. Unfortunately it does not seem possible to do this; but it affords an illustration of the benefit which all builders would obtain by joining the organisation of the National Federation. No architect desires to deprive the builder of his legitimate profits; but in the stress of present-day competition it is practically impossible for the builder to take his profit if he wishes to secure a contract. The correspondent already referred to suggests that if list prices were taken, the builder "would take care to ascertain the discount, and if it were, say, 50 per cent., he would deduct accordingly. If he wanted too much profit, the result would be inevitable failure to secure any contracts." There is something to be said for this view. Another correspondent, replying to this letter, retorts somewhat savagely: "The majority of builders are men of the worst possible class, and their capacity for buying the worst and cheapest kind of material is well known. If 'Kynance' had been 'had,' as I and many others have, by trusting to the honesty of builders, then he would buy everything used on the job (as I shall do in future), and simply let the builder quote for erecting the house. Only by this method can one get what is specified." This is, of course, an extreme view, and the writer has evidently been somewhat unfortunate in his choice of builders. But this discussion raises a question whether, even in the metal trades, the discounts are not extraordinarily large, much larger than they need be to allow for fluctuations in the price of raw material. Contractors on the ordinary list prices would get, say, an ordinary discount of $33\frac{1}{3}$ per cent. upwards, plus $2\frac{1}{2}$ per cent. for cash, less the cost for carriage and packing, from which must, however, be deducted the credit on empties returned. The architect very naturally desires to secure a price approximating the actual worth of the goods, and he also frequently specifies goods of a special make, of which he has knowledge, or which possess advantages over the ordinary, and possibly cheaper, pattern or type which the builder would buy on his own initiative. If the procedure which obtains among many architects of allowing a percentage on the prime cost sum, based on the actual invoices produced by the builder, were generally adopted, we do not think anyone concerned would have reason to complain.

A Railway on the Malvern Hills.

THE proposal to run a funicular railway up the Malvern Hills is likely to arouse considerable opposition. The Malvern Hills seem to be exceedingly unlucky in attracting the attention of the business speculator. It is but a short time since the operations of the quarry owners were attracting public attention and disapproval, mainly owing to the unsightliness of their waste heaps; and if memory serves us it was finally arranged that quarrying operations were to be confined and the waste heaps removed. Compared with a funicular railway these waste heaps would be artistic adornments. The people of Malvern appear to be indifferent to the destruction of the very beauties that attract people to the town, and therefore seem in no small danger of killing, or allowing to be killed, the goose that lays their golden eggs. Some seaside towns, appealing to a certain crude taste, have no doubt found it financially profitable to cultivate these areas on the lines of Coney Island and other pleasure cities of the United States. But natural surroundings are by no means a necessary factor in the attraction of people of crude feelings; indeed, they would probably pass unnoticed. It is to the quieter and more cultivated minds that such districts as Malvern must appeal if they are to maintain their reputation as watering-places.

Building in Haste.

ONE of the most delightful of the southern counties was formerly known as "sleepy" or "soporific Sussex." Hustling Horsham is going to win for it a very different reputation. "Already some forty years of haphazard consideration have been devoted to the subject" of "the much-needed baths" for Horsham; and now, according to the "Sussex Daily News," "once again the spirit of revolt is out against these slow methods. 'What we want we'll have!' seemed to be the sentiment of the representatives of the athletic clubs and kindred organisations, who devoted an evening to preliminary discussions. . . The only fear is that there may be those who desire gradual development to be the policy, whereas a bold effort would in all probability be far more profitable in the long run." The writer seems to be perfectly serious in these daring observations. There is not the slightest indication that he is afflicted with an abnormal sense of humour; which is rather a pity, for its absence may lead him to encourage the rash but determined athletes of Horsham to plunge with headlong precipitancy into the baths scheme. Already, in the course of a single evening, they have arrived, as at a bound, at the "preliminary discussions," and their headlong haste in thus forcing to immature fruition the sturdy growth of forty years of "consideration" is little short of scandalous. Why, if such indecent haste is allowed to go on unchecked, those baths may actually come into being before this hurrying century's clattering close! If it takes forty years to arrive at the "preliminary discussions," how long should it take to complete the building? Anyhow, we may be very sure that the time-penalty in the contract will be enforced with the utmost strictness.

NOTES AND NEWS.

The Shrine of Aphrodite-Astarte.

Dr. Max Ohnefalsch Richter contributes to the "Times" a long account of his discovery (in conjunction with Dr. K. Koritzky, a German archæologist) of the ancient Shrine of Aphrodite-Astarte in Cyprus. He refers to the abortive excavations at Kouklia, carried out by English scholars in 1887-8, where nothing prior to the fourth century B.C. was discovered, thus establishing the fact that the more ancient sanctuaries and altars, such as the shrine mentioned by Homer, must be situated elsewhere. He claims to have discovered the locality at Rantidi, stated as Randi on Kitchener's map. The position is indicated as follows:—"The new like the old road to Papho runs through Rantidi. After leaving the Kha Potami river farm, we mounted to the Rantidi plateau and followed the road eastward until we reached the 86th milestone, which is exactly 86 miles distant from Nicosia, the capital of the island. There we left the road, going to the right southward in the direction of the sea, and entered the State forest. Many wild olive and carub trees, together with other wild trees, shrubs, and thorns, cover the ground at this point. After walking for about ten minutes we lighted on the first field of ancient remains. A thicket more or less dense partially surrounds them, and bushes grow between the stones and over them." The explorers had little time to spare and "after the inspection of the ground we were very anxious to be the first to inform the Government of the island and the authorities of the museum, as well as our friends at home, of the discovery; and to preserve the place to the Prussian and Saxon academies and the editor of the "Corpus Inscriptionum Cypriacarum" for the purpose of excavation."

This has been done, and Dr. Zahn, one of the Assistant Keepers of the Royal Berlin Museum, has been instructed to meet Dr. Richter on the site and make a surface examination and topographical survey of the district, upon which the plans for excavation will be founded. Dr. Richter bases his discovery on the visible remains being of entirely early date and the inscriptions being exclusively Cyprian-Greek syllabaric. The fields of remains are very extensive, and are said to extend over several English miles.

The A.A. at Bath.

The members of the Architectural Association, on the occasion of their visit to Bath, were entertained to lunch at Monk's Park on Saturday, July 23rd, by Sir John Goldney. Sir John presided over a large company, which included no less than six nationalities—American, Russian, Indian, Japanese, Swede and English. Baron Frederics was also present. The chairman extended a hearty welcome to the members of the Association, expressing the great pleasure it gave him to have the privilege of presiding at the luncheon. He also paid a very high compliment to the Bath Stone Firms, his tenants. The President of the Association (Mr. Arthur Keen) responded briefly, and other speeches were delivered by Baron Frederics and Mr. Matsuoto Maeda, the representative of the Japanese Government. The toast of the Bath Stone Firms was proposed by the President, to which Mr. T. Sturge Cotterell responded on behalf of the company. Afterwards the company continued their drive from Corsham to South Wraxhall Manor, at the invitation of Mr. Richard Cox, J.P., who conducted the company through the interior of this beautiful old Elizabethan building, which was for some years unoccupied. Upon the return journey up to Bath being completed, an inspection of the Baths was made, the company being received by the Mayor (Alderman Major C. H. Simpson), Alderman C. B. Oliver (Chairman of the Baths Committee) and Mr. A. J. Taylor. Tea was partaken of at the Roman Promenade. A vote of thanks to the Mayor for his hospitable reception was moved by Mr. Keen, who paid a high compliment to the architectural beauties of the city of Bath, which they, as architects, appreciated so much. In replying, the Mayor expressed the pleasure it gave him to be able to receive them, particularly as they were architects from whom they could learn so much. Afterwards Mr. A. J. Taylor conducted the party round the building, and gave the members a most interesting description of the Roman antiquities. On Sunday a private visit was paid to Prior Park and Lodge Style, Combe Down, where the party was entertained to tea by Mr. Cotterell. They afterwards proceeded to Conkwell Manor, the residence of Mr. J. Thornton, who showed them round the interesting building.

The Restoration of the Propylæa.

In the August issue of "The Architectural Review" is published the concluding part of Mr. Budden's series of articles on recent reconstruction work on the Acropolis at Athens, of which two illustrations appear in this issue. The author deals in this article with the reconstruction of the Propylæa, now in progress, a work which may be regarded as the culminating achievement of a study extending over seventy-five years. The approach to the Acropolis was cumbered with rubbish arising from the mediæval and Turkish fortifications, and the task of clearing this away has been one of considerable difficulty. Beulé's excavations in 1852 revealed certain data with regard to the great Roman stairway which was constructed in the first century A.D., but after his investigations were concluded, nothing further was done till 1875, when Schliemann engineered the removal of the mediæval tower built over the west wing, and so prepared the way for a realisation of the original intention of the design. The work of excavation, begun under M. Carradias in 1885, contributed little more information about the Propylæa, and it has been left to Professor Dörpfeld (under whose direction the present reconstruction is being effected) to solve the problems of the site. It is interesting to note that reinforced concrete is being employed to some extent in the restoration, in preference to the steelwork adopted in the case of the Erechtheion, where rolled joists were inserted under the marble beams of the north portico and in other places.

The September issue of the "Review" also contains a number of photographs of Mr. John Murray's very successful new building for H.M. Office of Works and Forests in Whitehall. Garden design is represented by some delightful examples of the work of Mr. Thomas Mawson, and a fountain by Mr. Alfred Gilbert. The Deanery of St. Paul's is the subject of the "Historical Town Houses" article: the "Exemplar" comprises some details of the ceiling at the Guildhall, Rochester, the fine example of brickwork from a house at Enfield which is now in South Kensington Museum, and a simple piece of wrought-iron balustrading: a number of illustrations are given of English, French and German furniture of the sixteenth and seventeenth centuries; and, in the "Town Planning and Housing Supplement" is a profusely illustrated article on Berlin by Mr. Raymond Unwin, in which the author deals not only with the city as it is, but also with the schemes projected for Greater Berlin. It is noteworthy that, although town-planning powers have been exercised for many years by the different municipalities around Berlin, for want of common action and a central body co-ordinating their work, many parts of the city, though well planned as isolated portions, have grown up with little more proper relation to the whole plan of Berlin than we find in the different areas of London. It was with the idea of finding some solution to this difficulty that a huge competition was held recently, for the promotion of which no less a sum than £8,000 was voted by the authorities.

MR. BURNS ON TOWN PLANNING.

Mr. John Burns, President of the Local Government Board, inaugurated the new garden suburb at Romford on Thursday last, by laying the foundation stone of the first house. After the luncheon, which followed a tour or inspection of the estate, Mr. Burns delivered a speech from the steps of Gidea Hall. They were inaugurating that day, he observed, another link in the garlanded chain of garden suburbs surrounding London. It followed the lines of the garden city at Ealing, the garden city of Hampstead, and schemes of housing approaching the dimensions of garden suburbs that in recent years had been springing up—as, for instance, those at Tooting and at Tottenham. The object of this movement was to bring the town into the country, the garden into the town; and, by judicious amalgamation of both, to secure, irrespective of class, something more tolerable, more decent, and more human than the houses that had been dumped in and around London during the last hundred years. They were inaugurating a new community—a new hope. He hoped that the Romford suburb should serve as a model and example to be followed throughout Essex. The spot had been alternately British, Roman, and Elizabethan. He welcomed the grafting of democratic communities upon the sites of the houses of the old nobility. They had been well advised in preserving the ancient amenities of the Elizabethan property. Age alone could give fine trees and good gardens; and these created one of the most pleasant environments that he had been associated with during his twenty-five years' experience of housing and town planning. The prospects of the suburb entitled him to say that the name of Mr. Raphael fully deserved the gratitude which posterity would undoubtedly accord. The name of Mr. Raphael would rank with those of Mr. Cadbury, Mr. Lever, Mr. Rowntree, Mr. Vivian, and scores of others intimately associated with town planning. This movement was not confined to Romford, to Britain, nor to the continent of Europe. Every community of civilised people wished to become more civilised, and were actively engaged in planning out the futures of towns, villages, and cities. This garden suburb was an attempt to make a community consciously to order its present habitation, and so arrange its civic expansion on lines healthy, wealthy, beautiful, and wise. It was an attempt to arrange that ugliness, meanness, and squalor be avoided in the near future, and in years to come. He was emphatically for the homestead against the tenement, the house versus the flat, the home against the barrack—peace to the cottage and death to the institution. He liked the detached house, the separate garden; the private home with the collective playground. They had nothing to gain, but, on the contrary, all to lose, by imitating the example of Germany and America. The British was the domestic ideal of a home, and the best in the world. They had miserable croakers, living in a fog of pessimism quite foreign to us as a nation, who said that we ought to go abroad in order to see what to do. He would rather be found dead in England than alive anywhere else. In Berlin 75 per cent. of the population were living in three rooms or less. There was no Arcadia, Utopia, or earthly paradise. London, against this figure, had 52 per cent. In Berlin 539 houses in every thousand were five storeys, and 99 per thousand six or seven storeys. The average in London was from two to three storeys. Berlin had 46 persons per house, London had 8 per house. In Berlin 80 per cent. of the houses faced courtyards, and 20 per cent. faced the open street. London led by 20 to 50 per cent. all capitals in the world.

And yet they were advised by miserable Jeremiahs to imitate countries inferior in the matter of housing. Battersea had something less than 200,000 people; yet it had more separate buildings and houses than Berlin with over ten times the population. In forty years the population had increased nearly four times; yet infant mortality had dropped. When the Romford estate was completed, care should be taken that there were not too many houses to the acre. It would be the envy of Bournemouth, and an example to the seaside and pleasure towns.

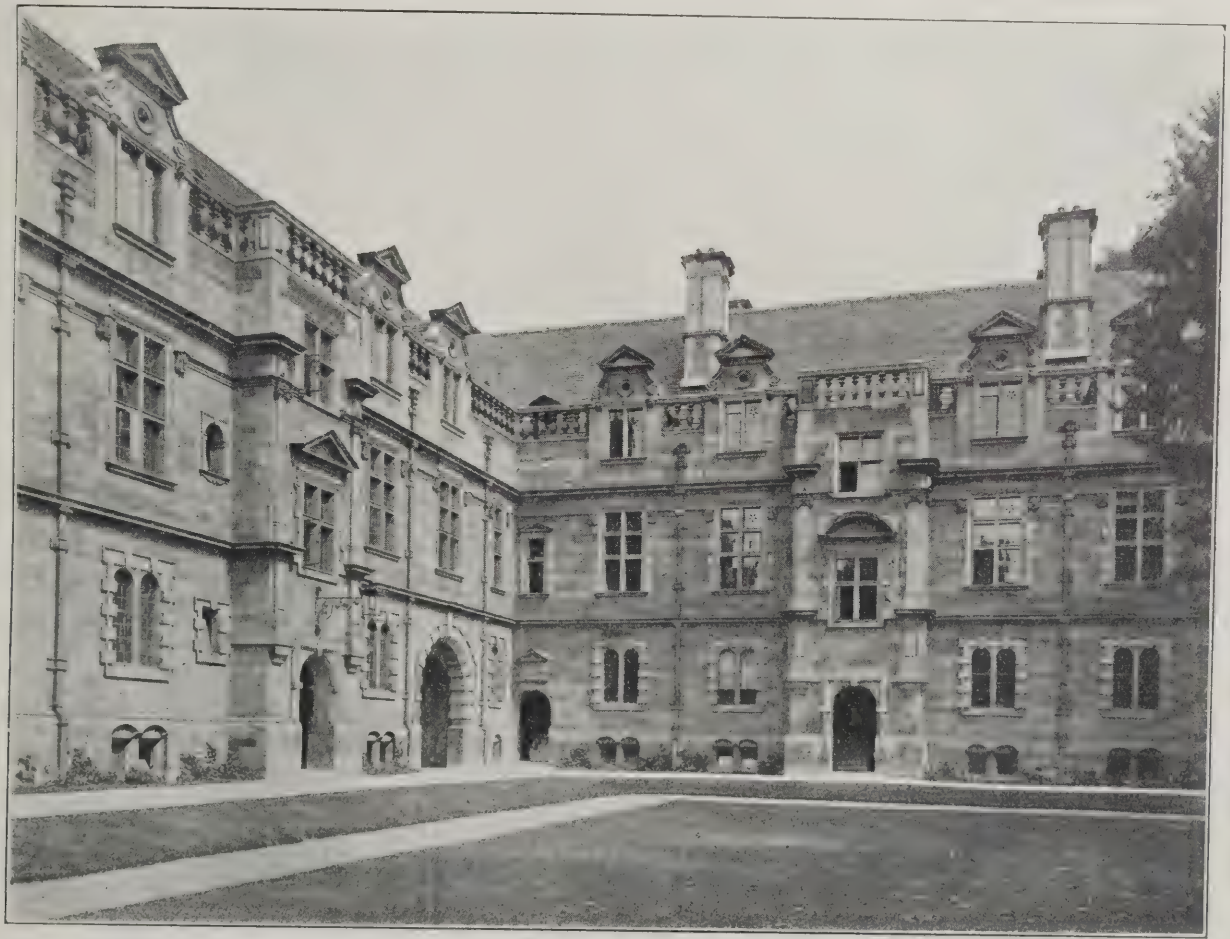
In London during the past twenty-five years 500,000 houses had been built, 7,500 streets made, and 23 squares created. It would be a reproach and a scandal if efforts were not made to arrest any attempt to deprive London of its 400 gardens and squares. In the same time 600 street improvements had been carried out.

Our municipal forefathers were entirely lacking in foresight, and in civic imagination. Were this not so, all waste would have been avoided. From 13 to 16 families per thousand were leaving the inner ring of London every year. Twelve of the central parishes were either stationary or declining. To the men of Romford, therefore, he would say that the future was all on their side. From the purely agricultural land were being abstracted 500,000 acres to be converted into roads, railways, factories, houses, and workshops. This absorption pointed emphatically to the necessity of so ordering the growth of the transfer that drawbacks and obstacles as those to which he had referred be avoided entirely. A town plan was needed for almost every growing village. There were now less than 25 per cent. of the people in the country and the village. He wanted to see every town with its park and garden arrangements, and its proper sanitary equipment. In the past, all law and regulation had been to prevent the expansion of towns. They had only to refer to Elizabethan or Cromwellian times to see that it was customary to prevent houses from being built at a greater distance than one mile from Westminster, or half a mile from Charing Cross. Who knew but what London might extend in the future from Windsor to Gravesend, and from Hayward's Heath to Northampton. The greatest architect we had produced, Sir Christopher Wren, notwithstanding that he built 55 churches, Greenwich Palace, and Hampton Court, had made a curious mistake in his plan for the reconstruction of London. This was so arranged within walls that there should be "no cemeteries, parks, or gardens, and other unnecessary vacuities" within its confines. Expansion was inevitable. Hitherto towns had grown up in a sporadic, squalid, and shapeless way. They had been defined by narrow laws and narrower men. They were confronted by the architectural defects of their forefathers. The economical ratepayer would say: "Will these improvements pay?" He would answer: "The more you spend on the architect, the less you will spend on governors of gaols. The more you spend on drainage, the less you will spend on the policeman. The more you develop, the more healthy and sober the community than could possibly be reared in the large towns and cities."

In 1899, before town planning was introduced, and before the Notification of Births Act existed, England and Wales had a death rate of 18 per cent. In 1904 this was reduced to 16 per cent. To-day it is 14 per cent., a wonderful diminution. In 1899 infant mortality was 163 per thousand; in 1900, 145; and in 1909, 109—as against 163 in 1899. It was, therefore, a sound and wise investment to encourage by all the means in their power such schemes as meant the improvement of the race. They had got to recognise that education was abroad. There were 50,000 empty houses in London. The L.C.C. was not to blame. The people who were to blame were the architects who advised basement dwelling. There were 500,000 empty houses in England and Wales. This was due to the fact that forty or fifty years ago things were not arranged to meet the needs of the future.

He advised them not to have more shops than necessary in the garden suburb. There were 30 to 40 per cent. too many shops. The shameless vulgarity of advertisements displayed on the side walls of shops quite naturally drove people elsewhere, and sometimes out of their minds.

In his concluding remarks, Mr. Burns admonished the residents to avoid street noises in Romford—to get rid of the smoke nuisance before it began.



This Court, built in 1883, is a good example of the work of the architect. But though he caught the spirit and detail of old work he has spoilt the feeling of repose by making the staircases far too obtrusive, with the windows at a different level from those of the actual "keeping" rooms, and so cutting through the lines of these other windows.

NEW COURT, PEMBROKE COLLEGE, CAMBRIDGE. GILBERT SCOTT (THE YOUNGER), ARCHITECT.

LEGAL.

By OUR LEGAL EDITOR.

Accidents During Building Operations.

The question Who is liable for an accident happening and causing personal injuries during building operations? is one which may be approached from many different points of view. It raises a number of other questions. Who was injured? If he was a workman, was he employed by the builder or a sub-contractor? Did the accident happen owing to a defect in the ways, works, machinery, or plant in the building, or did it arise out of and in the course of the employment? If the injured person was a stranger, was he invited on to the premises, or was he there in defiance of a notice—" No admission except on business"? If the injured workman was employed by a sub-contractor, and the accident took place in circumstances which gave him a right to make a claim under the Workmen's Compensation Act, the law is as follows. The workman may sue the contractor in the first instance, and then, if the sub-contractor is liable under his contract with the head contractor to take responsibility for accidents, the head contractor may be indemnified. All disputes of this kind must be settled by arbitration under the Act. Again, suppose the accident was due to the wrongful and negligent act of a stranger; as where, for instance, a builder's workman on a ladder is knocked down by a person carelessly knocking against the ladder in the street, in that case the employer, while having to pay compensation in the first instance, would have a remedy over against the stranger.

The question whether an accident happened owing to a defect in the ways, works, and machinery or plant only arises in cases where compensation is claimed under the Employers' Liability Act. That measure, while it is not nearly so wide as the Compensation Act, makes the employer liable for accidents arising (*inter alia*) through the defects above mentioned. Although this method of procedure is not often resorted to, yet as the cases are tried by a judge and jury and a lump sum may be recovered, litigants are sometimes advised to proceed in this manner. This is a risk which the builder must usually assume.

The question Was the injury the result of an accident arising out of and in the course of the employment? is one which has occasioned much difficulty. The kind of injury which the builder's workmen sustain is usually the result of an accident, but it is not so easy to decide that it has "arisen out of the employment." The words point to accidents which arise from acts or omissions of the injured workman himself, or of his fellow-workmen, which acts or omissions are within or, at least, are not outside the scope of the employment on which such workmen are engaged, either expressly or impliedly to perform; and they also include such accidents, however and by whomsoever caused, as may naturally arise out of the character of the employment itself, or from those risks which may reasonably be contemplated as incident to that employment. The following principles may be deducted from the decided cases: An accident happening during the time of going to or coming from work is one for which the builder is not responsible, unless the contract of employment expressly or impliedly includes that time. An accident during dinner is within the Act; but where a workman meets with an accident owing to a breach of rules, he is clearly not entitled to compensation. Again, an injury sustained by an idle workman who is larking cannot form the subject of compensation. It should be mentioned, too, that the employer is under no liability in a case where the injury is due to serious and wilful misconduct, unless the injury is serious and permanent, or results in the death of the workman. In order to determine the liability as between builder and building owner, it is necessary in the first instance to look at the building contract. It generally gives the building owner a complete indemnity against all accidents, whether those accidents give rise to claims at Common Law, under the Employer's Liability Act, or the Workmen's Compensation Act. If there is such a clause in the contract, the building owner has but little concern with the accident.

The accident clause in the form of contract sanctioned by the Royal Institute of British Architects is as follows:—

"The contractor shall be responsible for all structural and decorative damage to property, and for injury caused by the works or workmen to persons, animals, or things, and shall hold the employer harmless in respect thereof, and also in respect of any claim made under the Workmen's Compensation Act, 1897, or any amendment thereof, by any person in the employ of the contractor. He shall also be responsible for all injuries caused to the buildings, the subject of this contract, by frost or other inclemency of weather, and shall reinstate all damage caused by the same, and thoroughly complete the whole of the works."

This would extend to make the builder liable for an accident to a passer-by in the street, or any accident to a workman.

The employer is liable to third persons for the tortuous acts of the builder, where he has expressly authorised or subsequently ratified such acts; for everyone who procures the violation of a right to be done by another is as responsible as if he did the act himself. Moreover, he who procures or authorises an act to be done by another is responsible for all that the other necessarily does in the execution of his authority.

If an employer contracts with a builder to do work which can lawfully be done without injury to others, and the builder selects his own workmen, and has the immediate control over the work, the employer will not, as a rule, be liable for injuries to strangers caused by negligent execution of the work.

So, if the execution of work is left to a builder, who exercises an independent employment and selects his own workmen, and has the immediate control and superintendence of the work, the owner of the house, who employs the builder, may not be responsible for the creation of nuisances by the negligence of the builder's workmen, if he was ignorant of their unlawful proceedings, and had no knowledge of the probable consequences of their acts. But the employer may also be liable if he interferes with, or retains control over, the builder. It is immaterial, however, if they are acting substantially as the contractor's servants at the time of the injury.

But where an employer orders a builder to do an act which is unlawful in itself, or which cannot be done without creating a nuisance, then the act done by the builder is in substance the employer's act, and he, as well as the builder, is responsible for the consequences which naturally result from it. For when an employer contracts for the performance of work which, properly conducted, can occasion no risk to his neighbour's house, which he is under obligation to support, he is not liable for damage arising from the negligence of the contractor. But, in cases where the work is necessarily attended with risk, he cannot free himself from liability by binding the contractor to take effectual precautions. He is bound, in a question with the party injured, to see that the contract is performed, and is, therefore, liable, as well as the contractor, to repair any damage which may be done.

The consequences of negligence do not, however, stop short at making good the immediate monetary loss which may be sustained. A faulty design may involve disaster and personal injuries, for which the architect may be held civilly responsible.

In Mosdell v. Mitchell and others ("Times," Jan. 20, 1891) the widow of a workman brought an action under Lord Campbell's Act against a building owner, his contractor and architect, for the loss of her husband. It appeared that the plaintiff's husband had been one of the workmen engaged in erecting certain houses, of which one of the defendants was the architect and another the builder. After the houses had been partly erected they fell, and the plaintiff's husband was buried among the falling walls and killed. It was shown that the fall of the building was due to a wall being too slight to bear the strain put upon it. During the hearing the jury, on the suggestion of the judge (Lord Coleridge, C.J.), stopped the case as against the building owner, but in the result they gave a verdict of £500 against the builder and the architect jointly.

With regard to strangers, it is obvious that a mere trespasser upon works takes a risk upon himself.

With regard to children, however, steps should be taken to prevent their having access to the works on any consideration; for if a door abutting on the street is left open, and a child comes in "to see the wheels go round" and is injured, the builder may be held responsible although the child was a trespasser. This rule is founded on good sense, for it is the instinct of a child to meddle with dangerous machinery. (See Harold v. Watney, 1898, 2 Q.B. 320.) Danger of this kind may be avoided by placing a half-door at the front entrance and keeping it always shut.

MEMORIALS TO THE LATE KING.

Newmarket.

A meeting of the King Edward Memorial Committee was held here recently, and discussed various schemes. One was to obtain the Severalls as a recreation ground; but the Jockey Club stewards would not consent to surrender it for this purpose. Another proposal was to sell the Town Hall for the purpose of a school of cookery, and apply the purchase money in part payment of the cost of a new Town Hall. An objection was raised to the erection of a monument to the late King at the cost of the rates. A counter suggestion was made that St. Mary's Square should be made a place of beauty and called King Edward's Square. A sub-committee was appointed to consider the Town Hall scheme, and if this could not be proceeded with the St. Mary's Square scheme might be taken up.

IN PARLIAMENT.

(From our Gallery Representative.)

Work at Rosyth.

Mr. Lambert, the Civil Lord of the Admiralty, in explaining the naval works vote in the House of Commons recently, gave some information as to the creation of the new naval base at Rosyth, on the Firth of Forth. The new dock at Rosyth, he said, would be increased by 100ft. in length, 10ft. in width, and 3ft. in depth. When finished it would be 110ft. wide, 850ft. long, and 38ft. deep. It was proposed to order another new dock at Rosyth which would cost an additional £280,000. This was considered to be a wiser and more economical plan than to scatter docks up and down the East coast. Referring to the transfer of torpedo factory workers from Woolwich to Greenock, where the new torpedo factory is progressing very rapidly, Mr. Lambert spoke of the difficulty of finding proper housing accommodation for 500 or 600 men. The Admiralty had agreed to guarantee the rent up to 100 houses, which were to be provided by a private company.—Mr. John Ward had something to say about the Fair Wages Clause in building contracts, and he complained of the want of housing accommodation suitable for workmen employed at Rosyth who had wives and families.—Mr. Macnamara, in reply, stated that there was nothing in the contract which compelled the contractors to put up a certain kind of house at Rosyth, but six acres of land had been placed at the disposal of the contractors for housing purposes. Up to the present every effort had been made to meet the needs of the men as they came to Rosyth, but he would again make personal representations. He had found the contractors very willing to meet suggestions.

Foreign-made Gymnasium Structures.

In reply to a question by the Earl of Ronaldshay as to whether the foreign-made wall-bars and beams recently supplied to the military depots throughout the country had proved satisfactory, Mr. Haldane, the Secretary of State for War, said they had proved entirely satisfactory. No reports had been received either at the War Office or by the Inspector of Gymnasia of any lack of durability, or as to the apparatus being unsafe.

Land Tax Return.

The return which owners of land require to fill up under Section 26 of the Finance (1909-10) Act has been issued as a Parliamentary white paper. The questions fill four foolscap pages, and there are two pages of instructions, including definitions of "gross value," "full site value," "total value," and "assessable site value."

The Condition of St. Magnus Cathedral.

In the House of Lords on 27th July, Lord Balfour of Burleigh, on behalf of Lord Avebury, asked the Secretary for Scotland whether it was the case that alterations were proposed to be made on St. Magnus Cathedral, Kirkwall; and, if so, what was the nature and extent of the alterations contemplated; in whom was the Cathedral vested, and who were responsible for its upkeep; what was the present condition of the fabric; what was the amount of money proposed to be expended on the alterations, how was it being provided, and under what architect's advice was action being taken; he further asked, in view of the great architectural and historical interest which attaches to the Cathedral, what were the powers of the Government in regard to it, and what were they willing to do in the matter.

Lord Pentland, in reply, said:—The answer in the first paragraph is in the affirmative. The nature and extent of the alterations contemplated cannot be stated, as those who are responsible for the plans have not communicated them to his Majesty's Government. The Cathedral is vested in the Town Council, and they and the Heritors are responsible for its upkeep. So far as I am aware the present condition of the fabric is good, and while the removal of certain galleries, screens, etc., which have been erected in modern times, would be an improvement, I am advised that there is no need for restoration. The amount of money proposed to be expended now on the alterations is, so far as his Majesty's Government can learn, £30,000, or possibly more, of a sum of £60,000 bequeathed for the purpose by the late Sheriff Thom. I am informed that the architect under whose advice action is proposed to be taken is Mr. George Mackie Watson. Under existing legislation the Government possess no powers in regard to the Cathedral, and therefore they are unable to take such steps as may, in their opinion, be necessary for the preservation of the building except the powers under the Ancient Monuments Act to take over the guardianship of the building as an ancient monument at the request of the owners. The First Commissioner of Works has arranged for the Inspector of Ancient Monuments to visit Kirkwall in August.

Bluestone as a Mineral.

The Chancellor of the Exchequer has proposed to make inquiries into a case brought to his notice by Mr. Courthope, in which notices were served demanding returns for the purposes of the mineral rights duty in respect of quarries from which bluestone is obtained for road material. Mr. Courthope suggested that as bluestone was an indurated sandstone it should be exempted from the tax.

South-Eastern District Post Office.

Mr. Herbert Samuel, the Postmaster-General, has informed Sir Wm. Dunn that the work of demolishing the old buildings of the South-Eastern District Post Office would be commenced by the Office of Works in August, and he hopes that it will be possible to begin building operations early in November.

Land Valuation Returns.

Mr. Pretyman asked the Chancellor of the Exchequer whether an owner who did not, on Schedule II. v. of the Valuation Return required from owners of land, state his intention to claim site value deductions would be debarred from or prejudiced in afterwards claiming those deductions; and whether the form referred to in the last paragraph of Schedule II. v. of the Return would be required to be completed before or after the gross value of the land had been estimated by the Government valuers and communicated to the owner.

Mr. Lloyd George, in reply, said all owners of land will receive a copy of the provisional valuation when made, and they will then have an opportunity of claiming any deductions which they omitted to claim when making their returns. It is intended that the form referred to should be completed before the provisional valuation is made.

Mr. Pretyman also asked the Chancellor of the Exchequer whether the valuation forms now being issued under Section 26 of the Finance (1909-10) Act, 1910, were to be immediately served upon all owners of land, or whether they were, in the first instance, to be served on certain selected owners; and whether, in the latter event, he could state by whom and on what principle the selection would be made.

The Chancellor of the Exchequer, in reply, said the forms of return now being issued were confined to cases in which an occasion had arisen for the collection of Increment Value Duty, and in which, therefore, it was necessary to value the land affected in advance of the general valuation. As regarded the forms which would be issued next month in respect of the general valuation, no selection was contemplated of the owners on whom they were to be served, and the forms would be issued to all owners with as little delay as possible.

Preference for United States Cement.

Mr. Hamilton Benn called the attention of the President of the Board of Trade to the preferential tariff of 20 per cent. granted on United States cement by Brazil, and asked whether, seeing that there was a large export of cement from the United Kingdom to Brazil, any steps would be taken to obtain from Brazil the same concessions as had been accorded to the United States.

Mr. Mackinnon Wood answered the question on behalf of the Foreign Office. He said a preference amounting to 20 per cent. of the import duties had been accorded in Brazil to certain United States products and manufactures, including cement, since 1904, and the list of articles had been extended from time to time. There was no commercial treaty between Brazil and the United Kingdom, but representations had been addressed to the Brazilian Government by the present Government and its predecessor with a view to securing most-favoured-nation treatment for British goods. Other European Governments—those of France, Germany, and Belgium—had also made representations to the Brazilian Government, which, like those of this country, remained without effect. The reply was followed by a series of supplementary questions by members of the Opposition, who suggested the desirability of this country possessing a tariff weapon, but Mr. Mackinnon Wood, amid the cheers of his own party, pointed to the fact that the representations of European countries which possessed a tariff had been ineffective.

Another Brass Plate in Westminster Hall.

Mr. Harcourt has informed Mr. Oliver Locker-Lampson that he has arranged for a brass plate to be let into the floor of Westminster Hall to mark the spot where His Majesty the late King lay in state.

The Amenity of St. James's Park.

Major Archer-Shee asked the First Commissioner of Works whether, in view of the fact that the roads in St. James's Park were among the widest and least congested in London, and that they were thoroughfares to all the main stations, as well as to the Houses of Parliament, he would consider the possibility of raising the speed limit in that park to 15 miles an hour instead of 10 miles, whilst still maintaining the present strict observance of the regulated speed.

Mr. Harcourt said he had to consider the convenience of pedestrians as well as that of those who used motors, and the faster motors travelled on the roads in question the less would be the enjoyment of the Park by the majority. He would, however, consider whether the limit could be raised to twelve miles per hour.

NEWS IN BRIEF.

It is announced that Lord Northbrook is selling some 400 acres of land at Lewisham for building development.

* * *

Nearly £1,300 has been received or promised towards the scheme of protective works which it is proposed to construct to prevent the further inroad of the sea on the Lyme Regis Parish Churchyard. The scheme will involve an expenditure of £2,000.

* * *

The Contemporary Art Society has been formed for the acquisition of the meritorious works of British artists living or recently deceased. It proposes to lend its acquisitions.

* * *

Lord Leighton's "A Noble Lady of Venice" has been purchased by his sister, Mrs. Matthews, to be added to the collection of his works in Leighton House, where during the past two years his "Death of Brunelleschi" and "Corinna of Tanagra" have been also placed.

* * *

A vote of £2,995,300, for naval works, buildings, and repairs, at home and abroad, was passed in the House of Commons on Tuesday, July 19th.

* * *

It is stated unofficially that it is the intention of the Government to introduce before the summer adjournment a Bill amending the Copyright Acts. It is hardly likely, we think, that such a Bill can ignore the question of copyright in architecture; but concerning this point we must wait and see.

* * *

The Council of the Junior Institution of Engineers (Incorporated), in conjunction with the Council of the Society of Engineers (Incorporated), have arranged for a course of six fortnightly lectures on "The Law relating to Engineering," to be delivered by Mr. L. W. J. Costello, M.A., LL.B. (Cantab), the first to be given on the 10th October next.

* * *

King George has approved of the proposal that the All-Indian Memorial to King Edward should take the form of an equestrian statue at Delhi. The total of the fund that is being raised for this purpose is to be limited to five lakhs of rupees (£33,333). Part of this amount will be expended in taking up land for an ornamental garden.

* * *

Prince Christian of Schleswig-Holstein presided on July 19th at a meeting convened by the Mayor of Windsor to discuss the project of a permanent memorial to King Edward VII. A fund is to be raised to pay off the existing debt on the King Edward VII. hospital, at Windsor, and to erect a statue to his late Majesty on the green in front of that institution.

* * *

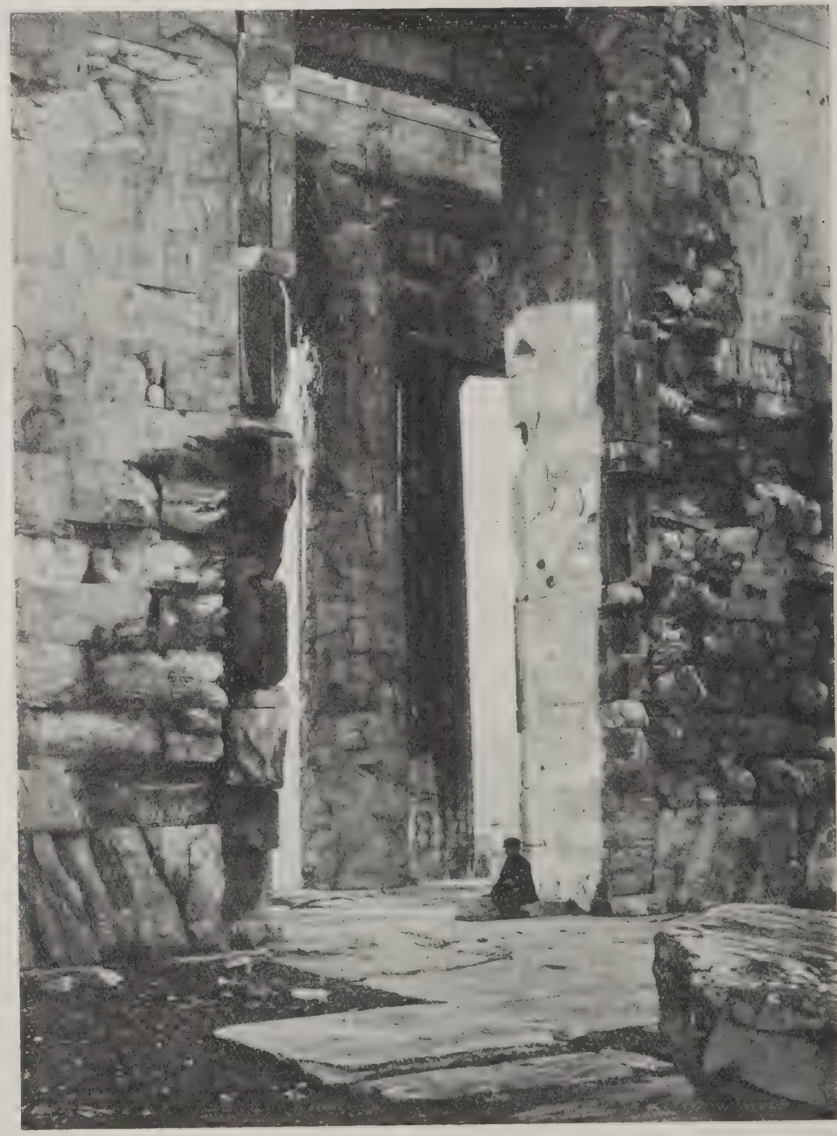
Dr. H. M. Burge, headmaster of Winchester College, issued an appeal to Wykehamists some time ago in connection with the Preservation Fund for Winchester Cathedral, reminding them that in response to his appeal in 1906 there was an offering of £1,500. The sermon was preached by the Ven. Archdeacon of Winchester (Dr. Fearon), who was Dr. Burge's predecessor as headmaster, and in a letter which he appended to Dr. Burge's appeal he said that the work which lay before the Dean and Chapter had a peculiar interest for Wykehamists, because it was to complete and crown the work of their founder, William of Wykeham. The nave was generally allowed to be Wykeham's masterpiece, while it was his last creation, but after his death was carried to conclusion by inferior workmen, with the result that preservation work was absolutely necessary. He suggested that there could be no dearer privilege for Wykehamists than to give Wykeham's unfinished work the strength and permanency he would have wished to have given it himself, and to leave it secure for another five hundred years that mighty "avenue of stone" as the undying witness of his greatness. The fund has just closed, and it is announced that £1,756 has been contributed by Wykehamists past and present. More than £10,000 is still needed to complete the work.

* * *

The rebuilding the Polytechnic in Regent Street is now in active progress. It will be a steel-frame structure, and is the first building to be commenced under the L.C.C. General Powers Act, 1909, which means that the walls at no place need be more than 14in. thick. Without that Act they would have to be at least 3ft. 6in. in thickness. The façade has been designed by Mr. F. Verity, F.R.I.B.A., and will be in the French Empire style. The height from the pavement level will be 104ft. The building will comprise two basements (24ft. below the pavement level), a ground floor, and six storeys. The ground floor will be in Cornish granite, and the storeys above in Portland stone. Mr. Verity's design, it may be added, is the centre part of a larger design which may be completed as the leases of the shops on either side fall in, and they are rebuilt. The internal alterations are being carried out by Mr. George Mitchell, A.R.I.B.A. The cost of the rebuilding will, it is estimated, be about £70,000.

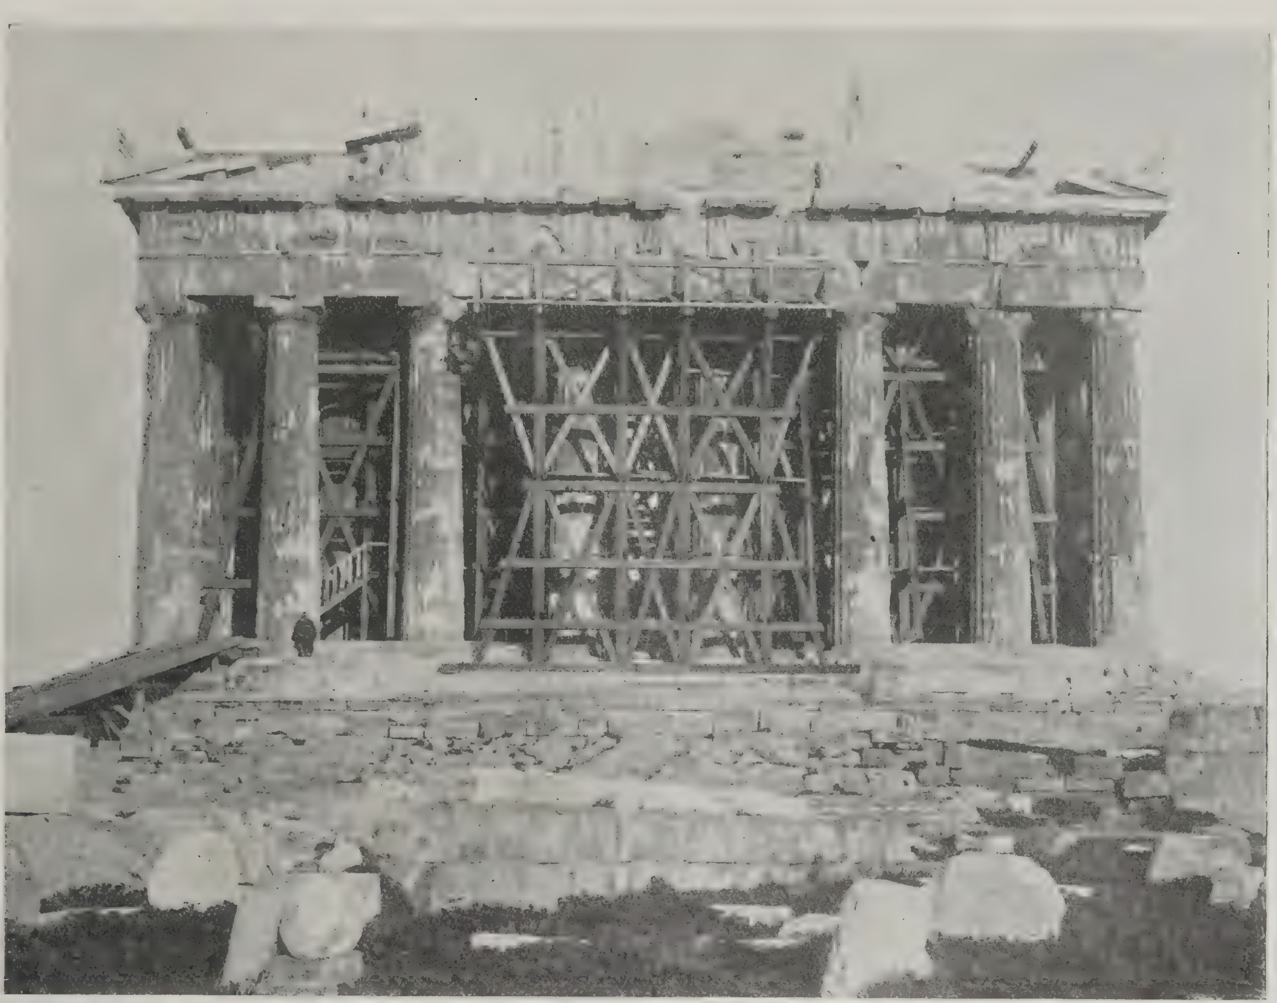
* * *

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels has made grants of money in aid of the following objects, viz.: Building new churches at Bishopswearmouth, St. Gabriel, County Durham, £200; Grimsby, St. Augustine, £150; Pontyates, near Kidwelly, Carms., £75; and West Streatham, St. James, Surrey, £175; rebuilding the churches at Caerwent, St. Stephen, Monmouth, £40; and New Ferry, St. Mark, Cheshire, £100; and towards enlarging or otherwise improving the accommodation in the churches at Cockfield, St. Mary, County Durham, £60; East Thorpe, St. Mary, Essex, £50; Harlton, St. Mary-the-Virgin, Cambs., £25; Ilford, St. John-the-Evangelist, Essex, £25; Windermere, St. Martin, Westmorland, £30; York, St. Luke, £150; and Chesham Bois, St. Leonard, Bucks,



This view illustrates a piece of the past history of the Parthenon, showing as it does the jamb-linings which, among other alterations, were introduced during the Byzantine occupation, when the Parthenon was converted into a Christian Church.

THE WEST DOOR OF THE PARTHENON: DETAIL SHOWING BYZANTINE JAMB-LININGS CONSTRUCTED OF ANCIENT MATERIAL.



This view is an illustration of the work which is at present being carried out in repairing the buildings on the Acropolis. The funds for the work have been mainly supplied by the Greek Government and the Greek Archæological Society, and members of the American School at Athens have been helpful in discovering and sorting out from the debris the various stones which have been rebuilt into their original position.

THE PARTHENON: RESTORATION OF THE WEST FRONT IN PROGRESS.

£55. Grants were also made from the Special Mission Buildings Fund towards building mission churches at Bow, Devon, £20; Bowburn, County Durham, £30; Carlton Vale, Kilburn, Middlesex, £25; Furzedown, Surrey, £50; Grimsby, St. Hugh, £40; Rodley, near Leeds, £20; Stockwell, The Epiphany, Surrey, £50; and The Brook, Chatham, £30.

* * *

The Finsbury Borough Council have granted a contract for ten years to the Gas Light and Coke Company for the lighting of all their streets by the new inverted burner lamps, which will show an increase in total illuminating power of 100,000 candle power over the existing system of lighting, but with a reduction in cost of £525 a year. This decision was taken after the latest examples of gas and electric lighting had been carefully inspected and relative costs considered.

* * *

The Clothworkers' Company have voted £5,000 for an additional building to complete the front elevation of the Clothworkers wing of the University of Leeds, and to provide extensions necessary for teaching the French system of worsted-combing drawing, and spinning. The freedom of the City of Winchester has been conferred upon Alderman Stopher, architect. Mr. Stopher, who was born at Saxmundham, went to Winchester in 1847, and has designed many important buildings in the locality. Alderman Stopher is said to possess one of the best libraries of Hampshire topographical works. He was Mayor of Winchester in 1884, when the 700th anniversary of the Winchester Mayoralty was celebrated.

* * *

Mr. Reginald G. Kirkby, A.R.I.B.A., F.S.I., has resigned his appointment as City Architect of Bradford, a position he has held for the past two years. His work since going to Bradford has been of great value to the Corporation in spite of the fact that it has largely been of a routine character. He has supervised the completion of the Town Hall extension, and among other buildings he designed are the open-air school at Thackley, the textile school now in course of erection, and the cottage baths in several parts of the city. He now has the completed plans for the reconstruction of the Victoria Hall, Wyke, as a free library, reading-room, and baths.

* * *

The death is announced as the result of an accident, of Mr. R. G. Cowe, architect, of Chester-le-Street.

* * *

A case has been brought by the Brighton Town Council against Mr. Alfred Carden, Architect, of Brighton, for erecting a new building at No. 53, North Street, without having deposited the necessary plans and sections. The work appears to have consisted in re-roofing a back addition, and it was contended that the new building was 6in. higher than the old. The cross-examination of the Corporation witnesses tended to show that the roof required reinstating and that the difference in height was accounted for by the subsidence of the old roof, and the necessary alterations in the construction to make a good sound building. The case was dismissed.

* * *

Mr. Walter H. Derriman, B.Sc., A.C.G.I., A.I.E.E., Fellow of the Chartered Institute of Patent Agents, has entered into partnership with Messrs. Dicker and Pollak, Chartered Patent Agents, 37, Furnival Street, Holborn, E.C., and in consequence the name of the firm has been changed to Dicker, Pollak and Derriman.

* * *

It is stated that there is some possibility of the famous Kirby Hall (inhabited by the Winchelsea family up to 1820, and now a ruin) being restored by the present heir, Lord Maidstone, who has just married Miss Drexel.

* * *

The Committee of the House of Commons on Unopposed Bills, Mr. Emmott, Chairman of Ways and Means, presiding, on July 2nd approved of the Bill to confirm a Provisional Order made by the Board of Education authorising the compulsory acquisition of land for elementary school purposes in Bridge Road, Battersea; Prichard Road, Bethnal Green; St. Nicholas Street, Deptford; Gilsted Road, Fulham; Vespan Road, Hammersmith; Delhi Street, Islington; Wickham Street, and Vauxhall Street, Lambeth; Plassy Road, Lewisham; Aldenham Street, St. Pancras; and Trinity Place, Shoreditch. The Bill, which has passed the other House, was ordered for report without amendments.

TOWN PLANNING.

Winchmore Hill Woods. The Enfield District Council have provisionally agreed to purchase 60 acres of Captain Taylor's Estate, Greenlands, the area including seven acres of lake. The necessary sanction of the Council is all that is needed to complete the transaction, and it is not likely to be withheld. The land will then be devoted to the public, and will form one of the most beautiful parks near London.

Birmingham and Town Planning. The first meeting that has been held under the Town Planning Act took place at Birmingham, when a number of property owners and others were invited to meet representatives of the City Town Planning Council in furtherance of a scheme for acquiring land in the parishes of Quinton, Harborne, Edgbaston, and Northfield. The Lord Mayor presided, and said the Corporation wished to take the fullest advantage of the Act; they were willing to do all they could to co-operate with property owners for their mutual advantage. Their entire staff of experts was at the disposal of property owners or builders for advice as to how a particular piece of land should be laid out. Councillor Nettlefold said he wished it to be understood that it was not intended to force owners of land to develop it at once. The number of houses per acre was about ten.

Holland House. Mr. Harold Spender sends to the "Times" an *ex parte* statement concerning the manifesto issued by the owners of Holland House, that "If Holland House is destroyed as an open space in the midst of a crowded neighbourhood, it will be against the wish of the present owners, and only under the pressure of circumstances over which they have no control." Mr. Spender goes on to state that "The owners of Holland House complain that they will have to pay a heavy sum under the land taxes. Of course they will. Any individual who claims the luxury of keeping for himself and his family 70 acres of unoccupied wilderness in the midst of a crowded city ought to pay something for that luxury. But the owners have an easy way out. There is a clause in the Finance Bill which relieves from taxation any large park or garden where reasonable facilities are given to the public. Lady Ilchester and her family have only to open Holland Park without fee to the public, say twice a week, to escape taxation altogether." He concludes that "It is not fair that Holland House should be sacrificed to this petty Budget spite. This is one of the great historical estates of Great Britain which ought to be saved to the nation. Holland House, the home of the Foxes, the favourite resort of Macaulay, the vestal temple of freedom in England's darkest hour, the nursery of wits and genius, ought to be accessible to the people—ought to be owned by the people. The time has come when we ought seriously to consider whether, if individuals can no longer maintain these precious heirlooms, the nation ought not to buy them. Compulsory purchase for the nation by arbitration would seem to be the best reply to these insolent threats to throw on the scrap-heap the great national monuments of which they are trustees."

Liverpool's First Garden Suburb. Liverpool's first Garden City Suburb, which was recently inaugurated by the Marchioness of Salisbury, has for its site 185 acres of land, which has been leased for the purpose to the Liverpool Garden Suburb Tenants, Ltd., by Lord Salisbury. The movement is one in which Lord and Lady Salisbury and Lady Gwendoline Salisbury have taken a great interest. They have visited and inspected other estates in different parts of the country which have been developed on similar lines, and have expressed themselves as thoroughly in sympathy with the garden suburb movement, and pleased with the tasteful way in which the gardens have been laid out. A pleasing feature of the ceremony was the gifts of flowers from the various garden suburbs in the country, which were in the form of bouquets, one of which was presented to Lady Salisbury, and another to the Lady Mayoress.

A Facetious View of "Common or Garden Cities." The humorous view of any movement is natural and inevitable, and may, in its way, be not without its value. We therefore take leave to transfer the following lively effusion from the editorial columns of the "Globe": Of the building of garden cities there is no end. Nor should it surprise one that this comparatively new type of community—we say comparatively, because the first inhabitants of a garden city were Adam and Eve—appears in an attractive light, for, apart from any specific advantages of the mode of life it offers, the thing has the invaluable asset of novelty. It seemed that the garden city gave an adequate response to the "Give me air" of the Metropolitan householder, and that if the honeysuckle did not climb in proper profusion around the house, it was only because the plant was not sufficiently trained by the occupier. Already established, a garden city life has lately been consolidated, as it were, by the uncontradicted statement that it is producing a race so much above the standard in weight and height that they are to be little less than supermen. And now come the Norwood Urban District Council, panting to use their powers under the Housing and Town Planning Act on an acreage of wood and meadow land bigger than the acreage of Richmond. That the proposal is made on finely wrought business lines is shown by the fact that the architecture of the place is the basis of a town-planning competition in which "some of the leading architects" are competing. That the scheme, when completed, will create a furore of illimitable dimensions is certain. Who is there that will not wish to discover and enjoy whatever cryptic benefits accrue from a "caddy-free" golf links?

Middlesex Garden Estate Scheme. A preliminary notice is about to be issued of a company which it is proposed to form for the purpose of establishing a new garden estate within easy reach of London. The scheme will be undertaken with the co-operation of the authorities of King's College, Cambridge, and will be one of the earliest attempts to put into practice on a large scale the Housing and Town Planning Act, 1909. The authorities of King's College, Cambridge, are the owners of an estate of about 1,300 acres of land at Northwood and Ruislip in Middlesex, and the new company hopes to take over from Garden Estates, Ltd.—a company formed in 1909 for investigating the suitability of the estate for being developed in the manner now proposed—the benefit of a provisional agreement between the latter and the College. The Provost and Fellows of the College have intimated their willingness to sell on terms which will enable a harmonious scheme of town planning to be applied to the general development of the estate as a whole, while securing to the College a profitable price, amounting to more than £200,000, when the whole estate is sold. If sufficient promises are forthcoming a company will be formed and a prospectus issued. The estate, it is pointed out, exceeds in area many important towns, and is within 15 miles of Charing Cross, being served by four railway stations. With a view to securing the best possible plan a town-planning competition has been instituted, and the successful competitor's plan will be handed over to the company, for which he will be invited to act as consulting architect. The scheme will only be proceeded with provided that sufficient public support is forthcoming to warrant that step. The temporary offices of the proposed company are at 33, Henrietta Street, Covent Garden.

A Garden at Kensington. Representations are being made to the London County Council in favour of vesting the garden enclosure of Emperor's Gate, Kensington, in a committee of residents, in pursuance of the Garden and Towns Protection Act, 1863, with a view to its being kept as an ornamental ground for the use of the inhabitants. If the Council acquiesce, it will be the duty of the Kensington Council to levy a rate on the occupiers of the houses surrounding the garden for maintenance purposes.

L.C.C. Garden Suburb Scheme. Replying to Progressive criticism of the working-class dwellings' accounts for the year ended March 31st, at a recent meeting of the London County Council, Major Boscawen, the Chairman of the Housing of the Working Classes Committee, said that the Committee's work was being carried on as far as possible without regard to party politics. Referring to remarks made by Mr. W. C. Johnson, he said that the question of the possibility of enabling working men to buy their own dwellings in "garden suburbs" by a copartnership scheme or otherwise was under the consideration of the committee, and he had read an official report on the subject that morning.

Paris and Its Fortifications. A writer in "Justice" gives some details of the proposals of the League for the Institution of Open Spaces for dealing with the fortifications of Paris. The uselessness of these in modern warfare was demonstrated in the Franco-German War; but the ground covered by them has become increasingly valuable, and the financial question has no doubt stood in the way of their development for other purposes. The ground actually covered by the fortifications is valued roughly at £4,000,000, and it is hoped, on the ground of public improvement, that the State will sell to the city for £2,800,000. The *zone militaire* surrounding the fortifications is estimated as being worth another £5,600,000. It is proposed to construct a chain of eleven parks around the city on the land acquired, and to sell what land is not required for £8,400,000. This would cover the cost of purchase; but the figures are, of course, entirely fanciful.

The Romford Garden Suburb. The Romford Garden Suburb, at Romford, Essex, is one of the latest manifestations of the garden city and town-planning movements. It was inaugurated on Thursday last, July 28th, when the Rt. Hon. John Burns, President of the Local Government Board, laid the foundation-stone of the first house. No more appropriate spot could have been chosen for a garden suburb than his estate, about a mile outside the town of Romford. The historic associations of Gidea Hall (the fine early Georgian house, which is to be left standing as the central building of the suburb); the magnificent trees in which the park abounds, and which are to form avenues along the ample gardens of the houses to be built on the estate; the presence within five minutes' walk of the new railway station at Squirrel's Heath, with an excellent service of trains to Liverpool Street; and the fact that the Romford golf course on one side and the Romford public park on the other adjoin the suburb—all combine to give it unequalled advantages. Designs have been made for the houses in the suburb by some of the ablest modern architects, and sufficient care has been taken in planning the estate to guard against any kind of overcrowding on the one hand and speculative jerry-building on the other.

Sealand Garden Suburb. At Sealand, a picturesque spot situated on the river Dee, near Connah's Quay, and about six miles from Chester, a new garden suburb has been started, under the auspices of the Sealand Tenants, Ltd., on copartnership lines. The land has been laid out under the supervision of Mr. Raymond Unwin, and it is proposed to erect 470 houses at a cost of £80,000. About ten acres have been purchased, and an option secured on a further thirty acres.

Garden City for London Boys. Prince and Princess Alexander of Teck have laid the foundation-stones of two of the houses which are to be erected on a recently acquired estate of 39 acres at Woodford Bridge, Essex, where a garden city for boys is in course of development in connection with Dr. Barnardo's Homes. The estate is beautifully wooded; and Gwynne House, a fine old residence standing on its slope, is famed for its associations with Nell Gwynne. Thirty houses are to be erected in the grounds to accommodate about a thousand waifs and strays.

HARE STREET, SQUIRREL'S HEATH, ON THE ROMFORD GARDEN SUBURB ESTATE.

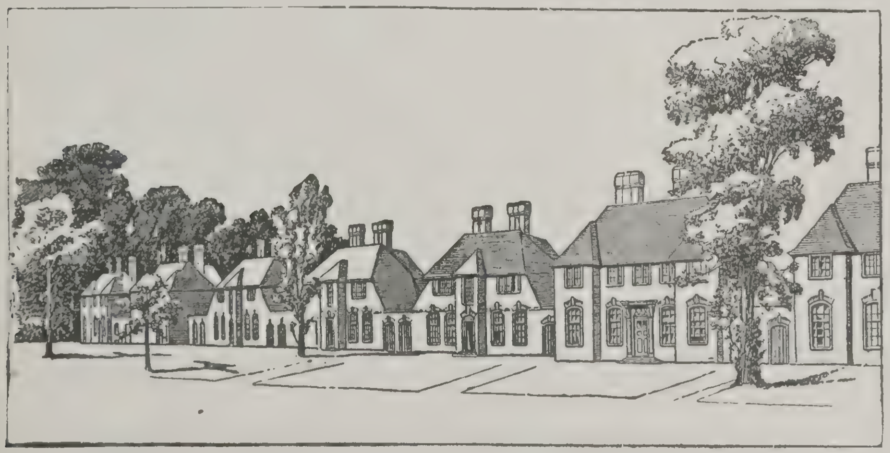
A Kilburn Park. The estate of 20 acres, known as The Grange, in the High Road, Kilburn, is to be purchased and devoted to the purposes of an open space to be called King Edward VII. Park. Towards the purchase money the Willesden Council have agreed to provide £3,000, the Hampstead Borough Council £4,000, and the London County Council, who will be responsible for its maintenance, £5,000.

OBITER DICTA.

Our Lack of Artistic Temperament. Do you think the French would have permitted St. Paul's Cathedral to be hemmed in by gaunt-looking warehouses? Do you think they would have sanctioned the expense of the new triple arch which forms the culmination of the east end of the Mall and allowed it to be hidden from view by a series of minor buildings? Is it possible to believe the French guilty of putting a new bridge across the Thames under conditions making for artistic failure? Other countries can grasp big schemes more readily than we can, and, what is more, the authorities are not so prone to play pranks with approved undertakings. In this country there is a tendency to get frightened about expenditure towards the concluding stages of a big structural undertaking, and the oddest innovations are made in the guise of economy. It was so in the case of the Foreign Office. The allotted sum was running out, and it was thereupon decided to dispense with a few towers. The architect's design was seemingly a matter of small moment.—*Mr. T. E. Colcutt, F.R.I.B.A., in "The Observer."*

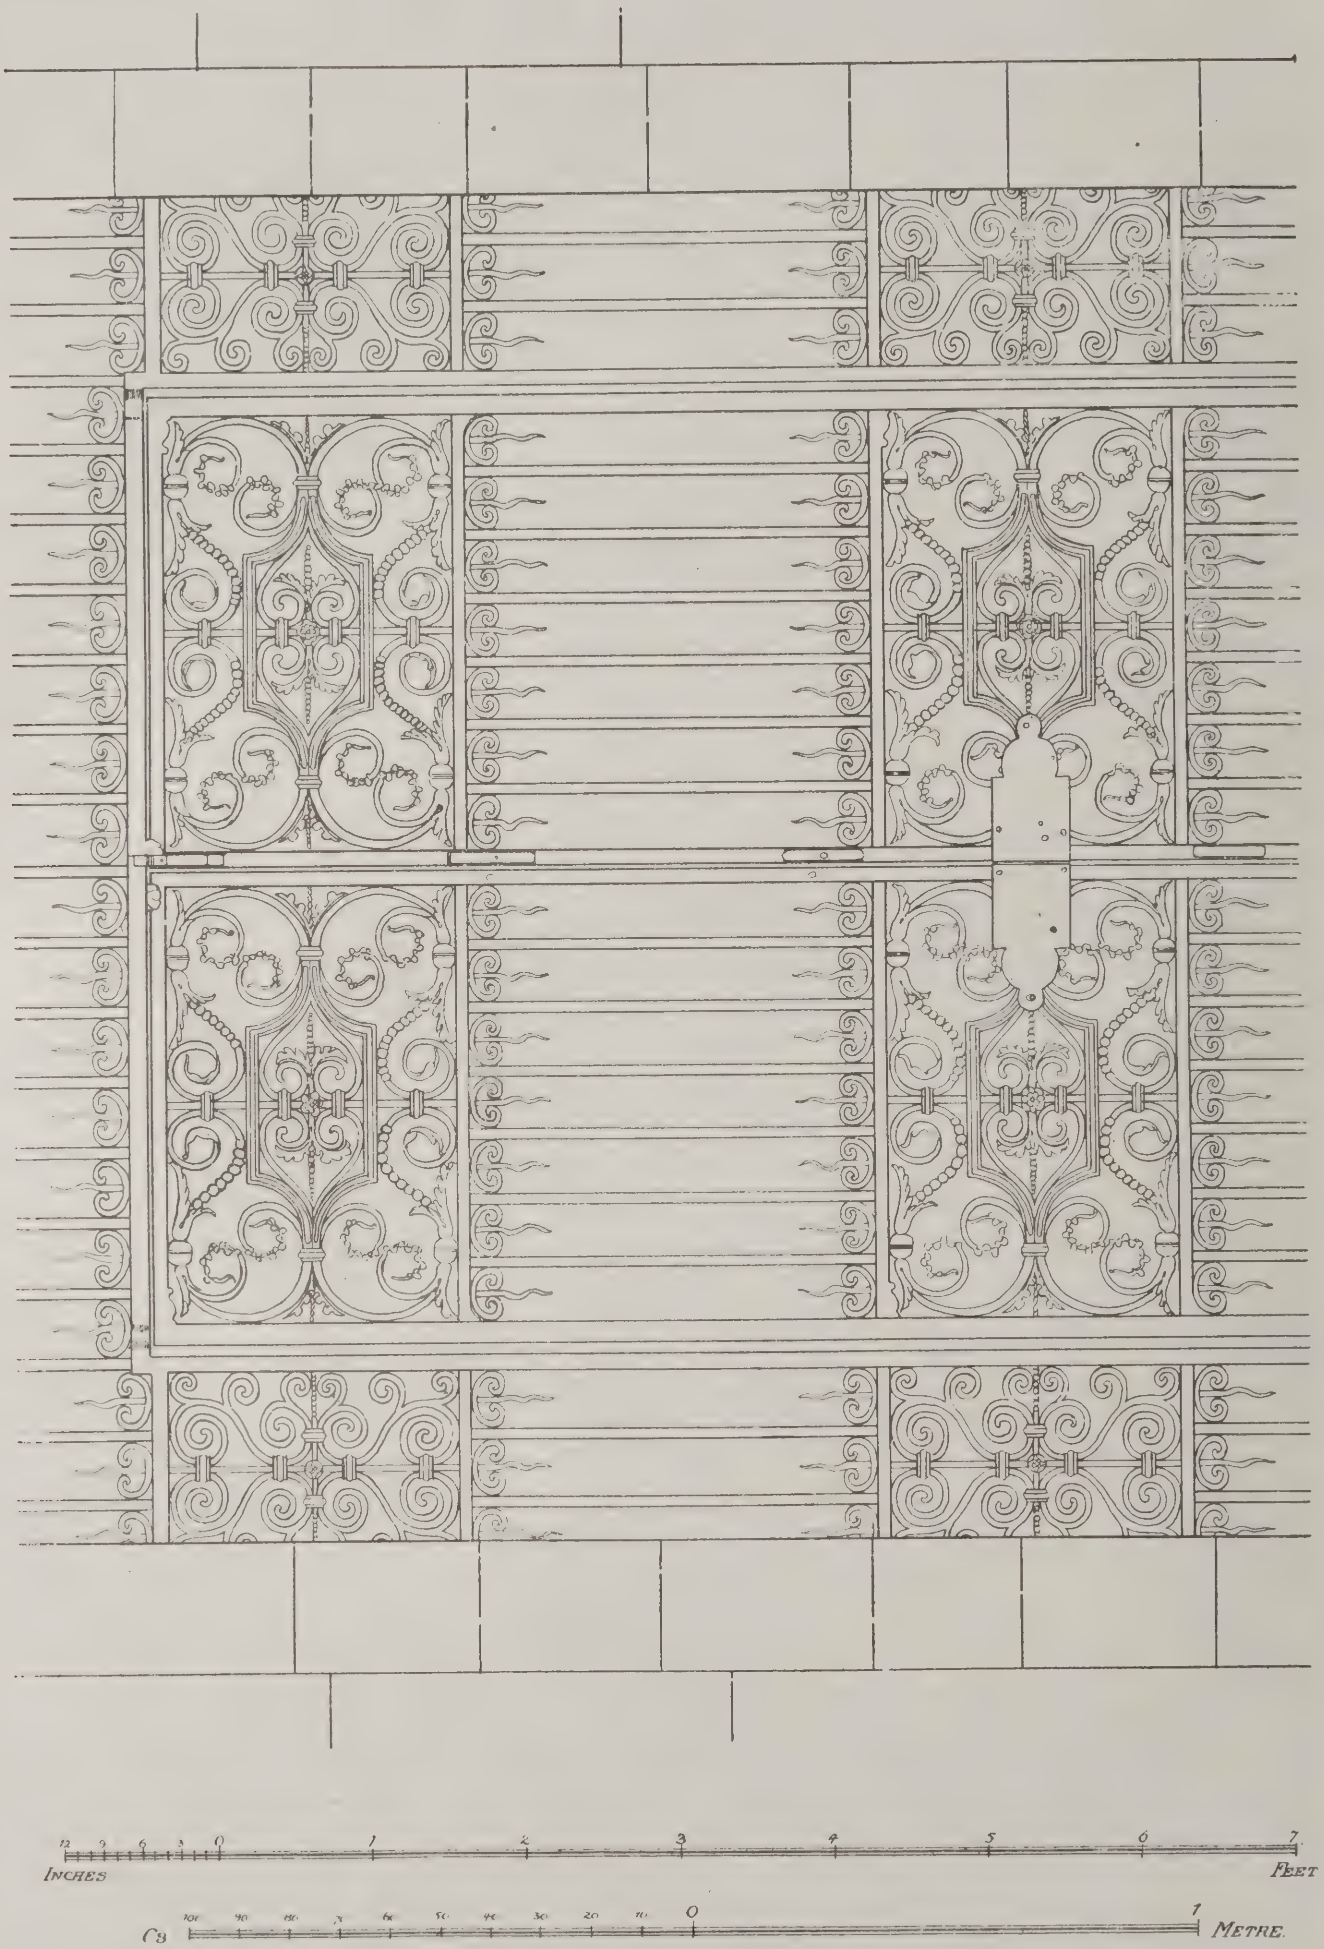
English and French Street Planning. In regard to individual buildings, I think we compare favourably with Paris, but where the French capital is far ahead of London is in the grandeur of her street planning. The difference is so conspicuous that when one gets back to London from Paris it is difficult to avoid feeling that you are returning to a provincial town, and it is greatly to be hoped that the work of making the Mall the most magnificent avenue in London will not be spoilt for want of the finishing touch.—*Professor Reginald Blomfield, A.R.A., in "The Observer."*

Benefits Forgot. That our architects are unrivalled in domestic buildings and in the decorative treatment of interiors is admitted, even by Continental critics, but in regard to grand scale architecture we cannot compare with France, Germany, or the United States. The reason is lack of opportunity. Had the Prince Consort lived this would have been altered. The Prince not only had an eye for the artistic in public buildings, but he realised that art could not be expected to find encouragement at the Office of Works, an excellent but soulless institution. Temporarily, he managed to lift architecture out of the rut by welding architectural art to engineering skill, but at his death the whole business got back into the old groove, and there it has remained ever since.—*Professor Beresford Pite, F.R.I.B.A., in "The Observer."*

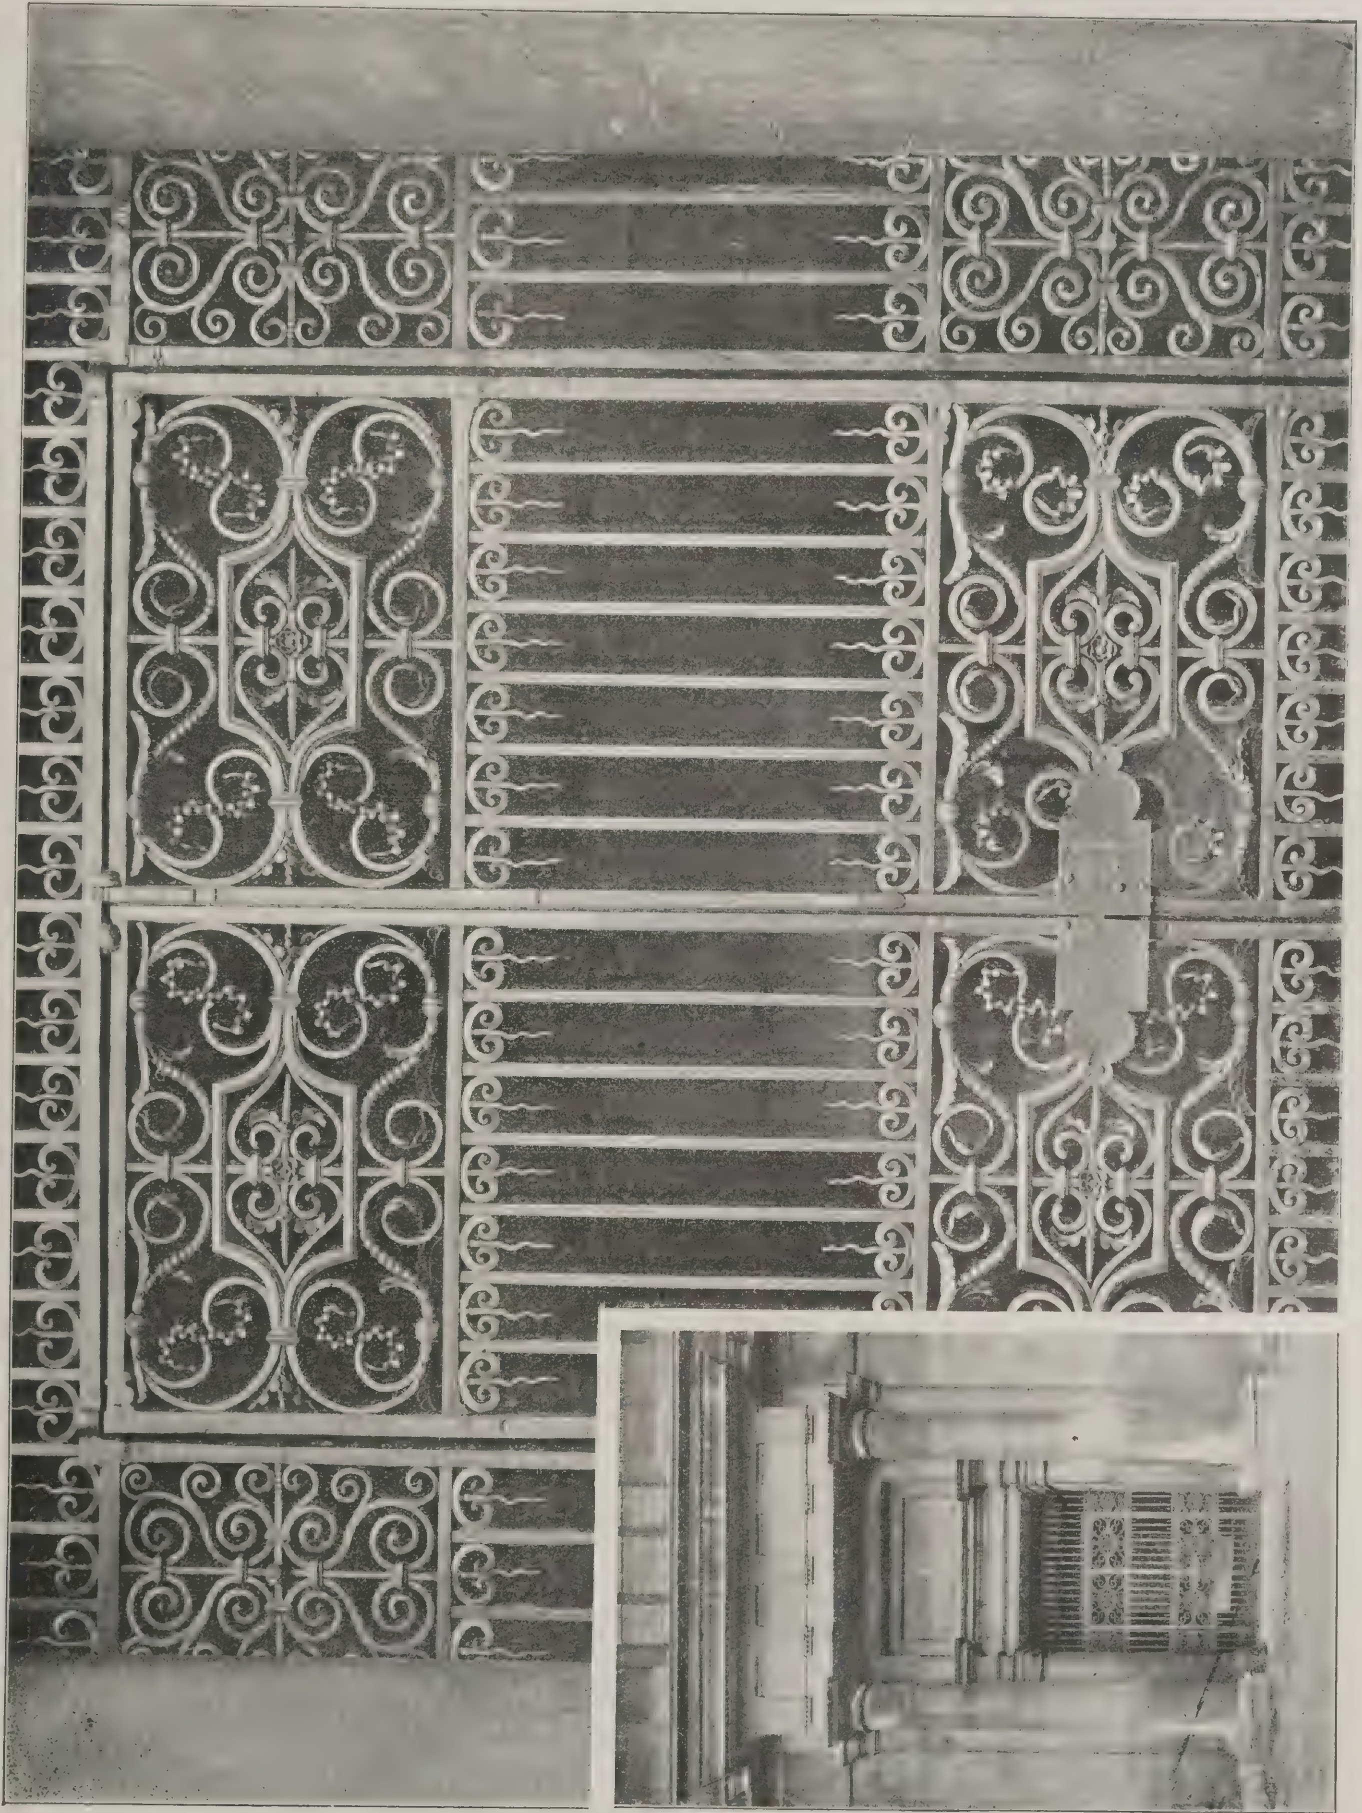


This is a sketch design for an avenue when completed. The foundation stone of the first house was laid last Thursday by the Rt. Hon. John Burns, M.P.

THE ROMFORD GARDEN SUBURB.



DETAIL OF WROUGHT-IRON GATE, RIVER FRONT OF TRINITY COLLEGE LIBRARY CAMBRIDGE. MEASURED AND DRAWN BY JAMES JENNINGS.



In the building accounts of Trinity College Library there is an item of £400 in favour of "Mr. Partridge, the London smith, for three iron gates in cloister and the iron railes in the staircase." This is the only record. The gates were erected in 1691, and are of quite an unusual type of Renaissance ironwork

PALACE OF FRENCH ARTS AND INDUSTRIES.

(*See Centre Plate.*)

After having been for some years left idle, the London County Council's fine centre site between the Strand to Aldwych is to be utilised for a very important project. The French Palace Development Syndicate, Ltd., has secured a long lease of the site from the Council; and the plans, about which there has been considerable discussion, have at last been finally approved. It is now evident that the scheme, when carried out, will result in placing in the heart of the metropolis one of the most extensive blocks of buildings which London will possess; and the activities when the scheme is completed will add considerably not only to the commercial intercourse between England and France, but also to the social intercourse between the people of the two countries.

The total area of the site at the disposal of the Syndicate is 124,000 sq. ft. The principal frontage extends for 650 ft. along Aldwych, the Strand frontage is 450 ft., and the average depth of the site from the Strand to Aldwych is 300 ft. Upon this site the Syndicate is about to erect buildings at a cost of £800,000, and the excavations will commence in a very few weeks' time.

The buildings have been designed by M. Ernest Gérard in the style of the French Renaissance period, and will, it is thought, be one of the best examples of this style in London

The buildings comprise, first, the Palace proper, which will be an imposing building abutting on Aldwych, and will provide a fine *coup d'œil* as one approaches the site from Kingsway. The Palace will contain an immense Hall, in which a permanent exhibition of French arts, including paintings and sculpture, and French industries, including the products of the French colonies, will be housed. There will also be a large Congress Hall with accommodation for about 1,000 persons, which will be utilised for international receptions, banquets, conferences on arts and industries, and similar functions. Accommodation will be provided in the Palace for an important French club which is now in progress of formation. This club will provide a rendezvous for French business men visiting this country and for members of the French colony in London, and combine the functions of a Chamber of Commerce with those of a social club.

The right wing of the Palace will be occupied by a large café-restaurant, containing dining-rooms, grill-room, and billiard-rooms, with winter gardens attached. The control of the restaurant will be placed in the hands of an eminent French chef, and will doubtless become a popular centre for gourmands. Naturally all the adjuncts which make Continental restaurants so popular, such as music, etc., will be found here.

The left wing of the Palace is to be devoted to a Theatre. One or two novelties have been embodied in its design, notably the provision of a special royal entrance and a suite of rooms attached to the royal box for the accommodation of distinguished parties. It is intended to devote the Theatre to the presentation of classical and modern French plays interpreted by the most famous Parisian artists. The decoration of the Theatre will be on a very lavish and beautiful scale.

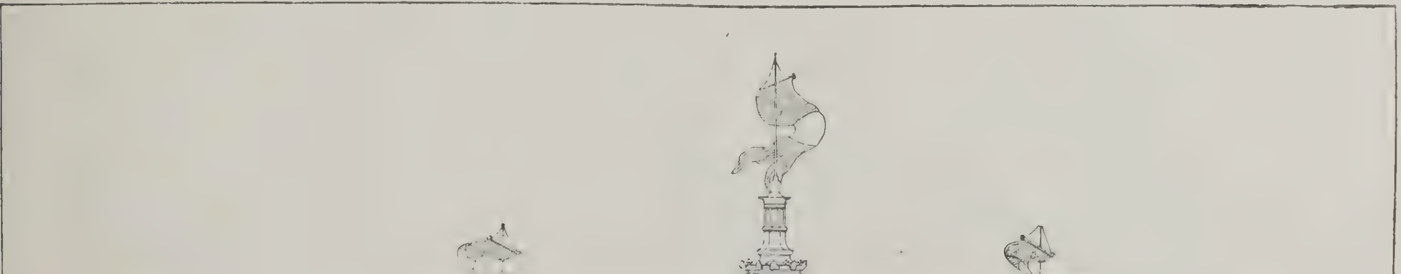
From the wings of the Palace fine buildings will run on the fringe of the site enclosing the whole of the interior from the streets. These buildings, which will be about 80 ft. high, will be devoted to *grands magasins* of the type so familiar to visitors to Paris, to the number of over 100, and above them there will be about 800 suites of offices which will be utilised principally by French firms having interests in England. There is also accommodation for banks and exchange offices, and the basements will be occupied by safe deposits, etc.

The enclosed grounds are to be laid out in exact imitation of the boulevards of Paris. At one end there will be a *café-patisserie* surrounded by a terrace where one may sit as in Paris and take one's refreshment alfresco to the accompaniment of music from a bandstand near by. The shops already referred to will have entrances on the boulevards within as well as on the street without, so that upon entering visitors may well imagine themselves to have left London behind and to be in the Gay City itself, a feature which has already caused the scheme to be known popularly as "Paris in London."

The conception of this scheme is the outcome of the Anglo-French *rapprochement* which has been such a feature of European life since the establishment of the famous Agreement of 1904, and will serve not only to cement England and France closer together commercially and socially, but will also remain a permanent memorial of the *entente cordiale*. In pursuance of this idea the architect has provided for a memorial in the shape of an immense bas-relief, which is to be placed in the tympanum over the main porch of the Palace facing Kingsway. This bas-relief will depict King Edward extending the hand of welcome to M. Loubet, surrounded by a distinguished company, including the present King, the Duke of Connaught, Lord Lansdowne, Mr. Balfour, M. Delcassé, M. Paul Cambon, and others who participated in the *pourparlers* which culminated in the Anglo-French Agreement of 1904.

Naturally, such a vast project as this will occupy a considerable time in completion, but the Syndicate hope to have everything ready for the inaugural ceremony early in 1913. Great interest is being taken in the scheme, and already the Syndicate, which has taken offices overlooking the site at 167, Strand, is receiving numerous inquiries from both French and English firms for accommodation in the buildings which form part of the scheme.

The views given in this issue are of the preliminary designs, and include a reproduction of the elevation to the Strand on this page; and, in the Centre Plate, the elevation to Aldwych, a view in the Principal Hall, and the ground-plan. On the latter it will be noted that the Palace proper and the theatre occupy a centre island site, the plots on either side being occupied by shops back to back, fronting both to the inner roads and also to the surrounding streets. On the East side is situated the café-restaurant. It is stated that building operations will be commenced in October next.



THE FRENCH PALACE OF ARTS AND INDUSTRIES, LONDON: ELEVATION TO THE STRAND. ERNEST GÉRARD, ARCHITECT.

ART ITEMS.

Windows at Ripon. Seven stained glass Roman Catholic church windows have been placed in St. Wilfrid's at Ripon, in memory of the late Marquess of Ripon. They are the work of Messrs. Atkinson Brothers, of Newcastle-on-Tyne.

Wimbledon Common Extension. The Committee are still appealing for further contributions towards the £53,000 required for the purchase of 172 acres which can now be secured. Just over £11,000 has at present been subscribed, and about 13 acres have been purchased at a cost of £7,000.

Du Maurier Drawings for the Nation. The Victoria and Albert Museum has acquired a group of drawings by the late George du Maurier from the Exhibition of the famous "Punch" artist's work which is now being held at the Leicester Galleries, Leicester Square, under the title of "'Society' in late Victorian days." The Exhibition was to have closed at the end of this month but owing to its continued success Messrs. Brown and Phillips have decided to keep it open until the middle of August.

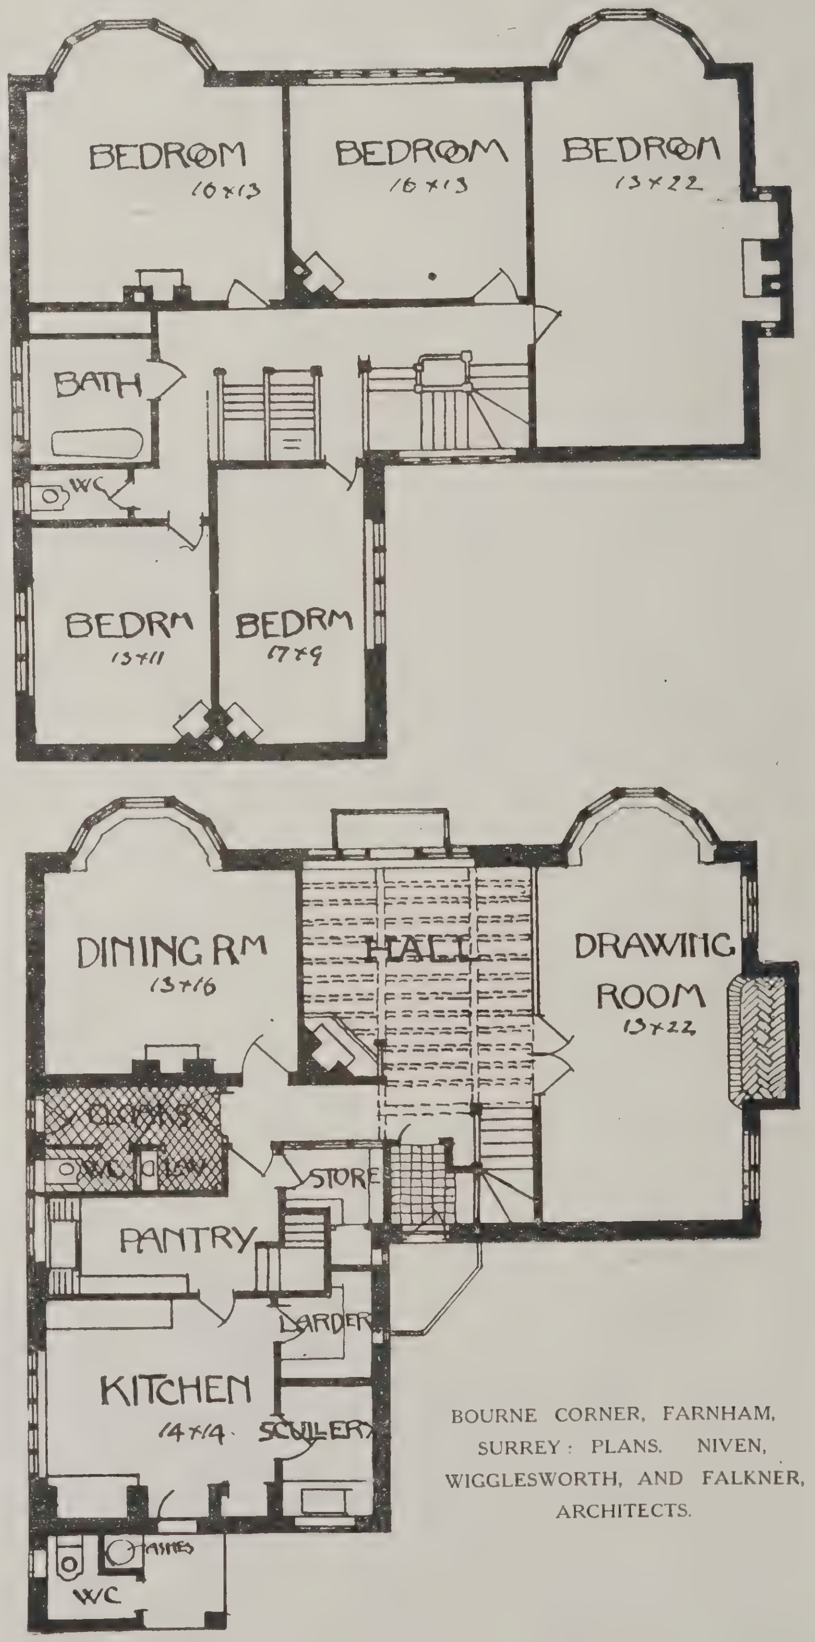
Maumbury Rings. The Maumbury Rings Excavation Committee have met at the Dorset County Museum, Dorchester, to make arrangements for the third instalment of digging, for which the leave of the Duchy of Cornwall, the owners, has been obtained. It was resolved to begin work on Monday, August 29th, and to ask Mr. H. St. George Gray, of Taunton, the director of the excavations, to visit Dorchester on July 30th and confer at the amphitheatre with a sub-committee, consisting of the chairman (Dr. H. Colley March), the hon. secretary (Captain John E. Acland), the Rev. C. W. Whistler, and Messrs. Charles S. and W. de C. Prideaux. It will then be decided what portions of the Rings will be investigated this third year. The cost of last year's excavations was £57. The Dorset Field Club, who are co-operating with the British Archæological Association in promoting the examination of Maumbury with the spade, have appointed a standing Earthworks Committee for the systematic investigation of the ancient earthworks of the county—prehistoric Roman, and *post*-Roman. Dr. Colley March has been appointed chairman, and the Revs. C. W. Whistler and C. W. H. Dicker joint hon. secretaries.

William Pitt's Statue in Hanover Square. A "Morning Post" correspondent raises the question of the responsibility for the preservation of the site and sight of monuments. Municipal responsibility, he holds, should concern itself not alone with the material welfare of the citizens, but also with their æsthetic culture. With reference to the statue of William Pitt in Hanover Square, he says that here we have a really dignified statue admirably placed; it looks down a broad sloping roadway towards an historic church, and he recalls the lines of Macaulay (looking northwards from the steps of the portico of the church):

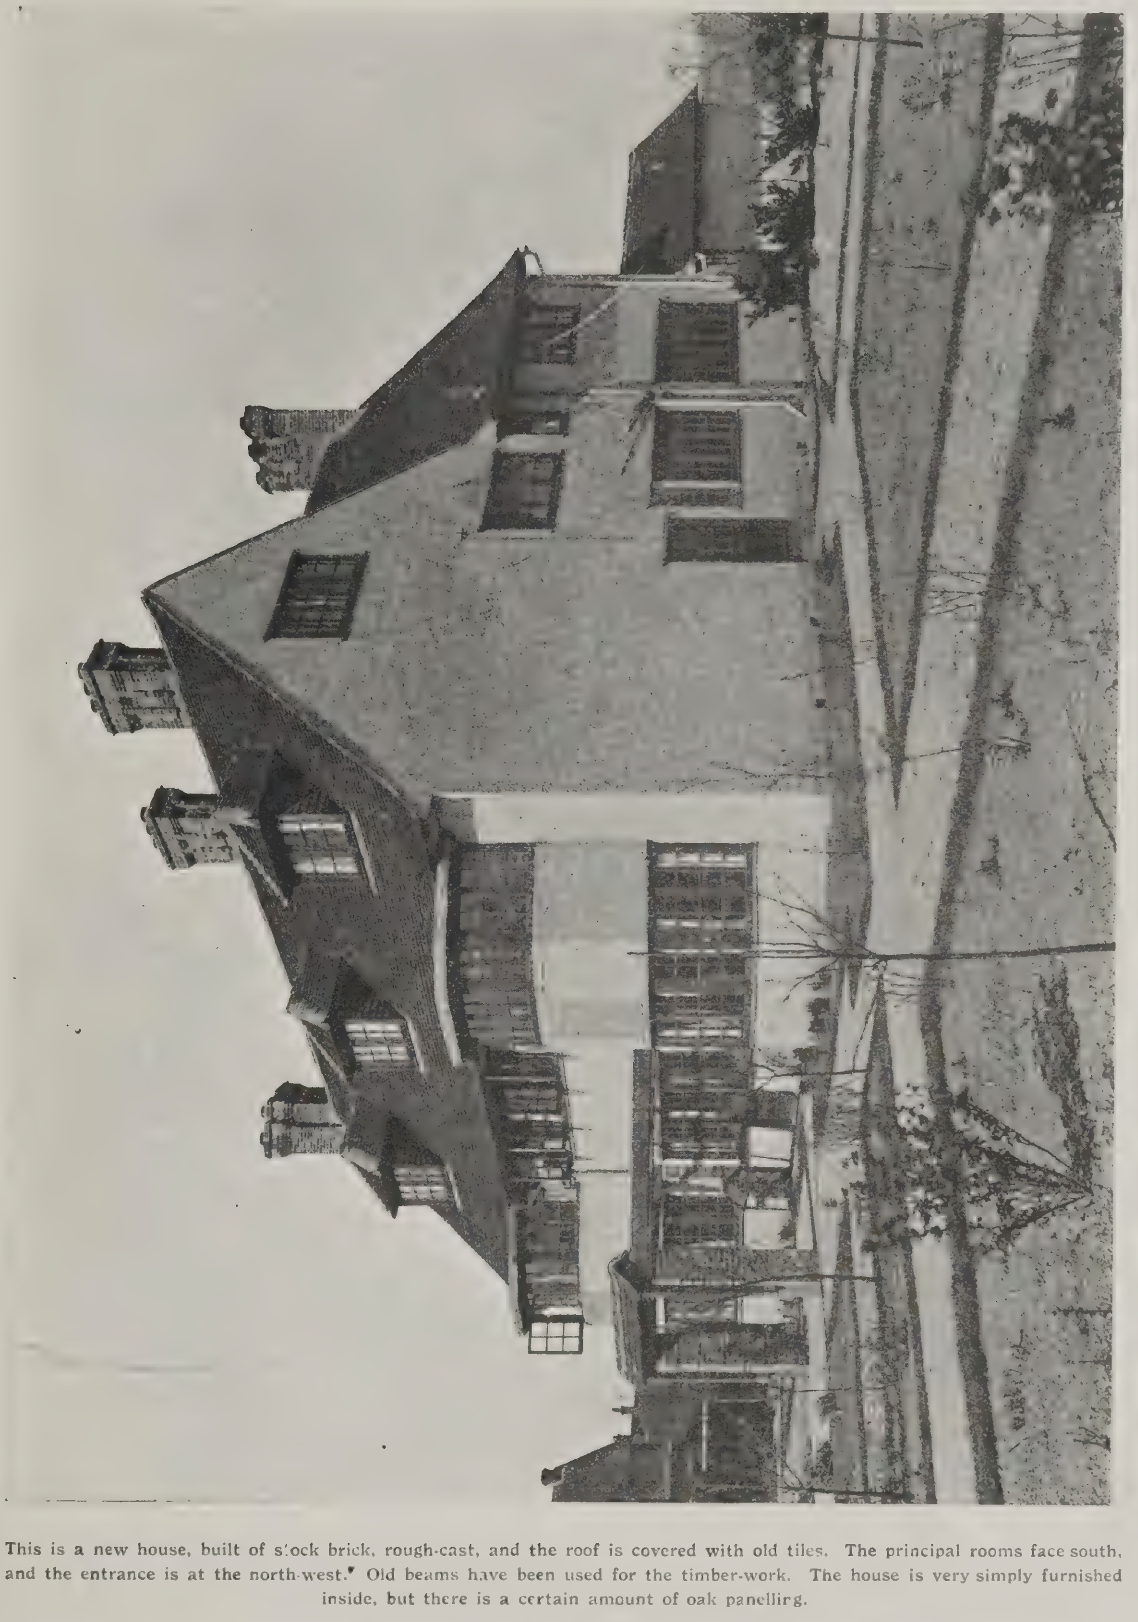
> "To where I see with outstretched hand,
> Majestic, thy great kinsman stand,
> And half unbend his brow of pride
> In welcoming so fair a bride."

The bride mounting those steps and seeking the comfort of that welcome, the correspondent (Mr. Harrington Sainsbury) declares, will now see the great globe of an electric street lamp entirely obliterating the head of Pitt, whilst the standard of the lamp will be seen to bisect the monument. What is the use, he asks, of selecting a fine site, in which selection no doubt Chantrey must have been consulted, and then making nought of all the care and attention which has been bestowed? A lamp at the south-eastern corner would serve every purpose of illumination, and at the same time would preserve a fine setting to a noble statue.

Buckingham Palace. The Government (says "Truth") do not see their way to spend any money on the beautification of Buckingham Palace. And up to the present nobody has responded to the suggestion recently made in that paper that the re-fronting of this edifice should be carried out by a national subscription as a memorial to King Edward VII. Under these circumstances it may not be out of place to mention a suggestion made to "Truth" the other day by a correspondent—namely, that coastguards should be set to work to whitewash the walls and tar the roof and chimneys. The building would then at least be clean, the cost would not embarrass the Chancellor of the Exchequer, and the decorative scheme would have associations which might not be unpleasing to his present Majesty.



BOURNE CORNER, FARNHAM, SURREY: PLANS. NIVEN, WIGGLESWORTH, AND FALKNER, ARCHITECTS.



This is a new house, built of stock brick, rough-cast, and the roof is covered with old tiles. The principal rooms face south, and the entrance is at the north-west. Old beams have been used for the timber-work. The house is very simply furnished inside, but there is a certain amount of oak panelling.

BOURNE CORNER, FARNHAM, SURREY. NIVEN, WIGGLESWORTH, AND FALKNER, ARCHITECTS.

FIRE PREVENTION NOTES.

Fires at Country Houses. The destruction, by fire, of Menlough Castle, Galway, reported in the papers of Wednesday last, is one more illustration of the dangers attendant in country houses lacking ready means of escape and the provision of proper means of fire prevention. In the present instance the fire was attended by the lamentable loss of three lives, two of maidservants who were fatally injured by leaping from the roof to the ground, a distance of 40 feet, and the third that of the invalid daughter of the owner, who perished in her bedroom, where the outbreak is presumed to have occurred. The loss of life necessarily overshadows the other terrible results of the fire, the destruction of the whole of the valuable contents, including the valuable furniture, armour, pictures, and other treasured heirlooms, only the bare walls of the building, which were in some parts eight feet thick, withstanding the flames. Menlough Castle, in part, dated from the thirteenth century, and was a magnificent, creeper-clad pile of buildings. We have frequently urged before in these columns the necessity of overhauling these historic residences, and bringing them up to modern standards in fire-prevention; and though this may involve considerable trouble and difficulty in the case of old mansions which contain fine old panelling and other fitments, it is a duty not to be ignored. The provision of ready and adequate means of escape is most obviously necessary in old and rambling piles of buildings. It is hardly possible to say more than we have already said on the question of fire-prevention; but the fires that occur from time to time give point to the immediate necessity of providing against outbreaks that may cause irreparable damage.

Fire at a Belfast Hotel. At the same time that Menlough Castle was burning, an hotel in College Square, Belfast, was also destroyed, three people being suffocated and several others being injured. The building was an old house, said to have been the birth-place of Lord Kelvin, and was largely of wood; and the fire, which started on the ground floor, spread, therefore, very rapidly. Many of the inmates when aroused opened their windows; the draught thus occasioned further aided the fire, and drove the flames up the house. The staircase soon collapsed, and the escape of a number of the inmates was cut off. One visitor and his wife escaped from the third floor by means of a rope made by knotting the bedclothes together; three others jumped from the windows, two being seriously injured; and three others, a visitor and two male employees, were suffocated in the upper rooms. From the description of the building given in the Press, it seems doubtful if it was at all fitted, from the fire point of view, for the purposes of an hotel, as apparently there was no escape staircase or additional means of egress, and when once the ordinary staircase was destroyed escape was cut off. Add to this the fact that the building was largely composed of wood, and it becomes evident that the dangers from fire were very grave indeed. The question whether any but approved fire-resisting structures should be permitted for use as hotels is one that will doubtless be raised as a consequence of this fire.

A New Use for Sprinklers. An amusing anecdote is related in the June issue of "The Sprinkler Bulletin," by which it appears that two burglars broke into premises in Farringdon Road, E.C., and set to work to cut out the lead piping. They appeared to have used a light for their work, and the light was held too near one of the sprinkler heads, with the result that their endeavours were very considerably damped. Moreover, as the sprinkler opened the alarm gong rang out, and, our contemporary adds: "Unaccustomed to undiluted water in any form, and evidently scared to death, Bill Sykes and his companion decamped, leaving their professional implements, the cut lead piping, the fused sprinkler, the alarm bell ringing, and the sprinkler pouring forth copious supplies of water to tell their own tale."

Fire-resisting Construction and Insurance. In referring to the new fire-resisting factory of a talking machine firm, "Insurance Engineering," of America, says:—"About ten years ago the company began to manufacture a new device in a small way. Early in its history the enterprise was hampered by lawsuits over patents, diverting business capital from the ordinary channels to costly litigation. Before the business was five years old, the factory was completely destroyed by a fire that started in another plant. Apparently this was a turning point. The lawsuits having been won, the company called upon the underwriters for suggestions for construction and equipment of a new plant which could not be destroyed by fire, agreeing to pay whatever such a plant might cost. The result must be satisfactory to the far-sighted corporation. The business has not been interrupted by any fire since its reconstruction; and the insurance expense item has been reduced from about 1.25 dols. per 100 dols. of insurance to about 15 cents. The saving is due to modern fire protection engineering methods. Fire-resisting construction was adopted for the buildings. Interior doorway openings were protected by standard fire doors to prevent the spreading of fire from room to room. Openings in exterior walls were protected where necessary to prevent the passage of fire through them. The entire premises were equipped with apparatus for extinguishing fire automatically and manually. The company provided itself with a generous private water supply. Employees were organised into private fire companies and drilled in the use of the appliances. In other words, ever since it adopted modern methods of protecting itself against fire the company has been prepared to fight fire independent of the public fire department of the city in which its factory is located." This description is valuable for the information it gives of the fire-protection of a modern factory; but it omits here to state (though the fact is given in another part of the paper) that the buildings are constructed of reinforced concrete. The diminution in the amount of the insurance rate is very notable, and should not be without its lesson to business men in this country.

Fire Stations of Concrete. Among the improvements which are shortly to be carried out by the fire authorities of New York is the provision of twenty-five new fire stations in the Manhattan and Broux districts, and ten in Brooklyn. The buildings are to be of a new and distinctive design, all alike, and built of concrete, so as to make them absolutely fire-resisting. Thus the new stations will have a distinctive type of building.

Insurance on the basis of Inflammability. The fire insurance on structures of the United States reclamation service is carried out on a co-operative basis of a somewhat unusual character, it being the policy of the Supreme Government to carry its own risks. The scheme is to apply the standard underwriting formulæ more particularly to the needs of the reclamation service, computing the risk on each insurable item of property. Each building is given a series of risk debits depending on its construction, occupancy, exposure, and other conditions; it is also given a series of credits due to the extent of the fire protection provided, the non-inflammability of its valuable contents, and the rapidity with which they could be removed. Each material condition affecting the status of the risk is given an appropriate weight, and the debit weights are computed on a unit basis. The credits are computed on a percentage basis, and their sum, subtracted from the sum of the debits, gives a remainder which is used as a multiplier, with the value of the building and its contents as a mutiplicand, to obtain the sum of risk for the whole structure. The total of all these weights on a project is the unit weight for that project, and its ratio to the total weights of all the projects is the basis on which its proportion of the 80 per cent. of fire losses for the year is computed. This method may be of interest to other organisations on which the burden of fire insurance rests heavily, which may find it worth while to become familiar with this system of co-operation.

SOCIETIES' REPORTS.

The Institution of Municipal Engineers.

At a meeting of the Council held on July 23rd the following applicants were recommended for admission:—

To Membership:

T. G. Menezes, Chas. J. Conquest.

To Associate Membership:

Chas. Lill, W. H. Sandoe, N. L. Mehta, H. A. Brazier, Chas. Newell, J. N. B. Bhasker.

To Studentship:

H. S. Cowen, J. T. Brown, W. F. Mason, H. W. Lovelock.

The following students were recommended for admission to the *associate-member class*:

J. H. Moore, R. W. Burr.

Under the new by-laws these elections will be ratified at the next Council meeting if no written objections are, within fourteen days, lodged with the secretary.

From the applicants recommended for admission at the last Council meeting, four members, six associate-members, and one student were elected, and four students were transferred to the associate-member class. The report of the Examination Board was received and adopted Letters from Messrs. Aveling and Porter, and from the Improved Wood Pavement Co., Ltd., were read, and the secretary was instructed to arrange for visits to their respective works. Nomination papers for Council election may now be obtained, and members are requested to note that these must be sent in before August 20th.

The Surveyors' Institution.

The following are winners of scholarships granted by the Institution:—

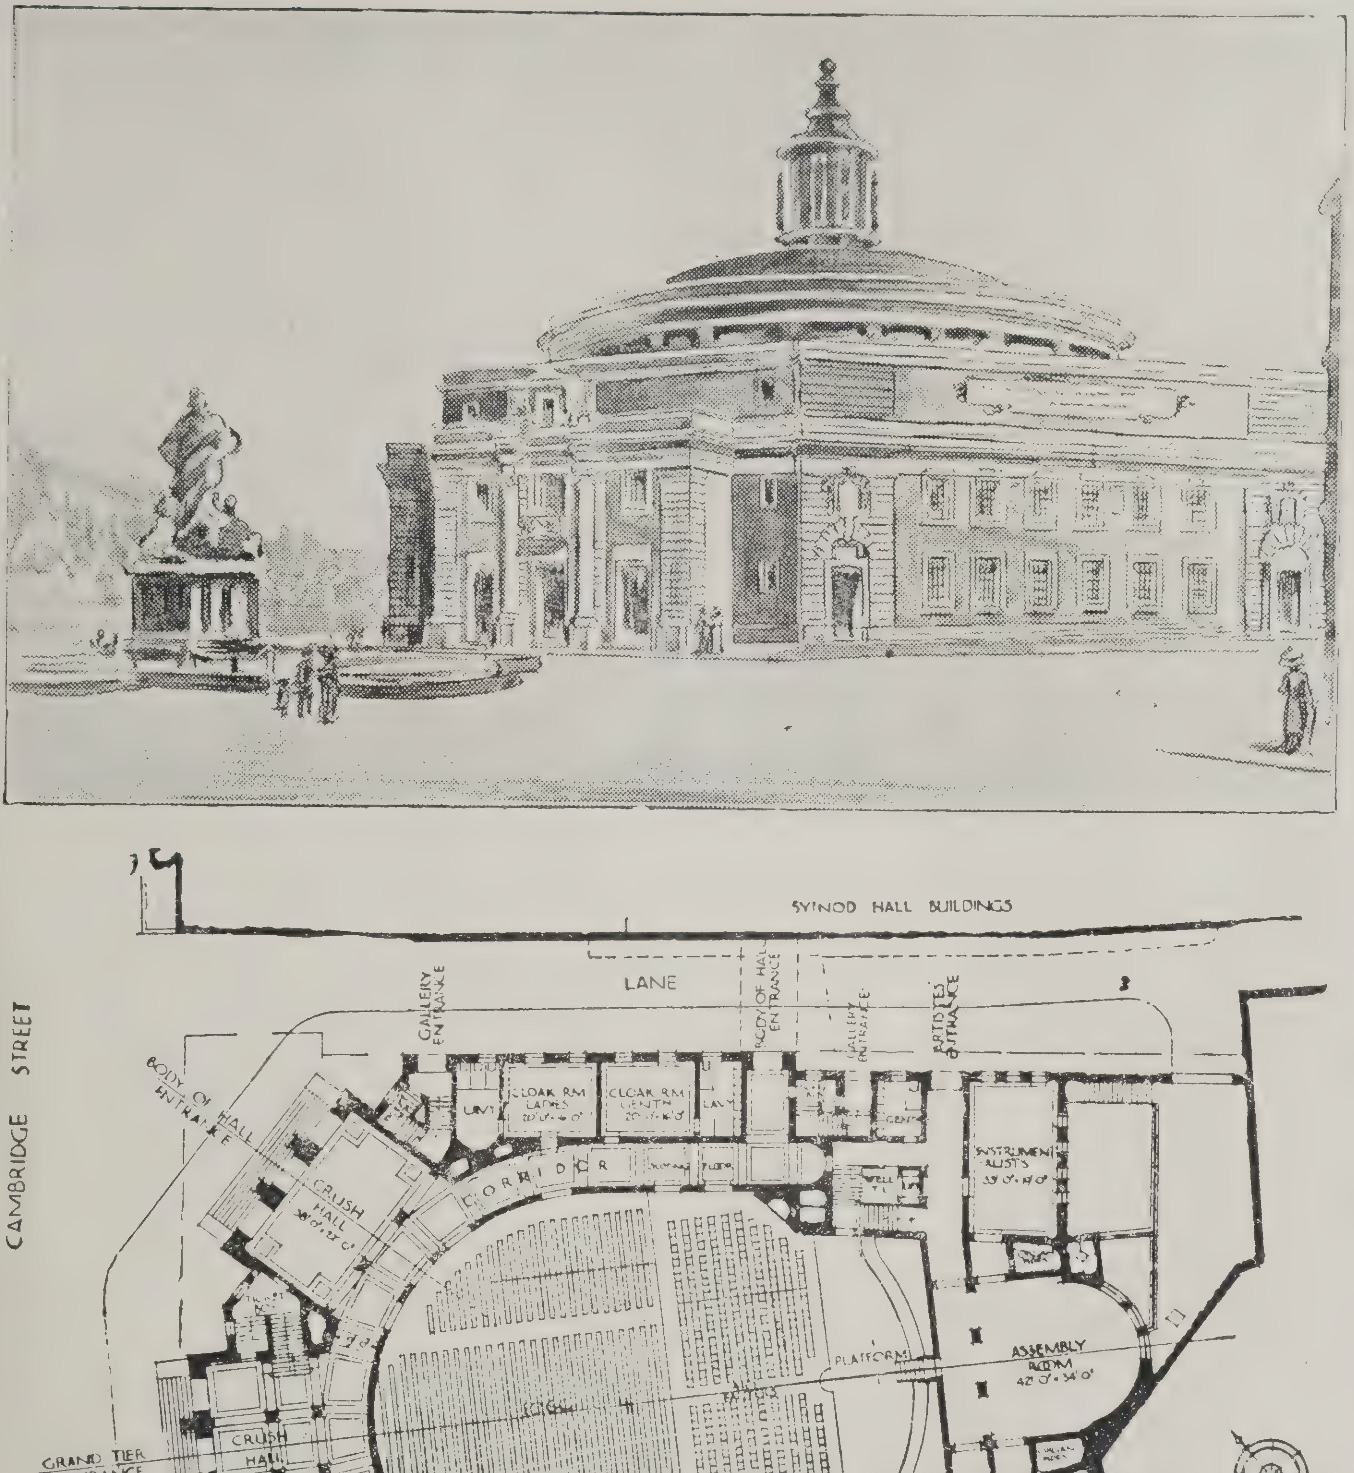
Cambridge University Scholarship of £80.—Tenable for three years. P. D. Sturge, of Fern Hollow, Stoke Bishop, Bristol.

Penfold Scholarship of £60.—Tenable for three years at any University. C. F. Hill, of Broad Lane, Hawarden, near Chester.

Scholarship of £50.—Tenable for three years at any University. G. O. Searle, of 35, Macaulay Road, Clapham Common, S.W.; R. E. Stradling, of 5, North Street, Bedminster, Bristol.

Northern Architectural Society.

A party, consisting of twenty members of the Northern Architectural Association, visited the Thirsk and Helmsley district on July 15th. Arriving at Thirsk station at 11 a.m. they were met by a motor char-a-banc of the North Eastern Railway Company, and driven via Coxwold, Byland Abbey, and Wass Bank to Helmsley, and thence to Rievaulx Abbey. Returning to Helmsley, the party proceeded via Oswaldkirk, Ampleforth, and Newburgh Priory to Thirsk. The chief object of the party was to inspect the noble ruins of Byland and Rievaulx Abbeys, but in addition to these, they also visited the parish churches of Coxwold, Helmsley, Oswaldkirk, and Thirsk. On their return to Thirsk the members dined at the Fleece Hotel, after which they entrained at Thirsk Junction.



Note. The orchestra and organ is carried over the assembly room shown on the plan.

THE USHER HALL COMPETITION: THE ACCEPTED DESIGN. STOCKDALE HARRISON AND SONS AND HOWARD H. THOMSON, JOINT ARCHITECTS.

CORRESPONDENCE.

[*The Editor declines responsibility for the statements made or opinions expressed by correspondents.*]

The Completion of the Mall.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In your issue of July 20th you have a note to the effect that the new thoroughfare from the Mall to Charing Cross is expected to be opened in about a month's time.

Is it too late to expect that the Office of Works, or whatever department is responsible in the matter, will see fit to widen the entrance at the Trafalgar Square end by pulling down the buildings on either side, which at present mar what would otherwise be a fine improvement?

One has only to stand inside the Park and look outwards through Sir Aston Webb's fine triple archway to see how hopelessly spoiled the whole effect will be unless these buildings are removed.

Surely it is not too much to hope that a great country erecting a memorial to a great Queen will see fit to finish off in a worthy and fitting manner an improvement so excellently begun, and by removing a collection of ramshackle old buildings from one side and a bank of no architectural pretensions whatever from the other open up the fine entrance to the processional roadway in a dignified and proper manner.

London. H. O. CRESSWELL, F.R.I.B.A.

Licentiate R.I.B.A.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—I have read with great interest the letters published in your journal with reference to the above, and should like, if I may be permitted, to make one or two suggestions. I think before taking steps to obtain a Registration Bill, it would be advisable to get a Bill through Parliament to prevent builders erecting buildings without the professional assistance of a qualified architect. The question now to be answered is: What constitutes a qualified architect? My reply is, like that of many of your readers, "One who has satisfactorily served a term of at least three years' articles with an architect in practice. I may add that I consider anyone who can produce his articles satisfactorily endorsed should be elected a Licentiate of the Royal Institute of British Architects, and be entitled to affix Licentiate R.I.B.A., to his name. These suggestions, if carried out, would, I am sure, greatly benefit the profession.

Brondesbury. K. K.

The Decline of Technical Education.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Your editorial note under the above heading in this week's issue draws attention to a matter of great importance to all builders and their employees throughout the country. It is to be feared that Sedgley is not the only place where classes have been closed for want of students. As a teacher of over twenty years' experience in various parts of the London district, it has been my privilege to deal with large numbers of young men engaged in all the leading branches of building industry; and the experience thus gained leads me to offer a few observations upon the cause of the evil referred to. In your article it is pointed out that very little is done by employers generally, by way of inducing their employees to make themselves proficient in their respective trades. Work secured under modern conditions of tendering demands that in order to show a profit it must be pushed through in the least possible time. As a consequence, learners are not wanted, the time of skilled workmen being too valuable to spend in teaching beginners The result is that lads willing to learn are discouraged, and a large number drift into indifference, if not positive aversion, and finally incompetence. Returning home from work, tired and discouraged, the young aspirant is advised by some well-meaning relative to join some classes at the nearest Polytechnic. He goes, perhaps willingly at first. The work is difficult, even uninteresting, and soon finding that additional homework is expected of him, is it surprising if he yields to the more alluring amusements?

But, presuming our student to be made of sterner stuff, we find him resisting counter-attractions, and patiently sticking to his classes two or three nights per week for perhaps one or two sessions. He acquits himself well, passes his examinations, and receives his certificates. By this time his initial difficulties have been surmounted, and soon finding that he can use his knowledge to some purpose in life, he has started upon the high road which leads to ultimate success. He may, or he may not, subsequently win scholarships and gain prizes; but in either case habits of study and application have been formed, and the education institution has not failed in its object. The chief difficulty occurs, however, with those lads who cannot be induced to overcome their inherent lethargy. At present, compulsory attendance at evening classes cannot be enforced; and, left to his own unconcerned indifference, the beginner only too often drifts into the habit of carelessly or even viciously wasting his evenings.

In the current issue of your paper is given a lengthy list of prizes, studentships, and other awards gained at the Architectural Association Day School. Valuable prizes and studentships are also given in many of the University Colleges, and by the Royal Institute of British Architects to young men training as architects. Turning to the evening classes organised by the various county councils for the benefit of artisans, we find that, excepting a very few medals and prizes offered by the City and Guilds, and by the Board of Education, there are practically no prizes what ever which an ordinary student can compete for. The medals and prizes just referred to are, in any given subject, easily enumerated upon one's fingers, and being open to competition by students throughout the whole country, it will be seen that the chances of any individual student are extremely small—so small, in fact, that only the very élite of our largest and best taught classes have practically any chance of gaining an award.

It seems to me that some stimulus to the beginner is needed. A few prizes of small value offered to each class would, I think, produce results far outweighing their original cost. Having had opportunities of teaching classes where a few prizes have been offered, and of comparing these with precisely similar classes where no prizes are given, I can say without hesitation that the work done, the results obtained, and the whole tone of the class have been undoubtedly in favour of prizes.

The County Councils say they have no power to award prizes with funds derived from the rates. My reply is that if the money already spent in technical education is not to be largely wasted there must be either some form of compulsory attendance, or some scheme of prizes which shall secure larger and more regular attendance at our evening classes. I think the rivalry and emulation promoted by competition for prizes is far healthier than the morbid resentment which would be engendered by any form of compulsion and therefore unhesitatingly support the latter alternative.

Again, if prizes are found necessary or desirable in the case of young architects, many of whom have had the advantages of a liberal education, and who are supposed to be alive to their own future interests, how much more necessary are they in the case of young bricklayers, carpenters, and other artisans whose primary education is only too often seriously defective, and who are also frequently blind to their own best interests; and who, moreover, are expected to give their evenings to study after a hard day's work in the shop or on the building?

Surely, the raising of a local prize fund should not be an impossibility. I have known cases where teachers themselves, convinced of the importance of this feature, have offered prizes. If private generosity fails, the various trade organisations in each district might be approached, and as a last resource a small increase in the entrance fees paid by students would easily cover the cost of examination fees and prizes.

Plumstead. HAROLD BUSBRIDGE.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In your issue of to-day's date, referring to the seeming apathy of the students attending the technical classes in this country, you appear to consider the students alone to blame, but in many instances the poor attendance at these classes is due to the total incapacity of the teachers, making it sometimes necessary for a student who desires to pass the examination to absent himself in order to find time to study privately. Most pupils at these classes are engaged during the day, and if they wasted their time listening to incompetent teachers they would pick up more of the "way not to do it" than of the matters the classes are instituted to provide. In the provinces at least the teachers of these classes are usually appointed according to the influence they can bring to bear to secure the post, and with no regard whatever to their suitability for the position.

Some years ago I attended a large class of this kind where the master took the advanced class one night and his "assistant" (getting about one-fourth the remuneration) the elementary, and on the following night the masters exchanged classes. Before the session was half over the assistant had a full attendance almost invariably, and the master would lecture to almost empty benches! This assistant had made application for the post at the same time as the other man, but he was not able to bring to bear the same amount of influence, and so the pupils had to suffer.

I know of many cases where students have deliberately absented themselves because they might as well be asleep as listening to the incompetent "instructor." I also know one man at present holding a post as head teacher at a technical school, who makes a very good living "coaching" students for an examination he has himself failed to pass on more than one occasion.

If the Education Committees who are deploring the apathy of the young men in their districts would always make quite sure that the instructors they have appointed knew their business at least as well as the students they are about to instruct, we would hear much less of the "Decline of Technical Education."

A STUDENT WHO HAS SUFFERED.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In your last issue, you touched upon a subject which would well repay further investigation, viz., the technical education of the artisan.

The average employer of building operatives does not seem to appreciate the fact that an artisan who is grounded in the theory of construction, and has a knowledge of the work of other trades, is better fitted to perform his own particular function than the "rule of thumb" man. You will invariably find that a man who will sacrifice his leisure time to study is a mechanic skilled above the average, and is capable of a better return for his employers' money.

Yet, in spite of all this, the positions of trust and authority upon a building are only too often filled by men who, while professing a profound contempt for the "theoretical men," do not hesitate to exploit their knowledge, forgetting that these men have the practical experience in addition to their other knowledge. The primary object of an artisan's study is to improve his position; but you find that no value is placed upon the certificates which show the measure of proficiency to which he has attained. Thus I myself, although possessed of qualifications which should prove my fitness for a responsible post, am still

A BRICKLAYER.

NEW BUILDINGS.

PROPOSED.

Barnet.—The U.D.C. have obtained the sanction of the L.G.B. to the borrowing of £2,500 for the purchase of land upon which it is proposed to erect workmen's dwellings.

Batley.—The Corporation has approved the following plans:—Six houses in Southbank Road, Carlinghow; enlargement of house in Thorneycroft Terrace, Staincliffe; addition to premises in Bradford Road; conveniences for Staincliffe Church of England School; two houses in Gladwin Street; three houses in Fox Street, off Taylor Street; house in Beaumont Place, Staincliffe.

Bridlington.—At a recent meeting of the Bridlington Rural Council, the East Riding County Council scheme for the establishment of a sanitoria at Beverley and Kilham for infectious diseases was considered, and it was unanimously decided not to participate in the scheme, but to erect an isolation hospital for the Bridlington district.

Bury St. Edmunds.—At a recent meeting of farmers at Bury St. Edmunds, it was resolved to take steps to establish a bacon factory in West Suffolk, and to carry it on as a limited liability undertaking, the capital outlay being estimated at about £20,000.

Cardiff.—The question of a new fire station for Cardiff was under discussion by the Watch Committee at a recent meeting, when a joint report by the city engineer and the head constable was considered. It was estimated that the proposed chief fire station in Westgate Street would cost £13,066 5s. 7d., plus the value of the land, which was fixed at £21,400. For the proposed subsidiary station at Beresford Road, Roath, the total cost was estimated at £5,666 3s. 9d., while for the proposed subsidiary station in Wellington Street, Canton, the estimated cost was the same. A motion to affirm a previous resolution passed by the Committee that a new station be built in Cathays Park at a cost not exceeding £15,000, and that competitive designs be advertised for, was carried.

Edinburgh.—A motion, dealing with the utilisation of the old mansion-house in Saughton Park, was considered by the Public Parks Committee of Edinburgh Town Council at a recent meeting. The committee recommended that the building should be thoroughly repaired; that the offices and walls on the ground facing the bandstand, which are not part of the mansion, should be cleared away; and that the area should be converted into tea gardens, with lavatory and cloakroom accommodation, at an estimated cost of £1,000. The question of the utilisation of the house was delayed, and a sub committee were appointed to consider the preservation of the features of the ancient building.

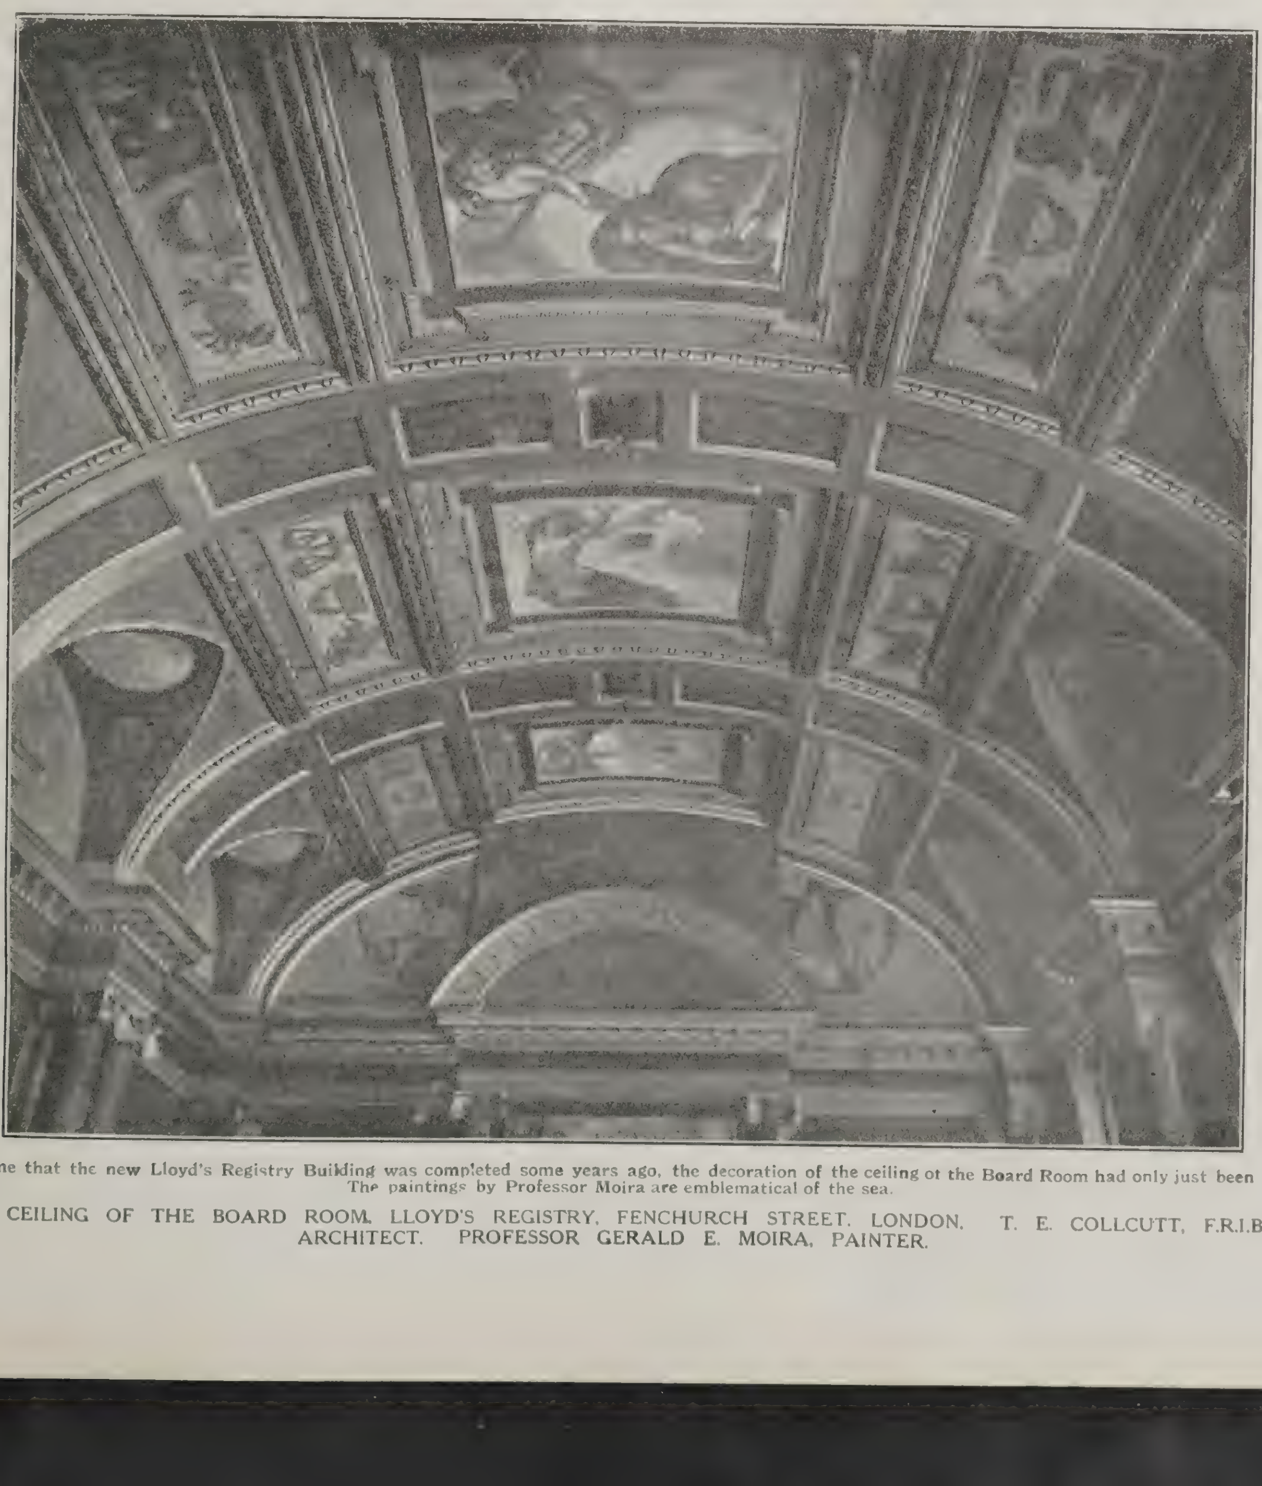
Farnborough (Hants).—The Town Council has approved the following plans:—House in Reading Road; mission church in Queen's Road; additions to National Schools in Farnborough Street; house in Ashley Road.

Leeds.—At the monthly meeting of the Council of the Leeds University a letter from the clerk to the Clothworkers' Company was read intimating that the Court of the company had voted £5,000 for an additional building to complete the front elevation of the Clothworkers' wing in College Road, and to provide extensions necessary for teaching the French system of worsted combing, drawing, and spinning. This gift is an addition to the £70,000 previously granted to the University on capital account.

Lincoln.—The Corporation has approved the following plans:—Additions to Lincoln Laundry, Altham Terrace; 2 houses, Yarborough Road; 2 houses, Sausthorpe Street; additions to dwelling-house, the Grove; additions, etc., 5, Pottergate; 18 houses, McInnes Street; house, Ellesmere Avenue; 4 houses, St. Catherine's Grove.

Liverpool.—An agreement has been made between the Midland Railway Company and the Liverpool Corporation, under which a large block of property beyond the Adelphi Hotel is to be leased to the railway company for 999 years. The scheme, which will come before the City Council, has reference to the construction of an extensive hotel at a cost of about £500,000.

London.—At the annual meeting of the Aerial League of Great Britain, which recently took place, it was stated that the league had decided to push forward details for the establishment of a practical school of aeronautics, to be called the Rolls Memorial School, and that negotiations were in progress for the acquisition of a site near London for the flying ground and building.



At the time that the new Lloyd's Registry Building was completed some years ago, the decoration of the ceiling of the Board Room had only just been begun. The paintings by Professor Moira are emblematical of the sea.

THE CEILING OF THE BOARD ROOM, LLOYD'S REGISTRY, FENCHURCH STREET, LONDON. T. E. COLLCUTT, F.R.I.B.A., ARCHITECT. PROFESSOR GERALD E. MOIRA, PAINTER.

London.—The London County Council, by a small majority, has adopted a recommendation by the Housing Committee to apply to Parliament for powers to enable the Council to lease part of the White Hart Lane estate for development on the lines of a garden suburb.

London, S.E.—The Bishop of Southwark is appealing for a total sum of £40,000, of which £7,000 will be devoted to the restoration of certain portions of the fabric of Southwark Cathedral, that stand in urgent need of reparation, and did not come within the scope of the recent restoration and rebuilding of the nave. The proposed works will be entrusted to the superintendance of Mr. J. Oldrid Scott, F.R.I.B.A.

London, W.—The Paddington Guardians have instructed Mr. E. Howley Sim, architect, 14, Norfolk Street, W.C., to submit an approximate estimate of the cost of adapting a portion of the administrative block of the infirmary for the purpose of isolation wards.

London, S.W.—The designs of Mr. H. P. Burke Downing, F.R.I.B.A., have been accepted for the erection of a new church and parish hall in the vicinity of Narbonne Avenue and Hambalt Road, Clapham, as a memorial to the late Canon Greene, for many years Rector of Clapham. The church has been designed in the thirteenth-century style, and will provide total seating accommodation for 600 persons. It is arranged with a wide nave and an aisle of equal height and almost equal width, whilst the line of the roofs is unbroken internally and externally from west to east. The choir and sanctuary are a continuation of the nave, and of the same width without any intervening chancel arch. The distinction between sanctuary and choir will be marked on the inside by a double rib of the barrelled roof and carved bosses, and externally by a lead cross, thus securing an effect of great length. The church is to be built of picked purple-brown Crowborough bricks and Chilmark stone, with Caen stone internally, and will be heated on a low pressure hot-water system. The proposed parish hall can seat on the ground floor 254 persons, and its principal entrance faces Hambalt Road. The upper hall is approached by two staircases with external entrances, and is of the same size as the lower hall. The estimated cost of the Church is £5.630, and of the parish hall £2,115, thus involving a total expenditure of £7,745. The designs are those selected from a competition, which was limited to twelve invited architects, Mr. Temple Moore, F.R.I.B.A., being the assessor.

Merthyr Tydfil.—The Corporation has decided to apply to the Local Government Board for sanction to borrow £15,000, to cover the cost of a contract to convert Cyfarthfa Castle into a municipal secondary school.

Normanton. — The Normanton Urban Council's proposed housing scheme to erect 38 workmen's dwellings at an estimated cost of £8,250 has not been sanctioned by the Local Government Board. The objections are that the site is unsuitable; that the proposed rents are too high; and that the scheme would be a charge to the ratepayers which, in future, would probably increase. The Board are prepared to consider a modified scheme, and the Council intend to reconsider the matter.

Scarborough.—At the Scarborough Town Hall, Mr. Edgar Dudley, F.S.I., Inspector of the Local Government Board, has held an inquiry into the application of the Corporation for sanction to borrow £2 625 for the purchase of property for the widening of St. Thomas Street.

Sketty (Swansea).—A Vicarage is about to be erected at Sketty, and Mr. Glendinning Moxham, F.R.I.B.A., Swansea, has been instructed to prepare the plans.

Torquay.—The Town Council are promoting a scheme for the erection of a Town Hall, with municipal buildings and offices, at a cost of £30,000, and the erection of a pavilion at the junction of Castle Circus and Lymington Road, at a cost of £16,000. In connection with this scheme, Mr. W. R. Hooper, M.I.C.E., on behalf of the Local Government Board, has held an inquiry into the application of the Council for sanction to a loan of £45,000 for carrying it out. The inspector also inquired into an application in connection with the electric light works extension.

IN PROGRESS AND COMPLETED.

Aldershot.—The King has sent a donation of £1000 to the Aldershot Churches Extension Fund. Owing to the influx of population, caused by the development of the camp in the last few years, it has been found necessary to build a new church, and to double the accommodation of the old parish church. Nearly £10,000 is required for these undertakings, and about £1,000 remains to be collected. The new church was completed in 1907, and the first stone of the parish church extension was recently laid by Lady Wantage.

Bootle (Lancs.).—The new Metropole Theatre, situate in Stanley Road, Bootle, is now in course of erection, and will provide accommodation for 2,500 persons. The architects are Messrs. Havelock, Sutton and Sons, of Liverpool, and the builders Messrs. J. and G. Chappel, of Walton. It is proposed to complete the building by the end of the present year.

Colwyn Bay.—The building of the pavilion of wood and iron which is to accommodate the Welsh National Eisteddfod at Colwyn Bay in September is being rapidly proceeded with.

Crynant (Neath).—The Bishop of Llandaff has consecrated the new church of St. Margaret, which has been erected at a cost of £2,697, in the early English style. The church consists of a nave and aisles, which afford accommodation for 275 worshippers. Internally the arcading and chancel arch have been executed in Bath stone, and the roof treated in wrought open timber work in pitch pine. The building is heated by a low pressure hot water system. Mr. J. Cook Rees, Neath, is the architect, the contractor being Mr. Henry Smith, of Kidderminster.

Forest Town (Mansfield).—A commencement has been made with the erection of the new Parish Church, from the designs of Mr. Louis Ambler, F.R.I.B.A., London. The building will consist of nave, south aisle, chancel, sacristy, clergy vestry, choir vestry, and organ chamber, and will provide seating accommodation for about 320 persons. It will be built of Bulwell stone, lined inside with brickwork, and the dressings will be of fine-grained Weldon stone. The pillars will be octagonal in shape, and the internal stonework will be of Ancaster stone. Broseley tiles will be used for the roofs, and the western end will be surmounted by a bell turret. The building will be heated by a hot-water apparatus. Messrs. Chas. Pallance and Son, Mansfield, have secured the building contract, and the total cost is estimated to amount to about £3,800.

Gorleston. — The new Congregational Church, erected at a cost of £1,500, has been opened by the Mayor of Gorleston. It takes the place of an older building, which was condemned as unsafe, and some of the old walls have been utilised in the new structure, which is of brick roofed with tiles. Mr. G. Scott Cockrill was the architect, and the contractors were Messrs. Sheen Brothers.

Knaresborough.—The foundation-stone has been laid of the new Urban Council offices, which are in course of erection in the Italian style, from the designs of Mr. Arthur Hiscoe, of Leeds. The total cost of the building is about £3,500, and it is expected that it will be ready for occupation early in 1911. The contractors are: Mason and joiner's work, Messrs. D. Kitching and Son, Knaresborough; plasterer, Mr. M. Coleman, Knaresborough; slater, Mr. J. Shepherd, Harrogate; painter, Mr. J. Morley, Knaresborough; plumber, Mr. Thompson, Harrogate, and Leeds.

Leeds.—The new church of St. Margaret, in Cardigan Road, has been consecrated by the Bishop of Ripon. The building was begun in 1907, and the present portion, consisting of four-fifths of the whole structure, and seating 700 people, has been completed at a cost of about £11,000.

London, W.—The large stone cross over the new frontage of the Church of St. John the Baptist, Holland Road, Kensington, has been formally dedicated. The church, which was begun over thirty years ago, is now being completed by the erection of the baptistery and two porches, at a cost of over £5,000.

Morecambe.—The promenade improvements, which have been made at a cost of £20,000, have been formally opened on completion. The scheme has included an extensive system of road widening, the building of a new sea wall, the laying out of greens, the erection of bandstands, the construction of underground lavatories with roof gardens, the doubling of the tram track, and electric lighting on an improved scale. The work has been carried out under the supervision of Mr. J. W. Hipwood, A.M.Inst.C.E., borough engineer.

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to architects practising in Coventry. Particulars given in our issue of March 16th.

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglican Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. The competition will be confined to architects having an office or residing in the areas of the following education authorities: Cambridgeshire, Isle of Ely, Lowestoft, Norfolk, Norwich, East Suffolk, and Great Yarmouth. D. O. Holme, clerk of the Governors, Castle Chambers, Norwich.

SEPT. 1. CARNEGIE LIBRARY, KINGSTOWN, CO. DUBLIN.—The U.D. Council of Kingstown offer premiums of £50 and £20 respectively for the two best designs for the above to be erected at Lower George's Street. Particulars from Mr. J. Sherlock Vaughan, Town Clerk, Town Hall, Kingstown. Deposit one guinea.

SEPT. 5. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT.. 5. SHERINGHAM COUNCIL OFFICES.—Architects desirous of submitting designs for the council offices proposed to be erected at Sheringham may obtain full particulars on written application, accompanied by a stamped addressed envelope, to Edgar C. Rolfe, Clerk of the Council, Church Street Chambers, Sheringham.

SEPT. 10. SECONDARY SCHOOL, FOLKESTONE.—Competitive designs are invited from architects (being Fellows, Associates, or Licentiates of the Royal Institution of British Architects or members of the Society of Architects) for a new secondary school to accommodate 150 boys. Particulars, together with site plan, can be obtained from Mr. A. F. Kidson, town clerk, Folkestone, on payment of a deposit of £2 2s., which will be refunded on the receipt of a bona-fide design being submitted.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, together with a plan of site and sections at ground level, may be obtained from the engineer and surveyor, Mr. Samuel J. Harpur, Town Hall, Maesteg. Designs must be deposited at my office by noon on Monday next, September 19th. Two premiums are offered, namely, 25 guineas and 10 guineas, as first and second respectively.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries embodying questions which have been set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor, will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible or any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

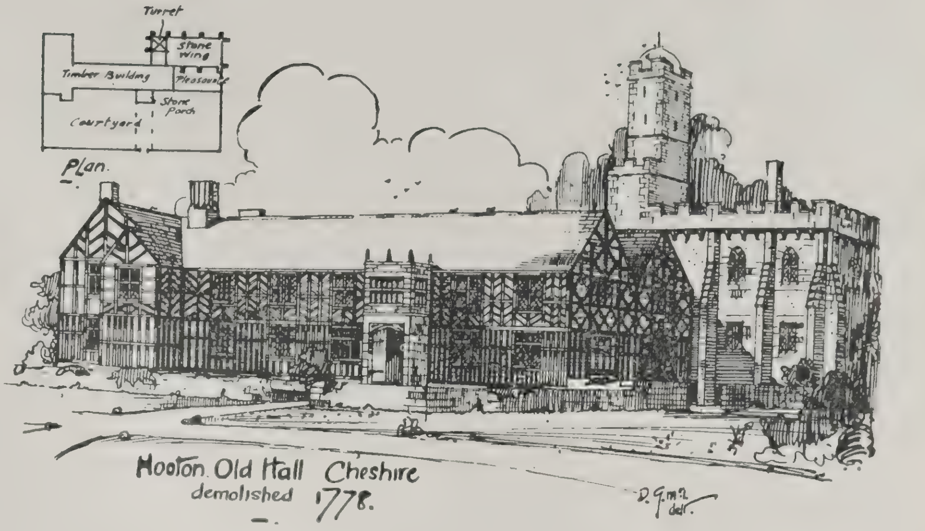
The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Hooton Hall, Cheshire.

In further reply to G. H. (NEWCASTLE, STAFFS), whose enquiry appeared in our issue of June 8th last, we have received the following from a correspondent :—"Hooton Hall, Cheshire, was originally the seat of an ancient family named Hotone, in the reign of Richard I., and subsequently from the reign of Richard II. the home of the Stanley family, being for nearly five centuries the most important manor house in the Forest of Wirral. An old chronicler says of the family of Stanleys of Hooton, that 'they were of great dignity and worth, deriving their pedigree from Alan Sylvester, upon whom Randulph, First Earl of Chester, bestowed the Bailiwick of the Forest of Wirral, and delivered unto them a horn in token of the gift, from whence we gather that the Wirral was holden to be a place of no mean account in those time, where have continued the same Stanleys in a direct succession, being lately possessed by a very worthy and noble-minded knight, Sir Rowland Stanley, who lived to the age of 100 years—the oldest knight in the land.'

"The old Hall of the Stanleys, as the accompanying sketch will show, must have been a most striking and interesting building. It was a very large quadrangular building of the usual Cheshire 'magpie' timber and plaster work, one wing being occupied by a massive stone, embattled and machiolated tower which was dominated by a very slender turret of great height, built by Sir William Stanley under a special licence from King Henry VII., dated August, 1488. This remarkable turret is supposed to have served the purpose of a look-out turrent, for observing the approach of marauders from the Welsh borders, its great height being necessary in order to clear the tops of the forest trees which covered practically the whole of the Wirral at that period.

"The sketch is taken from a record of an original contemporary painting belonging to the Stanley family. In one of the rooms of the old hall the wainscoting was painted and decorated with rude paintings of the Earls of Chester. The Hall, which was taken down in 1778, was succeeded by a most palatial house, built of Storeton stone, in the style of the Italian Renaissance, from designs by W. Yatt, and was described at the time by Mr. Ormerod, the county historian, as 'the most elegant building of the kind which Cheshire could produce.' So magnificent was it that Napoleon III., Emperor of France, frequently stayed there as the guest of Sir William Stanley. A lofty noble banqueting hall occupied the east or river front, together with a long picture or sculpture gallery, the whole being enriched with columns and walls of varied and rare marbles.



Hooton Old Hall Cheshire demolished 1778.

"The sale of the ancient estate was necessitated about 1850 owing to the great extravagance of its owner, and it is said that the Emperor of the French, being then in the zenith of his power, repaid his friend's former hospitality in the handsomest way. The estate and hall were bought by the late Mr. Naylor, who made great additions to it, including a massive colonnaded façade and tower at the west front. The Hall was unfortunately dismantled and untenanted for many years, but has recently been leased to the Hooton Park Steeplechase and Racecourse Co., Ltd.

"An ancient heronry is still maintained, and there is in the park a holy well, known as St. Helen's well, over which Lady Marie Stanley erected a little well house, now converted into a cottage." D. G. M.

Gothic Work near Wilmslow for R.I.B.A. Intermediate Exam.

In further reply to A.R.M. (OLDHAM), whose enquiry appeared in our issue of June 29th last, we have received the following from a correspondent :—"I can recommend the following churches in the neighbourhood of Wilmslow, Cheshire, for the testimonies of study of Gothic work, R.I.B.A. intermediate examination, viz. :—Wilmslow, Decorated and Perpendicular windows ; Mobberley (4 miles), rood loft, sedilia and piscina ; Prestbury (4½ miles), Norman chapel and doorway, thirteenth-century work, tracery windows, Perpendicular tower, sanate bell gable of unusual form ; Northenden (5 miles), fifteenth-century works ; Cheadle (5 miles), fine panelled roof, Late Perpendicular screens ; Bowden (6 miles), fifteenth-century work ; Gawsworth (9 miles), fifteenth-century work ; Astbury (11 miles), Perpendicular font, rood screen, and choir stalls (finest in Cheshire) ; Witton (11 miles), Perpendicular work, fine belfry tower ; Great Budworth (11 miles), fine panelled roof and Late Perpendicular tower, 1528." D. G. M.

Prospects for Architects' Assistants in Johannesburg.

ANXIOUS (CARDIFF) writes : "Would you kindly inform me what are the prospects for an architect's assistant in or around Johannesburg, South Africa ; also the usual standard of payment given there?"

—This question has been submitted to the Emigrants' Information Office, whose Chief Clerk courteously replies that he is unable to give the information asked for with regard to the rates of remuneration for architects' assistants in or around Johannesburg. He has been in communication with a South African official, who is well acquainted with the Transvaal, and he agrees that the salaries must of necessity differ very largely in accordance with the capacity of the man, with the status of the firm employing him, and with the class of work upon which he is engaged. As to the demand, his opinion is that such a man would be ill-advised to go to the Transvaal, or to any part of South Africa to seek for employment in his profession.

The Temple of Theseus.

DORIC (SOUTHPORT) writes : "Can you inform me of the subjects of the carving in the metopes, north and west fronts, of the Temple of Theseus, Athens, or the name of a book or books where I can find same? Mr. Banister Fletcher, in his History, page 64, gives those in the S. and E. fronts only."

—The metopes on the west front of the so-called Theseum are not carved at all. It is conjectured that they may have been painted. The only metopes carved are the ten on the east front, representing nine of the Labours of Hercules (one of the subjects being divided between two metopes), and the four on the north and four on the south side. nearest the east end. These are much dilapidated, but are supposed to represent the eight labours of Theseus, in the suppression of tyrants and robbers in Greece. It is doubtful whether the temple was really dedicated to Theseus.

Liability for Repair of Roads.

NOM (BURNHAM) writes : "A firm of hauling contractors verbally agreed to deliver by steam traction a quantity of goods, viz., bricks and tiles, to a site in the country at a less rate than could be done by horse haulage. In the case of a claim made by a Rural Authority against the employer of the hauling contractors (a builder in this instance) as the first party for repairs to roads damaged by the traction, can the builder legally claim —from the hauling contractors—repayment of all costs, legal or otherwise, that he may be called upon to pay the Rural Authority?"

—It is to be assumed that there is nothing in the contract between the builder and the haulage contractor which regulates the question of liability for extraordinary or excessive traffic. This being so, one has to look at the statutes dealing with the matter. Formerly, that is to say, prior to the Locomotion Act, 1898, the person liable to pay the expense occasioned by extraordinary traffic was the person or contractor who actually led it. It having been found, however, that this gave rise to hardship, it was provided by the Act of 1898 that where extraordinary expenses are incurred owing to extraordinary traffic, the highway authority may recover in a summary manner from the person by "or in consequence of" whose order the weight or traffic has been conducted. This provision would seem to impose liability on the employer of the hauling contractor, namely, the builder. In the circumstances of the case, the builder could not recover from the haulage contractor unless the latter has bound himself by contract to take over the liability. This is because the statute expressly puts the liability on the builder. He in his turn might of course be liable to say that the traffic was led in consequence of the order of the building owner (see *Bromley R.C. v. Croydon Corporation* (1908), 1 K.B. 354)." X.

Temple at Eleusis.

A. O. A. (Birmingham) writes: "Can you give me the date or an approximate one of the Ionic Temple at Eleusis? It does not appear to be given in 'Spiers's Orders,' 'Banister Fletcher's History,' and such standard works of reference."

—There was no Ionic temple at Eleusis. The great temple, of which only the plan and a few fragments remain, was Doric. The Lesser Propylæa is supposed to have been decorated internally by Ionic colonnades against the walls at each side, of which a base, capital, and part of the entablature were found. A small conjectural elevation of the colonnade is given in Anderson and Spiers's "Architecture of Greece and Rome," page 88. It is stated in a foot-note there that the order is included in Normand's "Parallèle des Ordres d'Architecture," but there is no such plate in our copy of Normand. The work was probably late; perhaps about 300 B.C.

Party Wall.

Fair Play (Bristol) writes: "In the event of an adjoining owner not agreeing to the erection of a party wall between two properties, can the building owner erect an external wall on the boundary line of his land with the footings projecting on to the adjoining owner's land? The London Building Act, I know, makes this provision, but would it be legal to do so in the case in point—a small West Country town, It seems to me the L.B.A. is the fair and equitable arrangement, as otherwise my clients must sacrifice a portion of their land equal to the projection of footings. The local bylaws say nothing on the matter."

—The answer to this query is reasonably plain. For a man who enters upon his neighbour's land for any purpose is a trespasser; and it matters not that the neighbour may at some future time derive a benefit from the work or erection which has been put upon his land.

It was held in an old case (*Barlow v. Norman*, 2 Wm. Blackstone, 959) that the builder of a house on a new foundation was not entitled to build his side or flank wall one-half on his own ground and the other half on the vacant ground of his neighbour, "for no man has a right to presume that his neighbour will hereafter build a house adjoining to his, and erect half of his outside wall on his neighbour's ground in consequence of such a presumption." The London Building Act not being applicable, the parties are relegated to their rights at common law; and even under the London Building Act it has been held that where each adjoining owner has an external wall the Act does not give them right to place footings on the adjoining land (*Thornton v. Hunter*, Builder, Feb. 4, 1898). X.

Fireproof Casing to Iron Joists.

A. O. C. (Barnsley) writes: "Can you inform me whether you think there is any demand in the building trade for a fireproof casing to iron joists under floors, etc., so made in sections that it could be readily fixed to the joist with special iron clips. What is the usual method of covering these, and what would be the approximate price per foot run for covering, say, a 12×8 steel joist?"

—I do not think that such a casing would meet with much demand. It would be expensive as a centering, and it would be inefficient as a fire protection unless it were filled in with concrete. The usual method at present is to attach some kind of wirework or expanded metal to the under side of the joists, fix a temporary boxing of timber, and fill in with concrete. There is, however, an alternative method of fixing to the underside a moulded concrete slab, in which hoop iron is embedded with the ends projecting so that they can be bent over the lower flange. Then only shuttering to the two sides is necessary. The cost of encasing the portion of a beam projecting 12in. by 8in. below the joist would be 1s. per ft. run. D.

Assignment of Property.

Hammerless (Crewe) writes: "I have a business which I am anxious to make over to my sister, and I shall be glad to have your advice on the following points. (1) Can I do so, legally, without any payment on her part? (2) Can I form it into a limited liability company and make her the sole holder of the shares? (3) What would be the cost of the first method? (4) What would be the cost of forming it into a company with, say, £1,500 to £2,000 capital, fully paid up, and all ordinary shares?"

—It is quite legal for a man to make an assignment of all his property without consideration, but the proceeding is open to certain objections. In the first place the transaction may be set aside as being a fraud upon creditors, if any creditor thinks it worth while to attack it. It is often thus with assignments which are made "in consideration of natural love and affection" (*Gale v. Williamson*, 8 M. and W. 405). It was provided by a statute passed in the reign of Elizabeth that such assignments were void against creditors. The assignment may also be declared void against the trustee in bankruptcy, should bankruptcy supervene. A further point to be remembered is that by Finance Act, 1910, estate duty would be payable *ad valorem* if the grantor were to die within three years. As to questions 3 and 4, the cost of preparing a deed of assignment would not be great. As to the cost of forming a company, a solicitor should be consulted. X.

Liability of Architect.

Devorgilla (Dumfries) writes; "Please let me have your opinion regarding the following, and if at common law I am liable. A small hall was built four years ago, constructed of timber framing covered with corrugated iron sheeting, and plastered inside, but no felting or match boarding was used. The roof sheets were specified in the original specification to be overlapped two cores or 6in., but through some clerical mistake in the copy written out for the tradesman's use, that phrase was omitted and the contractor accordingly gave the ordinary lap of 1 core or 3in. The result has been that at frequent intervals the roof has leaked very badly in heavy driving rains, but the contractor has endeavoured to repair and remedy it by puttying and additional strips of iron at the joints—as I held him by the general clause in specification of 'making the roof watertight.' That has occurred for the past 3½ years, until after a thorough overhaul a few weeks ago, he applied for his final certificate, which I granted, after (it seemed to me) the building was fairly and honestly overhauled, and after some rain which occurred, it seemed to be practically tight. Since then a very heavy rain of some duration has happened, and I am led to believe that the roof leaked in a number of places. The proprietor has taken action, and evidently intends to come upon me to make the building right and absolutely tight, having 2 cores lapped joints in the roof sheets according to my original specification. Of course, he has no recourse against the contractor, seeing I have certified the work to be to my satisfaction. Possibly I have made a mistake in granting the certificate, still, it became so annoying through 3½ years, that I got a thorough overhaul and finished the matter, as I thought. First, can the proprietor hold me responsible for the overlapping of 6in. (which was not done, owing to a clerical error in the copy of specification)? Secondly, Could an action be brought against me successfully to cover the roof according to my original specification. Thirdly, if felt was first laid over the roof purlins and then the corrugated sheeting lapped 2 cores, would you consider then that the building would be as watertight as possible?"

It is presumed, although it is not expressly stated, that "Devorgilla" was acting in the ordinary way as architect in relation to this job. That being so, he assumes the liabilities and responsibilities which attach in connection with the employment of an architect. He would seem to have made the initial mistake of allowing the builder or tradesman to rely on a mere copy of the specification. The tradesman, presumably, is bound by the agreement itself and not by the copy; and it appears that at one stage he might have been held liable to complete the work according to his contract.

The position of things, however, is altered by the certificate having been granted. It discharges the builder: *Goodyear v. Mayor of Weymouth* 1 H. and R. 67; and the Scots case of *Ayr Roar Trustees v. Adams*, II. Ct. of Sess. cas. 326. So far, however, as the architect is concerned, it is feared that the employer might be entitled to come upon him for damage occasioned by negligence in granting a certificate. The leading case on this point is *Chambers v. Goldthorpe* (1901), 1 K.B. 124, where it was held that a building owner may claim against an architect for negligence in incorrectly measuring up work done and in improperly allowing payment for certain items.

As to the last question put, it is conceived that the word "watertight" must be read in connection with the specification as a whole. The builder could not discharge his obligation to build the roof to specification by making a watertight roof in some way not specified. X.

COMING EVENTS.

Wednesday, August 3.

Cambridge University Local Lectures.—Summer meeting at York. Mr. A. Hamilton Thompson, on "The Parish Church in Yorkshire" Second lecture. 5.15 p.m.

Friday, August 5.

Cambridge University Local Lectures.—Summer meeting at York. Mr. A. Hamilton Thompson on "Military and Domestic Architecture." First Lecture. 8.30 p.m.

Monday, August 8.

Cambridge University Local Lectures.—Summer meeting at York. Mr. A. Hamilton Thompson on "Military and Domestic Architecture." Second lecture. 5.15 p.m. Mr. John Bilson, F.R.I.B.A., on "The Architectural History of York Minster." 8.30 p.m.

Wednesday, August 10.

The "National" Competition Designs at South Kensington.

WE put the word "National" in apologetic commas, as we have always considered it an absurdly large term to use for these annual displays of students' work, and one likely to be misleading to the stranger within the gates. The heading, "National Art-Schools Competition," would be the correct one, and would prevent misunderstanding.

The drawings, models, etc., are arranged in some rooms in one of the temporary structures on the west side of Exhibition Road, a nest of ugly erections which are a discredit to the neighbourhood, and which it is to be hoped will before long be swept away, and the site turned to some better purpose. Disregarding for the present the Reports of the Examiners, we will give our own impression of the collection, taking it as an ordinary exhibition to be judged on its merits.

Commencing with the furthest or innermost room, we find here some good drawings and etchings of buildings, by Inez Topham (Bristol School), for which a book prize has been awarded. The room contains life studies of the figure, rather black and heavy in execution, and a number of sketches of igures, which are superior to the finished studies. A frame of quick-time sketches from the model deserves notice. In he second room are oil studies from the life, and still-life tudies, which are the best work in the room, and for one of which, by Elizabeth Hancock (Hackney School) a gold medal has been awarded, apparently (from the Report) for the ense of lighting displayed; this is true, but it is dull in olour, and we do not quite share the admiration expressed or it; there is more colour sense in the two silver medal till-life paintings which flank it. But it is satisfactory to find till-life showing well in the competition, as it is one of the most valuable means of training in technique and colour. among the subjects treated in this room are two monochrome tudies of a Byzantine-looking capital, which are carefully rawn and shaded, but whether they were worth bronze medals is another question; this kind of shading work in monochrome is not a very subtle form of artistic execution.

The third room contains a good deal of plaster relief work, mong which No. 40, a low-relief wall decoration design of conventional floral treatment, by Florence Bate (Devonport chool) is a really beautiful bit of decorative work, both in tyle and execution, and well deserved its silver medal. A tudy for a panel in relief (235), a nude figure of a man eated turned away from the spectator, and looking down ver the back of the seat, is both original in idea and effective n design and execution; this, to which a silver medal is warded, is by Rosie Bauerkeller (Manchester School). A ss original but very decorative panel figure is that (462) by oyce Reddrop (Lancaster School). One of the gold medals f the year is awarded for the large bas-relief panel over the oor, by W. H. Wright (Nottingham School), apparently of nude poet reciting to some half-draped admirers; it is only escribed in the catalogue as "modelled design for a doorway," for one of the little peculiarities of the Department is that the subject or meaning of a design is never stated, it is merely put in a certain class. For important figure compositions this is rather absurd, as part of their merit may and should consist in the degree of success with which the subject is expressed, and one ought at least to know what the artist meant to express; unless the "National" students are taught to think that execution is everything and subject nothing; which is a fallacy. A design for the decoration of the hall of a seaport town, by Harold Dickinson (Regent Street Polytechnic), is on good architectural lines, with symbolical mosaic figures in the spandrels of a decorative wall arcade. The crayon sketch compositions of figure subjects by Violet Hawkes (Liverpool School) show both spirit in drawing and a good sense of composition. Among examples of furniture and wood-carving in this room a carved walnut writing bureau by Lilian Hitchcock (Thurloe Place Classes) shows a very nice bit of carving on the lid; a lid of a linen-chest by Lydia Royle (Manchester School) has a band of good relief carving; but the best thing in this class of work is the carved wood finial for a bed-post (so described; it would do equally well for a stair newel, for which we want some new ideas) by W. B. Binns (Birmingham School); this shows a small circular panel ornament on each face, above which the post is worked into a figure of an owl, the whole work keeping the square outline of the post. This is an excellent piece of work on an original *motif*. We observe that the catalogue, with its usual vague carelessness of wording, describes these last-mentioned works in wood as "design for" this and that; they are not designs, they are the executed work, which makes all the difference. W. Shearsmith's large piece of wrought-iron work, a sign for a country inn, which is a good piece of work, is also described as "a design for wrought-iron sign." The framers of the catalogue might really remember that words have a meaning, and that a "design for" any object means making a drawing or other form of proposal for it, and not the execution of the work.

In the fourth room, the large room, there are a great number of works of various classes, many of them of no very great value, but the first thing we come upon is a set of very able drawings in line by Leslie M. Ward (Bournemouth School), stupidly called in the catalogue, "designs for book illustrations"; they are not illustrations for books, they are original conceptions in landscape and shipping compositions, of very great merit. The author describes in a good script hand the principle on which he went to work—selecting a special effect, "using pen textures which the objects themselves suggest," etc. A gold medal has been rightly awarded to this set of drawings; one of the best-earned gold medals of the year. Another gold medal is awarded for a stained-wood mirror frame by Florence Gower (Regent Street Polytechnic); we have not much sympathy with the type of work, but the work, which appears to illustrate successive episodes of a mediæval legend, is well designed in a decorative sense, and achieves a rich colour effect. Designs for jewellery are not very numerous, and that for which a gold medal has been awarded to Alice M. Camwell (Birmingham School) is more remarkable for minuteness and delicacy of execution than for high artistic quality; the bracelet especially wants point and contrast of parts, though the execution is very fine. A better design in an artistic sense is the silver necklace with an enamel pendant by Mary A. Gilfillan (Camden School).

Among the numerous designs for or specimens of textiles and wallpapers there are not many that we care for. The designs for dress fabrics by Berengaria Fildes (Morecambe School), are two excellent little floral designs of conventional type. A great many of the textile designs are far too naturalistic in character. No. 444 is a good design for printed linen, by Cecil Mellor (Huddersfield School); Lucy McArthur's design for printed cotton is also good (Battersea School), as well as another of which we have not the number. Two very good pieces of furniture silk are shown, No. 81, G. Arthur Mason (Macclesfield School), and No. 231, by Arthur Oldfield, of the same school; the first-named obtained a silver medal, the second a bronze medal.

There are some fair specimens of executed stained glass in small panels, but there does not seem to be sufficient stress laid on the necessity for avoiding pictorial treatment in stained glass. These are all praiseworthy attempts at purely decorative panels, but a silver medal is given to a panel by Cyril Lavestein (Birmingham School), an interior with figures and a chequered floor in perspective, which is good in colour, but absolutely pictorial in treatment, and, as stained glass, ought never to have received a prize; and we observe that in the examiners' Report in regard to stained glass not a word is said as to the special kind of design required for stained glass, and its radical difference from pictorial design. We should have thought that Mr. Walter Crane, who was one of the examiners, would have recognised the importance of this principle. It is also somewhat odd to find that the gold medal for stained glass design is given for a couple of cartoons in monochrome, while all the others are represented by the glass itself, as stained glass should be. The cartoons in question, by Edward Ridley (Birmingham School), are certainly, as designs for glass, the best we saw, and are in the conventional and symbolical style of design which alone is suitable for stained glass. But colour is so important an element in stained glass that we do not think any prize ought to be awarded in that art for anything except the glass itself. Another gold medal award we are inclined to criticise is that given to a student of the Bradford School for an iron church door handle and lock-plate. It is a satisfactory design of an ordinary type, but a gold medal for it strikes us as a gold medal very easily earned.

Architecture is relegated to the corridor, and the drawings are not worth a more central position. We may quote the general remark on the subject in the Report:—

> "The examiners have to report that, although no individual works of great excellence are submitted, the general average is slightly improved, chiefly owing to the absence of incompetent work. They regret to note, however, that some drawings are still sent in which are too bad and show too great ignorance to be submitted for the National Competition, and that in certain cases the subjects set are too ambitious for the age of the student. Buildings with such elaborate requirements in plan and arrangements as the main post-office of a large city are unsuitable problems for students of 18 years of age; it would be far better to set simpler subjects which would afford students a real opportunity of exercising their ingenuity in design."

The fact is that architecture is not a subject that can be efficiently taught in art schools; it is based on constructive and technical knowledge of a different kind from that required for modelling, sculpture and drawing the figure and decorative design. C. T. Pledge's design for Council Offices for an Urban District is commendable, and merited a bronze medal (the highest award given in the architecture department). The set of drawings for a Shakespeare memorial theatre we think we recognise as an abortive design for the Soane Medallion; it appears to have issued from the L.C.C. Lambeth School of Building. That is not where students will learn architecture. F. H. Newrick (Sunderland School) sends a good set of drawings of a bay of Durham Cathedral. But the architecture in the National Art-schools competition is always the weakest element, for reasons which should be obvious enough. The real mission of the National Art Schools is first to teach drawing, or modelling, then to teach, or to stimulate by rewards, their application to the improvement of industrial art. In that sense they are carrying on a great work. But they cannot become schools of architectural design.

The Late King's Memorial.

THE decision of the Government to encourage local memorials to King Edward VII., rather than a National one, will be received with mixed feelings. Undoubtedly the majority of people will regret that some big scheme like the rehabilitation of the Mall will not be attempted, and that the late King's memory in his capital will only be brought to the minds of his people and their visitors by minor statues or fountains in the suburbs, or by tablets in the wards of hospitals which the majority of them will never see. Undoubtedly this question of memorials augurs a golden time for the hospitals; the late King's known interest in them, and his establishment of the Hospital Fund, has given an impetus to hospital memorial schemes all over the country. The idea of building or extending hospitals as memorials may prevent many artistic blunders which would result from attempting a system of local monuments; but the essence of a memorial seems to us to lie in its intimate association with the person commemorated, or—as someone has expressed it—its uselessness for other purposes. Few people passing a new wing of a hospital would be thereby reminded that it was a memorial of the late King Edward VII. Moreover, hospitals are not national buildings, or administered as such. A national memorial scheme might not be without faults; but it could be made really commemorative and national, and the funds subscribed for it would not pass into the hands of private boards and committees over whose inclinations and artistic aspirations the subscribers will have no control.

The Wimbledon Hospital Competition.

IN a recent competition for a small hospital at Wimbledon, the assessor, Mr. W. A. Pite, selected the plans of Mr. Hatch, who has an appointment in the War Office, a fact which, it appears, he had duly stated when entering for the competition. It appears that the Committee now propose to take the work out of his hands, either by asking the assessor to select another design, or by paying him the estimated value of the plans and appointing another architect to carry them out; this on the ground that owing to his official duties at the War Office Mr. Hatch could not have time to see to the carrying out of the building. If it were a very large building of the first importance there would be something in this; but apparently it is only a building of about £6,000, and the Committee seem to be under the impression that they have a right to have the architect always on the building—in fact, doing the duty of a clerk of works. If that is their idea, they ought to be better informed. A personal visit to the building about once a week is the utmost that is necessary, or that they are entitled to expect from the architect—many architects would not give as much as that, nor would it be necessary with a properly competent clerk of works; and there is little doubt that the War Office authorities would in such a case allow the architect reasonable time off for a visit to the building now and again. The assessor, who understands the business of looking after a building, has advised the Committee that they need be under no anxiety as to the building being properly supervised. But the Committee apparently persist in believing that having given an architect a small commission of this kind, they have purchased the whole of his time, and that he is to be always on the building! It is really absurd that a Committee should be so ignorant. What do they think happens with an architect in large practice, who may have a dozen buildings going on at once? The fact seems obviously to be that they want to save the expense of a clerk of works, and expect the architect to do the work of one. They are treating Mr. Hatch in a most unreasonable manner.

NOTES AND NEWS.

Midhurst Town Stocks.

The well meant suggestion of a former Lord of the Borough of Midhurst to erect a shelter for the old town stocks, to preserve them from the weather has been temporarily postponed. Local people are making caustic comments concerning the delay, apparently in ignorance of the reason for it. The stocks are adjacent to the old Town Hall, and as the plans provided for the use of modern red bricks, it was felt that the new structure would not be in keeping with the town hall. The work was therefore stopped for the arrangement of a more suitable scheme.

The Garden Suburb House.

A writer in the "Westminster Gazette" extols the merits of the garden suburb house by saying that the purchaser of a house in a garden suburb not only obtains a residence which is designed to his own wants, but he has neither the cost nor the trouble of discovering an architect, a builder, a surveyor, or a solicitor. He pays a stated sum, which may range from £300 to £400 for a modern cottage to £3,000 for a large mansion; and in that sum all other costs will be included. For the definite amount the house is designed, built, and finished ready for occupation. We presume that the next suggestion will be that the architect should be dispensed with.

Building By-laws Again.

Gateshead has recently evolved some new by-laws, and a Local Government Board inquiry has been necessitated to hear bjections to their confirmation. The principal objectors were uilding owners and builders in the district, and the main bjection was that the new by-laws would increase the cost of uilding, and especially of the improved type of house which t was desired to erect. The borough surveyor, asked the uestion: "The cheaper you make houses the more you will ncourage building?" replied, "You can go too far in that irection." Apparently that is the bone of contention. The urveyor's intention is "to improve the present by-laws." The ew by-laws require 13½in. solid external walls; footings re to be 28ins. instead of 22ins., a width of 70ft. between he rows of houses, of which 40ft. will be roadway. The uilders contend that an 11in. cavity wall is quite equal to he 13½in. solid wall. Objections were also raised as to the imbering of roofs, and to the yard space. A councillor ppeared for the local trade unions in support of the proosed by-laws. On behalf of the objectors it was urged that hey did not want to encourage a system of cheap and nasty ouses. They found that the demand was for small selfontained houses with more garden ground than self-contained ouses had hitherto had. What people wanted was a cheaper ind of house, with more land, and it was found that the urchasers would rather pay more for the land and less for he house. The Town Clerk pointed out that the arguments rought forward were the objections of those interested in e sale and building of property, whilst it was the duty of he Corporation to look after the interests of the whole of e ratepayers. The Corporation, in framing these by-laws, ad before them the interests of the public health, and, on ehalf of the Council, he hoped the Board would see its way confirm the by-laws as passed by the Council.

St. Paul's Bridge.

The City Corporation and the London County Council re not apparently "hitting it off" very well in the matter f St. Paul's Bridge. The County Council have stated their illingness to contribute a sum not exceeding £300,000 wards the cost of the proposed widening of the east side f St. Paul's Churchyard, but they will only do this on very erous terms. The Council must be satisfied "as to the etails of the scheme in all respects, and in particular as to e adequacy of the southern approach to the bridge, and all be satisfied that no further expenditure on its part ill be necessary for a considerable period either with regard the continuation to the south of Southwark Street of the southern approach, or in any other portion of the scheme. It is further proposed that the payment by the Council of the suggested contribution shall be spread over as long a term as possible. The whole arrangement indicated above is further subject to the Council being afforded such facilities as it may desire for constructing tramways on the new bridge and approaches, it being understood that the Council shall be under no obligation to construct such tramways, or if constructed, to extend them to the north of Cheapside, so as to link up with the existing tramways in Aldersgate Street." The conclusion of the letter was greeted with some ironical laughter. Mr. Thomas stated that the committee intended after the vacation to recommend the Court to apply for Parliamentary powers to construct the bridge without reference to the County Council.

"Vandalism" at Oxford.

The repair of the garden front of the second quadrangle of St. John's College, Oxford, has been the occasion for quite unreasoning and unmerited alarums and excursions. It was stated that portions of the carving and tracery were being obliterated by the simple but vandalistic process of covering them with cement. The report arose apparently through the whole front having, in order to arrest the erosive action of the atmosphere on the stone, received repeated dressings of Baryta water, which gives the stone the appearance for all the world of having been treated with cement. Mr. Harry Redfern, F.R.I.B.A., the architect in charge of the reparations, says that in his opinion this treatment with Baryta water has one defect, and one defect only, it leaves the stone a most unpleasant colour, but it is his ultimate intention, with the primary object of increasing the preservative effect of the Baryta water, to give it a coating of limewash, and at that stage it will be comparatively a simple matter to restore the original yellowish brown of the stone. Mr. Redfern points out that in the course of this delicate work of repair not a single old stone has been removed, nor a new one inserted, and, in fact, there is not a stone in the front which was not there when Archbishop Laud built it (1631-6), except that in 1889, when the methods employed in this instance were unknown, a few very small pieces of new stone were inserted in the two end gables. As far as the carved portions are concerned, he says, they have been left absolutely alone, for they are in Burford stone, which resists the action of the atmosphere more successfully than the Headington stone, of which the parapet and the mullions of the windows are made. Where the decay of the stonework has left cavities in the face, these have been repaired, after the manner of "dentistry," as the architect describes it, by inserting pieces of hand-made tiles embedded in lias lime mortar, the surface finished off approximately flush with the original surface of the stone.

Artistic Licence.

The story of a window in St. Alban's Church, Carlisle, to be erected to the late Bishop Ware, of Barrow-in-Furness, is amusing. It seems that before the Chancellor would grant a faculty for this window, he insisted on amendments in the design. Oswald, King of Northumbria, is represented in the cartoon as an old man, whereas he died at the age of 38. So this is to be altered. Further, one of the angels is represented wearing the coat of arms of the Dean and Chapter of Carlisle. The Chancellor does not believe an angel would wear such a coat of arms, and this also must be changed. The "Daily News" takes leave to point out that while the Chancellor may be correct about the limitations of angelic costume, they would be inclined to back any opponent of his "who undertook to prove that angels have again and again been depicted, in stained glass and elsewhere, as wearing the coat-of-arms or other cognizance of some mundane person or corporation. Our contemporary blunders badly, however, in attributing the angel with side whiskers in St. Alban's Cathedral as the likeness of *the late Lord Denman, who restored the cathedral.* As a matter of fact, it was the late Lord Grimthorpe who enjoyed that distinction.

ARCHITECTS OF THE DAY.

XIII.—MR. ARTHUR KEEN, F.R.I.B.A.

TO the majority of our readers the new President of the Architectural Association will be known as the architect of much excellent domestic work in the Home Counties; but, in reality, Mr Keen has two sides to his practice, and is responsible for large number of factories and warehouses in London which have never been illustrated, and probably never will be illustrated. For although from some views of these severely commercial buildings that Mr. Keen had at hand they appeared to us very good, and a welcome improvement on much of the stuff we see in our London streets, their designer could not be persuaded to allow their publication. In his view there is not sufficient architectural interest in such buildings, and he prefers to be known and judged by his domestic work, to which our illustrations are, therefore, practically confined.

It is, therefore, as a designer, principally, of domestic work that we must consider Mr. Keen. His training in this branch of architecture probably could not have been bettered, for he was one of that band of brilliant men who passed through Mr. Norman Shaw's office, and who have all since come to the front. It was in Mr. Shaw's office that Mr. Keen first met Mr. Ernest Newton, who has previously been victimised in this series, and there commenced a friendship and pleasant association that have continued to the present day. For though Mr. Keen and Mr. Newton are not partners, they are to be found in the same offices in Raymond Buildings, looking out over the beautiful green that the Benchers of Gray's Inn, to their everlasting credit, preserve from bricks and mortar. Which reminds us that we have frequently been attacked for defending some threatened oasis from the blight of development on the ground that we should encourage building, and not debar it. To the purely material mind this may appear to be an unanswerable argument, but every artist, be he architect, painter, or sculptor, knows that he requires sufficient space for the proper setting of his work, whether it be on the ground, the wall, or the floor.

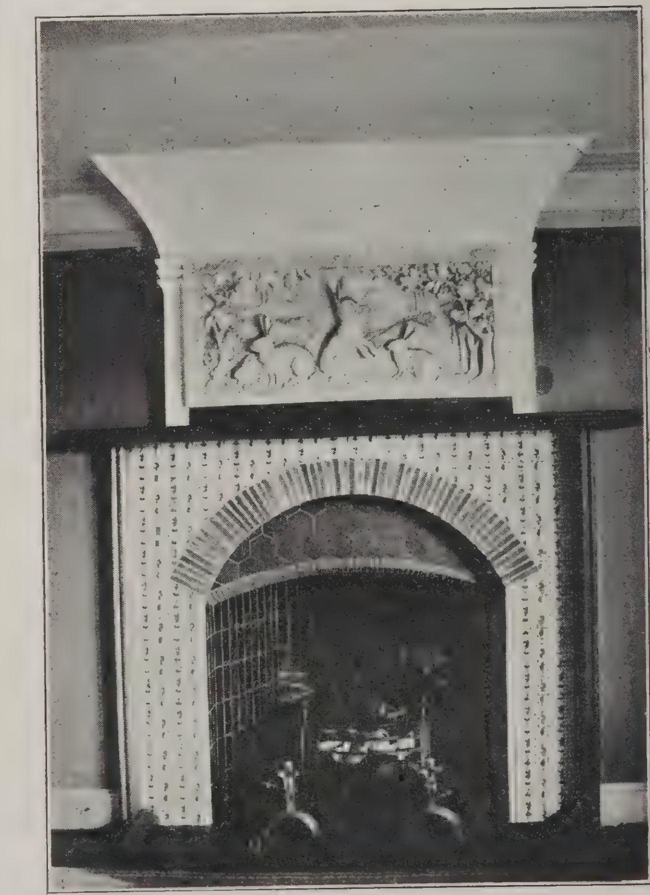
Mr. Keen studied also at the Royal Academy, but confesses that although he obtained a prize he did not derive all the benefit from this institution that he might have done. In his own view he entered too early, and was a little too young to appreciate the possibilities of the training, or to get out of it all that could be obtained. This led him in conversation to generalise a little on the subject of the Royal Academy School. Mr. Keen looks on this as the finishing course in architecture—that is, of course, as far as there can be any finish to the study of this great art. He would desire it to be brought to the plane of the Ecole des Beaux Arts in Paris, where men rarely obtain high honours until they reach the late twenties. It is in no sense, from this point of view, to be regarded as a general teaching or elementary training, and students can therefore make the mistake of entering the school too soon. Rather, it should be regarded as the continuation and culmination of the excellent work done in the A.A. schools in developing the faculties of study, application and deduction, so that a fairly mature and receptive mind may derive the fullest benefit from the later teaching.

Continuing our conversation on this and various allied topics, Mr. Keen touched upon the question of draughtsmanship, to which he attaches very considerable importance in the training of an architect. He believes that all students should join a life class; the delicate nuances of the figure are of great value in educating the hand and eye of the would-be architect in the subtleties of form. Mr. Keen believes that much more attention should be given to sculpture and painting, especially decorative painting; and this is one of his reasons for advocating the Academy as a finishing school, as there, students in architecture, painting, and sculpture meet and get into touch with each other's work. Undoubtedly the camaraderie of the Parisian art student contributes greatly to the success of the Ecole des Beaux Arts as the leading art training centre. There the architect is an artist, a painter and sculptor, but principally an architect; the painter is a sculptor or an architect, but chiefly a painter —and so on. The segregation of the Fine Arts both in training and after life has had a very deleterious effect on art in this country; and we have arrived at a point when the painter, sculptor, and architect are out of sympathy with each other, largely because the limitations and technique of each other's work is imperfectly understood. And by this it is not to be supposed that we expect the architect to have executive ability in the other branches of art; but only that he should have a sympathetic understanding of the aims and limitations of the daughter arts. At present, Architecture is rather in the position of the old-fashioned matron with two revolting daughters whose temperament she fails to understand, and whose aims excite in her scant interest, and a good deal of dismay.

In emphasising his point on the importance of draughtsmanship, Mr. Keen admitted that he now wished he had devoted more attention to it, and that although he, personally, had always been fond of sketching, and found it a delightful hobby, he regretted now that he had not given draughtsmanship greater attention.

The decoration of the rooms of the Royal Society, the Chemical Society, and the Geological Society at Burlington House, carried out a year or two ago under Mr. Keen's supervision, was a work that gave him peculiar pleasure; but he thought that such work falling to the architect pointed to the necessity for a wider study of decoration, and was evidence of the wide range of activities and interests in which the modern architect must busy himself.

An opinion of ours, perhaps not well founded, that the A.A. curricula tended rather to the study of domestic work was disputed by Mr. Keen. We were emphasising the inevitability of "The Orders" as architectural pot-hooks, holding that a knowledge of them, well grounded, should produce a subconscious sense of proportion in the student. This idea



This chimney piece is a recent addition to the house. The modelled plaster panel in the upper part illustrating a woodland scene, is the work of Mr. Laurence Turner.

CHIMNEYPIECE EDGEHILL, LIMPSFIELD. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

ARCHITECTS OF THE DAY.

XIII.—MR. ARTHUR KEEN, F.R.I.B.A., PRESIDENT OF THE ARCHITECTURAL ASSOCIATION.

(Sketched from life by our Special Artist.)

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

was brought to our minds by a modern French building, which, though it exhibits neither columns nor pilasters, still gives classic proportions in the vertical disposition of the wall treatment. Mr. Keen claimed, on the contrary, that the A.A. Schools had done a great deal—which we admit—in the matter of a more classical training and better draughtsmanship. The life class there was well attended, and they hoped to get all students to attend it. Indeed, he thought that attendance at this class, which is conducted by Professor Constable Alston, might soon be made compulsory. The study of sculpture and decoration could not well be included in their curriculum—they had so many subjects at present on the list that it was hardly possible to add more. These were subjects that Mr. Keen thought were more fittingly taken up at the Royal Academy.

The present congested state of the architectural profession and the question of Registration were topics also touched upon. It is, perhaps, hardly necessary to state that Mr. Keen is not a believer in Registration. He feels that if a man has capabilities as an architect he will inevitably come to the front, and that competition will not hurt him. That we admitted, but argued that the capable man would come to the front whether registered or unregistered, and that some means of shutting the door should be at command to exclude the incapables in their own interests as well as that of the profession. The idea that architecture is "a nice, respectable occupation" for mediocre people is responsible for a good deal of the present trouble. Mr. Keen sympathises with the object; but not the means. He also deplores the wastage of young men in the study of an art in which they have neither abilities nor opportunities of making headway; but we gathered that he saw no royal road out of the difficulty. Mr. Keen no more believes in examination as a test of real ability and aptitude than we do; but examinations at the R.I.B.A. and elsewhere still confer a false status.

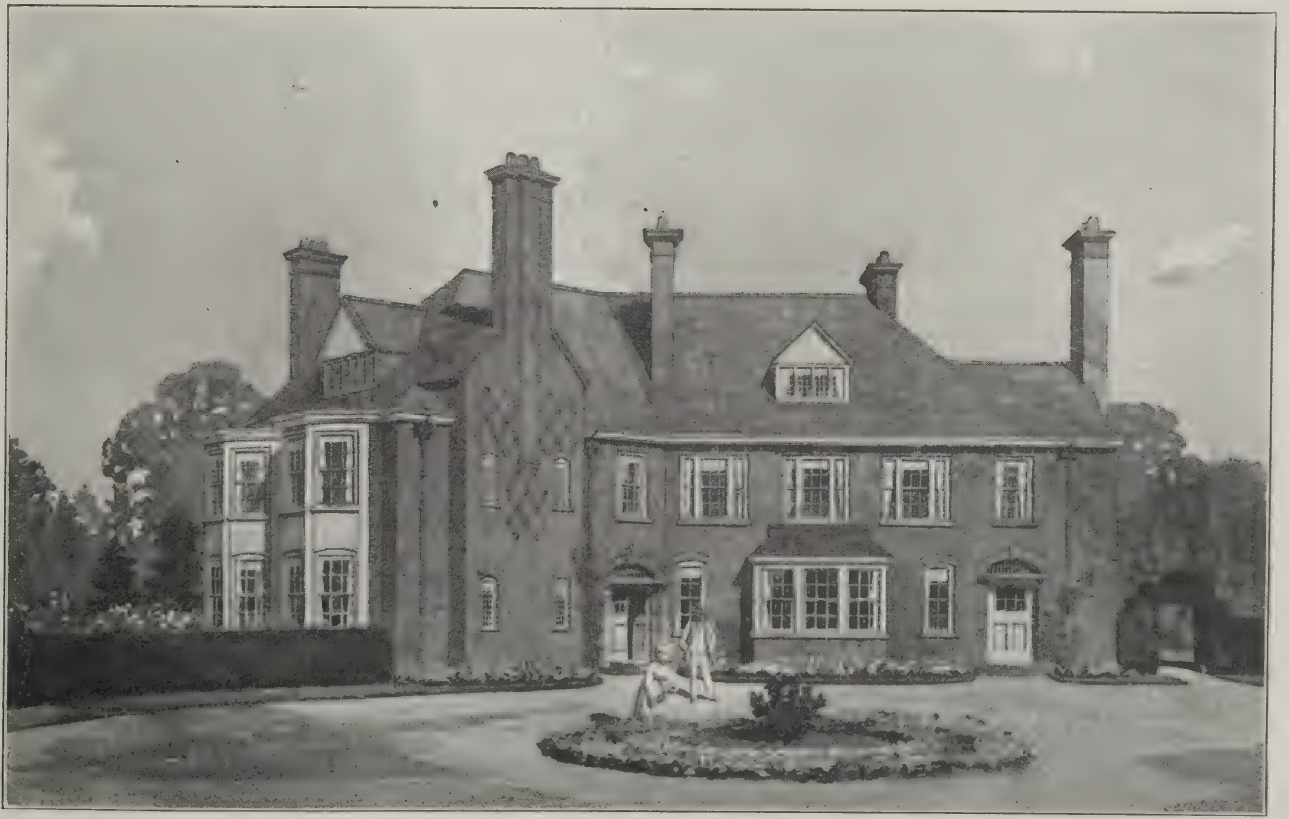
The alternative to registration is the lengthening of the educational course, so that the "cramming" element may be superseded by an "influencing" one. In other words, the training must not tend, as now, to the acquisition of a given number of facts in the shortest possible time; but the gradual instillation of principles into the mind of the pupil. This looks like a six or seven-year course under good men, a heavy expenditure in time and money for the serious-minded student. And, even then, you have done nothing to prevent a man launching out on the strength of one session at the A.A. Day School. The conversation on this head was inconclusive. Mr. Keen agreed to differ with us as to the remedy.

Returning to more personal matters, Mr. Keen comes to the President's chair at the A.A. after a connection of six years, during which time he has served on the Council, and as vice-president, and has contributed to the A.A. journal.

Among the buildings designed by Mr. Keen may be mentioned two or three chapels, including one at Cricklewood, Kingsgate House, High Holborn; the Baptist Church House and Kingsgate Chapel, Southampton Row; six houses at Whetstone (one built for the architect's own occupation), "Hillsborough," Totteridge; three houses at Hampstead (one for Mr. G. H. Swinstead, the artist), three or four houses at Highgate; No. 66, New Bond Street (one of Mr. Keen's favourite works); house at Mill Hill; house at Sanderstead; seven or eight houses in the Limpsfield district; a golf clubhouse at Stoke Poges. The last-named work was a very interesting work, and consisted in alterations to the well-known mansion of Stoke Park, to fit it for the purpose of a clubhouse. Mr. Keen has also designed a good many dwellings at Limpsfield for a Cottage Building Company, run on more or less philanthropic lines; and he is responsible for a block of flats at East Dulwich, with shops under.

Of the buildings illustrated in this issue the following particulars may be of interest:—

The Baptist Church House and Kingsgate Chapel is situated in the widened part of Southampton Row, London, and is the headquarters of the Baptist Union. In addition to numerous offices and committee-rooms, it contains a library 46 ft. by 26 ft., a council chamber 35 ft. by 26 ft., a large visitors' room, and a publication department. Oak panelling and inlaid woodwork have been used freely in the principal rooms, the corridors are paved with black and white marble tiles in patterns, and are ceiled with groined vaulting. The staircase to the first floor is in Hopton Wood stone, with

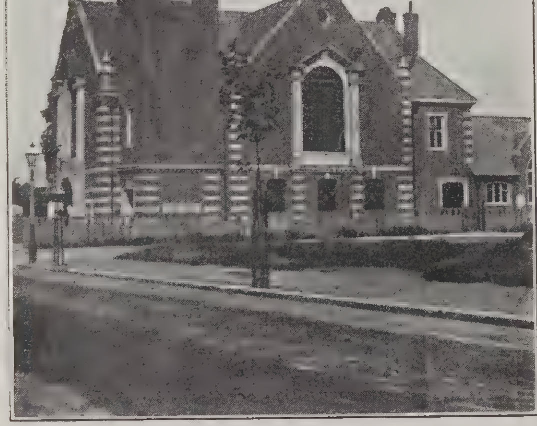


This is a doctor's house, containing a good consulting-room, waiting-room and dispensary in addition to the ordinary sitting-rooms and some twelve bedrooms. The materials are red brick and Broseley tiles, which have toned well.

"BURRINGTON," WHETSTONE. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

massive teak balustrades. The modelled plaster ceilings are the work of Mr. Laurence Turner; the bronze statue of the late C. Haddon Spurgeon in the entrance hall is by Mr. F. Derwent Wood, A.R.A.; and the figure of John Bunyan at the corner of the building was sculptured by Mr. Richard Garbe. Two presentation terra-cotta panels, by George Tinworth, have been set in the chimney-pieces of the council chamber and the visitors' room. It was at first intended to build the library over the chapel, and the octagonal form was adopted to facilitate the lighting of the chapel; but this idea was abandoned to save time in settling a point raised by the district surveyor under the Public Buildings portion of the Building Act, and the chapel was therefore given the benefit of a domed ceiling with a lantern light above it. The panels in the spandrels were modelled by Mr. Garbe to illustrate the various trees mentioned in the Bible. The organ, though small and comparativly simple, has a most beautiful tone. Under the chapel is a large Sunday school. The elevations of the buildings are in Portland stone, and Borough Green red bricks are also used on the side frontage.

Of Cricklewood Baptist church only the chapel is at present erected, the Sunday-school being still to be built. The building is of red brick, with a green slate roof in graduated courses, and with stone dressings to the windows and to the doors. The Greek cross plan is peculiarly well adapted to Nonconformist purposes, because galleries are always characteristic features in these churches, and this plan enables everybody without exception to obtain a view of the preacher. The church is designd to hold 750 people, including the galleries, which are not yet built. The main feature of the interior is the vaulted ceiling, which consists of two main barrel vaults intersecting over the central area. The church has cost about £5,240, exclusive of the Sunday-school, but including the seating, which, with the furniture, has been carried out by Messrs. Bennett and Co. Messrs. Mattock Bros., of Wood Green, are the builders. The glazing was done by Messrs. Morris and Co., and the modelled plaster ceilings by Messrs. Samuel Wright and Co., of Hackney, the heating being by Messrs. Wenham and Waters.



The building is of red brick with a green slate roof and stone dressings.

BAPTIST CHURCH, CRICKLEWOOD.
ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

Kingsgate House (see Centre Plate) bears that name by virtue of its standing upon the site of old Kingsgate Street, which was demolished to make way for the Holborn to Strand improvement. The two figures of the first and last Edward, which sit at the base of the gable, and which were ably modelled by Mr. Richard Garbe, were suggested by the same fact, and in consequence of the building facing Kingsway. The lower part of the building accommodates a branch of the National Provincial Bank of England, and the upper part consists of suites of offices. The front elevation has a ground storey in unpolished Cornish granite, and the upper part is of Borrough Green red bricks and Portland stone. The roof is covered with Wrotham tiles. The carved work throughout the front elevation was executed by Mr. Laurence Turner. The builders were Messrs. Dove Bros.

The chimneypiece at "Edgehill," Limpsfield, is in a recent addition to the house. The modelled plaster panel in the upper part, illustrating a woodland scene, is the work of Mr. Laurence Turner.

Headland Cottage, Limpsfield, was built especially for a literary man, in a very quiet part of the country overlooking one of the finest views in Surrey. The cottage, the walls of which are built of local stone, covered with rough cast, was erected at a cost of about £500, and has since had one or two additional rooms incorporated at the back. Messrs. Wiltshire and Sons, of Sevenoaks, were the builders.

"Burrington," Whetstone, is a doctor's house in the north of London, containing a good consulting room, waiting room, and dispensary, in addition to the ordinary sitting rooms and some twelve bedrooms. The house is built of red brick, with sand-faced Broseley tiles, which, although very hard and strong, and not originally of a very good colour, have in a short space of time toned and mellowed in fairly the same way as ordinary hand-made tiles. The principal rooms have oak floors, and mantelpieces of the same wood. One of the rooms on the top floor forms a very good billiard room. Mr. Henry Brown, of Harrow Road, W., was the builder.

It may be remarked, in passing, that drawings of all the above buildings have been exhibited at the Royal Academy.

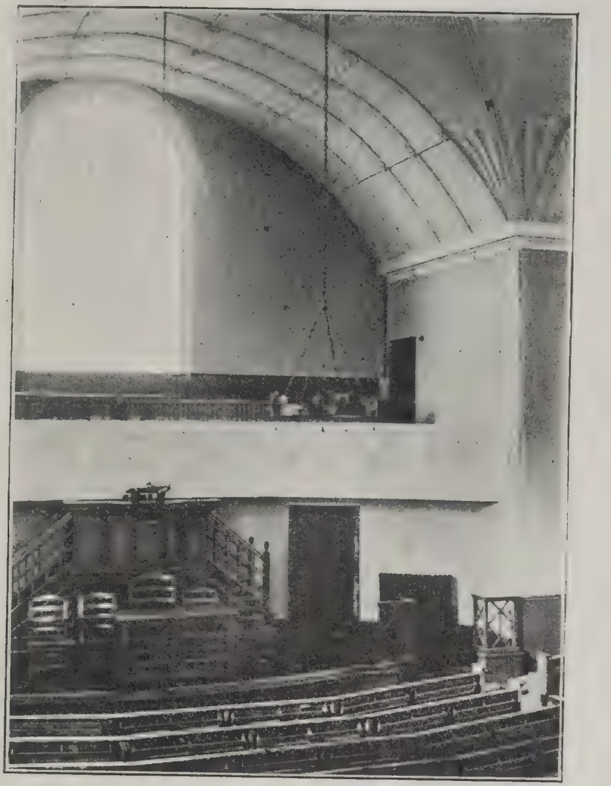
"Elmstead," Limpsfield, is another house built for a literary man. It stands among old elm trees on the edge of Limpsfield Common, and was intentionally made as unobtrusive as possible, so as to harmonise with the immediate surroundings. The tiles found on an old barn, which formerly occupied the site, were used in the present building. One of the first floor rooms forms a study. The builders were Messrs. Brasier and Sons, of Limpsfield.

"Studland," Highgate, is a suburban house, built on a 70ft. plot of ground, and comprises a great deal of accommodation at a very moderate price indeed. The three sitting rooms have wide openings between them for purposes of entertainment. The house contains in all seven bedrooms. Mr. Henry Brown, of Paddington, was the builder.

"Penkerrow," Enfield, is a house of exactly the same type as the last. Some additions have since been made to it, including, in the drawing-room, a screen of fluted Ionic columns in oak. The builders were Messrs. Mattock Bros., of Wood Green.

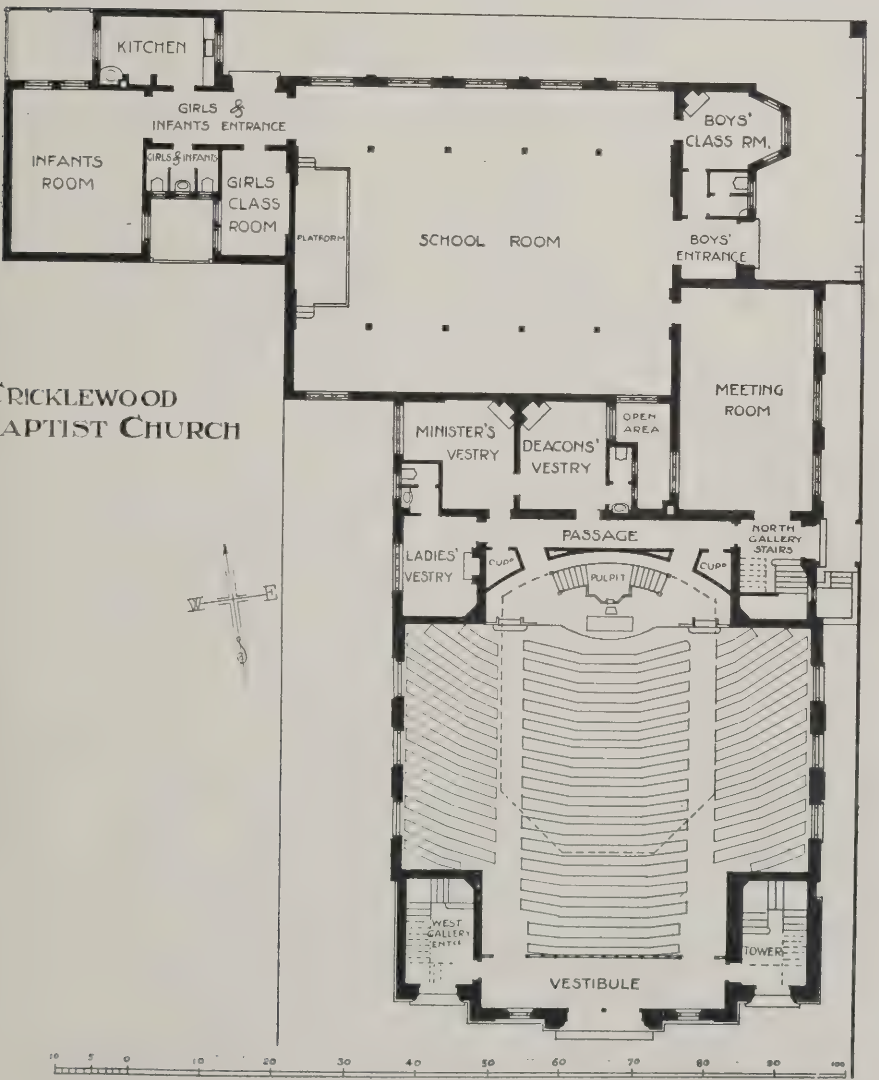
Mr. Keen has excellent qualities for the Presidential office to which he has been elected; and we may expect therefore that the great work which the Architectural Association has and is carrying on will continue to be carried forward on its present praiseworthy lines. Quiet in manner and very charming as a conversationalist, Mr. Keen will rule matters with an apparently light hand, for domination by sheer physical impression is not his role; but shrewdness and method are his qualifications, and, we should imagine, considerable tenacity of purpose in support of anything he believes in; and for these reasons there will be no slacking while he is at the helm. He is a sincere believer in the A.A., and the work of its schools, and may be trusted to further their welfare and the vital interests of architectural education.

We should add that Mr. Keen has lately been appointed to the surveyorship of the Saddlers' Company.



INTERIOR VIEW, SHOWING ROSTRUM AND CHOIR GALLERY.

CRICKLEWOOD BAPTIST CHURCH



ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

BUILDINGS FOR MUSIC.

It is not a little curious to observe that in the critical notices that have been published of the designs in the Usher Hall Competition, hardly a word is anywhere said as to the suitability of the proposed designs for the real purposes of a concert hall, the making of music and the hearing of it. In the report of the assessor the point is not even alluded to; the award seems to have been made only in respect of the convenient planning of the approaches and exits and the architectural style of the exterior. But this is a competition for a concert hall; it is surely of some importance in such a case to consider the merits of designs from that point of view; but it never is done. There was a competition some years ago for the remodelling and re-building of a large concert-room at Bristol, in which the professional assessor made his selection in favour of a design in which the organ and orchestra were planned in the least suitable manner for securing an effective performance. The fact is that as a rule competing architects and professional assessors know nothing whatever about the musical side of the question.

The promoters of the competition have made a mistake to begin with, in their directions for a concert-room to seat 3,000, and an orchestra to provide for a band of 100 and a chorus of 350. If they wish to have oratorio performances on a grand scale, that orchestra is not large enough. The proper proportions are a band of 100 and a chorus of 500. It seems probable that the Queen's Hall has been taken as the *point de départ* both by the promoters of the Usher Hall competition and by the authors of the selected design. If so, it only shows what mischief may be done by the establishment of a bad precedent. The Queen's Hall orchestra was planned by an architect who admitted that he knew little about it, and who, after the main plan of the building and of the external walls was all settled, came to the present writer for advice; he had been instructed to provide space for a band of 80 (which is rather below present ideas), and I found that he interpreted that as meaning standing or sitting-room for 80 persons. I pointed out that the two (sometimes three) kettle-drums and the bass drum—often, though not always, required along with them—would in themselves occupy the space of at least a dozen people, besides room to play them, and his orchestra was too small. But the limitations of space had been settled then; the band space had to be enlarged; the whole space of the orchestra was too small in any case for choral performances, consequently no really adequate choral performance has ever been possible at the Queen's Hall; the chorus, packed together inconveniently close, is always too small when the band is kept up to the numbers now demanded. No provision was originally made, either, for space for a pianoforte on the front part of the orchestra. The organ is treated in the most unsuitable way, being spread out all across the hall, whereas an organ needs to be as much concentrated as possible, and the player is in an alcove at one end, where he cannot properly hear either what he himself or the band are doing. The Queen's Hall is, for its size, acoustically good, and the entrances and exits are very well arranged; but those are its only merits as a concert-room. The whole arrangement of the orchestra is bad and inadequate, and should never be taken as a model.

Messrs. Harrison and Thomson appear

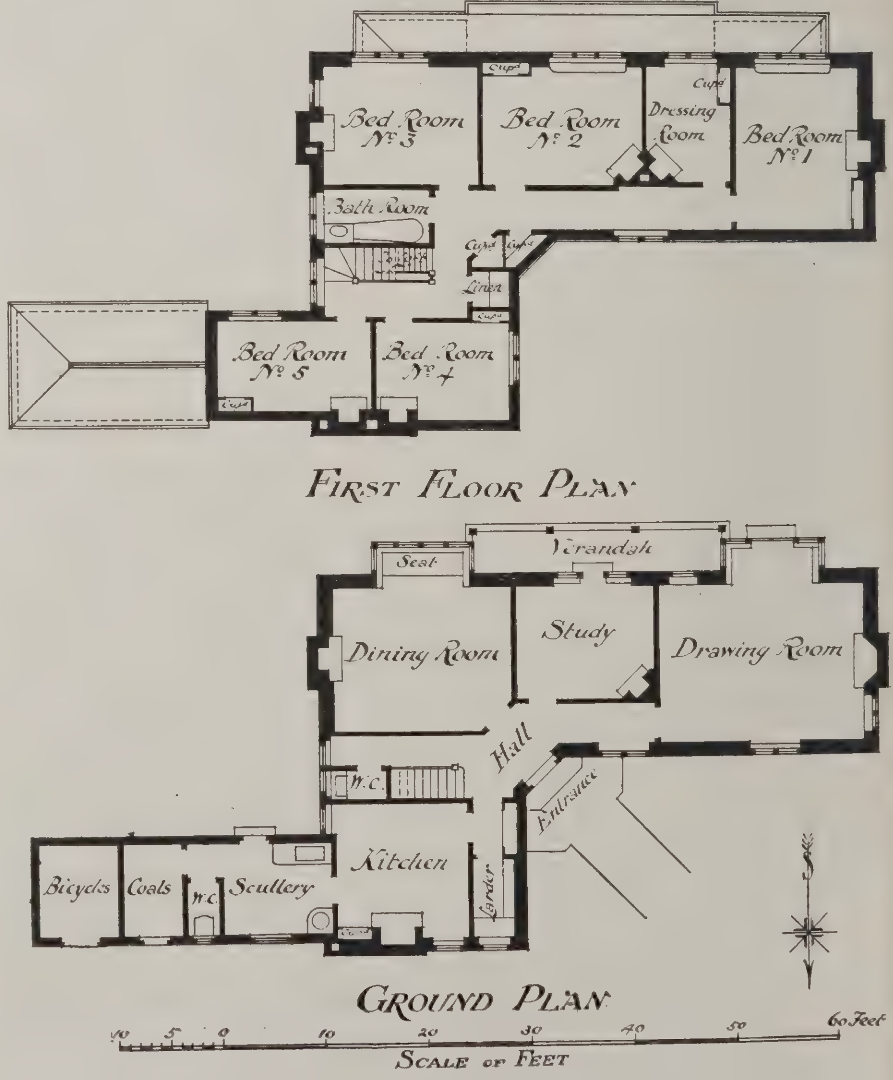
to have provided room enough for a concerto player and his pianoforte at the front of the platform; that their chorus space is too small is the fault of the instructions. But they have made sad mistakes with the organ. In the first place, the organ keyboard ought always, now that we can command electric action, to be placed down in front, just beneath the conductor's desk, and the organist should face the conductor and have his back to the organ. This is perfectly easy to arrange, and has been done in one private concert-hall; I do not know of any public hall in which it has yet been done, but it ought to be done everywhere. The organ-player can then hear what effect he is producing in combination with band and chorus, which he cannot do if he is placed in a recess under the instrument; it is all guess-work then; he may be nearly inaudible, or (if it is a very large organ) he may be drowning the band and chorus without knowing it. This position for the organist, however, is such a common mistake that one can hardly blame an architect for falling into it. But the contrivance in the selected design for providing for the largest pipes by sending them up into a tower practically outside the building is quite absurd. It is a popular fallacy to suppose that it is the vibration of the organ pipe which produces the sound, and so it is probably imagined that if half the pipe is within the building that is sufficient. The fact is quite otherwise. It is the column of air within the pipe that vibrates, the pipe is only a means for defining a column of air of a certain length; you can put your hand on a pipe when it is sounding, and you will feel nothing. For an organ to produce its best effect it should have some empty space above it. The mistake in the selected design is that the organ is too high up and the roof of the orchestra too low.

It is rather a difficult problem, but it is to be met in this way. The chorus seats should not rise higher than is absolutely necessary; if the heads of each rank of singers are well clear of the heads of the rank next below it is sufficient. Having thus kept the summit of the chorus seats as low as can be, all the mechanism of the organ bellows, windchest, etc., should be sunk behind the chorus; the soundboard, on which the feet of the pipes rest, need not be higher than the top level of the chorus seats, and may even be below it; the sound-board for the long pedal pipes may be some distance below it, to allow room for their height; they will be heard just as well. The pipes in front, if they are sounding pipes, must be raised a little above the seat level, but on the supposition that the organist is where he ought to be, down in front, and there is no keyboard recess to be provided for in the organ front, the front pipes need not stand on anything higher than a dado some 2ft. 6in. high. The organ should not be spread out over the whole width of the back of the orchestra, the sounds then seem to come first from one side, then from another; it should be concentrated as far as possible in the centre portion, and the space left at each side, between the organ and the side walls, utilised as rooms —they may form part of the retiring rooms for the chorus. They must not be used as space for chorus seats (a mistake often made), as then the singers seated with the organ between them cannot hear each other, as it is essential that they should, to assist unity in chorus-singing.

The position given to the organ in the third premiated design is even more defective. It is there shown in two blocks on towers (which do not appear large enough) in front, on each side of the orchestra, and separated by its greatest width. The effect of that would be that if the instruments were used for organ solos, its effect would be broken up and seem to come from side to side; and when it is used with the band and chorus it would be a disturbing element, and would not blend with the total effect. An organ when used along with band and chorus is always, in a musical sense, a background, and should be placed accordingly.

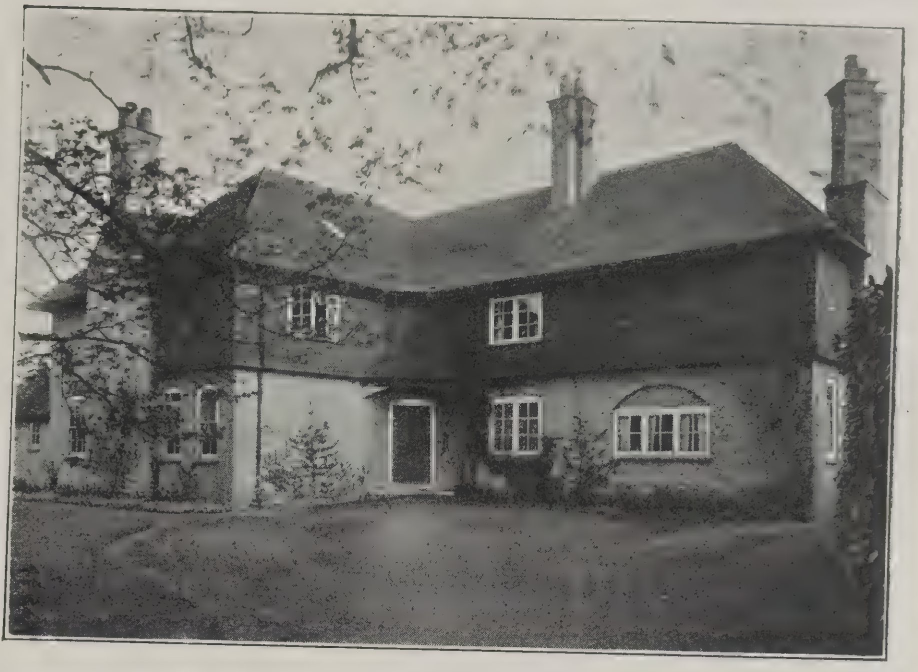
To come to the general question of acoustic conditions in regard to plan and material. The acoustic property of buildings is not, and perhaps never will be, an exact science; acoustic effect is a most elusive problem; buildings which ought not, theoretically, to be good for sound sometimes prove unexpectedly satisfactory, while those over which great pains have been taken turn out failures. But one general principle is undeniable; it should be the object of a concert-room to assist sound at its point of production, and to prevent any reflection or reduplication of it by echo when it has once been produced. To speak first of materials; the materials used in the construction of the orchestra and its surroundings should be such as will sympathise with and reinforce sound without reflecting it sharply. Nothing is like wood for this, and there should be as much wood about orchestra and organ as possible. Let no one ever dream of building a fire-proof orchestra; the thing cannot be done. Hard substances on the walls will no doubt drive sound forward, but will give it a harsh clanging effect. Textiles, on the other hand, drink up sound without vibrating with it; there should therefore be no curtains or such things anywhere about the orchestra. In the auditorium they may sometimes be useful in choking an echo, but this is only when the building is wrong to begin with. Fibrous plaster is a good material for lining the walls of the auditorium; it acts in sympathy with sound without producing much echo. As a general rule, all substances which give sharp reflections of light will give sharp reflections of sound; polished marble and other such materials, however decorative they may look, are therefore misplaced in a concert-room. Plate-glass windows are equally bad; they send sharp echoes back; windows should be broken up into small panes with wooden bars.

Then shape has to be considered as well as material. As a general rule, concave surfaces are bad, either in plan or section; they tend to focus echo. The two best rooms I can remember for hearing music were the old Exeter Hall, a wide parallelogram with the seats going up in a slope from front to back (the plan adopted also by Wagner in his Bayreuth theatre), and the Liverpool Philharmonic Hall, also a parallelogram, with a flat floor, and a flat ceiling with a cant at the walls, and the surface broken up by a cross rib pattern in relief. The sloping floor, of course, prevents the room for being used for balls or receptions, which is a practical objection, but it is an excellent way of seating an audience for hearing well, and would be still better if the section were a long curve, flattest near the orchestra and ris-



"ELMSTEAD," LIMPSFIELD: PLANS. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

ing more quickly at the rear. To enable, however, so large an audience as 3,000 to hear well, it may be admitted that something like a horseshoe form is necessary, otherwise some of the audience would be thrust too far away from the performers; but both the fronts of the galleries and the wall at the top should be broken up in plan—the wall especially, to prevent their concentrating an echo on any focus in the hall. I noticed a remark about the Usher Hall design that there was nothing to check the progress of sound. It is sometimes necessary to check the progress of sound. Either along a long side wall or a circular wall, sound will run in some peculiar manner, which produces a wave back at the end of its course. Both a straight wall and a circular wall should be broken up, by pilasters or otherwise, to check this. The author of the second premiated Usher Hall design has adopted a complete circle for his plan. There could not be a more risky form for a concert-room; it would be sure to make echo. The whispering gallery at St. Paul's furnishes an object-lesson in this. And the curve, though a flat one, of the roof of the accepted design is a very doubtful form; at events, it must not be left a smooth, unbroken surface—it will be almost certain to make echo if it is. The flat, curved section of the Albert Hall skylight made the building almost impossible for music, owing to the echo, until the velarium was hung under it; one of the examples of the use of textiles in absorbing echo.



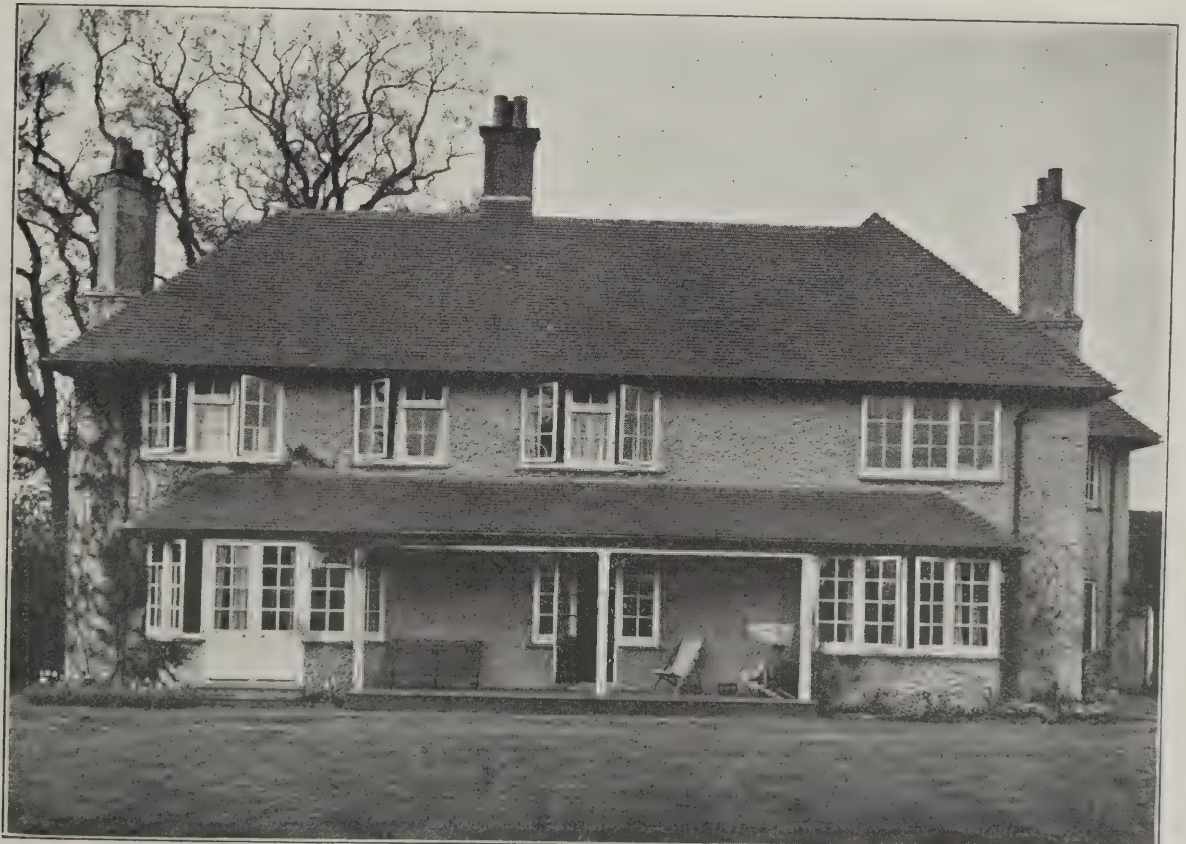
This house is built for a literary man, and stands among old elm trees on the edge of the common. The tiles found on an old barn which formerly occupied the site were used in the present structure.

"ELMSTEAD," LIMPSFIELD: ENTRANCE FRONT. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

The exterior architecture of the selected Usher Hall design is satisfactory without being very remarkable; it may, however, be pointed out that the lantern on the roof, as now sketched, is quite out of scale—that is to say, it is too large for the kind of thing it professes to be, and therefore reduces the apparent scale of the building. As far as the auditorium is concerned, the building seems likely to be a success, if echo from the curved ceiling can be prevented; but the arrangement of orchestra and organ ought to be entirely reconsidered. The second premiated design is a much more interesting and striking piece of architecture externally, but its plan is out of the question for a concert hall, and it is certainly matter for comment that the second place in a competition for a large concert hall should have been awarded to a plan which everyone who has given any attention to the subject of buildings for music must know to be a mistake.

Considering this, and considering also the extraordinary mistakes which have been made, here and elsewhere, in the planning of the orchestra and the placing of the organ in large concert rooms, it seems not unreasonable to suggest that it would be wise in such cases for promoters and architects, before planning an orchestra, to take the opinion of some one who knows something about music, and the conditions under which it is produced.

H. H. STATHAM, F.R.I.B.A.
Fellow of the London Philharmonic Society.



This view shows the garden front, the ground floor rooms looking on to it, being (from left to right) the drawing-room, the study, and the dining-room.

COMPETITIONS.

Eccles Bath Extensions.

Messrs. Sydney Moss, T. J. Bushell, G. H. Kay, Fred. W. Dixon and Son, John Knight, Potts and Hennings, N. H. Hacking, Brameld and Smith, and Ernest Woodhouse have been selected to compete for the above.

Archibald Council School, Middlesbrough.

The report of the Assessors, Messrs. T. Mellarde, Read and Son has been received concerning the competition for the above school, which is to be erected in Ayresome Green Lane. The designs of Messrs. Clarke and Moscrop, Middlesbrough, were selected. Second place was awarded to the design of Mr. James Forbes, Middlesbrough; third place to Messrs. Kitching and Lee, Middlesbrough; fourth place to Messrs. Clarke and Moscrop's alternative design; fifth place to Mr. James Forbes's alternative design; sixth place to Messrs. Bottomley and Welburn, Middlesbrough; and seventh place to Mr. W. G. Haslock, Middlesbrough. The school, which is to provide accommodation for 1,450 children, is estimated to cost £14,150.

LIST OF COMPETITIONS OPEN.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to architects practising in Coventry. Particulars given in our issue of March 16th.

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglican Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. The competition will be confined to architects having an office or residing in the areas of the following education authorities: Cambridgeshire, Isle of Ely, Lowestoft, Norfolk, Norwich, East Suffolk, and Great Yarmouth. D. O. Holme, clerk of the Governors, Castle Chambers, Norwich.

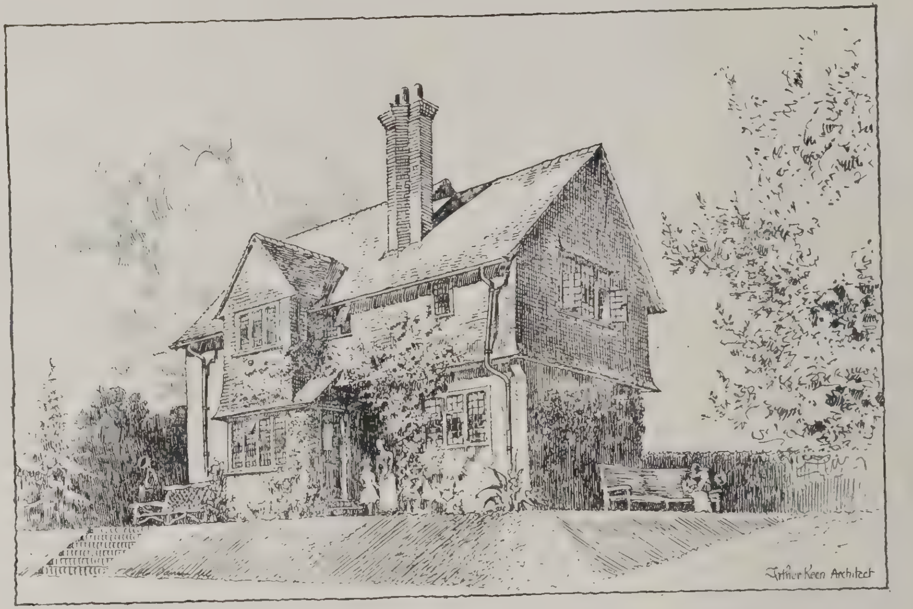
SEPT. 1. CARNEGIE LIBRARY, KINGSTOWN, CO. DUBLIN.—The U.D. Council of Kingstown offer premiums of £50 and £20 respectively for the two best designs for the above to be erected at Lower George's Street. Particulars from Mr. J. Sherlock Vaughan, Town Clerk, Town Hall, Kingstown. Deposit one guinea.

SEPT. 5. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 5. SHERINGHAM COUNCIL OFFICES.—Architects desirous of submitting designs for the council offices proposed to be erected at Sheringham may obtain full particulars on written application, accompanied by a stamped addressed envelope, to Edgar C. Rolfe, Clerk of the Council, Church Street Chambers, Sheringham.

SEPT. 10. SECONDARY SCHOOL, FOLKESTONE.—Competitive designs are invited from architects (being Fellows, Associates, or Licentiates of the Royal Institution of British Architects or members of the Society of Architects) for a new secondary school to accommodate 150 boys. Particulars, together with site plan, can be obtained from Mr. A. F. Kidson, town clerk, Folkestone, on payment of a deposit of £2 2s., which will be refunded on the receipt of a bona-fide design being submitted.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, together with a plan of site and sections at ground level, may be obtained from the engineer and surveyor, Mr. Samuel J. Harpur, Town Hall, Maesteg. Designs must be deposited at my office by noon on Monday next, September 19th. Two premiums are offered, namely, 25 guineas and 10 guineas, as first and second respectively.



This cottage was built for a literary man in a quiet part of the country overlooking one of the finest views in Surrey. The walls are of local stone, covered with rough-cast.

HEADLAND COTTAGE, LIMPSFIELD. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

SOCIETIES' REPORTS.

The Institution of Gas Engineers.

The visit of the German Association of Gas and Water Engineers to Great Britain, which was postponed on account of the death of King Edward, has now been arranged to take place during the week commencing October 2nd next. The visitors are to be the guests of the Institution of Gas Engineers, the Gas Light and Coke Company, the South Metropolitan Gas Company, the Croydon Gas Company, and the Corporations of Edinburgh and Glasgow respectively, of which latter city the engineer of the gas department, Mr. Alex. Wilson, M.Inst.C.E., is now the president of the Institution of Gas Engineers.

Manchester Society of Architects.

On the 23rd of July, the fourth Saturday summer visit took place, when the members had a long afternoon's sketching at Nantwich. The fourteenth and fifteenth century parish church, with its beautifully vaulted chancel, fine choir stalls, exquisite buttresses, and well-known octagonal lantern, is one of the architectural gems of Cheshire, and naturally received most attention. Less famous, but deeply interesting in a quiet way, are several examples of domestic work of Georgian and earlier date, which show most admirable proportion and a nice feeling for scale, their architectural charm giving keen pleasure, although realised through the simplest possible means. Mr. A. E. Corbett was the leader.

On the following Wednesday a large number of members under Mr. J. H. Woodhouse's leadership visited "The Acorns," Fallowfield, where, by the kind courtesy of Mr. W. L. Behrens, they viewed the extensions and alterations to the house by Messrs. T. Worthington and Son, the wonderful collection of works of Japanese art housed in the galleries, and the fine specimens of furniture and objects of art of many periods and nationalities in the various rooms. It was hardly possible in one short evening to realise the magnitude and value of Mr. Behrens' collection, and time did not allow for the beauty of more than a very small proportion of the thousand of objects to be individually appreciated. The original work of Messrs. Worthington is no less interesting for the skilful way in which the fine old panelling which lines the main gallery, and the great fireplace, have been adapted to the building by the architects.

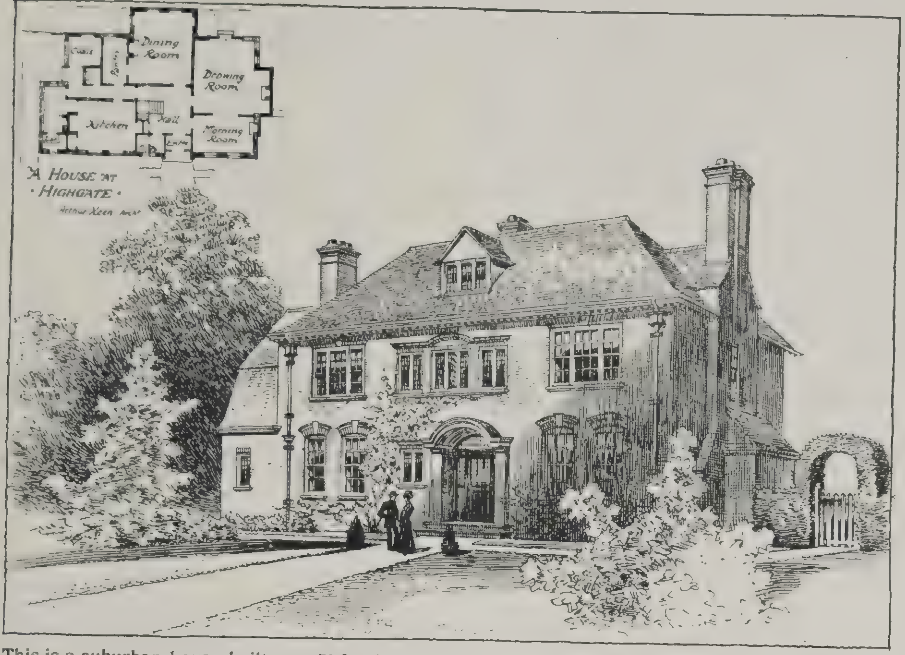
Afterwards the party proceeded to the "Oaks," the new Hall of Residence for women students of the University, also the work of Messrs. Worthington and Son. One wing of the quadrangle is almost complete, and forms a delightfully grouped building, one of the most striking features of which is the successful use of the various materials employed: Ravenhead bricks, Alderley stone, and Cotswold slates to the roof. The windows are sashes and frames, set near the face of the wall and painted white. The party was conducted over the building by Mr. Percy S. Worthington, M.A., the President of the Society.

R.I.B.A.

THE JUNE EXAMINATIONS.

The Preliminary.

In the preliminary examination one hundred and seventy-four candidates were admitted, and claims for exemption from sitting were allowed to the number of forty-six. Of the remaining 128, 87 passed and 41 were relegated. The passed candidates, with those exempted—making a total of 133—are as follows:—E. Adams, Oxford; L. M. Angus, Hampstead, N.W.; S. D. Appleby, Bolton; H. D. Archer, Chelsea, S.W.; J. R. Ashworth, Accrington, Lancs.; G. P. Bainbridge, Balham, S.W.; A. Bamford, Chesterfield; C. A. R. Barry, Victoria Street, S.W.; G. C. Beath, Aberdeen; E. Belfield, Church End, Finchley; T. P. Bennett, Kilburn, N.W.; H. Berry, New Barnet; G. Bevan, jun., Bridgend, Glam.; E. R. Bill, Shrewsbury; T. S. Bowes, Roath, Cardiff; W. H. Brigden, Sittingbourne; E. H. Brown, Halstead, Essex; W. Brown, Stretton, Stafford; E. Cavanagh, Upton Manor, E.; R. S. Cave, Oxford; R. Cawkwell, Wincobank, Sheffield; A. Chandler, Haslemere, Surrey; W. W. T. Ching, New Cavendish Street, Portland Place, W.; T. H. Chalkley, Bermondsey, S.E.; L. D. A. Church, Epping, Essex; H. H. Clark, Walthamstow, N.E.; L. H. Clarke, Harrogate, Yorks; G. S. Cook, Baulkham Hills, via Paramatta, Aust.; R. T. Cooke, Griffiths Town, near Newport, Mon.; H. T. Cooksey, Islington; C. E. Cornish, Pilton Bridge, Barnstaple; J. P. Craig, Johnstone, near Glasgow; F. M. Craik, Glasgow; A. S. Crumpler, Bournemouth; J. A. Dartnall, Wanstead; E. C. Davies, Bedford; H. F. Davies, Chester; J. Dickinson, Bolton-on-Dearne, near Rotherham; H. U. Diplock, Clapham Junction, S.W.; C. B. Dixon, Darton, near Barnsley; A. Douglas, Ayr; L. G. A. Dubuis, Hugh Street, Eccleston Square, S.W.; J. R. Edwards, Bristol; H. W. Egerton, Burton-on-Trent; W. J. Evans, Irlam-o'-th'-Height, Manchester; S. H. Fisher, Barrington Road, S.W.; A. A. Foote, Edinburgh; J. E. Foster,



This is a suburban house built on a 70 ft. plot of ground, and comprises a good deal of accomodation at a very moderate cost.

"STUDLAND," HIGHGATE. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

Preston, Lancs.; G. E. Francis, Sydenham, S.E.; E. G. D. Fromant, Hadleigh, Suffolk; C. F. Fryer, Chiswick, W.; R. E. Furse, Taunton; E. W. Glass, Dundee; A. Gordon, Bucksburn, Aberdeenshire; R. D. Graham, Carrickfergus, Co. Antrim; F. Green, Birmingham; D. M. Griffin, Birkenhead; F. W. G. Hall, Norwich; H. J. Harding, Cardiff; P. Hardy, Letchworth, Herts; W. Harkess, Bedford Park, W.; C. F. W. Haseldine, Attenborough, Nottinghamshire; F. S. Haynes, Leytonstone; A. Henderson, Dundee; J. M. D. Henderson, Ayr, N.B.; R. C. Henderson, Aberdeen; H. L. Hickmott, Bristol; G. H. G. Holt, Brighton; T. W. Hughes, Bangor; R. Humphreys, Maesteg, Glam.; A. J. Hyde, Manchester; G. H. Hyde, Southport; S. Jones, Swansea; G. Kenworthy, Uppermill, near Oldham; A. O. Kersey, Great Bealings, near Woodbridge, Suffolk; R. Kerby, Dulwich; H. A. J. Lamb, Tonbridge; J. B. Lawson, Chelsea, S.W.; A. E. Lees, Sherwood, Nottingham; C. M. Leys, High Wycombe; D. W. Locke, Newton Abbot; W. W. Locke, Balham, S.W.; R. M. Love, Barton-on-Humber, Lincolnshire; H. Mackey, Fulham, S.W.; J. Macpherson, Nottingham; A. P. McConnell, Dartford, Kent; C. W. Mercer, Llanelly; G. J. Moss, Buckhurst Hill, Essex; C. A. Murray, Sunderland; A. Needham, Gainsborough; A. Nisbet, Portobello; L. A. Norris, Wandsworth, S.W.; R. B. Nundi, Regent's Park Road, N.W.; W. S. Owen, West Hampstead, N.W.; B. R. Penderel-Brodhurst, Gunnersbury; W. F. Pennington, Kendal; G. Perrin, Moseley, Birmingham; W. G. Pidsley, Exeter; R. Pollard, Accrington, Lancs.; N. H. Pratt, Sneinton, Nottingham; R. H. Preston, Pendleton, Manchester; H. C. Richardson, Ashton-on-Mersey, Cheshire; J. Robb, Edinburgh; W. A. Robertson, Dundee; S. Rubery, Wolverhampton; W. G. Saunders, Brynhyfryd, Swansea; R. Schofield, Halifax; H. J. Scoles, Torquay; J. E. Shakeshaft, Chorlton-cum-Hardy, Manchester; G. Shenstone, Leytonstone; G. Shuffrey, Ealing, W.; M. Sidki, Victoria Park; N. W. Slater, Wolstanton, Staffs; H. M. Smail, Broughty Ferry, Scotland; W. C. Spencer, Nottingham; A. P. Stoner, Northampton; A. E. Stott, Liverpool; T. P. C. Stuttaford, Plymouth; E. Tanner, Gravesend; T. S. M. Terrace, Dysart, Fife; F. M. Tozer, Maidenhead; J. Turnbull Ayr, N.B.; Sybil Aimée Vincent, Camberley, Surrey; L. H. Walker, Holland Road, W.; R. S. Wallace, Marlborough Place, N.W.; A. G. Wallis, Northwich, Cheshire; E. L. Watson, St. Albans; J. D. Watt, Westcliff-on-Sea, Essex; S. Welsh, Forfar; L. G. Whitbread, Stalybridge; L. Whitehouse, Warrington; E. Willson, Southport; P. Wilson, Hunts Cross, Liverpool.

Intermediate.

In the Intermediate Examination, qualifying for registration as *Student R.I.B.A.*, one hundred and thirty-three candidates were examined, 48 passed and 85 were relegated. The successful candidates, who have been registered as *Students R.I.B.A.*, are as follows, their names being given in order of merit as placed by the Board of Examiners:—H. W. Brittan, Croydon; H. A. Mobbs, Oulton, nr. Lowestoft; T. Macgregor, Dunfermline; J. C. P. Toothill, Sheffield; A. T. Hardman, Northam, nr. Potters Bar, Herts; F. A. Crouch, Hove, Brighton; A. E. Lowes, Newcastle-upon-Tyne; W. G. Thoms, Nottingham; T. G. Scott, Lincoln's Inn Fields, W.C.; H. Young, Portsmouth; R. Anderton, Preston, Lancashire; W. Benner, Nottingham; G. H. Gibbs, Westbury-on-Trym, Bristol; H. H. Archer, Derby; W. C. Young, Heaton Moor, nr. Stockport; A. Pease, Horsham; G. E. Charlewood, Newcastle-on-Tyne; W. G. Lofthouse, King's Heath, Birmingham; A. T. Phillips, Harpenden, Herts; T. G. Ellis, Wood Lane, W.; E. Fincham, Marks Tey, Colchester; S. K. Bhedvar, Lee, S.E.; H. Baker, Selly Hill, Birmingham; F. W. Moore, Riddlesden, Keighley; F. Ratcliff, Sheffield; A. L. N. Russell, Vincent Square, S.W.; G. W. Bacon, Thames Ditton; W. A. Batty, Hull; W. S. Betts, Lavender Hill, S.W.; J. A. Cheston, Bloomsbury Square, W.C.; L. E. Cole, Hampstead, N.W.; A. B. Dailey, 89, Larkhall Rise, Clapham, S.W.; H. Dearden, jun., Battersea Park; W. E. Edge, Edgbaston, Birmingham; K. Glover, Earl's Court, S.W.; A. V. Heal, Cambridge; B. Hughes, Woldingham, Surrey; W. Ingham, Derby; A. E. Mayhew, 20, Gladsmuir Road, Highgate, N.; C. McLachlan, Lewisham, S.E.; S. W. Milburn, Sunderland; W. H. R. Oates, Lightcliffe, nr. Halifax; H. C. Perry, Bournemouth; A. Pratten, Swansea; C. T. Sherwin, Stafford; H. S. Taylor, Kilburn, N.W.; E. J. Thomas, Maesycwmmer, nr. Cardiff; S. H. Williams, Sheffield.

Exemptions from the Intermediate Examination.

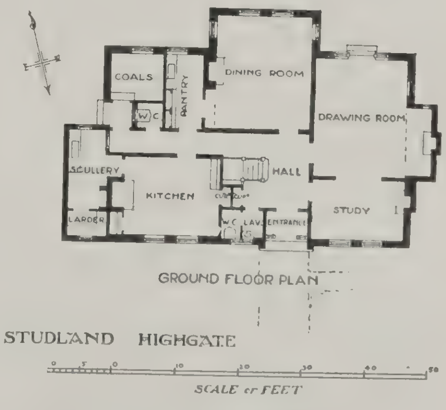
The following Probationers, possessing the qualifications required by the regulations, have been exempted by the Council from sitting for the Intermediate Examination and have been admitted as *Students R.I.B.A.*:—

L. M. Angus, Hampstead, N.W. (Manchester University); W. S. Owen, West Hampstead, N. W. (Manchester University).

The Final and Special.

In the Final and Special Examinations 123 candidates were examined, 54 passed, and were relegated. The following are the names and addresses of the passed candidates, † prefixed to a name signifying that the candidate entered for the Special Examination, which is designed for architects in practice and chief assistants exempted by the Council from the Preliminary and Intermediate Examinations and from submitting Testimonies of Study:—

†C. T. Armstrong, Charing Cross, S.W.; D. W Ayre, Cork, Ireland; †B. C. E. Bayley, Surrey; J. C. Beare, Newton Abbot; A. St. Hill Brock, Sutton, Surrey; F. H. Bulmer, Balham, S.W.; †J. M. Calder, Rochdale; A. E. Catt, Kingston-upon-Thames, Surrey; H. J. Chetwood, Waltham Abbey, Essex; A. R. Cornwell, Hampstead, N.W.; J. B. F. Cowper, Manchester; H. Cox, South Hampstead, N.W.; H. B. Elkington, Laurence Pountney Hill, E.C.; W. A. M. Fiddaman, South Norwood Hill, S.E.; T. F. W. Grant, Hampstead, N.W.; J. H. Gray, Hammersmith Terrace, W.; †W. H. Gummer, Cartwright Gardens, W.C.; W. H. Guntor, Bromley, Kent; A. W. Hall, Ealing; J. L. Hampson, Bolton; F. H. Heaven, Bridgend, Glam.; S. T. Hennell, Wandsworth Common, S.W.; S. W. Hill, Clifford's Inn, E.C.; G. Hollins, jun., Newcastle, Staffs; H. R. Hooper, Ipswich; W. Hoyle, Gravesend, Kent; †R. M. F. Huddart, St. Mary Abbott's Terrace, W.; R. Jaques, Harrogate; W. Keir, Stockwell, S.W.; †J. H. Kennard, Verulam Buildings Gray's Inn, W.C.; D. C. Leigh, Weaverham, Cheshire; S. G. Livock, Portsea Place, Hyde Park, W.; A. G. Lynham, Northampton; E. B. Mauffe, B.A., Oxon, Old Buildings, Lincoln's Inn, W.C.; P. W. Mulready, Victoria Street, Westminster, S.W.; E. G. Newnum, Nottingham Place, W.; B. Oliver, Southampton Street, Bloomsbury Square, W.C.; V. C. B. Reis, Highgate Road, N.W.; T. H. Rhodes, Northwood, Middlesex; B. Robson, Birmingham; H. J. Rowse, Great Crosby, Liverpool; H. Savage, Bushey, Herts; L. A. D. Shiner, Jermyn Street, Haymarket, W.; H. N. Smith, Lewisham Hill, S.E.; †A. L. Snow, Ovington Gardens, S.W.; E. W. Stubbs, South Croydon; T. A. Swan, Edinburgh; †S. D. Topley, Cheapside, E.C.; H. G. Turner, Thornton Heath, Surrey; R. L. Wall, Beddington Lane, Surrey; F. C. Webster, Primrose Hill, N.W.; G. C. Wilson, Streatham, S.W.; R.



"STUDLAND," HIGHGATE.
ARTHUR KEEN, F.R.I.B.A., ARCHITECT

Wilson, Eltham, Kent; F. Woods, Maidenhead.

Colonial Examinations : Special.

The following have passed the Special Colonial Examination qualifying for candidature as *Associate R.I.B.A.* held in Toronto and Johannesburg respectively in November last:

A. N. Cantin, West Montreal, Canada; H. R. Dowswell, B.A., Quebec, Canada; A. G. Monsbourgh, Johannesburg, S. Africa.

Colonial Examinations: Intermediate.

The following have passed the Intermediate Examination held in Sydney, New South Wales, in November 1909, and have been registered as *Students R.I.B.A.*:—

F. E. Boddington, Brisbane, Queensland; G. S. Cook, Baulkham Hill, via Paramatta.

Election of Licentiates R.I.B.A.

The following have been elected Licentiates of the Institute in accordance with the provisions of By-law 12:—

(Elected July 4th.)

Balfour Abercrombie (Glasgow), John Standen Adkins, Percy King Allen (Tunbridge Wells), Francis Van Baars, Charlie Owen Baines (Paignton), Thomas Henry Baker (Colchester), Thomas Christopher Thomas Barker (Scarborough), Fank Bell (Manchester), James Frederick Carruthers Bell, Thomas Morgan Bevan (Derbyshire), Hugo Ritchie Bird (Brentwood), Ellis Rawson Birks (Sheffield), John Bowley (Hastings), Walter William Bull, Arthur William Bungard, Arthur John Pearson Carrington, Alcide Chausse (Montreal, Canada), Stephanos Constanduros, Harold Cordery (Manchester), Joseph William Denington, Sothern Dexter, Charles Turnbull Ewing (Crieff, N.B.), William Finlayson, (Crieff, N.B.), James Edwin Forbes, William Henry George, (Ashton-under-Lyne, George Francis Grimwood (Monmouth), James Mitchell White Halley, Horace Ireton Hands (Birmingham), Thomas Francis Hewitt (Lincoln), Edwin Morcombe Hick, David Henry Hunter (Glasgow), Charles Henry Isaacs, John Henry Jacques, John Alfred James (Port Talbot), Thomas Jenkins, J.P. (Burton-on-Trent), Sydney Jupp, Charles King, George John Joseph Lacy, Arthur Landstein (Liverpool), Matthew George Martinson (Newcastle), Harvey Mennie (Aberdeen), John Galt Mitchell (Edinburgh), Thomas James Morgan, William James Marmaduke Morrish (Dorset), Frederick Charles Moscrop-Young, James Neill (Leeds), Ernest Ogden (Manchester), Samuel George Parr, F.S.I., James Alfred Payne, Ernest Llewellyn Percival (Birmingham), Harry Reginald Poulter (Camberley), George Povey (Birmingham), Ernest Wyatt Ralph (Wigan), Alfred Rangeley (Manchester), Sydenham W. Richards, Benjamin Sattin, Blunden Shadbolt (Horley), John Shanks (Kirkintilloch, N.B.), Lewis William Simpson, Renfrew Spencer (Nottingham), Arthur John Stedman (Farnham), John Steel (Wishaw, N.B.), Donald McKay Stoddart (Glasgow), John Duncan Tate, Albert John Thomas, Henry Hugh Walford, Samuel George Walker (Nottingham), Daniel West, Frederick White, Edward Wilkins, Howard John Wonnacott, P.A.S.I., Francis Houlton Wrench, Assoc.M.Inst.C.E. (Sheffield), Gordon Lorimer Wright (Edinburgh), Lionel Stanley Youngman (Bournemouth).

(Elected July 18th.)

Cecil Alder (Johannesburg), Fred Baker (Lincoln), Howard Leslie Baker, William Joseph Ballard (Birmingham), Roger Bradley Barker (Arnside, Westmorland), William Vallance Betts (Nottingham), James Stirling Boyd (Glasgow), George Christopher Copestick (Derby), Henry Elwig, jun. (Tunbridge Wells), Frederic Snowden Hammond, Joseph William Berry Harding (Liverpool), John Edward Henderson, Frederick James Hobson (Rawtenstall, Lancs.), John Alfred Taylor Houston (Glasgow), George Hutchins (Chester), Martin Thomas Ernest Jackson, Thomas Martin (Coatbridge, N.B.), Izmay Massey (Plymouth), Alfred Young Mayell, Albert Emanuel Pearson (Cheltenham), Charles Pickford, William Harold Poole (Maidstone), Archibald Frederick Preston, Frank Harrington Chas. Rimmington (Liverpool), William Pinchard Delane Stebbing, Albert Perkins Stokes, Joseph Ernest Stout (South Shields), Frank Rice White (Basingstoke), Walter Harry Woods (Long Eaton, Derby).

Council Appointments to Standing Committees.

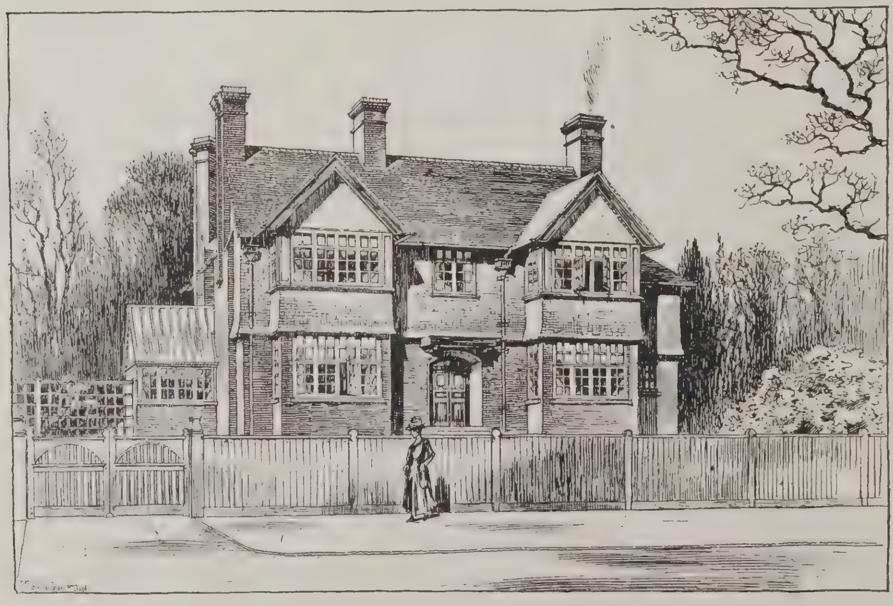
The following appointments to Standing Committees have been made by the Council in accordance with By-law 51:—

Art.—Messrs. T. Raffles Davison (H.A.), W. A. Forsyth (F.), Sir George Frampton, R.A. (H.A.), S. S. Reay (F.), Sir Aston Webb, C.B., R.A. (F).

Literature.—Messrs. Francis Bond, M.A.Oxon (H.A.), J. D. Crace, F.S.A. (H.A.), W. Curtis Green (F.), Sir A. Brumwell Thomas (F.), E. P. Warren, F.S.A. (F.).

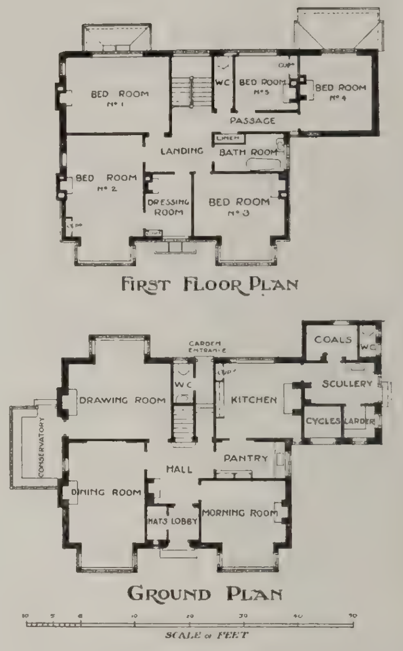
Practice.—Messrs. Ernest Flint (F.), A. W. Moore (F.), Herbert A. Satchell (F.), W. Henry White (F.), W. Gilmour Wilson (F.).

Science.—Messrs. R. J. Angel, M.Inst.-C.E. (A.), C. E. Hutchinon, (A.), F. N. Jackson (H.A.). F. T. Reade (H.A.), A. T. Walmisley, M.Inst.C.E. (H.A.).



This house is of a type similar to "Studland," Highgate, illustrated on the opposite page.

"PENKERROW," ENFIELD. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.



"PENKERROW," ENFIELD: PLANS.

ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

NEW BUILDINGS.

PROPOSED.

Aberdeen.—A meeting is to be called by the Bishop to set formally on foot the movement for a cathedral church in Aberdeen. The idea is to extend St. John's Church, and by acquiring some property secure an entrance from Crown Street. To carry out the scheme in an adequate manner, the cost, it is stated, will be about £30,000.

Denbigh.—The Denbigh Town Council has decided to apply to the Local Government Board for a loan to carry out a scheme for the erection of a new public hall and market, the sum not to exceed £12,000.

Holywell Green (Halifax).—The West Riding Education Authority have decided to erect a new school at Holywell Green, to accommodate 400 scholars, at an estimated cost of £4,800.

Lancaster.—At a recent meeting of the Lancaster Town Council it was reported that the Board of Education had approved the plans for a new elementary school to be erected on the High Street estate, at a cost of about £20,000, and that the Lancashire County Council would shortly proceed with the erection of a secondary school for girls, costing about £15,000.

Letterkenny.—A Local Government inquiry has been held in the Courthouse, Letterkenny, to a petition by the Urban District Council to the Local Government Board asking for an order authorising the acquisition of land and an application for their sanction to a loan of £5,800 for the purpose of erecting working-class lodging-houses under the Housing of the Working Classes (Ireland) Acts, 1890 to 1908, and the Public Health (Ireland) Acts, 1878 to 1907.

Lichfield.—A Local Government Board inquiry has been held at Lichfield into an application of the City Council to the Board for sanction to borrow £3,300 for works of sewerage extension at Gallow's Wharf, Berry Hill, Knowle Lane, and Short Butts Lane, a suburb of the city in the direction of Whittington Barracks.

Liverpool.—A beginning has been made with the building of the Lathom Memorial Chapter House of Liverpool Cathedral, which is to be erected by the West Lancashire Province of Freemasons in memory of the first Earl of Lathom (Grand Master of the Province), the estimated cost being £10,000.

London, E.—The tender of Messrs. Cubitt and Gotts, of Westerfield, near Ipswich, for the erection of an institute in connection with St. Michael's Church, Little Ilford, has been accepted, and building operations have already begun. Messrs. Cubitt's price was £2,100, being the lowest tender received.

London, W.—The foundation-stone of the new buildings for cancer treatment and research which are to be erected at the Middlesex Hospital, has been laid by Prince Francis of Teck. The buildings, which will be of brick and Portland stone, will cost about £50,000, and are intended to form the Barnato-Joel Memorial. Mr. Edwin T. Hall, F.R.I.B.A., is the architect.

London.—At the recent quarterly meeting of the magistrates for the County of London at Newington, the following resolution was unanimously passed:—(1) That it is absolutely necessary, in the opinion of this Court, that a central building for the Sessions of London should be at once constructed; (2) that any building on the south side of the Thames will not, in the opinion of the Court, be convenient for the purposes of the work of the county. The Local Government Committee of the London County Council had suggested a scheme for the rebuilding of the present Sessions-house at Newington, and declined on the ground of expense to select a site on the north side of the Thames. The justices had also informed the committee that unless the London County Council carried out their wishes they would exercise their power to the fullest extent, select a site, and erect a building, leaving the London County Council to pay the bill.

London, S.W.—At a recent meeting of the Middlesex County Council, at the Guildhall, Westminster, the Extension Committee presented a report regarding the proposed Guildhall enlargements, showing that the plans provide for two new courts, 40ft. by 36ft. and 40ft. by 32ft. respectively, with a public waiting hall 42ft. by 30ft. (the dimensions of the present courts are 36ft. by 31ft. and 42ft. by 24ft., and the existing public waiting hall is really only the corridor adjoining the courts); a new Council chamber 50ft. by 36ft., as against the present Council chamber of 36ft. Summarised, the total floor area of rooms available for business purposes in the existing buildings approximates 17,600 square feet, and the accommodation provided on the plans now submitted amounts to 42,491 square feet. The cost of the new buildings and the alterations to the existing structure is estimated at £68,000, and the time required to carry out the works will not exceed two years. The Committee recommended the adoption of the plans submitted, and that tenders be invited, to which the Council agreed.

Manchester.—The inadequacy of the Council Chamber of the Manchester Town Hall to meet the requirements of the present number of members has been under the consideration of the Town Hall Committee for several months. There have been at least two proposals—(1) to enlarge the Council Chamber and (2) to make arrangements for Council meetings to be held in the large hall. A sub-committee has had before it a proposal for the enlargement of the Council Chamber at a cost of £6,000. The consideration of this proposal stands adjourned.

Middlesbrough.—It is proposed to extend Albert Park by including 1,774 acres of meadow land belonging to the Middlesbrough owners on the east side of the park. The Middlesbrough owners have offered to accept £10,000 for it, and this in all probability will be accepted by the Middlesbrough Corporation. The proposed additional land is intended to be set apart for recreation and playground purposes.

Portobello.—The Edinburgh Town Council has agreed to purchase the property of Inverey House, High Street, Portobello, as a suitable site for a Town Hall for Portobello.

Sale (Manchester).—The Bishop of Chester has dedicated the new tower of St. Paul's Church, Sale, which has been erected at a cost of £1,700. Messrs. Roger Oldham and David Bird were the architects, and Messrs. Twyford and Sons, Stretford, the contractors.

Silsden (Yorks).—The Silsden Urban District Council and the Education sub-committee have decided to accept a plot of land off Skipton Road, for the erection of a proposed new school, the estimated cost of which is between £3,000 and £4,000.

Tunbridge Wells.—Further improvements to the South Eastern and Chatham Railway Station at Tunbridge Wells are foreshadowed, the Works Committee of the Town Council having received from the Company for consideration designs of what is suggested shall be carried out. The alterations concern the down side, and when completed should have a beneficial effect upon the general appearance of the Broadway. One of the most important of the proposals, it is understood, is the demolition of the old square clock tower, which has been a feature of the structure for many years. On this site something far more commodious will be erected, and it is intended to put up a row of shops and offices from that point towards Mount Pleasant.

IN PROGRESS AND COMPLETED.

Canton.—The Building and Sites Committee of the Cardiff Education Committee have accepted the tender of Mr. F. Bond, of Canton, amounting to £12,265 15s. 1d., for the erection of a new elementary school in Kitchener Road, Canton. The school is to accommodate 1,094 children.

Exeter.—A new United Methodist Church has just been erected at Mount Pleasant, Exeter, by Messrs. Westcott, Austin, and White, contractors, of Exeter, from the designs of Mr. Alfred J. Dunn, architect, Waterloo Street, Birmingham.

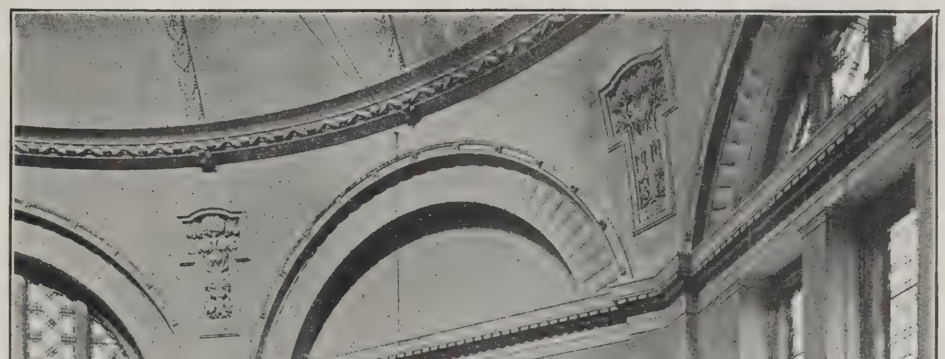
Keith.—The Post Office authorities have decided to build a new post office at Keith from the designs of Mr. F. D. Robertson, architect, Keith, and they have accepted the tender of Mr. William M'Connachie, Millwynd, for carrying out the work.

Leeds.—The foundation-stone has been laid of the new building for the Pearl Life Assurance Company. The total cost of the land and building will exceed £60,000. The work is being carried out from the design and under the superintendence of William Bakewell, F.R.I.B.A., architect.

Liverpool.—New buildings for the St. Paul's Eye Hospital, Liverpool, are being erected upon a site at the junction of Oldhall and King Edward streets. Mr. John Clarke, F.R.I.B.A., Liverpool, is the architect.

Llanrwst (N. Wales).—The following works are about to be carried out under the direction, and from the designs of Mr. D. Henry Roberts, architect, Llanrwst:—New residence for Mr. F. A. Charlton; alterations, and additions to the Glan Conway Cafe; alterations and additions to the Dafarn Fedw C.M. Chapel.

London, N.—The new infirmary, erected by the Edmonton Guardians on a site adjoining the workhouse, has been opened by Sir W. J. Collins, M.P. The premises consist, in addition to an administrative block, of two large pavilions of three floors, containing six double wards, with accommodation for nearly 400 beds, and an operating block. The contract price of the buildings was £72,724.



The panels in the spandrels of the dome were modelled by Mr. Richard Garbe, and illustrate the trees mentioned in the Bible.

KINGSGATE CHAPEL, HOLBORN. ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

London, N.W.—The new quarters of the Zoological Society in their Gardens, Regent's Park, have been built, after the plans and designs of Mr. John Belcher, R.A., near the northern end of Broad Walk. The buildings have been constructed, at a cost of about £17,000, of Portland stone for the lower storey, and of purple Luton bricks for the portions above, with a mansard roof covered with Delabole slates.

London, W.—The Duchess of Teck has laid the foundation-stone of the Church Army's new Central Labour Homes and Relief Depots in the Marylebone Road, which will involve a total expenditure of £21,000. The site was purchased some time ago for £12,000.

London, W.—The Cinema House, which has been erected by the London Cinematograph Company, Ltd., at 225, Oxford Street, has been opened by the Duchess of Portland. The building has been erected by Messrs. J. Chessum and Sons, from designs by Mr. Melville S. Ward, F.R.I.B.A. The frontage is of Portland stone on the main thoroughfare. The interior of the theatre has been carried out in the Jacobean style; the auditorium (which has a depth of 87ft. with a width of 65ft., and a height of 25ft.), being panelled in old oak (the work of Messrs. Elliott, of Newbury), relieved by a Xelstone frieze below the ceiling, and scrollwork in plaster by Messrs. Clark and Co., Westminster Palace Road; the floor will seat over 500 persons, while the cantilever circle affords accommodation for some 100 more. Access to the circle is provided by a staircase, leading up from the vestibule; while an additional staircase gives direct means of egress into Hill's Place. The plumbing and sanitary work was carried out by Messrs. Spooner and Smith, Aldgate, E.C. The electrical installation has been carried out by Messrs. Clements and Sons and Messrs. Vaughan's Engineering Installations Company, Ltd., 106, Fenchurch Street, E.C., while the wrought steel electroliers and other metal fittings are by Messrs. Peyton and Peyton. The upper part of the building contains a range of offices for the use of the company, and a restaurant.

London, W.C.—Messrs. E. A. Roome and Co., builders, of 36, Basinghall Street, E.C., and Urswick Road, Homerton, N.E., have secured the contract for the alteration and extension of the Italian Hospital, Devonshire Street, Queen Square, W.C., under the supervision of Mr. J. D. Slater, architect.

London, W.—Extensive additions to the Clarendon Hotel, on the Broadway, Hammersmith, are about to be commenced. The adjoining premises are to be converted into an entrance-hall, giving access to a new dining saloon connnected with the existing grill-room. The upper portion of the existing hotel will be taken down, and, in connection with the adjoining premises, converted into a Masonic Lodge room, with ante-rooms and banqueting hall. In the basement will be lavatory accommodation and cloak-rooms, heating chambers, cold storage, and wine cellars. The work will be carried out by Mr. A. E. Flexman, and the architects are Messrs. Lovegrove and Papworth, of Hammersmith, and Old Street, E.C.

London, S.W.—The building operations in connection with the new premises of the Michelin Tyre Company, situate in the Fulham Road, are progressing rapidly, and the building is expected to be completed towards the end of the present year. The site has an area of more than 22,000 square feet, and possesses four frontages.

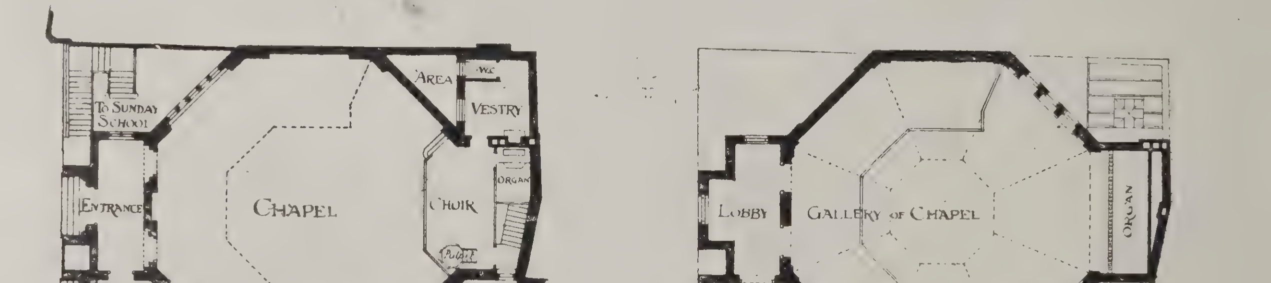
London, W.C.—The Palace Development Syndicate have completed arrangements for clearing the island site in the Strand, which has been acquired for the erection of a "Paris in London" Palace. There are many tons of old brickwork and rubbish to be removed before work on the foundation can be begun. The Palace will be the central part of the scheme, a permanent exhibition of French arts and industries will be housed in it, and a French club drawing its members from the French colony in London will have its headquarters there.

Lowestoft.—The building operations which have been in progress for many months past in connection with the General Post Office at Lowestoft, have now been completed. The building has been raised by the addition of a new floor its entire length, and other extensive additions have been carried out. Messrs. Charles Roper and Son, Ipswich, were the contractors for the work.

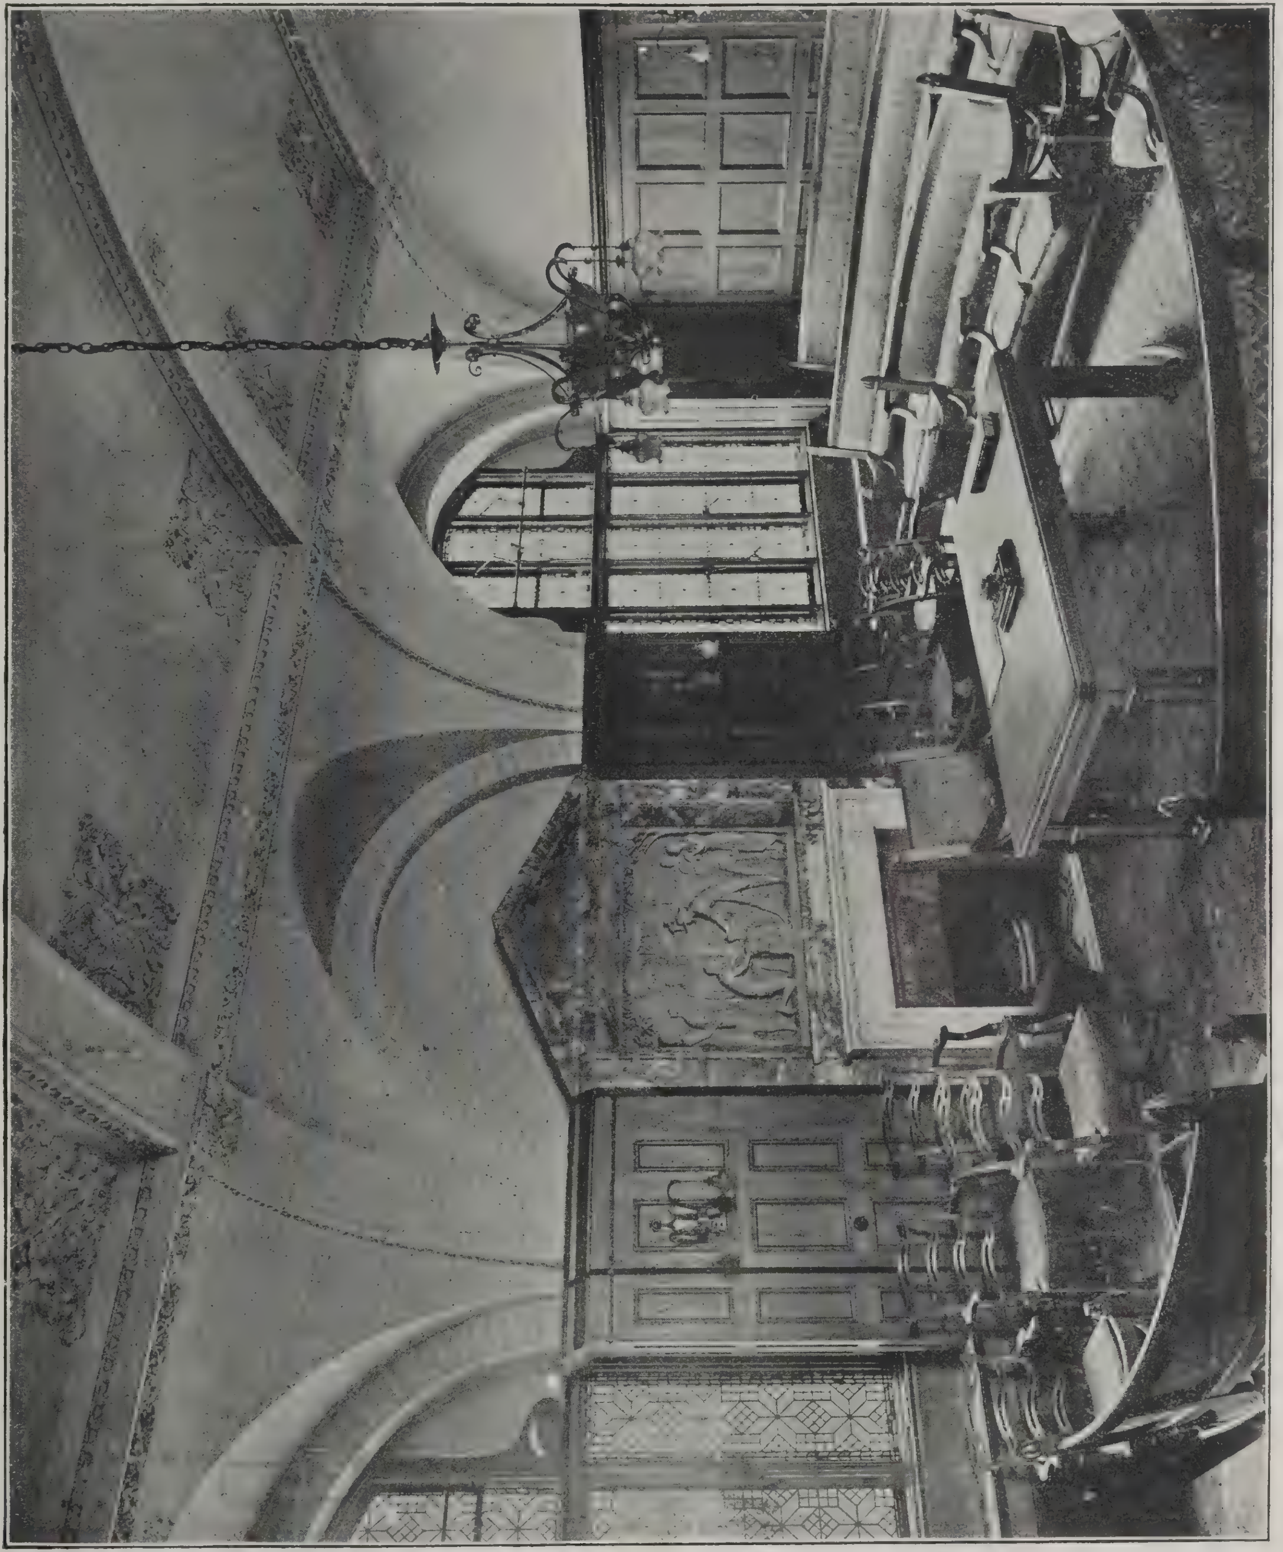
Macclesfield.—The completion of the tower of St. Peter's Church is being undertaken as a memorial to the Rev. William Sinden for many years vicar of the parish. The architect is Mr. Jabez Wright, and the builders Messrs. H. Berry and Sons.

Marsden.—A new elementary school, to accommodate 420 scholars, has been erected by the West Riding Education Committee, at a cost of £6,900. The building was designed by the committee's architect, Mr. J. Stuart.

Matlock Bath.—A portion of the new Kursaal, which is costing £11,000, or with the land over £20,000, has been opened to the public. The building stands in the centre of the town by the Fishpond, and has a front to the main road. Included in the Kursaal are the pump-room and a theatre, the pump-room being supplied by the local mineral thermal spring. The only part opened was the roller skating rink.



THE BAPTIST CHURCH HOUSE AND KINGSGATE CHAPEL, SOUTHAMPTON ROW, LONDON.
ARTHUR KEEN, F.R.I.B.A., ARCHITECT.



The walls have a dado of inlaid oak panelling, and the modelled plaster ceiling is the work of Mr. Laurence Turner. The terra-cotta panel in the chimneypiece is by George Tinworth.

THE BAPTIST CHURCH HOUSE, SOUTHAMPTON ROW, LONDON: THE COUNCIL ROOM.
ARTHUR KEEN, F.R.I.B.A., ARCHITECT.

Maidstone.—The Mayor has opened the new Council school situate in Union Street, which was erected at a cost of £13,418, and provides accommodation for 568 scholars. The building is of two stories, with a three-storey tower at the south-west corner. The walls are faced with red bricks, with Portland stone dressings, the roofs being covered with Nuneaton tiles. Mr. W. T. Burrows, Maidstone, was the contractor, and the heating of the school has been carried out by Messrs. J. F. Phillips and Sons, Westminster. The architect was Mr. T. F. Bunting, Borough Surveyor.

Middlesbrough.—206 houses are in course of erection at Middlesbrough, and 27 front streets and 35 back streets in course of construction.

Neath Abbey.—The foundation-stone has been laid of the Moriah Congregational Church, which is in course of erection at a cost of £1,200. Messrs. Lloyd and Martin, Skewen, are the architects, and Mr. Gorman, Neath, the contractor.

Penmaenmawr.—A new parish hall is in course of erection in the Vicarage grounds at a cost of £1,000. The architect is Mr. Harold Hughes, Bangor.

Porth.—A new wing to St. Paul's Church, Porth, has been consecrated by the Bishop of Llandaff, and will provide additional seating accommodation for 250 persons. The work has been carried out by Messrs. Bardoe and Cox, contractors, Cardiff, at a cost of £1,400, from the designs of Mr. G. E. Halliday, F.R.I.B.A., Cardiff, diocesan architect.

Romford (Essex).—The foundation-stones of the Carlisle Institute, in connection with Romford Congregational Church, have been laid. The building will be faced with Kentish rag and worked stone dressings. Mr. A. S. R. Ley, M.S.A., London, is the architect, and the contractors are Messrs. Dowsing and Davis, Romford.

Richmond (Surrey).—A recently completed extension of the sewerage works and additional pumping machinery constructed by the Richmond Main Sewerage Board were opened a short time ago. The new machinery has a capacity of 20,000,000 gallons daily. A new outfall has been constructed between the outlet channels and the river, doubling the capacity for discharge at high water. The new plant and sewers were designed by, and have been constructed under, the superintendence of Mr. William Fairley, Westminster, Engineer to the Board. The contractors were Messrs. L. W. Harrison and Co., Birmingham, and latterly Messrs. Monro and Co., Chancery Lane.

Royton (Oldham).—The new Parish Church Institute, built at a cost of £3,000 on a site obtained from Sir Joseph Radcliffe, has been opened by the Vicar of Royton. Mr. Ernest Woodhouse, of Manchester, was the architect.

Sheffield.—The new portion of the Glossop Road Baths was recently opened by the Lord Mayor. The improvement scheme in connection with the widening of Glossop Road provided the opportunity of acquiring the adjoining land, and the Council decided to erect first-class baths there, from plans prepared by Mr. Arthur Nunweek. Messrs. W. and A. Forsdike, Ltd., were the contractors.

Sheffield.—A new electric theatre has been erected in Union Street, from the designs of Messrs. Benton and Roberts. The contractors were: Messrs. Longden and Son, Ltd., Sheffield, building work; Messrs. Newton, Chambers and Co., Ltd., Sheffield, heating by low-pressure hot water on the patent "Cable" system; Messrs. Robinson and Hershaw, Manchester, constructional steelwork; and Mr. T. Peters, Sheffield, decoration.

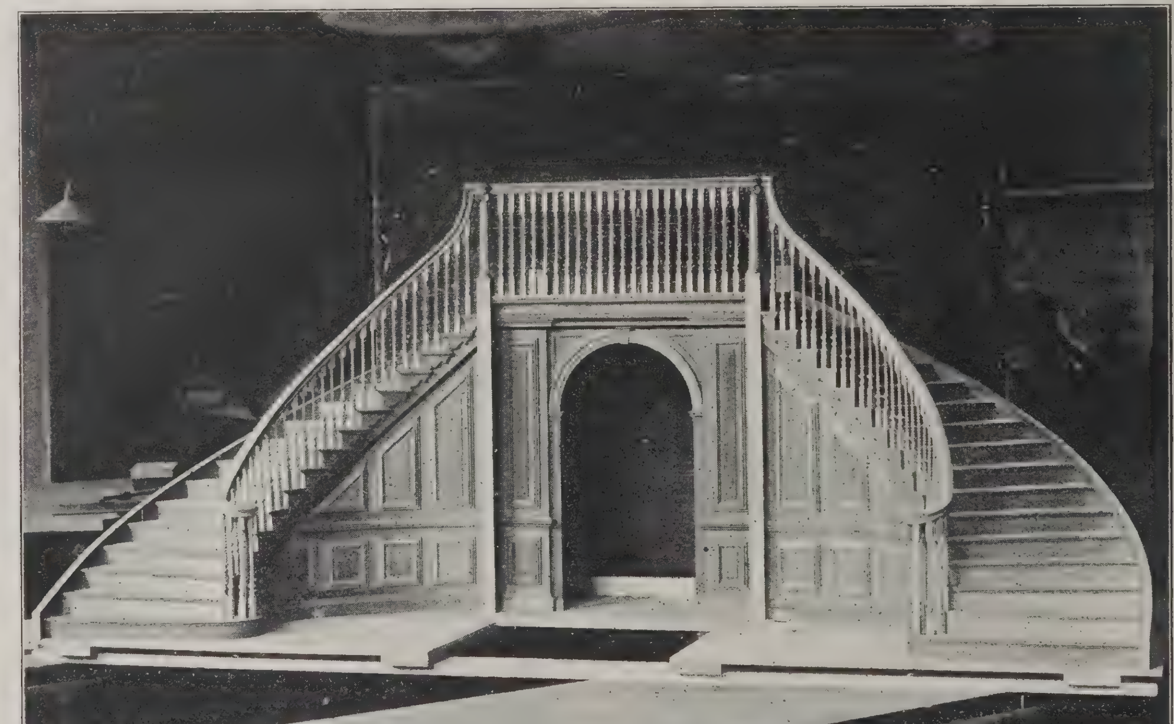
Stannington (Northumberland).—Considerable alterations and additions have been carried out in the Parish Church of Stannington, under the direction of Messrs. Fenwicke and Watson, architects, Newcastle. Part of the heavy wall on the north side of the chancel has been taken down, and an arch built to take its place, while a screen has been erected in the archway between the north aisle and the organ chamber. The building work has been carried out by Mr. Cuthbert, Stannington, the screen and carving being executed by Mr. Hedley, Newcastle.

Stirchley (Birmingham).—The foundation-stone has been laid of a new public swimming bath, situate on a site at the corner of Hazelwell Street and Bournville Lane, Stirchley, the gift of Messrs. Cadbury Bros. The exterior of the building will be of Accrington bricks and Grinsell stone, and the interior of glazed brickwork. The cost, inclusive of engineering, will be about £10,000.

Whalley (Lancs).—The contract for building the new asylum at Whalley has been awarded by the Whalley Visiting Committee of the Lancashire Asylums Board to Messrs. R. Neill and Sons, contractors, of Manchester, at the amount of £355,846. There were fifteen tenders. The contract is for the erection of buildings at the Asylum to accommodate 1,250 patients and for administrative building sufficiently large to deal ultimately with 2,000.

Winchester.—Extensive renovations have been carried out in the Chapter Room in the south transept of the cathedral, under the direction of Mr. T. G. Jackson, R.A. It occupies two-thirds of the west aisle of the south transept, the other portion, now choristers' practice room, being the treasury of the cathedral, and its arches of enriched Norman are presumed to be the work of Dr. Blois episcopate. The chapter-room floor had dry-rot, and had to be removed some months ago and the soil dug out. This has been done to the required depth, and the space filled with concrete, upon which are placed an oak-block floor. A Gothic wainscot has been designed round the walls of the area, but this does not in any way conceal the Norman arches, pillars, and masonry. At the south end are the sedilia for the dean and residentiary canons, and on either side are those for the greater chapter. The chapter-room proper is divided from the series of oaken cupboards by an open screen. The carved work is by Messrs. Brindley and Farmer. The flooring and the requisite attention to the old stonework of Norman time has been effected by Messrs. Thompson, of Peterborough.

Winnipeg (Canada).—The Board of Control of the City of Winnipeg has awarded the contract for a new bridge to carry Brown and Brant Streets over the Canadian Pacific Railway tracks at Winnipeg to the Cleveland Bridge and Engineering Company, Limited, of Darlington, the amount of whose tender for the superstructure was £41,000. The bridge will have a total length of 2,168ft., comprising one 340ft. span, two spans of 250ft. each, and five spans of 81ft. each, in addition to a number of small approach-spans. The bridge will accommodate a roadway 26ft. wide and two side walks, each of 6ft.



THE TRADES' TRAINING SCHOOLS. SPECIMENS OF WORK DONE IN THE HANDRAILERS' SHOP.

Whitley Bay.—The building of the new Theatre Royal has been completed, the construction being principally of ferro-concrete. Messrs. Davison and Miller were the contractors, and Messrs. Cackett and Burns Dick, F.R.I.B.A., the architects, all of Newcastle-on-Tyne.

Wilmslow (Cheshire).—The new Council schools have been opened and accommodation is provided for 700 scholars. The general contractors are Messrs. L. Brown and Sons, of Wilmslow, and the terra-cotta was executed by the Hathern Station Brick and Terra-Cotta Co. Mr. Herbert H. Brown, Manchester, is the architect.

Wrexham.—The new church of St. John the Baptist, built at a cost of between £6,000 and £7,000, the gift of Mr. John Jones, has been consecrated by the Bishop of St. Asaph. The edifice consist of a nave of four bays, with narrow ambulatories for aisles, and has a tower and a spire. It has a clerestory with tracery windows, and the ceiling is barrel-vaulted. The chancel is separated from the nave by a carved oak screen, the work of Messrs. R. L. Boulton and Sons, Cheltenham, who have also executed other sculptured work in the church. Messrs. Prothero, Phillott, and Barnard, Cheltenham, were the architects, and Messrs. Collins and Godfrey, Tewkesbury, the contractors.

Yarmouth.—The new grammar school for boys at Yarmouth has been opened by the Bishop of Norwich, Messrs. Olley and Howard, Great Yarmouth, being the architects. The contractors concerned in the erection of the school were:—Mr. J. D. Harman, building; the Bispham Hall Company, terra-cotta work; Mr. West, plumber, decorator, etc.; Messrs. F. Braby and Co., Ltd., zinc work; Messrs. Dawber, Townsley and Co., Ltd., slating; Messrs. G. N. Haden and Sons, hot-water warming; Mr. A. R. Pank, electric lighting; Messrs. Reynolds and Branson, Ltd., laboratory fittings; Messrs. A. C. W. Hobman, Ltd., tar paving.

CORRESPONDENCE.

[*The Editor declines responsibility for the statements made or opinions expressed by correspondents.*]

Licentiate R.I.B.A.

To the Editor of The Architects' and Builders' Journal.

Sir,—Your correspondent "K. K.," unless he thinks that the R.I.B.A. Council is working from a very exclusive basis (unlikely to be successful) for a Registration Bill, probably agrees with me in the opinion that the R.I.B.A. Council is not producing a Registration Bill in its usually accepted sense. In the event of the R.I.B.A. producing a Bill acceptable to the whole profession, it is practically certain that all who enter the profession will enter the Institute in some probationary manner, and thereafter qualify for membership. But registration is a measure (approved by a large majority of general practitioners) for the good of the profession and the protection of its members, and the use of an affix of any kind is a very secondary matter; and as in the medical profession to-day, many medical men do not use their "mystic letters," so, under registration in the architectural profession would the word "Architect" convey as much sense of responsibility and standing as "Physician" or "Surgeon."

"K. K." considers that anyone who can produce his articles satisfactorily endorsed should be elected a "Licentiate R.I.B.A." I heartily agree with "K. K."—with the proviso that the candidate produces testimonies of study and work, so that the Council may have something to go on before further endorsing his articles.

Unfortunately, as perhaps "K. K." knows, endorsed articles sometimes mean very little, and the three years he mentions, nothing at all—and then, who can imagine the Associates R.I.B.A. voting for such an augmentation of a class which they have already condemned in no uncertain terms in your pages?

I suggest that if the R.I.B.A. had invited qualified men to join its ranks without any affix, but given them a voice and vote in the solution of the registration problem and nothing else, even though it entailed an entrance fee and subscription for the privilege, instead of giving an affix with the class of membership to be written in full (a stigma which no other body gives its licentiates), and no voice whatever on any point affecting the management of the Institute or policy in the profession, it would have been more worthy of the R.I.B.A. and the Council.

Your correspondent "Tailless and Unashamed," in his letter in your issue of the 13th July, said, "that an alma mater is necessary to protect the children of architecture and elevate them to manhood of quality"; but there is a beginning to everything, and the R.I.B.A. may justly expect to be considered a respected alma mater when it has opened its heart and mind to counsels for a reasonable and just solution of those difficulties which degrade the profession, its productions, and the mode of producing them.

"K. K." suggests that "it would be advisable to get a Bill through Parliament to prevent builders erecting buildings without the professional assistance of a qualified architect," an excellent suggeston but for the fact that many builders are infinitely better qualified than the average three years articled and qualified architect of "K. K.'s" dream.

The R.I.B.A. has arranged in a most excellent manner a conference on Town Planning. Is it quite out of the question for the R.I.B.A. to arrange a conference on the important question of registration?

H. G. T.

London, E.C.

THE TRADES' TRAINING SCHOOLS.
SPECIMEN OF WORK DONE IN THE PLUMBERS' SHOP.

THE TRADES' TRAINING SCHOOLS.

The report of the judges upon the work done at the Trades' Training Schools of the Worshipful Companies of Carpenters, Joiners, Painter-Stainers, Plasterers, Tylers and Bricklayers, and Wheelwrights, at 153, Great Titchfield Street, London, W., has now been issued, together with particulars of the awards, which are as follows:—

Carpenters.

The judges are much gratified at the high standard of the work exhibited, which, in their opinion, is considerably in advance of previous years. The elliptical dome, to which the silver medal has been awarded, is of singular merit, and has been most conscientiously set out. In awarding the prizes, the judges have taken into consideration intricacy of work, and also the respective ages of the students. The Alexander Howard medal, for the best work executed in English oak, has been awarded to J. B. Graham.

Special prize of £2 in books (former recipient of the Banister Fletcher medal and silver medal): W. H. Gale.

Special prize of £1 in books (former recipient of the Banister-Fletcher medal and silver medal: E. J. Beesley.

Special prize of £1 in books (former recipient of the Banister Fletcher medal and siver medal): E. C. Owen.

Special prize of £1 in books (former recipient of the silver medal): A. W. Bailey.

Alexander Howard medal, silver medal and £1 in books: J. B. Graham.

Bronze medal and £1 in books: S. Lummes, C. Burle.

Certificate and 15s. in books: R. A. Lumeden.

Certificate and 10s. in books: A. L. Aston, J. G. Williams, E. V. Whicher.

Joiners and Handrailing.

The works exhibited this year are good, and, in some cases, of exceptionally high quality. The semicircular niche, with coved and fluted head, is an admirable specimen of curved panel work, and the curved sash window and oak reading-desk display considerable skill on the part of the craftsmen who have produced them.

Special prize of silver medal given by the Joiners' Company, and £1 in books (former recipient of the Banister Fletcher medal and silver medal): A. Duley.

Silver medal, and 21s. in books, given by the Joiners' Company (former recipient of the silver medal): R. J. Holley.

Bronze medal, and 10s. in books, given by the Joiners' Company: J. B. Heath.

Certificate, and 10s. in books, given by the Joiners' Company: E. Duckett.

Handrailing.

The examples of stair-building this session are far in advance of anything shown hitherto. The judges regret that there are not more specimens of handrail wreaths.

H. Durran exhibits one of the finest models that the judges have seen in this class since its initiation. He deservedly wins the premier medal for the best craftsman in the schools.

Banister Fletcher medal, silver medal and £2 in books: H. Durran.

Masons.

The work is considered by the judges to be in advance of that of last year. They are pleased to note that the honours panel has been completed and fixed in position. This was under consideration of the Banister Fletcher medal.

Silver medal: F. G. Beresford.

Bronze medal: H. G. Bush.

Certificate and 10s. in books: O. Jackson, W. F. Wells, S. Bysouth.

Painters.

The judges found that the specimens of general plain painting and varnishing were good. The graining, marbling, and signwriting evinced considerable application, but, with regard to the latter, they think that less florid forms might be attempted in the future, and more attention paid to the drawing and shading of the letters.

Silver medal (painting graining, and writing): J. H. Higgins.

Bronze medal (painting and graining): J. E. McCabe.

Certificate and £1 in books (painting and writing): H. P. Miller.

Plasterers.

There is an advance shown in the work of this class over that in previous sessions, both in subject and execution. The attendances also show a great improvement, which must be gratifying to the Plasterers' Company, who continue to take a keen interest in the welfare of the class.

Special prize of £1 in books (former recipient of the silver medal): G. Davies.

Bronze medal: P. Luker.

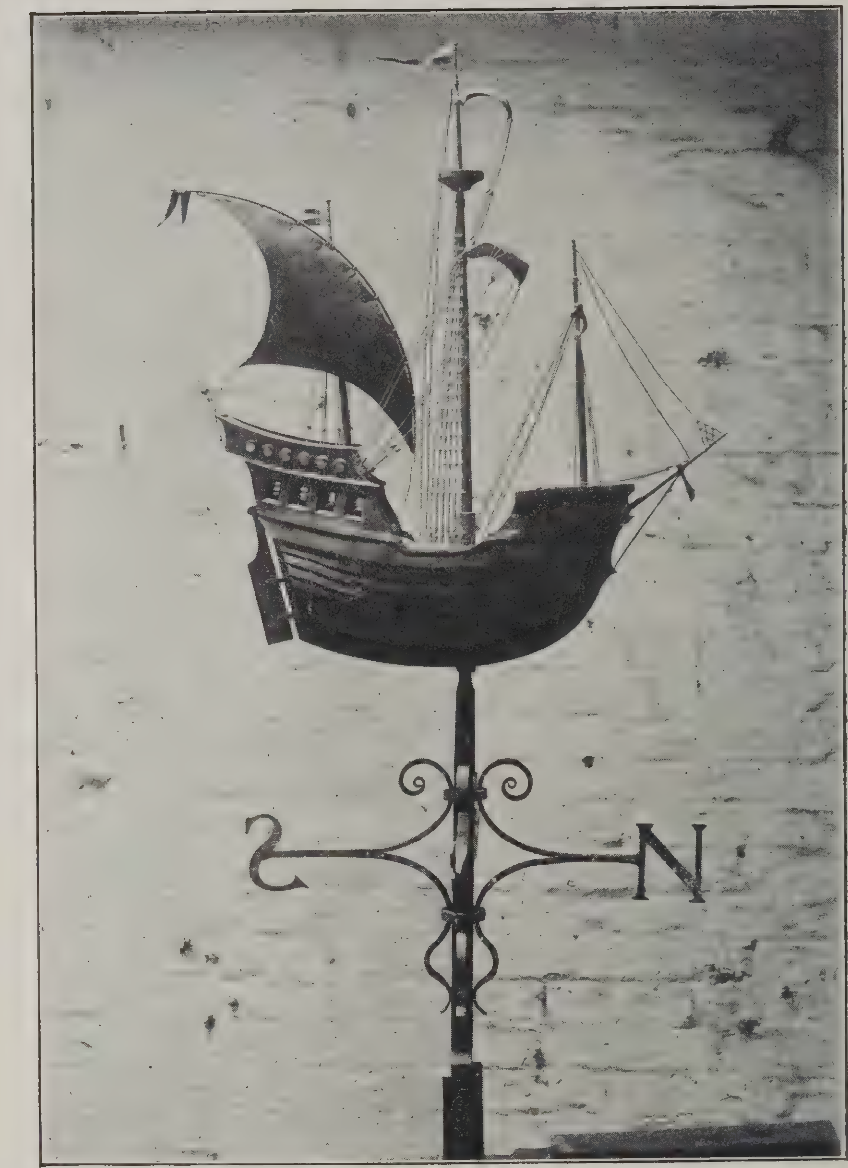
Certificate and 10s. in books: G. Cole.

Plumbers.

The work executed by this class during the session again fulfils the best expectation of the judges. There are some excellent specimens of branch jointing and bossing, and the cast lead work shows that the students are being kept well in touch with the modern developments of their craft.

Silver medal: F. Bardolph.

Special prize of £2 in books (former recipient of silver medal): E. Rowe.



THE TRADES' TRAINING SCHOOLS.
SPECIMEN OF WORK DONE IN THE SMITHS' SHOP.

Bronze medal: A. Kirkpatrick, J. D. Bates, P. Whitehead.

Certificate and 15s. in books: E. Gray.

Certificate and 10s. in books: L. Rodgers, G. W. Howlett.

Smiths.

The judges find it difficult to criticise the work exhibited by this class owing to the first-rate workmanship displayed, but they would be glad to see a few more finished examples. Some of the larger forgings executed by the students would do credit to an experienced smith, and prove the value of the instruction give in this class. The copper ship, mounted as a weather vane, shows considerable skill, both in design and execution, as do the side panels and wicket gate.

Special prize of £2 in books (former recipient of silver medal): W. Pinnock.

Silver medal and £1 in books, given by the Blacksmiths' Company: F. W. Porter.

Bronze medal: W. Cleveland.

Certificate and £1 in books: J. Batson.

Stone-carving.

The work exhibited shows that the impetus received in this class last year is being well maintained. The carved pilaster to which the silver medal has been awarded is a very creditable work, the exhibits generally showing a close application of the best principles of architectural stone-carving.

Silver medal and £1 in books: H. Bate.

Bronze medal and £1 in books: C. Limmer, T. Holmyard, M. Bartel.

Certificate and £1 in books: P. Barone, J. W. Drake, C. Watson.

Certificate and 10s. in books: E. S. Mertens. P. C. Rodgers.

Life Class.

Sir George Frampton, R.A., Messrs. Goscombe John, R.A., Ernest George, Banister Fletcher and Henry Tanner were glad to record the high standard of the work submitted this year. The vitality of this class is most encouraging, and the progress made in the last few years is appreciable.

Special prize of £2 in books (former recipient of the silver medal): P. Barone.

Silver medal and £1 in books: C. Cott.

Bronze medal and £1 in books: C. Watson, J. Allan.

Bronze medal: C. A. Austin.

Certificate and 15s. in books: H. Bate.

Tylers and Bricklayers.

The judges were again pleased to find a large number of exhibits for their inspection, many being the work of junior students, and showing great promise.

The cut brick font and gauged sundial are both excellent pieces of work, but, as both these students have formerly gained the silver medal, it was decided to withold this prize.

Special prize of £2 in books (former recipient of the Silver medal): R. J. Fever.

Special prize of £1 10s. in books (former recipient of the silver medal): H. G. Smith.

Bronze medal and £1 in books: F. J. Manley.

Bronze medal: G. A. Beard.

Certificate and 10s. in books: F. H. Wright, J. R. Wright, E. P. Smith, A. Churcher.

Certificate: G. R. Gorringe, W. J. Frigger, A. F. Walker, J. T. Pearson, H. Saul.

Wheelwrights.

The judges regret that, owing to unavoidable circumstances, the number of exhibits this year is below the average. The work, however, is of good quality, and equal to any which has been produced in former years. Some of the models are of a distinctly advanced type, and do credit to everyone concerned.

Silver medal and £1 10s. in books: B. Cavalier.

Bronze medal and £1 in books: D. Lee.

The Master's prize, £1 in books: W. Rowlands.

Certificate and 10s. in books: A. Gibson.

Wood-carvers,

The carving and preparatory plaster casts are more numerous this year, and embody the spirit which is aimed at in this class. Some of the drawings are excellent, and the choice of subject shows discrimination.

Silver medal (given by the Joiners' Company), and £2 in books (for carving): J. Cott.

Silver medal and £1 10s. in books (for carving): J Almond.

Certificate and £1 in books (for carving): A. Hammelt.

Certificate and 10s. in books (for carving): H. Glass.

Certificate and £1 in books (for modelling): F. Devisse.

Certificate and 10s. in books (for modelling): H. Crow.

Silver medal (for drawings): J. Eichberger.

Bronze medal and £1 in books (for drawings): J. H. Potter.

Bronze medal and £1 in books (for drawings): F. Roessli.

Certificate, and 10s. in books given by the Joiners' Company (for drawings): A. J. Harvey.

Certificate, and 10s. in books given by the Joiners' Company (for drawings): A. Austin.

Certificate and 10s. in books (for drawings): H. Povey.

Electric Wiremen's Work.

The practical work exhibited is of considerable merit, including, in an abbreviated form, the complete electric light and bell installation of a house, the different circuits being executed by different students.

The judges were very gratified at the success which has attended the establishment of this class.

The following awards were made for practical work and general knowledge, as shown by the students' note books, papers, and work exhibited:—

Bronze medal and £1 in books: W. Fathers.

Bronze medal and £1 in books: A. E. W. Forrest.

Certificate and £1 in books: A. G. Thwaites.

Certificate and 15s. in books: W. B. Wykes.

BUILDERS NOTES.

Dressed Stone Dispute.

The dispute between the contractor for St. Gabriel's Church, Sunderland, which is in the course of erection, and the stonemasons, with regard to the dressing of the stone used in the building, has been settled. It has been decided that the trade requirements that the stone should be prepared on the job instead of at the quarries shall be complied with. This will mean an extra expense, which the contractor and the church council have decided to divide between them.

Cork Master Builders' Association.

At a specially summoned meeting, Mr. A. Gaul (president) in the chair, the following resolution was unanimously adopted:—"That we tender to our much-esteemed fellow-member Mr. W. T. O'Mahony our very sincere sympathy in the great loss he has sustained on the death of his wife." The Hon. Sec. (Mr. Thos. Kelleher) was directed to convey the resolution of sympathy to Mr. O'Mahony. The meeting then adjourned.

Portsmouth Speculative Builders' Outing.

Members of the Portsmouth and District Speculative Builders' Association and a number of friends had an enjoyable outing to the Isle of Wight, and, despite the weather, greatly appreciated the drive from Ryde to Ventnor, via Brading, and thence to Carisbrooke, via Whitwell and Godshill. Halts were made for luncheon and tea, and the return route to Ryde lay through Newport and Ashey. Those present included Mr. A. Chase (president), Mrs. Chase, Mr. J. Brittan (vice-president), Mrs. Brittan, supported by members of the committee. The arrangements, which met with full approval, were left in the hands of Messrs. F. W. Winter, J. Williams, and M. Hart (secretary).

Peterhead Master Builders' Picnic.

The summer outing in connection with Peterhead Master Builders' Association took place recently, when the members of the Association accompanied by friends journeyed to Pitfour. The weather was dull, but remained dry, and a most enjoyable afternoon was spent within the beautiful grounds, permission to which was generously granted by Colonel Ferguson. Much of the success of the picnic was due to the efforts of Messrs. W. B. Taylor, president; A. L. Williamson, vice-president; and A. Clark Martin, the secretary.

Newport Builders' Excursion to Stratford-on-Avon.

A party organised by the Newport Master Builders' Association paid a visit to Stratford-on-Avon. The railway journey, embracing a circular tour via Cheltenham, Pershore and Evesham, took the party right through a veritable fruit garden. Dinner was served at the Unicorn Hotel. Mr. John Charles presided, and was supported by the Mayor of Newport (Mr. W. M. Blackburn, a past president of the Association), Messrs. R. W. Moon (vice-president), Robt. Lunn (town clerk of Stratford), Councillors Peter Wright, H. C. Parfit, W. Irwell, and Wm. Moore, both past presidents of the Association, and E. Hartley, of the Star Brick Co., Ltd., the company numbering 39. The Town Clerk of Stratford welcomed the Association and the Mayor of Newport to the ancient town of Stratford. He had, he said, heard a great deal of Newport, its magnificent docks, its commerce, the coalfields in its close proximity, and of the great future of the town as a great commercial and industrial centre. He wished Newport every prosperity, and associated with its prosperity "The Newport Master Builders' Association" and the Mayor. The Town Clerk also much regretted the absence from town of the Mayor of Stratford, who would otherwise have been present. After a photo group had been taken, the entire party, accompanied by the Town Clerk, enjoyed a delightful trip by electric launch on the Avon. All were charmed with its reaches and many windings. Upon landing, the party drove to Anne Hathaway's Cottage. A visit was also paid to the Collegiate parish church of Holy Trinity. The church in cruciform, 197ft. in length, 89ft. in width across the transepts; the breadth of the nave and aisles is 68ft., and the height to the roof 50ft. At the west end of the church is kept in a glass case the old parish register, with the entries of the baptism and burial of William Shakespeare. Shakespeare's birthplace was also visited. Newport was reached again at 10.20 p.m. The arrangements were carried out by the secretary of the Association, Mr. R. Richards, of Mount Eveswell.

Will.

Mr. William Osment, of Sandford House, Clapton Common, N.E., builder, who died on April 24th last, aged 71 years, left estate of the gross value of £148,886 4s. 1d., of which the net personalty has been sworn at £101,055 5s. 1d.

Hull Painting Contracts.

The decision of the Hull Town Council to place in the hands of the Works Department the contracts for repainting work in the schools has drawn vigorous protests from the Hull and District Master Painters' Association and from the Hull and District Chamber of Trades. The letter to the "Hull Daily Mail," signed by Mr. H. F. Smith, the President, and Mr. J. S. Cant, the Secretary, of the Painters' Association, states that "For the moment we are concerned not so much with the general question of municipal trading as with the system which permits the Borough Engineer to give a low estimate for work against a trader, upon a definite specification, and afterwards allows him to do the work in such a manner as will enable him to show an apparent profit, irrespective of such specification." They give in parallel columns statements concerning work done by the Engineer's Department and by contractors, tending to show that while the former has been favoured, the latter had been harshly treated. They dispute that "the contractor receives equal treatment with the much-vaunted painting department of the Corporation." The Hon. Secretary of the Chamber of Trades states that his organisation is supporting the Master Painters' Association, and goes on to say that "As we understand it, the master painters are requested to tender for outside and inside work in connection with the public schools. In tendering for the work, account has to be taken of the fact that only so many days are given for its complete accomplishment. The master painter clearly understands that if he gets the contract the work must be done in a certain time, or otherwise heavy penalties must be paid. On the other hand, no such restriction attaches to the Corporation employees, who can leave over until next Christmas the inside work in these schools which they have not been able to finish. If we understand the position, it is a most unfair one, because it amounts to the tenders of two competing parties, one with a time limit and a penalty, and the other practically without either."

Bristol Builders' Outing.

The members and friends of the Bristol Master Builders' Association held their annual summer excursion on July 21st, the venue being "Shakespeare's Avon." There were present: Mr. F. Chown (president), Messrs. Audley Perkins (vice-president), Geo. Hayward (president, Bath Association), S. Ambrose (vice-president, Bath Association, E. J. B. Mercer (secretary, Bath Association), E. I. Neale (hon. treasurer, Bristol), Frank N. Cowlin, W. H. Brown, G. W. Humphreys, J. Lovell, C. C. Cowlin, A. S. Scull, Geo. Wilkins, E. W. Walters, W. Foster, J. Browning, W. Newton (Midland Railway), J. Coles, J. Harris, A. F. Farbrother, C. F. Bryant, D. Crombie, A. W. Parkman, W. D. Goodfellow, F. Greenway, E. H. Chapell, A. Clark, J. G. Wightman, Tom Harris, F. R. Arscott, W. Hall, T. Berry, H. J. Cox, C. Cornish, C. P. Cornish, F. R. Norris, A. Thatcher, W. G. Thatcher, E. W. Sweet, E. Preece, Jas. Cox, H. J. Tanner, A. Peacock, G. Crispin, F. H. Ridd, A. Langlands, F. Emery, F. Scource, S. H. Verran, W. J. Foster, F. Sampson, and A. J. Pitt (secretary). Early morning brought unpleasant weather, but after leaving Bristol by the 8.5 train for Evesham, the sun broke out. Evesham was reached shortly after ten o'clock, and the party wended their way to the Workman Pleasure Gardens, inspecting en route the old buildings in the Alley and Market Place. All Saints' Church, the Bell Tower, and various other places of architectural interest. Having embarked on the steam launch River Queen, a most enjoyable trip was commenced through the Vale of Evesham. Having arrived at Pershore at one o'clock, luncheon was partaken of, and later the Abbey Church was viewed. The party then re-embarked for Tewkesbury. Tea was partaken of at the Bell and Bowling Green Hotel, certain members indulging in the game from which the hotel derives part of its title. A special train from Tewkesbury conveyed the company to Cheltenham, and Bristol was reached at 9.45.

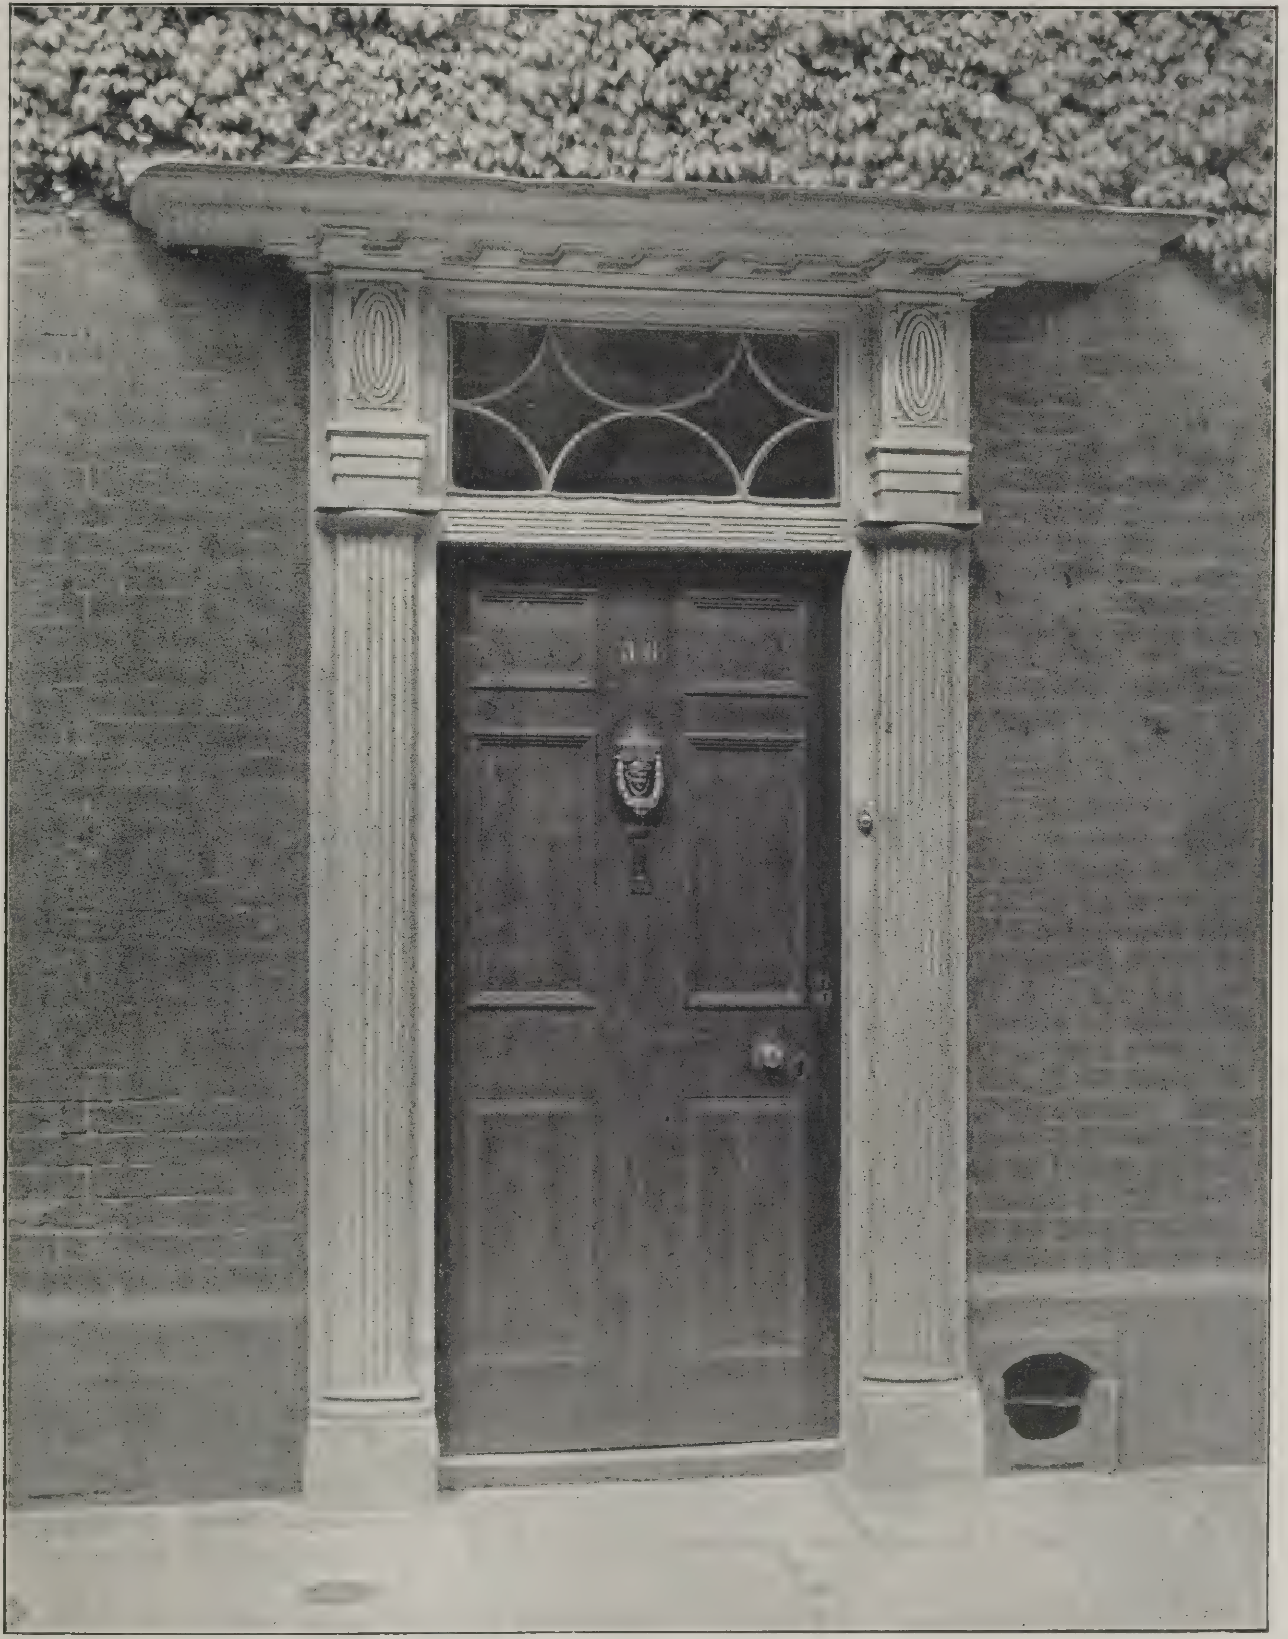
DRAWN BY EDWIN GUNN, A.R.I.B.A.



This doorway, executed in wood, is of early nineteenth century date, and exhibits the influence of Greek forms; but while bein delicate in treatment, it has none of the ultra-delicacy of the Adam period. The hood, moreover, is a thoroughly serviceable one.

DOORWAY, NO. 35, CHURCHGATE STREET, BURY ST. EDMUNDS.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

- ***(1) Enquiries about buildings to measure in particular towns and districts.***
- ***(2) Enquiries embodying questions which have been set in examination papers.***
- ***(3) Enquiries which ask for or require the preparation of special designs as part of the answer.***

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor, will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible or any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Constructing Sash Windows.

Brittany (St. Servan) writes: "Where can I procure working drawings to enable a local carpenter to make sash windows and frames of approved English pattern, with sash balances instead of cords and weights?"

—Information which would probably serve your purpose is given in Ellis's "Carpentry and Joinery," which is published at 15s. net by Mr. B. T. Batsford, 94, High Holborn, London, W.C.

By-Laws and Building Site.

In reference to the enquiry which appeared in our issue of July 6th last, we have received the following from a correspondent:—"Boundary has overlooked the by-law which allows public buildings, buildings of warehouse class, factories, etc., to be erected without rear space. It is only buildings of domestic class which require rear space, hence, Local Council have no jurisdiction as to depth of building plots or position of a new street."

Garden Wall.

T. H. W. (Bristol) writes: "The owner of a shop, as shown on diagram [not reproduced], proposes to cover a portion of the site with a ground floor extension. A 12in. division wall 5ft. high runs down the centre of the site, and there is a garden on either side. The wall is insufficient in strength and thickness for the purposes of the proposed building, and has no damp-proof course. (1) Is the owner of the property entitled to pull it down and build a new wall on the same line? (2) If so, may he dig the trench and project the footing? (3) What is the proper procedure in such a case? Is it necessary to give formal notice to the owner of the property which adjoins the shop on the other side of the wall? There is nothing in the deeds of the property to guide in the matter."

— Presumably the wall in question is a party wall, and each owner has an equal interest in it. Assuming that there is in the City of Bristol no local Act of Parliament dealing with party walls, I am of opinion: (1) That neither owner may pull down the present wall and rebuild it without the consent of the other. (2) The footings may not project further than they have been accustomed to do. (3) I suggest that the adjoining owner should be approached and that he should be allowed to see the drawings of the proposed new buildings, both in regard to the party wall and also with a view to avoiding any future question as to rights of light.

F. S. I.

Window Overlooking Adjoining Property.

F. A. R. writes: "The following is a covenant entered into by the owner of the residence shown on the enclosed plan [not reproduced]: 'That the purchaser, his heirs and assigns, will not in any building to be erected upon the said land hereby assured, make, or suffer to be made, any clear glass windows which shall overlook the adjoining property of the vendor, but that the only windows so made shall be of opaque glass, with no opening sash except a top fanlight to be hinged at the bottom, and to open inwards only.' The vendor and owner of the adjoining property shown on the plan now take objection to the window marked 'A' being glazed in clear glass, as he finds that a person inside, standing sideways against this window, can see a portion of his property. Yet, I take it that there is no limit to the size of the top fanlight, and it may open inwards completely, and still keep the letter of the agreement, although there would then be an open view of his property. However, the point I should be pleased to have your opinion upon is whether the window A is built to overlook, although it is built in a plane parallel to the front gable, and no objection is taken to the window. Has there been a similar case decided?"

—With regard to the first part of this query, it is clear that although the fanlight opens inwards, and, as appears from the drawing, is capable of being drawn right down, this constitutes no breach of the covenant. When a fanlight was permitted, the owner of the adjoining house must be taken to have considered all the consequences. As to the second question, this is by no means easy to answer, and there are no cases on the subject. It is conceived, however, that to build a window from which the adjoining property can be seen at all is a breach of covenant. The point may be tested in this way. Suppose the owner of the residence was claiming a right to the light entering this window, could he object to the light from the adjoining property being shut out? It has been held in a case relating to ancient lights (*National Provincial Plate Glass Insurance Co. v. Prudential Insurance Co.*, Emden's Building Contracts (4th edition) p. 294), that the alteration of the plans of a window do not amount to an abandonment of the right of light. A householder may claim the light reaching his window from whatever quarter it comes. By a parity of reasoning, if he agrees that he shall not have a window overlooking a particular direction, he must be taken to agree that no window shall be built from which a side view can be obtained. Cannot the difficulty be overcome by putting opaque glass in this window?"

Council's Excessive Estimate for Street Works.

E. F. C. (Frindsbury) writes: 104 provisional apportionment notices have been served on certain owners under the Private Street Works Act, 1892. The owners object to the estimate as being excessive, and desire to have tenders invited from contractors. The borough council wish to do the work themselves, and to this the owners would not object if they do it at a contractor's price. (a) Can the owners insist on tenders being invited, or, failing this, on the council doing the work at a definite price to be agreed on? (b) When the street was laid out the council required the formation, and accepted a system, of surface water drainage to cesspools. They now wish to do away with the cesspools and to lay a new drain at the owners' expense, and connect it to a sewer in a street constructed since the first street was formed (previous to 1892). The owners having provided one system, it appears inequitable for them to be called on to bear the cost of another (section 9 (1) of the Act "Incidental Works" is held to empower the council to insist on this). (c) The by-laws require a 24-ft. carriage way. A majority of the owners in number, value, and length of frontage wish this reduced to 20ft., to afford better space for trees on the edge of the footpath. Has the council power to consent to this? The street is not a main thoroughfare, and is 36ft. wide."

—As to (a), it is clear that, by virtue of section 7 (d) of the Private Street Works Act, 1892, owners may object to an apportionment on the ground that "the proposed works are insufficient or unreasonable, or that the estimated expenses are excessive." Although there appears to be no decision directly in point, it is apprehended that the fact that no tenders were invited would be strong evidence that the local authority did not take proper steps to do the work in the cheapest way. Objection could therefore be taken under section 8 of the Act. As to (b), the answer would seem to be in the negative having regard to *Winslow U.D.C. v. Sidebottom* (1906), 70, J.P. 537. The section can apparently only be put in force once for the purpose of carrying out improvements. As to (c), there does not appear to be anything in the Act of 1892, which enables the frontagers to have a voice in the decision as to the width of the road. This is a matter for the local authority alone.

X.

Gable and Chimney-Stack Enclosed by Adjoining Owner.

Curious (Newcastle, Staffs.) writes: "I am the owner of a detached cottage, and the adjoining owner has built up to the gable of my house. To do so he has cut off the projecting tiling to the gable, and, having carried up his wall (4½in.) about 2ft. 6in. above my roof, has enclosed 2in. of my chimney (which is corbelled out to the same projection as the tiles, viz., 2in.) within his wall, which will probably cause the chimney to smoke. What remedy have I? My property has been built about 50 years."

Presumably your verge and corbelled chimney-stack overhang your neighbour's ground (though you do not say so), but have acquired a right to do so, in the nature of an easement. If this be so, you have ground for action, though such a matter is best adjusted in a friendly manner if possible. The law appears to recognise no right to free access of air to chimneys, and has several times declined to interfere when neighbouring buildings raised higher have caused them to draw improperly. It is usual, however, for the building owner to raise the adjoining owner's chimneys when raising his building, as a matter of good feeling.

G.

Contractor's Right to See Bill of Variations.

W. F. (South Croydon) writes: "In adjusting omissions and additions, can a sub-contractor demand to see the bill of variations agreed to between the surveyor or architect and the contractor—so far as his work—the sub-contractor's—is concerned?"

—No, not unless he has been made a party to the contract by the terms in which the sub-contract was demanded and (or) accepted. The bill of variations relates to an agreement subsisting between the contractor and the building-owner, and is a private document between them. The fact that the contractor, in the exercise of power reserved to him, has entered into an agreement with a sub-contractor to execute some portion of the contract does not necessarily make the latter a party to the original contract; the adjustment, therefore, of any questions of omissions or additions which may arise between the contractor and the sub-contractor, must be either regulated by the terms of the agreement made at the time the sub-contract was accepted, or by subsequent mutual agreement, or by customary practice.

Assessors.

ALTHOUGH it is many years since the appointment of professional assessors in architectural competitions was first practically insisted upon by the profession, or by all its leading members, as a condition of competing, there are still points of uncertainty in connection with the subject; and there has even been evident of late years a partial reaction in the profession against the method of deciding a competition by the verdict of an individual, who may, perhaps, quite honestly and reasonably, have a prejudice in favour of a particular style of architecture; or who, in the case of a building for a special purpose, may have a fixed idea in favour of one special principle in planning, and be consequently inclined to rule out—again quite honestly—any plans which do not conform to his pet ideal. He may very likely be right in his judgment, but it is possible that he may not be; and in any case, say the objectors, one does not want to see a particular style or a particular form of plan stereotyped as the only right one.

This result could only really come about under certain conditions which we will pass over for the moment, in order to consider the general question first in its broadest aspect. We may say at once that we consider it quite unquestionable that the appointment of a professional assessor in the majority of competitions, and the insistence upon this course by the Institute of Architects, has been of immense benefit both to the profession and indirectly to architecture. The younger generation of architects can hardly have an idea of the preposterous selections which were sometimes made in the pre-assessor days, and of the high-handed manner in which competitors were victimised. We can recall one very large competition for a municipal building, far in the dim past, where there were large sets of drawings sent in by nearly a hundred competitors, and where the borough surveyor, asked by the Council to advise them which they should choose, reported that none of them were very suitable, but that he thought that, out of the suggestions in some of them, he could evolve a building which would be more suitable for their purposes than any of the competition designs. This proposal was acted on, and the building thus evolved now stands; as might be expected, a thoroughly commonplace one. This was in a great provincial town; it would hardly be possible now anywhere except in Little Pedlington; and that degree of purification is to be traced to the recognition of the assessor. And in the present day, those who frequent exhibitions of competition designs know the figure of the intelligent Town Councillor who shakes his head over the assessor's choice, and buttonholes you to show you the design he would have selected —something in which tawdry commonplaces of architecture are set out in the glories of a captivating draughtsman's style. The assessor has delivered us from the intelligent Town Councillor at all events.

On the other side of the question, there are two opposite tendencies—we will not necessarily call them weaknesses—to which assessors are liable, and which are apt to give a rather one-sided effect to their decisions. There is the assessor who is an architectural enthusiast, and who is inclined to fix his choice on the best and most effective piece of architectural design, content if the plan will do fairly well for the intended purpose, without being the best possible or the best of the plans sent in; who will recommend a design in a swimming-bath competition as a fine piece of architecture that will be a credit to the district, without considering whether its arrangements as a swimming-bath are the best. There is so much commonplace architecture turned out in these days of restless building and rebuilding that one cannot but feel a great deal of sympathy with this type of assessor; but it must be admitted that the position is hardly a sound one. He is making a selection of what other people have to pay for, and he has hardly a right to select what does not suit their practical purposes because it approves itself to his architectural perceptions. But this class of assessor is in the minority. On the whole, architectural assessors seem at present to be for the most part honestly endeavouring to select the best plans among competition designs, and the danger is rather the other way; that somewhat commonplace architecture will be erected because the plan is satisfactory. We can recall one large competition in which the award was given to a design with undoubtedly a masterly plan, for a very difficult site, in regard to which the remark was made that "no plan would justify the erection of that building"; not that the architecture was objectionable or in bad taste, but that, for a great occasion, it was absolutely commonplace. In that case the competition came to nothing, as the proposed building was never carried out; but had it been, there would have been a general feeling that a great architectural opportunity had been lost. And on the whole, this tendency to lean too much to the utilitarian side is the more common weakness with assessors, if it is to be considered a weakness. Conscientious and scrupulous assessors, passing judgment on other people's property, like to be on the safe side. Those who have paid much attention to competitions, or have competed much, will probably agree that it is of little use to send in anything that is architecturally very original in a competition. Critics in the Press may praise the architect's genius, and editors wish to publish "your fine design"; but it will not be selected. In a competition the *juste milieu* is always the safest. And that possibly is an inherent defect in the whole competition system. Competition, as a rule, is not the way to get original architecture. Competitors go in to win, and originality is too risky.

The conditions referred to at the outset, under which the assessor system may have the effect of rather stereotyping architectural style and plan, are when one distinguished architect gets rather a name for acting as an assessor, and is engaged right and left in that capacity by public bodies, and thus has practically the selection of the architecture of the principal new public buildings in his own hands. That actually was the case for some years in the days when Waterhouse was invited to fill the post of assessor for one competition after another. He was an admirable assessor, with a keen eye for the main points of a plan and design, and made some excellent selections; but there certainly was a feeling that the selection of designs in competition was becoming too much of a personal matter; and there is a strong feeling at the present time among many of the younger competing members of the profession that there is a tendency to repeat that state of things. Whatever the eminence of a universal assessor, and whatever respect may be felt for his character and acquirements, it is not well that the choice of the architecture for the majority of our important new buildings should be ruled by one individual will; and the position, we have reason to know, does not satisfy those who are in the habit of competing. The proper course would be for all public bodies to apply to the Institute to appoint assessors. They have a long list of members competent to act as assessors, and could make appointments, according to the importance of the occasion, so as to bring as many minds as possible to bear on the subject, which is a better condition of things.

There are cases in which what we may call sub-assessors ought to be appointed to assess the assessors. In the case of such a thing as a swimming-bath, for instance, already referred to, the architectural assessor would judge of the style and the general planning of the building, but he ought to have joined with him an adviser conversant with the engineering provisions of a swimming-bath, which are special and complicated. In the case of the Usher Hall, as was pointed out in a signed article last week, the second premium has been awarded to a form of plan which is radically bad for a concert-room, and the third to one in which the organ is placed in a position which would be condemned by every conductor at once. In the case of all concert-rooms a musical expert should be joined with the assessor, to advise him on such points. Even the most eminent architect cannot be expected to know everything. Theatres are, unfortunately, seldom the subjects of competition, or we might perhaps have some better theatre architecture than we have; they are generally "jobs"; but in the case of a theatre competition any architectural assessor ought undoubtedly to be sub-assessed by an experienced stage manager. The principle applies to all buildings which include some provision quite apart from ordinary problems of planning and construction.

The question is still undecided in many minds whether an assessor is an arbitrator or an adviser. The Institute, in its regulations, takes the line that he is an arbitrator, and is to impose a choice on the committee. That he should impose his choice on the committee is quite desirable; but there are different ways of doing it. In a court of law an "assessor," when appointed, is certainly not an arbitrator; he is a person to assist the Judge by his special knowledge; and that is what the word "assessor" means. We cannot help thinking that the profession would be in a better position with the public if that meaning of the word "assessor" had been recognised and acted on from the first; that he is a person not ostensibly to impose a choice on a committee, but to advise them in a right choice. Committees would welcome him much more heartily on that footing. If it is urged that then there would be no certainty of the right choice being made, our reply would be that any man with a thorough understanding of the subject and a power of explaining its points clearly and persuasively, would carry a committee with him; and that if he could not do so he would not be suited for the position. The tendency of committees to give a wrong award is much more often the result of ignorance than of bad faith. The majority of them would wish to do right if they were shown the way. It is the assessor's business to show it them.

It should be added that it is of the greatest importance that an assessor should be quite decided in his own conclusions as to the respective merits of designs, and should express them in a clear and definite manner. We can recall one instance in which an assessor was thrown over by his committee because he was vacillating in his expressions and did not seem to know his own mind, and the committee (excusably) declined to pay further attention to him: an unfortunate result in every respect.

The Brussels Exhibition Fire.

THE disastrous fire which destroyed, on Sunday night last, the Belgian, British, and French Sections will have a paralysing effect on this Exhibition in particular, and on International Exhibitions in general. For in our section alone we have lost one of the finest collections of antique furniture ever sent out of this country. One large court was filled with valuable specimens lent by the Victoria and Albert Museum, and, in addition, there were many choice examples from private collections. Well-known English decorating firms had also sent fine exhibits, one firm showing some genuine carvings by Grinling Gibbons. The pottery exhibits, which included picked examples of every English make, have also gone. Tudor panelling, belonging to the Toronto Museum, two large Morlaix tapestries, and priceless Chinese flowered wall-paper, are individual exhibits mentioned in the reports as having been destroyed. The loan collection is said to have been insured for £100,000, but as the articles can never be replaced, it is impossible to estimate the loss on a monetary basis. The fire, at first reported to be due to the fireworks which are a feature of the Exhibition, is now stated to have begun as the result of a short circuit in the illuminated device over the portico of the Belgian Section. The actual consequences of the fire upon similar exhibitions like that next year at Turin has yet to be seen. Exhibition buildings are, of course, intended to be merely temporary structures; but it has been assumed that they are fire-resisting, and that they will afford some protection for the priceless treasures which will be housed in them. The rapid spread of the flames negatives that idea in the present instance; and an enquiry is imperative not only into the cause of the outbreak, but also into the reason for the wholesale destruction and the apparent absence of firemen and fire-fighting appliances. By three o'clock on Monday morning the fire was reported under control, and it was then ascertained that in addition to the sections already stated to have been burnt, the Italian Exhibit was badly damaged, and that the Danish, Russian, Norwegian, Austrian, Japanese, American, Turkish, and Swiss Sections had suffered in part. The loss is estimated at £4,000,000 by the Brussels correspondent of the "Matin," a large stock of diamonds and jewellery having been destroyed. In the face of such tragic losses one is dumbfounded. But if future exhibitions are not to suffer there will have to be a radical alteration in the construction of their buildings, in the adoption of fire-preventive methods, and in the provision of firemen and fire-fighting appliances. No one will lend priceless art treasures under such risk as is shown to have been incurred at Brussels. From private sources we know that wood was very largely employed in the Brussels buildings; and wood, even when covered with plaster, has here proved useless to stay the spread of fire. Concrete and steel, wired glass, sectional divisions, and fire-doors must have their part in the future. It may involve greater initial expense, but it will be less costly in the end.

Another problem which will have to be considered seriously in future exhibitions of valuable antiques is the question of lighting. At the Japanese-British Exhibition the fine art sections are closed early in the evening, thus obviating the necessity for keeping the lights going at night, though we believe we are right in saying that owing to the velarium used in each room the lights often have to be lit during the day. The National Gallery closes at dusk, and there are no lights. Great care has recently been expended in making this latter building absolutely fire-resisting, new floors and roofs now being constructed, and the wooden sashes on the front now being replaced by metal ones. With exhibition buildings, the illumination of the exterior—if not the interior—is a feature at night time. The indiscriminate ringing round of buildings with many lights is bound to be productive of danger if the buildings themselves are not constructed of fire-resisting materials.

NOTES AND NEWS.

The R.I.B.A. Town-planning Conference.

At the International Conference on Town Planning, to be held in the second week in October, the R.I.B.A. has secured the galleries of the Royal Academy at Burlington House, for the important exhibition of drawings, maps, and illustrations of the most important schemes of town-planning that have been, or are being, carried out, or are proposed. Conspicuous among these will be the designs for the re-planning of Chicago by Mr. Daniel Burnham, by whom the reconstruction of Washington has been largely carried out. Plans for the remodelling of the old quarters of Berlin, and for the great scheme to which the Municipal Council of Paris is committed, including the completion of the Boulevard Haussmann, will also be shown. The international character of the conference is emphasised in the papers to be read. Among the authors are Dr. Rudolf Eberstadt, of Berlin, M. Augustin Rey and M. Eugène Henard, writer of "Les Transformations de Paris," two very distinguished French architects, and Mr. Burnham and Mr. Mulford Robinson from the United States. A paper on "The Planning of Khartoum and Omdurman," from Mr. M'Lean, the city engineer of Khartoum, should be of particular interest as showing what can be done with a clean slate. The King has consented to become patron of the conference, and Mr. John Burns will deliver the opening address. There is no doubt about the keenness with which these questions are being followed in Europe. A single architectural society in North Italy, for instance, has applied for 300 tickets. The Institute is anxious that the British attendance should be on a corresponding scale.

Architectural Departments.

The resignation by Mr. Reginald Kirkby of his post as city architect at Bradford has again let loose the flood of controversy which burst forth when Mr. Edwards resigned the post to assume a similar position in Bradford. A correspondent of the "Yorkshire Daily Post" calls for the costs of the architect's department, and asks three questions:—(a) The question of cost to the public; (b) the use which has been made of such official; (c) a comparison of his work in the city and that done by other architects. He answers them himself, by recording that no statement of cost has been made since the appointment of Mr. Kirkby, that few prominent buildings have been associated with the name of the official architects, and that other buildings of a public and private nature have been erected during the last eight or nine years by Bradford architects, which are as creditable to the architectural beauty of the city as anything done by the city officials. The correspondent adds that the condition of the building trade in Bradford has been deplorable for years, and probably the percentage of the unemployed among our architects is greater than among any other group of workers. As ratepayers, and as capable men, they are entitled to a fair share of that kind of Corporation work which they are able to do, and are justified in objecting to the bread being taken out of their mouths by the creation of unnecessary officials—unnecessary in the sense that the work can be done equally well, to say the least of it, and at less cost to the public. This is looking purely at the material side of the question. On higher grounds we have deprecated the appointment of official architects, not once, but many times. The scheme starts with the idea of saving on the already meagre fees of practising architects; and it excludes the architects of the district from any opportunity of adding to the embellishment or amenities of their own town.

The Housing of the Clerk.

There appear from time to time in the public Press grumbles about the lack of housing accommodation for the clerk, or the man earning £3 or £4 a week. From the pretty constant complaints — one occurs last week in the "Daily Mirror" — it seems evident that the speculative builder works only in very narrow and unenterprising grooves. There are but two types of houses for him, the semi-detached type, ranging in rental from £40 upwards, and the terrace house, with a rental of from £20 to £28 a year. If you cannot afford the semi-detached house you must live in the other. The correspondent in question says that while there is this difficulty for him, dwellings for the man with 30s. a week are getting more and more cheap and sanitary. He complains that "either one has to live in a street where it is an insult to one's friends to ask them to visit you, where dirty little barefoot children play on your very doorstep, or you must live in an ornate 'Laburnum Villa,' the maintenance of which—rent, rates, and taxes" (and one must not forget season ticket) "swallows up all one's available cash." At the bottom we fear this complaint is grounded on the old antagonism of the washed to the unwashed. Probably the clerk is making little if any more money than the workman, but that does not prevent him resenting the want of care in the latter's appearance, or the workman's want of supervision over his children's behaviour. We fear in such case there is little the man of refined temperament can do except to choose his district. Though social reformers may deplore the segregation of rich and poor in different districts—a fact that they usually attribute to the snobbishness of the rich and well-to-do—it is a fact that the number of clean, respectable poor people seems to be on the decrease; and the antagonism between the respectable middle class and the rougher and less respectable elements of the community is not likely to be bridged over by sophistries about the brotherhood of man. At the same time there is a great dearth of houses at a rental of from £30 to £40 a year; and this is a fact that building speculators might bear in mind for the future.

Architecture at Hull.

A correspondent of the "Hull Daily News" suggests the formation of a local body (affiliated to the Royal Institute of British Architects) for the furtherance of the study of the beautiful art of architecture. Says the writer:—"Why cannot we have a Hull and East Riding Architectural Society? Truly in this area we have some of the most celebrated gems of architecture. Who in the profession, no matter in what vicinity, knows not, or has not heard of, Beverley Minster, Bridlington Priory, and the churches of Hedon, Patrington, and Howden? Most of our leading authorities have, in their text books on Gothic art, referred to one or another of them. Besides these there are lesser known examples, containing equally fine details, surely, in the shape of a porch, or a font, or some particular moulding pleasing to the practised eye. There are many men in Hull of repute in the profession, who by virtue of their connection with the R.I.B.A. as Fellows or Associates, could give the necessary impetus required to start a society." What do the Hull architects say?

The Paris of To-day.

According to Mr. William Woodward, F R.I.B.A., London now leads Paris in architecture. Recalling in an article of "The Observer," the Paris of 1869 and 1871, Mr. Woodward records, with great regret, "the gradual but sure detoriation which forces itself upon one at every turn." Generally speaking, the matters in which Mr. Woodward finds La Ville Lumière lacking are mainly those of municipal administration and cleansing; also the nonchalance of the authorities in clearing off debris and unsightly hoardings round the various excavations for underground railways, etc., which obstructions have become almost a feature of the city. Mr. Woodward also attacks the upkeep of the public buildings. "Where has Paris been during the last fifty years, and wherein has London beaten her during that period? We have beaten her in our roads, in our tube railways, in our underground conveniences, in our shops, in our hotels, in our restaurants, in our public buildings, in our health, in our municipal works generally, and in our traffic regulations. We cannot beat Paris in anything that appertains to art—that is bred and born in every Frenchman and Frenchwoman—and a visit to the Salon and to the Royal Academy this season proves it. No Frenchman could be guilty of placing the Royal Artillery Memorial, just erected in St. James's Park, about six feet out of the centre line of the Duke of York's Column, and I am sure no Frenchman could be accused of paving the walk round that monument with memorial tablets of the dead heroes. Let Paris get rid of her incongruities; let her administrators remember that money expended upon the city is returned by the money expended by charmed visitors; deal with her contractors as we deal with ours; stop her handbills; clean and water her streets better; and, although one would have not dared to have breathed it fifty years ago, let her take some lessons from London, and we will return to our old love."

The Liverpool Sketch-Book.

The great lack, generally speaking, of a thorough grounding in monumental work is one of the defects of English architectural training, and more or less explains the failure of English architects when confronted with a problem to be solved in the "grand manner." The School of Architecture at Liverpool University, under Professor Reilly, has become closely identified with the modern and growing movement for a closer study of monumental architecture, and we need hardly emphasise here (seeing how frequently we have done so in the last few years) the importance of such study. By arrangement the publishers of "The Architects' and Builders' Journal" have arranged to issue in September next, under the above title, the first annual of the Liverpool School, a quarto volume, containing some 112 illustrations, at the modest price of 2s. 6d. nett. This will contain designs and measured drawings by present students of the school, through the work of its travelling scholars, of its old students, and others connected with it directly or sympathetically. For the first time there will be published detailed drawings fully shaded and rendered of St. George's Hall, Liverpool, (Elmes and Cockerell), the Taylor and Randolph Museum, Oxford (Cockerell), also measured drawings of the Bank of England, Manchester (Cockerell), the Customs House, Dublin (Gandon), St. Mary-le-Strand (Gibbs), the Palazzo Gran Guardia Vecchia, Verona (Cortoni), and many others. The book will be most valuable to architects and students alike, and is within the reach of all. We have no hesitation in recommending readers to obtain copies, but as the edition is strictly limited, they must order them early. Further particulars and an order form are given on page iii. of our advertisements.

More Vandalism.

Professor Baldwin Brown writes to the "Times" complaining bitterly of the destruction of two fine trees at Coldharbour, Dorking. These two trees were in juxtaposition to the School House. One of them, an elm tree, focused the whole of a uniquely picturesque view. It was "one of the most conspicuous ornaments of the village, sound and undecayed," but it has been felled; and a still finer tree, a Spanish chestnut, has also shared the same fate. The reason for this is stated by the Professor to be the reconstruction of the said school. The coal shed of the master's house is to occupy the site of the elm tree; and the school latrines are to occupy that of the chestnut. There seems to have been no particular reason why those buildings could not have been placed elsewhere and the trees saved. "I am not craving space for these lines," writes Mr. Brown, "merely to complain of what has been done, though the matter is lamentable enough to excuse this, but I would ask, if possible, help to make this sort of thing less easy for the future. The Government has recently shown its solicitude for our older architectural monuments by the appointment of Royal Commissions for the survey of them, and the time will probably not be long before it follows the example of the Prussian and other European Governments, and takes measures in the interest of the preservation of the natural beauties of the land. Till this comes about it is incumbent upon all who look on these matters from the public standpoint to do their best to prevent these local aberrations. The architects for this school reconstruction, a London firm of standing, surely did less than their duty as members of an artistic profession; surely the Surrey Education Committee were not fully mindful of Surrey interests when they failed to impress on the local authorities the need of considering seriously what they were doing. The Education Department takes a small view of what education really should mean if it is quite careless as to amenity in the surroundings of schools, and passes by on the other side" when architecture or natural beauty falls into unheeding hands.

A German Archæologist.

The death is reported, from Strasburg, of Professor Adolf Michaelis, the German archæologist, at the age of 76. Dr. Michaelis, who had travelled considerably in Greece and Italy, was the author of a large number of works on archæological subjects, and from 1872 until 1907 held the post of Professor of Classical Archæology at Strasburg University, where he organised the archæological museum. Professor Michaelis has also held the posts of Professor of Archæology at the Universities of Greifswald and Tübingen. He was an LL.D. of Cambridge and Edinburgh Universities.

The Meteorological Office.

The Press has chronicled the appointment of Mr. R. G. K. Lempfert, M.A., to the position of superintendent of the Forecast Department of the Meteorological Department—or as our contemporaries facetiously term it—to the post of Clerk of the Weather. This department is, by the way, to inhabit a new building now being erected for it in Exhibition Road, South Kensington. Gradually the collection of unsightly iron sheds is being removed to make room for more reasonable buildings. One wishes, however, that the department could as easily move the causes for our bad summers as it can itself be moved.

All Saints' Church, Woodham, Woking.

A mile to the north of Woking Station lies the Church of All Saints, Woodham, built from the designs of Mr. W. F. Unsworth. The church lies nestling among thick pine woods, and the idea of the architect has been to produce what is essentially a village church, simple in its lines and low in its proportions, with an oak-shingled central spire in true old Surrey fashion. The church is entered on the south side by an oak porch of ample proportions with broad oak seats. As regards the interior of the church the scale that should belong to a village church has been preserved throughout. The nave arcade consists of five bays of clustered columns, and next the chancel are two smaller arches of 4ft. span, over which the rood-screen is to be constructed, approached by a staircase and steps crossing the aisle, giving access to the rood screen through two openings; the same stairs lead to a muniment room over the entrance to the Lady Chapel. The choir is arranged with a clerestory arcade in the north and south aisles. The altar front and rails are carried out in olive, oak, ebony, and cedar, the former from the Mount of Olives. An arch in the south side of the choir opens to the Lady Chapel, with seating accommodation for about thirty. The west window of the nave, designed by Professor Moira, represents the Archangels of Light triumphing over the Powers of Darkness. It is a fine work, showing a powerful draughtsmanship and a masterly use of colour. The external walls are of Bargate stone carefully coursed in scale with the building; hand-made tiles have been used for the roof, and Monks Park Stone has been used for the windows. A few works still remain to be carried out, including the reredos, rood and choir screens.

NEWS IN BRIEF.

The Commissioners of Works give notice that the hours of closing the Picture Galleries at Hampton Court Palace on public days will in future be as follows: 6 p.m. in the months of May, June, July, and August; 5 p.m. in the months of March, April, September, and October; and 4 p.m. in the months of January, February, November, and December.

* * *

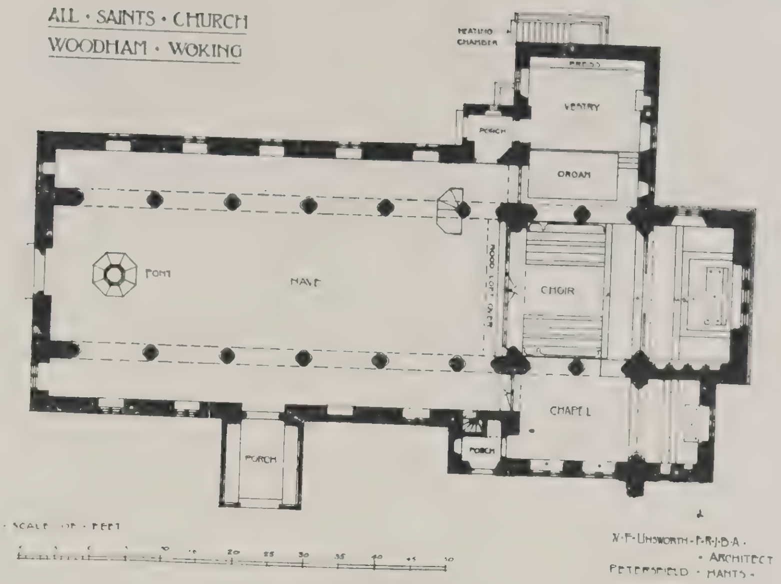
The eastern portion of the crypt under the Guildhall, London, was opened to the public on Monday week. The western crypt, which is believed to have collapsed during the great fire, and to have been restored by Wren, is still used as a storehouse, and next year being the quincentenary of the Guildhall, it is suggested that it would be a suitable date for its restoration. The eastern crypt is open from ten to five daily except Sundays.

* * *

The Guildhall, Westminster, the office of the Middlesex County Council, and the Middlesex Sessions house, which stands facing the north front of the Abbey, are to be extended at a cost of about £68,000.

* * *

The new Paul's Cross, which has been erected in the garden of St. Paul's Churchyard, with a sum of £5,000 bequeathed by the late Mr. H. C. Richards, K.C., has been completed; but the opening ceremony will not take place until after the vacation. The column, which is 30ft. in height, is surmounted by a bronze figure of St. Paul holding a pastoral staff. The memorial is erected, to all intents and purposes, on the exact site occupied for many centuries by the famous Paul's Cross.



The death is announced, on August 5, of Mr. Samuel Jackson, Architect and Surveyor, of Bradford. Mr. Jackson, who had been in feeble health for some years past, was well known in his district and had considerable experience in arbitration work.

* * *

Mr. Paul R. Montford, R.B.A., who is executing the statue of the late Sir Henry Campbell-Bannerman for Westminster Abbey, has nearly finished the mould. There remains the work in marble and the casting of the bust in bronze. The decorations also will be in bronze. The bust will stand in a niche of black marble, the pilasters of which are decorated with thistles in token of the nationality of the late Prime Minister. The pedestal upon which the bust will stand is to be of red marble, with laurel wreath in bronze.

ALL SAINTS' CHURCH, WOODHAM, WOKING: THE MORNING CHAPEL.
W. F. UNSWORTH, F.R.I.B.A., ARCHITECT.
(See Centre Plate.)

* * *

The memorial to Mr. John Boyd Dunlop, the inventor of the modern pneumatic tyre, is to be erected in the Princes Gardens, Edinburgh. Mr. H. S. Gamley, A.R.S.A., is the sculptor. The memorial will stand upon a raised platform architecturally with twin flights of steps leading up on either side. It will be surmounted by a classic female figure seated on the globe, her right arm resting on an ornamental motor wheel, emblematic of its universal use over the world, speed being indicated by the figure of Mercury held in the left hand.

* * *

A building to shelter the "Nigg stone" at Nigg, which contains the earliest Celtic designs known, has been erected by Mr. Andrew Carnegie.

* * *

A serious crack has developed in the wall of No. 9, Staple Inn, Holborn, E.C., and the house has been shored up for the purpose of repair. This house, rebuilt in 1729, faces the entrance from Holborn and is over the archway leading to the inner court by the Patent Office Library.

* * *

Mr. Edward Robert Robson, F.S.A., F.R.I.B.A., F.S.I., being now free from all public appointments (except that of architect to the Royal Institute of Painters in Water Colours), announces that he has taken as junior partner Mr. Joseph Harold Gott, and that the practice will henceforth be continued under the title of "E. R. Robson and Gott," at Palace Chambers, 9, Bridge Street, Westminster, S.W.

* * *

The Guardians of St. George-in-the-East, London, are inviting applications for the position of architect to their Board. Applicants, who must be duly qualified and certificated architects, will be required to prepare plans, specifications, etc., to attend meetings of the Board and committees when required, and to supervise alterations and repairs, etc., at the Guardians' establishments. The architect appointed will be paid a retaining fee of £52 10s. per annum, and a commission of £5 per centum on all contracts not exceeding £2,000 per contract carried out under his supervision. Applications, stating particulars of qualifications and experience, must be forwarded to Mr. R. M. Lochner, clerk, Guardian Offices, Raine Street, Old Gravel Lane, E., by 10 a.m., on August 25.

* * *

A company in Queensland has an arrangement with the Government by which it is to erect a large mill for the purpose of making spirit from pine trees, and, in consideration of a concession, has agreed to pay royalty at a reduced rate on the tops of trees, which hitherto went without payment. The arrangement will only come into force when the Nananga railway line is built, and the first sod has just been turned. The idea underlying this arrangement was that timber should not be cut and wasted until it could be hauled to market. Pine deteriorates as soon as it is cut, and after a very little time is quite useless unless protected from the weather.

* * *

An International Hygiene Exhibition is to take place in Dresden next year. A notable British Committee, with H.R.H. Princess Christian as Patroness, Sir Thomas Barlow, Sir William Bennett, Mr. Henry Butlin, Sir William Church, Mr. J. M Cotterill, Mr. Andrew J. Horne, Mr. W. A. Jamieson, Surgeon-Gen. Sir Alfred Keogh, Mr. D. N. Knox, Sir John Lentaigne, Sir Thomas Oliver and Sir William Treloar as Vice-Presidents, and nearly every hygienist of importance as members, will organise the Scientific Department, and will exercise a strict censorship over goods submitted for exhibition, while, in addition, the Administration in Dresden reserves to itself the right of refusing any undesirable exhibit. Thus the merit of articles displayed in the Exhibition is *ipso facto* established. Further information can be obtained from the London offices of the International Hygiene Exhibition, 47, Victoria Street, S.W.

* * *

The Willesden Paper and Canvas Works, Limited, has declared dividends at the rate of 15 per cent. on the ordinary shares, and 10 per cent. on the deferred shares for the year ending June 30.

* * *

The late Professor George Aitchison, of 150, Harley Street, London, W., R.A., past-president of the Royal Institute of British Architects, aged 84 years, left estate of the gross value of £13,077, including £10,974 in net personality. The testator bequeathed £100 to the Royal Academy Fund for Architects' Pensions. £100 to the Royal Institute of British Architects Benevolent Fund. His two University College of London prizes to the Royal Academy. His Royal gold medal (after the death of the survivor of trustees) to the Royal Academy of Arts. To his friends Timothy Holmes, Thomas Armstrong, C.B., Benjamin Inglelow, W. J. Locke (late secretary of the Royal Institute of British Architects), Henry Sweet, and J. J. Shaw, £5 5s. each, for a mourning ring. £50 to his clerk, Walter Homewood. £50 to his former housekeeper, Eliza King.

* * *

The total value of the buildings erected in Winnipeg during the first six months of the present calendar year amounted to nearly ten million dollars, an increase of two and three-quarter millions over the highest previous record. Building operations in 25 Canadian cities during May, 1910, show an average increase of 50 per cent. over the figures of May, 1909.

* * *

The committee which deals with the Bradford City Architect's Department met recently under the presidency of Ald. H. M. Trotter, and considered the position created by the resignation of the City Architect. Mr. R. G. Kirby. It was decided to advertise for a successor at £300 per year, which is £50 less than the previous salary. The chairman endeavoured to get the question postponed for six weeks, and maintained that by a general move upwards in the office the position could be satisfactorily filled and money saved, but the committee decided otherwise.

* * *

Mr. W. J. Devlin, A.R.I.B.A., late of 12, Buckingham Street, Strand, London, has removed to 156, Union Street, Aberdeen.

* * *

Messrs. William and T. R. Milburn, F.R.I.B.A., Architects, have removed from 20, Fawcett Street, Sunderland, to 3, Park Terrace, Toward Road, Sunderland.

* * *

Mr. J. T. Ashton, architect, of Ashton-on-Mersey, died recently. A few years ago he was a prominent public man at Altrincham, and had been chairman of the district council.

* * *

At a meeting of the City Corporation in regard to the proposal to sanction the erection of an iron and glass shelter over the main entrance to Cannon Street Station (Metropolitan District Railway), Mr. W. W. Green pointed out that such shelters were often a great annoyance, as the public ran under them the moment there was a shower, and pedestrians were in consequence hindered. Mr. J. Gunton, chairman of the Streets Committee, agreed that the point was an interesting one, and accordingly took the report back.

* * *

The R.I.B.A. Office and Library will be closed from the 22nd August to the 3rd September owing to alterations necessitated by the extension of the Institute premises. Party-wall notices, forms of building contract, and other R.I.B.A. publications may be obtained during this period from Mr. B. T. Batsford, 94, High Holborn, W.C.

* * *

The Lord Mayor, at a meeting of the Court of Common Council at the Guildhall, in calling the attention of the Court to the action he had already taken in trying to advance the apprenticeship and training of the young, said he would preside at a conference of representatives of all classes of industries and millions of workers to be held in the Guildhall, but had stipulated that the gathering should be thoroughly national in character and non-political, and that the proceedings should be arranged so as to focus the conclusions of the conference in the best form fitted to promote the important object in view. The Court then proceeded to nominate six members to work with the Lord Mayor as a committee representing the Corporation, namely, Sir George Woodman, Sir T. Vezey Strong, Sir Richard Stapley, Deputy Morton, M.P., Mr. A. J. Hollington, and Mr. George Briggs.

* * *

The City Corporation has voted £30,000 towards the cost of completing the widening of Bishopsgate Street Without. The London County Council agreed to contribute to the cost of the widening at the junction of Bishopsgate Street Within and Cornhill, the sum not to exceed £3,000. The estimated cost of the improvement is £7,000. About £80,000 was voted for street improvements and in other directions in which the ratepayers are interested. The cost of the large subway for pedestrians at the foot of Blackfriars Bridge was reported to be £25,869, which has been paid by the London County Council in return for the widening of Blackfriars Bridge. The Court adjourned for the summer vacation.

* * *

Mr. Frederick Christian Wellstood has been appointed secretary and librarian to the trustees and guardians of Shakespeare's birthplace in succession to Mr. Richard Savage, who retires from the office in October. Mr. Wellstood, who is now superintendent of the new reading-room at the Bodleian Library, has been since 1902 a senior assistant there. There were 182 candidates for the post.

* * *

Mr. Frederick Chance has laid the foundation-stone of the Stanwix Institute to be erected in the memory of Mr. Miles MacInnes, of Rickerby. There was a large gathering of friends from Carlisle and the county, over which Mr. Henry Howard, Chairman of the County Council, presided.

* * *

Mr. Paul Montford has completed the clay model of the bust of the late Sir Randal Cremer, which is to be placed in the Palace of Peace at The Hague in commemoration of his work for international peace. The bust has been inspected by the President of the Local Government Board.

* * *

The restoration of the ancient moat and bridge at the west front of Hampton Court Palace was delayed in consequence of the death of the late King. At that time the question of the designs of the castellated parapet along the front of the moat and the pillars and finials on the bridge were under consideration. The work, which has been put in hand, is expected to be finished in about two months. There were sufficient thin red bricks recovered from the excavations to complete the walls of the moat where they were defective, and the freestone coping and embrasures are being made to harmonise with the rest of the buildings. The bottom of the moat was sown with grass seeds in the spring, and now presents the appearance of a well-kept lawn, access to which is obtained by a doorway placed in one of the towers abutting on the moat.

* * *

The old castle at Newcastle, known more familiarly among archæologists and antiquarians as the Norman Keep, is once more in the hands of the repairers, and is being surrounded by scaffold poles. It was built between the years 1172 and 1177.

* * *

Messrs. E. A. Roome and Co., builders, of 56, Basinghall Street, E.C., and Urswick Road, Homerton, N.E., have secured the contract for the erection of Nos. 37 and 29, Marchmont Street, W.C., under the supervision of Messrs. Young and Hall.

* * *

The committee in charge of the scheme for a monument to ex-President Cleveland have decided that it shall take the form of a granite tower of novel construction at Princetown University. The estimated cost is £20,000, of which £15,000 has already been received.

* * *

The French President has awarded medals to the following architects, among others, for services rendered during the recent floods at the capital: Silver medals, first class to M. Jalabert, Paris; M. Pichot, Meudon; M. Pray, Architect-in-Chief, Prefecture of Police; a silver medal second class M. Mancel, Saint-Ouen; and a bronze medal to M. Batton, Argenteuil.

Mr. J. Taylor, Chairman of the Lordship Lane Progressive Association, writes to "The Star" to say that the decision of the L.C.C. Housing Committee is a wise one, "for a large portion of the estate is absolutely unsuited for the erection of working-class dwellings, owing to the distance at which it is situated from any line of communication. The present Housing Committee have done more to develop the estate and make it attractive to residents than any previous committee. Had the estate been developed upon the lines which the first Progressive Housing Committee started, it would have been an ugly, barracky, depressing conglomeration of houses; now it is an ideal spot."

* * *

The directors of the Hampstead Garden Suburb Trust, Limited, in their report to the shareholders, state that villas and houses have been, or are being, erected on seventy-four plots at a cost of £46,000. The Garden Suburb Development Company have undertaken the construction of houses valued at £139,000, and the Hampstead Tenants, Limited, have erected buildings to the value of £172,000. Other buildings have been erected at a cost of £40,000. The church, St. Jude's-on-the-Hill, will be consecrated by the Bishop of London when it is completed, and the building of the Free Church will, it is hoped, be commenced in the autumn. It is hoped that a first-rate secondary school for boys up to 12 and girls up to 18, with special relations with the University colleges, may be provided later.

* * *

The statue of Dr. Samuel Johnson, erected outside St. Clement Danes Church, was unveiled at a late hour on Thursday week by Mr. Percy Fitzgerald, the donor. The Rector of St. Clement Danes (the Rev. Septimus Pennington) died a few days before, and it was thought appropriate to unveil the statue, in the erection of which he was greatly interested, before his interment. The statue is a life-size figure in bronze, and the face is copied from Reynolds's well-known picture. It stands on a granite pedestal, and the inscription is as follows: "Samuel Johnson, LL.D., critic, essayist, philologist, biographer, wit, poet, moralist, dramatist, political writer, talker. Born 1709, died 1784. The gift and handiwork of Percy Fitzgerald, F.S.A., and erected by the Rev. S. Pennington, M.A., Rector of St. Clement Danes, 1910."

* * *

A total of £2,813 was realised in the sale of the contents of Parnham, the Dorset residence of the late Mr. Vincent Robinson. A German sixteenth century armoire made 70gs.; a three-tier sideboard from Godstone Priory and Nonsuch Palace, 120gs.; an old Italian draw table, 33gs.; two old Italian chairs, 80gs.; a French early seventeenth century armoire, 43gs.; an early seventeenth century cupboard, 60gs.; and an old Chinese black and gold lacquer work cabinet, 135gs.

* * *

Canon Benham, the rector of St. Edmund King and Martyr, Lombard Street, a well-known antiquary and authority on Old London, died recently.

* * *

The chairman and members of the Shoeburyness Council on August 3rd formally opened eight cottages erected by Mr. Michael Simpson, exclusively for old age pensioners. Each cottage is intended for two persons, and is let at 3s. per week, inclusive of rates and taxes.

Messrs. Stockdale Harrison and Sons, Leicester, the architects for the Usher Hall, Edinburgh, and Mr. H. H. Thomson, who is associated with them, have done much important work in Leicester, notably the new bank for the Stamford Banking Company, which cost £20,000, and the Vaughan Working Men's College. Mr. Thomson won in competition the Isolation Hospital for the Corporation of Leicester, which cost £56,000, and his design was placed first for a new Masonic Hall in Leicester.

* * *

Mr. J. F. Holden, architect, of Manchester, is dead. Mr. Holden was the Hon. Treasurer of the Manchester branch of the Dickens Fellowship.

* * *

Mr. Cecil Bernard, a young architect, of Burton-on-Trent, has been presented with the Royal Humane Society's medal and certificate for saving the lives of two ladies who were in danger of drowning. The presentation was made by the Mayor.

* * *

Owing to a stack fire at the Old Priory Farm, Dartford, Kent, the remains of the Old Priory, founded by Edward III. in 1344, very narrowly escaped destruction, but the building was saved by strenuous efforts.

* * *

The Royal Commission appointed under the chairmanship of Sir John Rhys, Principal of Jesus College, Oxford, to make an inventory of the ancient and historical monuments and constructions of Wales and Monmouthshire, issued their first report on Wednesday week. The report describes the methods which the Commissioners propose to adopt in making their inventory, and the hope is expressed that the visits made by the Commissioners to different centres will arouse a general interest in antiquarian research, and a desire to preserve the ancient monuments of Wales from destruction.

* * *

Mr. J. W. Synnerton, sculptor, has died in the Isle of Man at the age of 62. He first attracted attention by his statue "Cain," exhibited at the Royal Academy in 1873, and he has been a regular exhibitor there until recent years.

* * *

The remains of 30 bodies have been discovered by the explorers who are delving on the site of the ancient Roman city at Caerwent. The bodies were found generally in rows from east to west above some of the Roman masonry. As there was an early monastery there, it is suggested that there may also have been a burial-ground, and that the remains may not be Roman, but may belong to the monastery burial-ground.

* * *

Important extensions are to be carried out shortly at Port Talbot Docks, Swansea, at a total cost of £136,000. Of this amount £86,000 is to be expended on new sidings and lines to accommodate between 3,000 and 4,000 wagons, or from 30,000 to 40,000 tons extra traffic. Parts of the dock area are to be deepened, and new wharves, tips, and power stations are to be erected.

* * *

The fine old Tudor mansion Porters Grange, Southend, at one time the residence of Disraeli, has been sold, and the estate is to be developed for building purposes. An effort is to be made by the townspeople to save the estate.

It is reported that in regard to the opening to the public of the Crypt at the Guildhall, Mr. Sydney Perks, F.R.I.B.A., the City Surveyor, states that the whole of the building was erected at one time. It was begun in 1411 and completed in 1425, the porch being added last of all. No discoveries of Norman work have been made. Everything found—including windows, staircase, and passages—helped to fix the date as the fifteenth century. The Roman remains now exhibited were stacked away like rubbish in a back yard, and until they were recently unpacked no one knew how fine they were.

* * *

A famous fourteenth century window of priceless local and antiquarian interest in the Parish Church of Ashton-under-Lyne has been smashed, it is alleged, by a man and boy in order to rob the offertory boxes. The window represented a scene from the old family life of the Asshetons, one of whose members figures in a legend as "the Black Knight" who got rid of a succession of wives by rolling them down hill in spiked barrels and whose effigy is still every Easter Monday carried round the town and burned. Last Easter "the Black Knight" was the central figure in a town pageant.

* * *

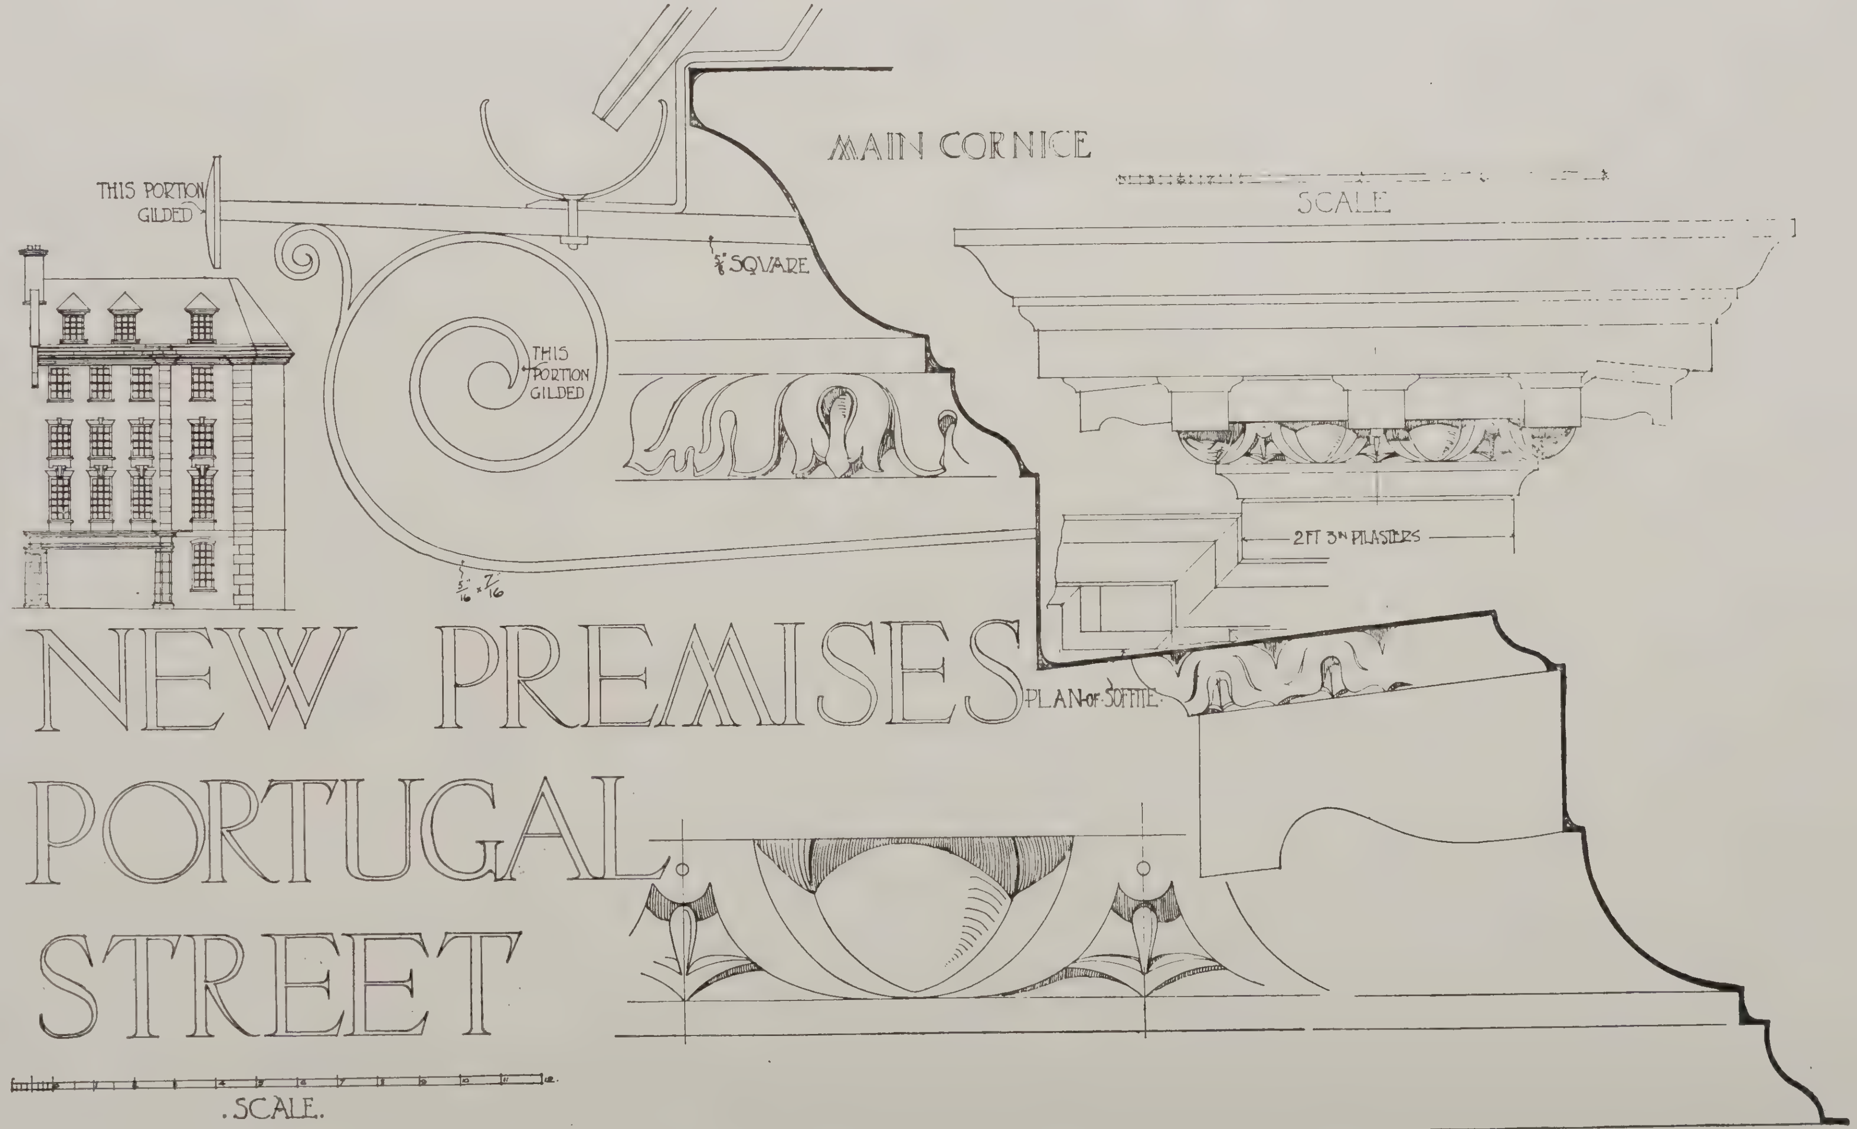
The partnership, existing for 21 years, of Messrs. Young, Tinker and Young, builders and contractors, of Monsall Street, Queens Road, Manchester, was dissolved as on June 1, 1910, owing to the failing health of Mr. Daniel Young. The business since that date has been carried on by William Tinker and Robert Young under the style of Tinker and Young, and for family reasons the business has now been converted into a private limited company under the style of Tinker and Young, Ltd. The assets and debts of the old firm are taken over by the new company.

* * *

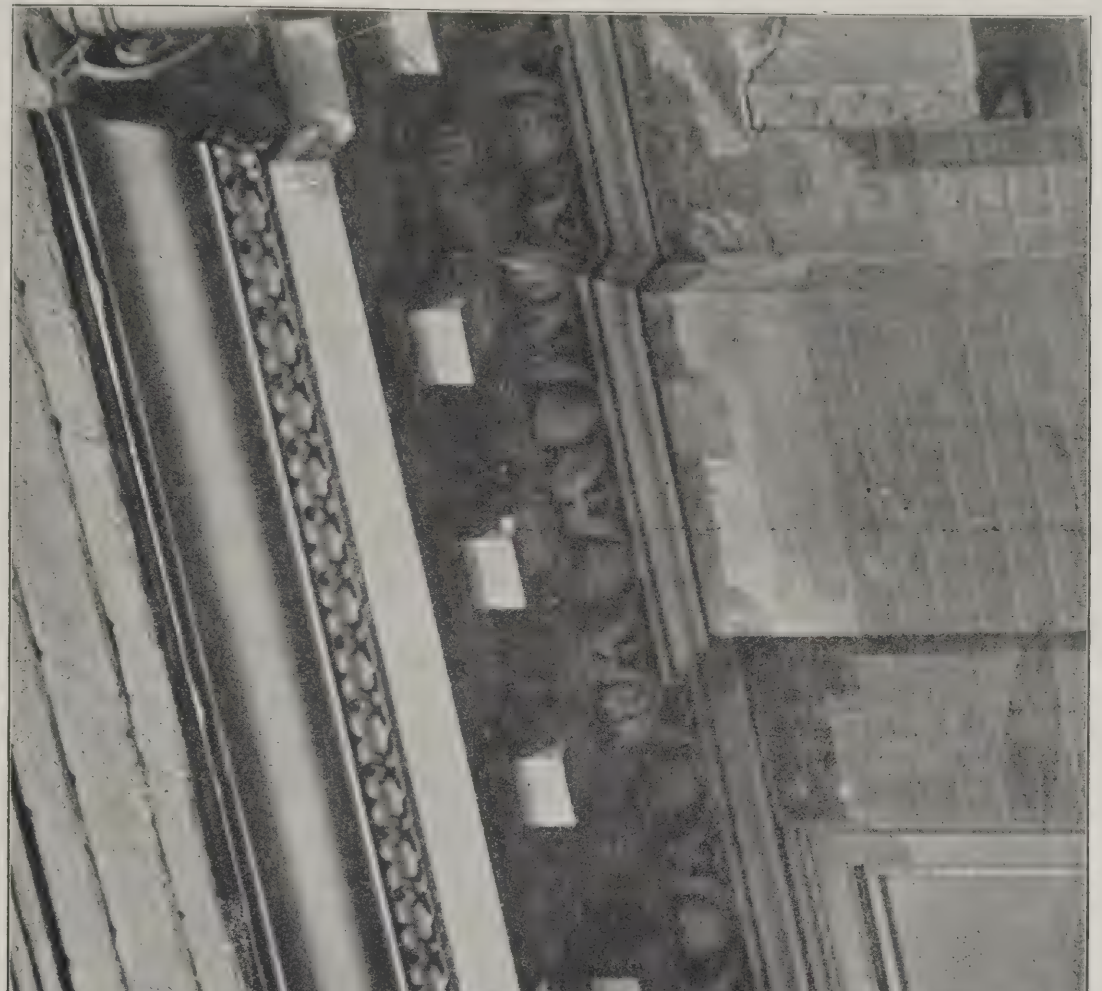
The architect for the Middlesex Guildhall extension is Mr. J. S. Gibson, F.R.I.B.A., and he, in conjunction with the County Surveyor, has submitted a scheme in which two new Courts, with a public waiting hall adjoining, are to be provided on the ground floor. On the first floor will be the committee rooms and offices, with a wide circular corridor giving direct access to every room. The present Council Chamber, seating 78, is to be replaced by one with accommodation for 105 members, with galleries for reporters and the public. The Special Building Committee are authorised to obtain tenders for the work from not less than 12 contractors approved by the Council. The new buildings are to be in red brick and Portland stone.

* * *

Consumers of gas in the district of the Gas Light and Coke Company will be glad to note that in the speech of the Governor (Mr. Corbett Woodall) at the meeting of the shareholders on the 5th inst., it was foreshadowed that there would be a further reduction in the price of gas at the end of this year, making the seventh reduction in eight years. This continuous decrease in the price charged by the Gas Light Company is very welcome alike to the consumers, who benefit to the extent of nearly £100,000 a year by every reduction of 1d. per 1,000 cubic feet; to shareholders, whose dividend can only rise as the price falls; and to the employees, whose share of the profits also varies inversely with the price of gas.



This drawing gives details of the cornice shown on the opposite page and of the wrought-iron gutter brackets.
CORNICE ON PREMISES IN PORTUGAL STREET, LINCOLN'S INN FIELDS, W.C.
HORACE FIELD, F.R.I.B.A., AND E. SIMMONS, ARCHITECTS.



This cornice is on the building occupied by "The Church Times" and Messrs. George Bell and Sons, the Publishers. It is executed in cement, painted. The mouldings are of good outline, and the whole cornice is bold in effect.

CORNICE ON PREMISES IN PORTUGAL STREET, LINCOLN'S INN FIELDS, W.C.
HORACE FIELD, F.R.I.B.A., AND E. SIMMONS, ARCHITECTS.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

MEMORIALS TO THE LATE KING.

Cromer.

At a meeting of the parishioners of Cromer, in the Parish Hall, it was resolved to support the scheme for the extension of the Norfolk and Norwich Hospital, to which half the funds to be collected will be devoted; the other half to go to the Cromer Cottage Hospital.

Windsor.

An appeal is being made for sums towards the memorial fund here, which is to clear the Edward VII. Hospital, Windsor, of debt, to endow the same, and to erect a statue to the late King in the grounds in front of the Hospital.

Manchester.

Opinion here is at present divided between the erection of a Consumption Hospital and the erection of an Art Gallery on the Piccadilly site, including the laying out of the latter.

Felixstowe.

A town meeting has been held at which alternative proposals to erect a statue or to contribute towards the Croydon Hospital were discussed. The matter was deferred for consideration in October.

Warwickshire.

At a meeting at the Shire Hall, Warwick, it was decided that "the best form of memorial is the establishment of an open-air hospital for the treatment of an instructional character of persons suffering from consumption." A large and influential committee was formed to carry out the scheme.

Ealing.

A town meeting has decided to dedicate the new hospital now building as a memorial; and the Mayor is now seeking permission for the use of the name "King Edward Memorial Hospital."

London.

On the invitation of the Lord Mayor, the following have joined the Mansion House Committee for providing a memorial in London to King Edward:—The Archbishop of Canterbury, Viscount Iveagh, Sir Thomas Barlow, Mr. Henry T. Butlin, Mr. W. H. Winterbotham, Sir Edward Poynter, Sir Edward Hain, and the Chief Rabbi.

Scotland.

Feeling in Edinburgh favours a scheme for the improvement of Holyrood Palace. It is understood that Glasgow may agree to the scheme, particularly if Holyrood is so improved as to be habitable by the King and Queen for a little while each year. The movement for a Scottish National memorial was started at a private meeting of representative citizens in Edinburgh in June. The meeting, which was called by Lord Provost Brown, approved of the proposal, and the co-operation of the local authorities is now sought.

Oxford.

The memorial scheme will probably take the form of a sanatorium for the treatment of tuberculosis for the City and County of Oxford. Plans for this have already been prepared, and the committee have in view a favourable site at Shotover.

Darlington.

Nothing definite has yet been decided, but the suggestion most favoured is that the Feethams Field, which the Corporation recently purchased, should be utilised in some manner—possibly by the erection of a monument or by the building of a Town Hall and municipal offices of which the town is in need.

Chard.

Three suggestions have been made as to the nature of the memorial. One is the erection of baths and wash-houses, which are badly neded; the second that a pleasure ground be laid out, and a third that the Jubilee Homes, erected to commemorate Queen Victoria's Jubilee, should be extended.

MAGAZINES & REVIEWS.

The "Architectural Record" (New York) is entirely taken up with illustrations of "American Seaside Homes," coupled with a short introductory article on the subject. Both are disappointing. Seaside homes, regarded as a class, should have a certain definite character suggested by their situation. There is no hint of such an idea in the article, and nothing of a special character in the houses, with the exception, the "new house at Buzzards Bay," of which Mr. Harry B. Russell is the architect. This has the character we want (in some degree at least), in its simplicity, low proportions, and plain masses of chimney-stacks. The rest of the designs published have no special character at all; they might be villas anywhere. A seaside house should suggest the seaside, either in an appearance of strength to resist gales, or in some character of design, not easily to be defined in words, suggestive of sea and shipping. One very good example we know; the terrace designed by Mr. Prior, at West Bay, Dorset. This is close on the sea, and there is an indefinable suggestion of ship construction about it which is very unusual; it looks as if made for the situation. But we seldom hit on anything like this in English seaside houses; and the Americans do not seem to get on any better. Some of the houses illustrated would do very well for lake houses, but not for seaside houses. There is (or should be) all the difference between the two.

The "Berliner Architekturwelt" is also largely occupied with a special class of designs—exhibition pavilions and kiosks for the exhibition of special classes of building materials and patents. Many of these are very interesting and original, and might be noticed with advantage for new hints for English exhibitions. There are also a series of designs, some of them very good for terra-cotta stoves—a specially German institution.

"Moderne Bauformen" seems to go on with a never-ending variety of illustrations of furniture and interiors—for, in spite of its title, it deals much more with these than with actual architecture. There is less of eccentricity and more of real design and character in these things than there used to be in this publication; a great deal of the simpler furniture is very good and contains what may be called new ideas.

The "Burlington Magazine" gives two studies of curious quasi-classic capitals, both consisting of Ionic volutes with a Corinthian abacus above and Corinthian leafage below. One of these is from a print by Giovanni Antonio di Brescia, the other from an etching by Altdorfer; both in the British Museum. They are obviously the same object drawn by two different hands, and present some curious differences of detail along with general resemblance of type. The original was apparently a capital from one of the Latin basilica churches. In an article on the Munich exhibition of Mohammedan art, Mr. Roger Fry draws attention to various details in Mohammedan art bearing a resemblance to details in Assyrian art. "It would be possible," he says, "by the help of exhibits at Munich to trace certain Assyrian forms right through to mediæval European Art." We should think it very likely; the point has been mentioned before in literature of Art, but Mr. Fry adds some new observations to it. In connection with the subject we may mention that the Italian mediæval device of columns resting on the backs of animals is found in an Assyrian bas-relief representing a palace. The "Burlington" contains also an article with some illustrations of English mediæval alabaster work—sculpture; also an illustration of a very fine bronze crucifix, from a private collection, attributed to Benvenuto Cellini.

The "Art Journal" contains an article by Mr. Yockney, entitled "An artist's holiday," which seems to be mainly a peg on which to hang a number of illustrations of nature by different well-known painters, ancient and modern. If we do not quite see the point of the article, or its connection with the illustrations, the latter are at all events an interesting set, and include a full-page plate of a landscape by that now rather unduly forgotten artist J. D. Harding. A fine illustration is given of a Dutch painting, "Avenue in a wood," by Hackaert, a seventeenth century painter whose style and composition remind one of Hobbema; or is it that two painters of Dutch landscape necessarily resemble each other? Mr. A. L. Baldry contributes the second of his articles on "Embroidery and Needlework," with some good illustrations, but why did he include the landscape with stags drinking, by the "Decorative Needlework Society"? The society ought to have been better employed than in work so entirely alien from the proper aims and methods of embroidery. Not a word is said in the article to point out the error; in fact, the work is referred to with implied praise, as showing the wide ground the society's work covers. A great deal too wide; embroidery has its own limits, and realistic landscape is outside of them; an "Art Journal" ought to point that out, instead of encouraging such an error.

The "Century" has an article on "Studying Earthquakes," by Professor Jaggar of the Massachusetts Institute of Technology, which has one piece of direct architectural interest in the shape of an illustration of "an earthquake-proof building at the University of Tokio." It is a small brick building to contain seismographs, and it is noted that "the walls have a parabolic curvature, theoretically correct, to withstand a strong earthquake"; the curve is in the section of the outer face of the wall, spreading toward the base; what is the section of the inner face is not shown; presumably perpendicular, but it would have been more to the purpose to have given a section of the whole building instead of a mere picture of it.

The "Fortnightly" has an excellent article by Professor Hartog on "The teaching of nature-study" in schools, and the right use of pencil and brush in connection with it.

In the "Antiquary," Mr. Fryer concludes his article on "Fonts with representations of the seven sacraments," with some illustrations; and Mr. Geo. Bailey commences a series on "Some curious carvings found in old churches." He takes some of the heads in the misericorde carvings as being of value as illustrations of the aspect of people living in those days. Mr. Tavenor-Perry contributes an important article on the interesting subject of "The Shield of Venice" and the history and meaning of its devices.

The "World's Work" contains an interesting article on the running of a big hotel, with particulars of the engineering plant now considered necessary for such a building.

ARCHITECTS UNDER EXAMINATION.

The passion for architectural symposiums in the general Press increases. In "The New Age" for August 11th, Mr. Huntly Carter has fired the following leading questions at a number of eminent architects :—

1. Have recent developments, in your opinion, shown any advance in the direction of increasing the beauty of domestic and public architecture?

2. Do you think that the artist, as distinguished from the artist-architect, should have a real place in the modern practice of architecture?

3. Do you believe that this place should be limited to design, decoration, or any one department of the practice of architecture?

4. Would you say that the causes which prevent artists occupying this place are to be found in the artists themselves or in the public administrators, or does the main cause lie in the limitations of our social life?

5. Have you any suggestions?

The results are various. Mr. Norman Shaw expresses his interest, but regrets that age and ill-health prevent him taking an active part in the discussion. Mr. Ernest Newton says "an architect is an artist or he is not an architect at all. Curiously enough, though we in England have a school of Domestic Architecture which more or less sets the pattern for the rest of the world, the English public, speaking broadly, are completely unaware of the fact, and would be quite uninterested if they were. To them an architect is a professional gentleman, sometimes quite respectable, who is an authority on ancient lights, ground values, etc., with some small skill in drawing plans. To this section of the public art is painting, and an artist is a painter; they have no desire for architecture and no appreciation of it, while on the Continent an architect of repute is accepted as an artist as a matter of course.

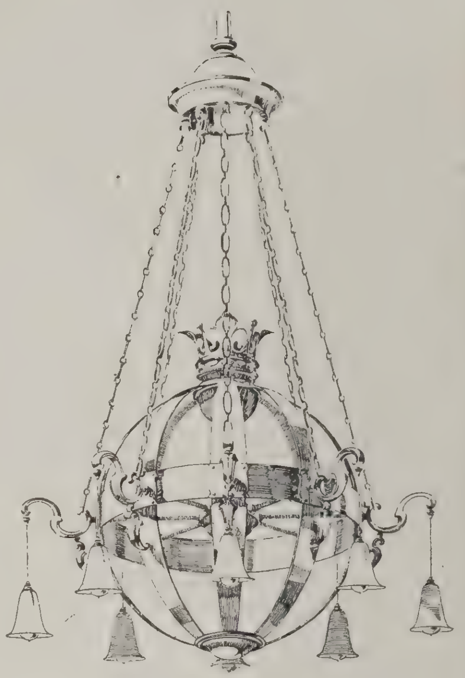
"This total want of understanding either of the meaning of architecture or the aims and accomplishments of the architect naturally produces a class of men who exploit this great art very much to their pecuniary advantage and greatly to the detriment of London and other big towns. Possibly ninety per cent. of the buildings put up in London at the present time are the work of men who have been selected quite at haphazard, because they are somebody's cousin or brother-in-law, or for some equally fantastic reason; no questions are asked—they are architects, and that is sufficient.

"Here and there a few buildings proclaim themselves as the work of accomplished men; and undoubtedly there is a gradual awakening to some sort of appreciation of the art of building. Many of the big commercial firms are now realising that a beautiful building is an asset. There is also a decided increase in the number of those who take a keen, appreciative, and intelligently critical interest in domestic architecture.

"We want no advisory bodies. A bad painter or sculptor simply drops out; a bad musician is of no account, not because there are committees of taste, or censors of art, but simply because the public have sufficient appreciation of those arts to demand and so to create a high standard. If they will only learn to show the same appreciation of architecture there will be no occasion to ask any of these questions."

Mr. G. L. Aitken, F.S.A., of Edinburgh, answers the questions categorically at some length. His main opinion concerns the want of originality in modern work, which he presumes to be due to public indifference.

Mr. C. R. Ashbee also answers categorically. In his opinion there are no new movements since the Arts and Crafts started twenty-five years ago. Its architectural development is best seen in the work of men like Lethaby, Ricardo, Lutyens, Holden, Vorpey, etc. He thinks there has been a set-back and checking of artistic architecture, which is best seen in the fashion "that has grown up for Georgian decoration, excellent, no doubt, in its way, especially when in the hands of good artists like Reginald Blomfield, Lutyens, Belcher, etc., but not really progressive and not useful for the craftsman whose business it is to carry out details and do this inventively." Answering question 2, Mr. Ashbee finds no development in public work; but answers "Yes, as regards domestic building." To question 3 he answers: "No, certainly not." Question 4 he thinks hardly admits a clear answer. "Roughly, much more should be done for (1) education, for (2) bringing artists more together compulsorily (e.g., Parliamentary registration of architects), (3) artists and craftsmen should be given public facilities for showing their work in municipal galleries rent free." To question 5 he answers: "Ignorance, conservatism, and want of imagination."



R.S.M.P. PREMISES, KINGSTON, JAMAICA: ELECTROLIER IN DOME. LIONEL U. GRACE, A.R.I.B.A., ARCHITECT

Professor Reginald Blomfield says :—"I have unfortunately mislaid your letter. It must, I think, be obvious that unless a painter, or whoever it may be, has received a thorough training in architecture, he is not qualified to design architecture, in other words, that only a trained architect can be an architect; and this is more than ever the case under modern conditions of practice."

Mr. T. G. Jackson, R.A., answers :—

1. I think the best of what has been done in London lately is better than any preceding modern work, but for the most part vulgarity, ostentation, and the abuse of ornament have made serious advances, and appear to command popularity.

2, 3, 4. I confess I do not understand the distinction you draw. Architecture is an art or it is nothing. And architects should be artists or they have no right to the title of architects at all.

I do not understand what is meant by "the artist as distinguished from the professional architect."

On pointing out the sense in which the word artist is here used, Mr. Jackson replied :—

The co-operation of a studio artist with an inartistic builder would make things worse and worse. Architecture and construction are inseparable if any good result is to be obtained. Consequently a studio artist is *ipso facto* incapable of architecture.

THE ROYAL MAIL STEAM PACKET CO.'S PREMISES, KINGSTON, JAMAICA: SECTIONS, ETC.
LIONEL U. GRACE, A.R.I.B.A., ARCHITECT.

(See page 174.)

Professor W. R. Lethaby finds some difficulty in answering the questions. "We always think of one who is really an architect as an artist. Certainly I think a Board of such architects and sculptors and painters is desirable for directing City improvements. Won't someone interested in the formal "economic" way of looking at things, tell us something as to the relation between 'cost' and beauty of the city? How is a city like Munich paid for, and does it pay? How are East, South, and North London paid for, and do they pay better than if they were better? Evidently cost is to some degree a matter of taking money from one pocket and putting it into another. Yes, but if you increase building you drain from other industries. True, but buildings remain; they are tools for further increase; they are productive capital, and labour would be absorbed into fine forms of craftsmanship. Net result, a beautiful city, with more masons and carpenters, and fewer shopkeepers, and the shopkeepers are going anyhow."

Professor Beresford Pite answers shortly:—

"1. Yes; doubtfully.

"2. No; decidedly.

"3. To Arts supplementary to building.

"4. Yes; to all.

"5. Education in Art of a broad and general character."

Mr. Halsey Ricardo is also brief, confessing that he does not understand the thesis propounded. "Artists are not employed designing beautiful buildings. By artists do you mean painters and sculptors as differentiated from architects? Every good architect is an artist." But Mr. Ricardo insists on this thorough and sympathic knowledge of materials, and his training in the science and craft of his profession if he is to deserve the attribute.

Mr. Thackeray Turner thinks, in many ways, architecture is going back as a necessary step to a further advance. He insists that Art is Creation—not copying; inveighs against the foolish restrictions on building resulting from the by-laws, and feels that the only possible line of advance must be in the education of the public.

Mr. Raymond Unwin thinks the forthcoming of a Town Planning Exhibition, by the Royal Institute of British Architects, may afford material for answering some of the questions. "I can only say generally that I think we are only beginning in this country to realise the importance of civic art, and that perhaps the municipal public realises it less than anybody."

HOTEL ENGINEERING.

Some idea of the fitting up of a modern mammoth hotel may be gleaned from the description of the engineering plant at the Le Salle Hotel, Chicago, as described in "Power and the Engineer." This building, constructed of steel and concrete, faced with stone and brick, is erected on a site measuring 168ft. 6in. by 178ft. It consists of 22 storeys above the level of the pavement, and is supported on 105 concrete caissons which extend to 110ft. below that level. The entire area of the sub-basement is occupied by the power plant, which mainly consists of five boilers, each of 400 h.p. working at 160lb. pressure, and provided with chain grate stokers, supplying steam to three engines connected to 250 volt dynamos. The normal load is about 500 kw., and the distribution is effected on the three-wire system. The building, which contains 1,172 rooms, is heated throughout by the exhaust steam, regulated by a thermostatic control to maintain an even temperature, and the ventilation is so arranged that on the average the air in the various apartments is changed every six minutes. In hot weather cool air is distributed by means of a 40-ton refrigerating equipment, while a similar plant, but of 50 tons capacity, is employed for general purposes. A pneumatic tube system with 42 stations is installed throughout the building for the transmission of letters, etc., and the speed of the motors which drive the blowers is automatically controlled so that the despatch of a carrier puts the motors into operation, while its arrival at its destination shuts off the power. A vacuum cleaning plant consists of three steam aspirator units, each of sufficient capacity to operate six power sweepers simultaneously, and here also the power control is automatic. When one of the units is operated up to its full capacity the second, and if required the third, are cut in to supply the necessary vacuum. The total cost of working this plant was guaranteed by the makers not to exceed 5 cents per sweeper per hour. Six hydraulic lifts are used for passengers, and three for goods, the hydraulic power being generated by special pumping engines; several small lifts, electrically driven, are used for conveying the food from the kitchens to the dining rooms.

LEGAL.

South Shields Town Hall Contract.

The case of Neill and Sons against the South Shields Corporation and Mr. E. E. Fetch, A.R.I.B.A., the architect, which is a dispute concerning a contract to build the Town Hall, was again before Mr. Justice Joyce in the Chancery division on a motion by the plaintiff to have the action referred to an official referee for trial on the ground that it involved prolonged examination of documents. Mr. Hudson, for the plaintiffs, said that the Corporation had wrongfully condemned the materials, knowing that they were wrong in doing so. He thought the official referee should see what had been substituted. Mr. Hughes, K.C., for the Corporation, opposed the application on the ground that there were important points of law which must be decided by a judge. Mr. Norman Craig, K.C., for the architect, also strongly opposed on the ground that very serious charges were made against his client, which must be heard in open court. His lordship said he could not possibly make the order asked for until the action was ready for trial, and adjourned the motion until then. He advised counsel to come to some arrangement as to what points should be tried in court, and what should be referred.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Lectures on Reinforced Concrete. We learn that a very complete course of lectures on Reinforced Concrete Theory, Design and Practice has been arranged for the eight months' session commencing at the end of September, at the London County Council School of Building, Ferndale Road, Brixton, S.W. The lecturer appointed is Mr. H. Kempton Dyson, the Secretary of the Concrete Institute. The course of lectures will be arranged in two sections, namely, practice and theory, the students of the latter taking the former as well; but students not wishing to design work themselves, only desiring to learn about the practical execution of reinforced concrete work, such as builders, quantity surveyors, estimators, clerks of works, foremen, and others, will only need to attend the practical lectures and the laboratory and workshop practice. The fees for the course will be most moderate, being just the ordinary school fees which include every subject taught at the school; these amount to 10s. the session for those earning over 30s. per week, or 4s. 6d. for those earning less than 30s. per week.

Retaining Walls. There is no dearth of theories for the calculation of the stability of retaining walls. Many engineers and mathematicians have applied their minds to the subject, and yet we still seem to be without a satisfactory solution, and probably we shall remain ignorant until a good many experiments have been made. It is really strange that so little has been done to ascertain the actual pressures and direction of line of thrust by actual experiment on a practical scale; indeed, little has been done on a laboratory scale. Yet retaining walls are not modern structures by any means, and one would have thought that engineers long ago would have made certain of the problem.

Some attention has recently been given to the subject by American engineers, and novel theories are being put forward to account for some of the divergencies in practice from older theories. The former theory was that the earth tended to slip down on some inclined line at the back of a retaining wall and push over the wall by sliding thereon. This resulted generally in regarding the earth as equivalent to a liquid, with the greatest pressure at the bottom. But in deep trench work it has been a matter of practical experience that the greatest pressures have been on the struts at the top. Now the American theorists suggest that this is due to an arching of the material of the backing, which applies a thrust near the top that causes that at the bottom.

But such a theory can only be true if the material is allowed to escape, if ever so slightly, at the bottom, which it would do in trench work, so as to allow the backing to settle and wedge itself into arch formation. The truth in a retaining wall may lie with both theories. If the material cannot escape at the foot of the wall (sometimes large weep holes or imperfect filling might allow of its escape), then the wedge theory holds good. If it does escape, then the other newer theory seems a good one. The problem, therefore, may possibly be solved by designing a wall to resist either tendency. Of course, cohesion generally gives a considerable factor of safety, but we do not generally rely on the questionable quality of cohesion in designing a retaining wall, though that will often account for practice giving results divergent theoretical calculations; still it does not upset the wedge theory, which, fully developed, allows for cohesion. The latest theories, however, explain some peculiar failures that have occurred; and if there is any danger of material escaping at the foot of a retaining wall, as where running sand is met with, it would be as well to calculate the walls for stability by either theory.

Loans for Reinforced Concrete Work. It is interesting and important to record that Mr. P. C. Cowan, D.Sc.Ed., M.Inst.C.E., the Chief Engineer to the Local Government Board for Ireland, stated at the Congress of the Royal Institute of Public Health in the course of a discussion on a paper recently read by Mr. Arthur C. Auden, M.Inst. C.E., on "Reinforced Concrete," that the Local Government Board for Ireland had definitely decided that the time for repayment for loans upon work in reinforced concrete in Ireland should be the same as for other building materials. Our readers will recollect that an agitation has been proceeding for some time to get a similar common-sense view taken by the Local Government Board in England, but unfortunately without success; though once again Irish officials lead the way, just as they have done in agriculture, and remove an altogether undeserved ban on reinforced concrete. The Local Government Board in England can have no reason for still holding out against a system of construction the durability and resistance of which has been thoroughly well established. It is indeed of the nature of a public scandal that officials should be able to hold out against a consensus of conservative professional opinion in favour of any system of construction and prevent the public obtaining the benefit of economy through local authorities being granted freedom to use the same. Considering that most of the other State Departments use reinforced concrete extensively, the attitude of the Local Government Board is ridiculous as well as aggravating. If those responsible for the attitude have any legitimate reasons therefor they can surely not object to giving them the light of day and letting them be subjected to criticism; but if their secrecy is dictated by ignorance and pigheaded conservatism then their attitude is perhaps understandable, if reprehensible.

A Concrete Institute Visit. The members of the Concrete Institute paid a visit on July 23 to the London works of the British Improved Construction Co., Ltd., at Stevenage Road, Fulham, where they were received by Mr. Alec. Matheson, the Managing Director of the Company, Mr. P. B. Jagger, the inventor of the process, and Mr. B. Livingstone, engineer to the Company. The Jagger process of manufacturing concrete, which these works are designed to exploit, is, in short, one which turns out work rapidly and embodies various features tending towards that end. First, attention may be drected to a special form of shaking table which causes the concrete to be violently agitated in the moulds, the motion of the particles being confined to a vertical direction however, so wedging the particles of aggregate together and removing air bubbles and rejecting the lighter and inefficient parts of the cement, and securing maximum density, which means great strength and durability. The face of the finished work is free from air bubbles, and the aggregate is right on the surface, which is also very free from holes. The moulding is effected in a few minutes; they are then removed to hot air chambers so as to become dried out and the casts are removed from the moulds in 24 hours. The moulds are, by a few ingenious contrivances, quickly opened out and the work left exposed to continue hardening in the open air, and the work undergoes as little handling as possible. The quick release of the moulds is, of course, economical.

Credit deserves to be awarded for the rapidity with which the works have been erected and put in working order. In 12 months the site of the works, which adjoins the Fulham Football Club grounds, has been converted from a swamp, buildings erected for offices, engine sheds, works, and steam cranes, tramways, river wharf, etc., installed.

The Concrete Institute members were first shown the moulding of plain and reinforced concrete pipes for the Corporation of Southend's main sewerage scheme. The materials, consisting of four parts crushed Guernsey granite to one part Portland cement, were mechanically mixed in Ransome mixers. The time taken to fill the moulds on the Jagger patent shaking table was 4½ minutes for a 3ft. length of a 3ft. diameter pipe 2½ins. in thickness. By means of two vibrating tables, 25 pipes per hour can be manufactured. A length of pipe two months old was tested before the members and broke with a load of 37 cwt. distrbuted on a line along the crown. The members were also shown the process of moulding and manufacturing reinforced concrete sleepers for the London and North-Western and Great Northern Railways. The reinforcements were prepared in great part by machinery, and the moulds were filled on the shaking tables. The method of spiking a rail chair to a sleeper was shown, and the great resistance of the sleepers to blows from a heavy sledge hammer was shown. The cost of the reinforced concrete sleeper is about 6s. The manufacture of partition slabs is also undertaken at these works, the rate being 100 yards super per hour. The moulds are formed with a batch of divisional iron plates, so that a block of partition slabs is moulded at once on the vibrating tables. Then they are removed to the hot air chamber, and can be emptied in 24 hours.

The members of the Concrete Institute were entertained to tea afterwards, and a vote of thanks was accorded the Company on the proposition of Mr. William G. Kirkaldy, Assoc.M.Inst.C.E. (member of Council), seconded by Mr. J. Wager, A.R.I.B.A., architect to H.M. Office of Works. Mr. Alec. Matheson replied.

THE R.M.S.P. CO.'S OFFICES, KINGSTON, JAMAICA.

This block of offices provides accommodation for two Cable Companies and the Royal Steam Packet Company's Jamaica staff, having been built to replace buildings destroyed by the earthquake. It has been placed well back from original building line, having grass plots in front with king palms planted in same. The building is constructed upon a ferro-concrete raft with flanged beams, and inverted reinforcement, designed to withstand upward shock. The ground floor is 6ft. 6in. above the road level, which gives greater stability to withstand earthquake shock, as the building was required to be fairly high in order to afford a land mark from the Harbour; this also gives a current of air under the floor, which is very essential in the Tropics. The whole of the material has been shipped from home with the exception of the electric light installation, which has been carried out by a Canadian firm. Great credit is due to Mr. Fuller Clark, the resident architect, who has also superintended the reconstruction of wharf, pier, etc., and to Messrs. the Empire Stone Co., of Thanet House, Strand, W.C., who have carried out the ferro-concrete work and fixed material sent out from England by the various sub-contractors.

The interior woodwork to the booking hall was carried out in West Indian mahogany, the ground floor walls being lined; the spandrels and soffits of the eight arches panelled and supported by panelled pilasters. Over the centre of the arches are carved panels bearing the monogram of the Company and various dates of interest in its history. The wall linings are surmounted by a richly carved foliated cornice moulding. The counters, also in mahogany, have brass mountings, and there are panelled and glazed screens to two offices. The carved entrance doors and frame are of teak with copper glazing, and there are two teak doors in carved frames in vestibule also with copper glazing. The whole of the woodwork, which was executed by H. C. Cleaver, Ltd., of Willesden, N.W., was coated with a preparation to resist the attacks of white ants, and finished with linseed oil.

The flooring of the hall is paved with Sicilian and Swedish green marble squares, and the walls of the vestibule, etc., are lined with Sicilian marble, the skirtings being of Swedish green. The treads of the steps are of Sicilian marble. The marble was supplied by the Art Pavement and Decorations, Ltd., of London.

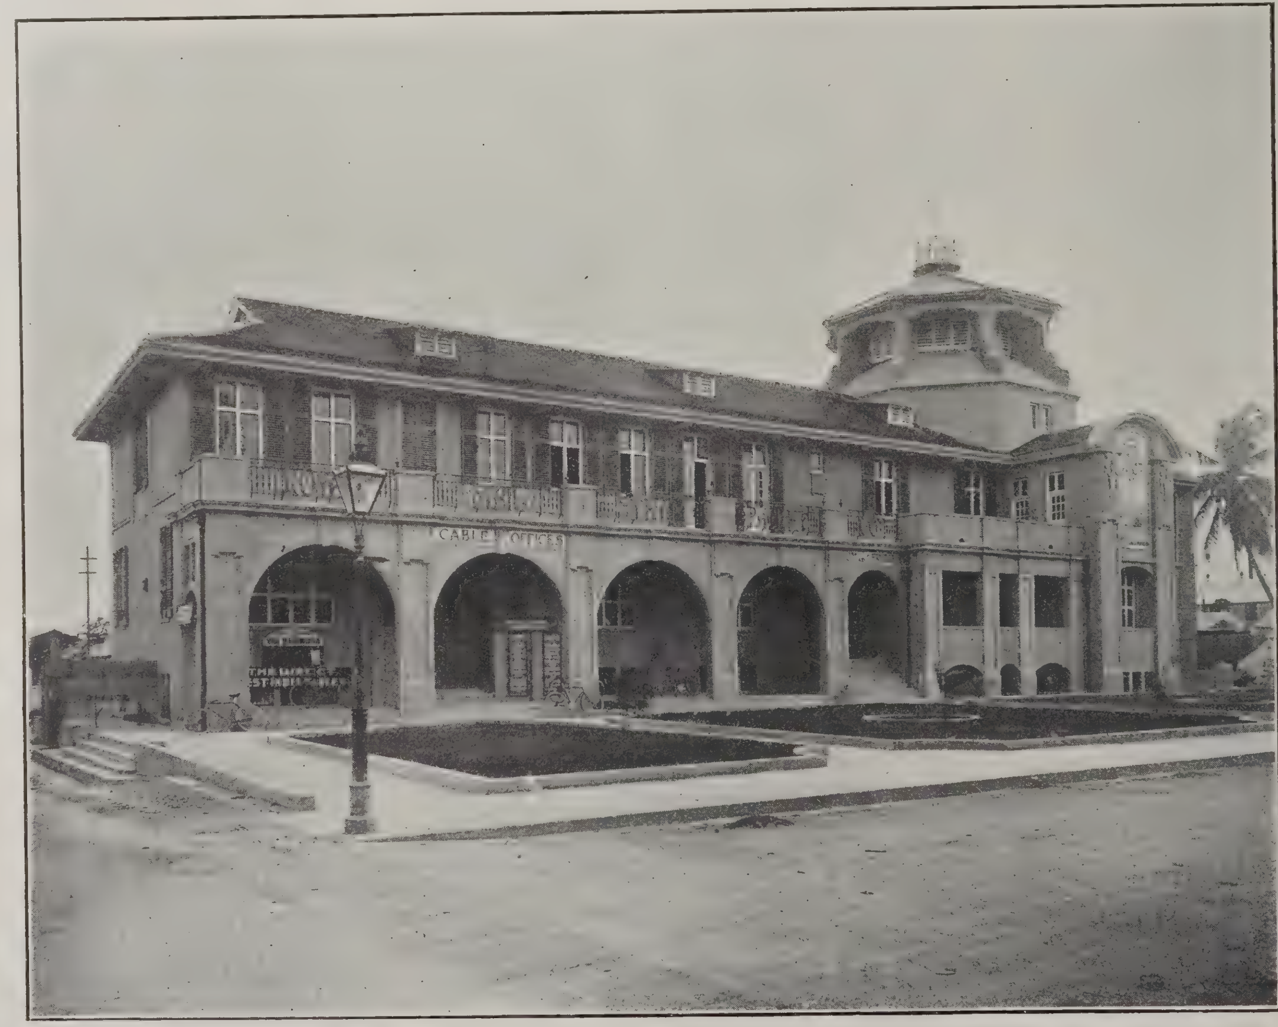
Among the other works were four steel framed iron store sheds, each to hold 1,500 shipping tons. The materials for these were sent out, ready, from the works of D and J. Main, Ltd., London, and fitted together without any trouble by a local contractor, S. J. Streadwick.

The electric fittings were designed and executed in real bronze by the General Electric Company, 67, Queen Victoria Street, E.C. The electrolier illustrated on page 170 is suspended from the dome. The fitting consists of a spherical body, having a diameter of 30in. round, which are eight cast arms, from which depend Osram lamps under translucent shades, bringing the total spread to about four feet. The crown is used emblematically in several of the fittings, and in the case of the electrolier is situated at the apex of the sphere, under which is glass dish containing a light.

Other materials were supplied by the following firms:—Faience work, Doulton and Co., Ltd., London; copper roofing, by F. Braby and Co., London; door furniture, etc., by James Gibbons, Wolverhampton.

The roof is covered with ordinary shaped 10½ by 6½ English roofing tiles, green glazed on the exposed surface by chemical process, the colour as we are informed not being apparent until after the tiles have been through the kiln. These tiles were supplied by Roberts, Adlard and Co., of Bermondsey Wall. The effect in such a climate as Kingston is very picturesque, and they would doubtless be used more frequently in this country were they less costly. The same firm quite recently sent out tilers to cover the roof of the Kingston branch of the Colonial Bank, Bishopsgate Street Within, with similarly coloured tiles, though of different shape; and as a consequence of this work were employed to cover the roof of the new Roman Catholic Cathedral in Kingston with similar tiles. The red 6in. by 6in. floor tiles laid on the office floors are of English manufacture, and were also supplied by Roberts Adlard and Co.

That reinforced concrete can lend itsel to architectural effect will be seen from the illustrations. It will be noticed from



The whole of the building is constructed in reinforced concrete to withstand earthquake shocks. The former offices were destroyed in the recent earthquake.

THE ROYAL MAIL STEAM PACKET CO.'S PREMISES, KINGSTON, JAMAICA: GENERAL VIEW OF THE BUILDING FROM PORT ROYAL STREET. LIONEL U. GRACE, A.R.I.B.A., ARCHITECT.

the drawings that in the foundations, floors, and roof, continuous beams are formed in both directions to thoroughly tie the building together. By this method of construction in the foundations the entire building practically stands on a raft formed by series of continuous beams. The whole of the roof trusses and purlins were formed in reinforced concrete and left ready to receive the rafters and tiling. A feature of the offices is a tower which is also entirely constructed in reinforced concrete. The main booking hall is surrounded by a double circle of columns supporting the inner dome and the tower. All mouldings, domed ceilings and arches were formed in-situ, and after removal of the centering the work was cleaned down and the whole given a finish to match artificial stone, which, with the coloured roof tiles, gives an effective appearance. The interior was given a fine plaster finish. The work was carried out by the Empire Stone Company's own workmen sent out from England.

The building, including the demolition of wrecked premises, took fifteen months to complete from the date of signing the contract in England.

CONCRETE BOOKS.

The Composition of Concrete.

A book written by an American technical author is usually pretty thorough, and this book, by Mr. H. F. Porter, and others associated with our American contemporary "Concrete Engineering" is certainly in the category deserving of praise. It is a most useful attempt to furnish some really scientific information regarding the chemistry and physics of cement and concrete making with an explanation of the principles of the basic process of the concrete industry. The data given in this book for concrete making, such as proportions, shrinkage, etc., are based on practice and are thoroughly reliable, so that it is just what the specialist and the general practitioner alike require. Cement and its manufacture are dealt with, as also the testing of the same, with laboratory and works procedure, then the aggregates receive detailed attention, next the proportioning, and finally such side issues as the effect of mineral oil on concrete.

"Concrete: Its Composition and Use," by H. F. Porter and other authorities. Published by "Concrete Engineering," Cleveland. Price $2.

Trade Book.

The cement industry is a large one, both the capital absorbed in the building of cement works and the production of cement in England, France, Germany, and America being very considerable. The production of cement in America has indeed been growing by leaps and bounds these last few years. There are various reasons for this, though the chief consumer of cement seems to be the small user, the farmer, the estate manager, and the like. The rotary kiln seems also to have made the manufacture easier and work economical, and has helped towards the increase in means of production and popularised Portland cement by cheapening it. It is valuable to have a directory of manufacturers, and we wish that there were such a handy directory in this country as one we have just received from "The Cement Era" of 842, Monadnock Block, Chicago, entitled "Directory of Portland Cement Manufacturers, together with Manufacturers of Gypsum and Lime." This 1910 edition is priced at one dollar, and is neatly bound in morocco. This directory gives the names of the officers of each company, the capital, the capacity for production, the number of kilns and the nature of the process of manufacture, viz., "wet," "or dry." There is also included an alphabetical list of the officers, superintendents, and chemists of cement companies. Such information is most valuable to the consumer. The directory is published annually.

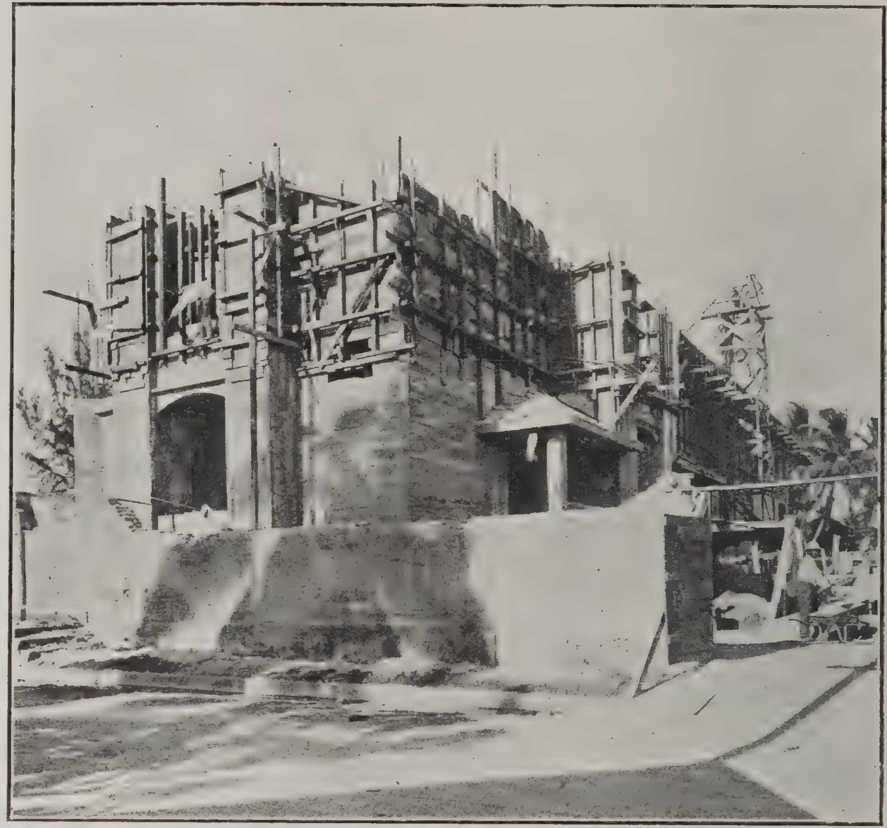
CONCRETE PACKING.

By THOMAS POTTER.

Packing—the only name by which the writer knows it—is any kind of rough unshapable quarry waste, old stone and bricks from buildings in process of demolition, or any clean, imperishable, and hard material for which cement has an affinity, which can be used for embedding in concrete foundations, concrete walls, and monolithic concrete of a massive character, such as retaining walls, bridge piers, abutments, etc., the primary object being to economise the concrete, and by so doing to reduce the cost without diminishing the strength.

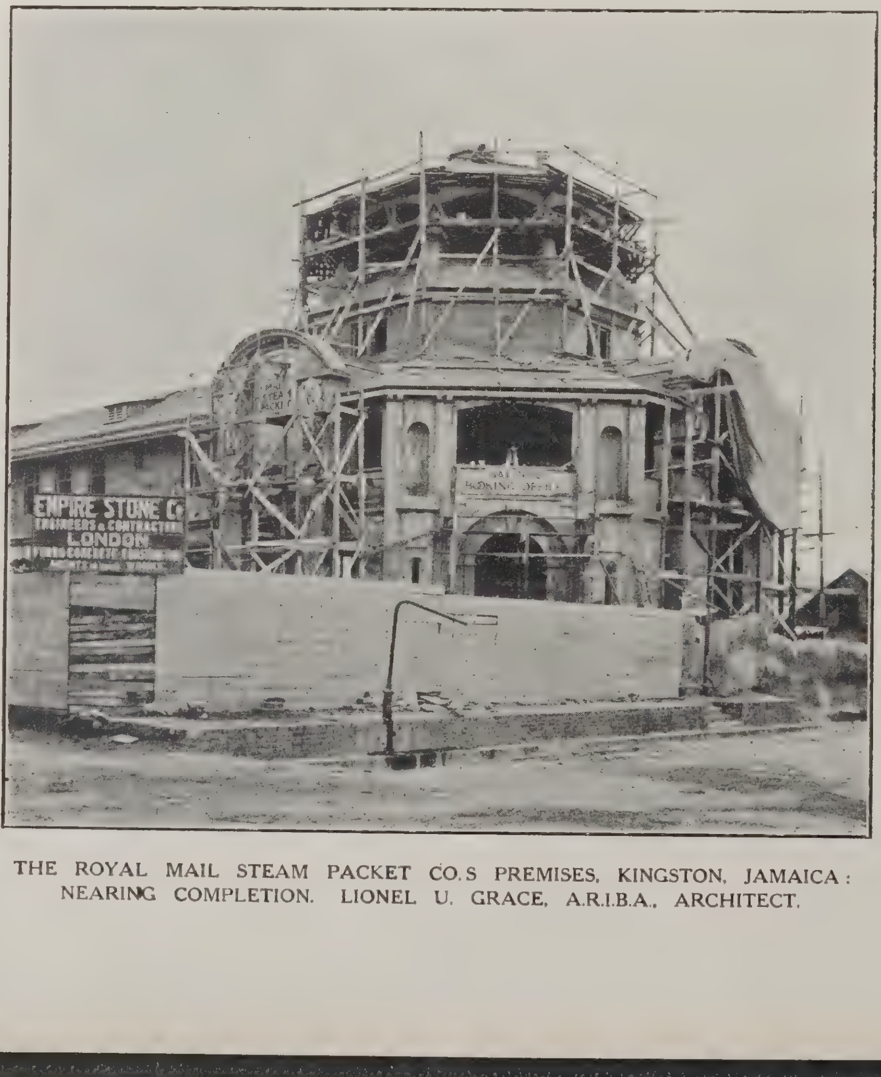
Packing has not been used to any extent in this country, the principal objection being that it is assumed to weaken the strength of the concrete. This assumption, however, is incorrect, provided the material is judiciously employed.

A specification may state that a fixed amount *pro rata* to the volume of concrete—perhaps 25 or 33 per cent—may be used, but it is a difficult matter to determine how this is to be arrived at when no two pieces may be alike in shape or size. Measurement is out of the question; the only way, apparently, would be to deliver the fixed amount on the site for the work it is intended for before the latter is commenced, but this would not ensure equable distribution. The human equation—a trustworthy man, if he can be found, to embed the right amount approximately in the work as it progresses, and in the way in which he has received preliminary instructions, or has had previous experience—should answer best.



THE ROYAL MAIL STEAM PACKET CO.'S PREMISES. KINGSTON, JAMAICA: DURING CONSTRUCTION. LIONEL U. GRACE, A.R.I.B.A., ARCHITECT.

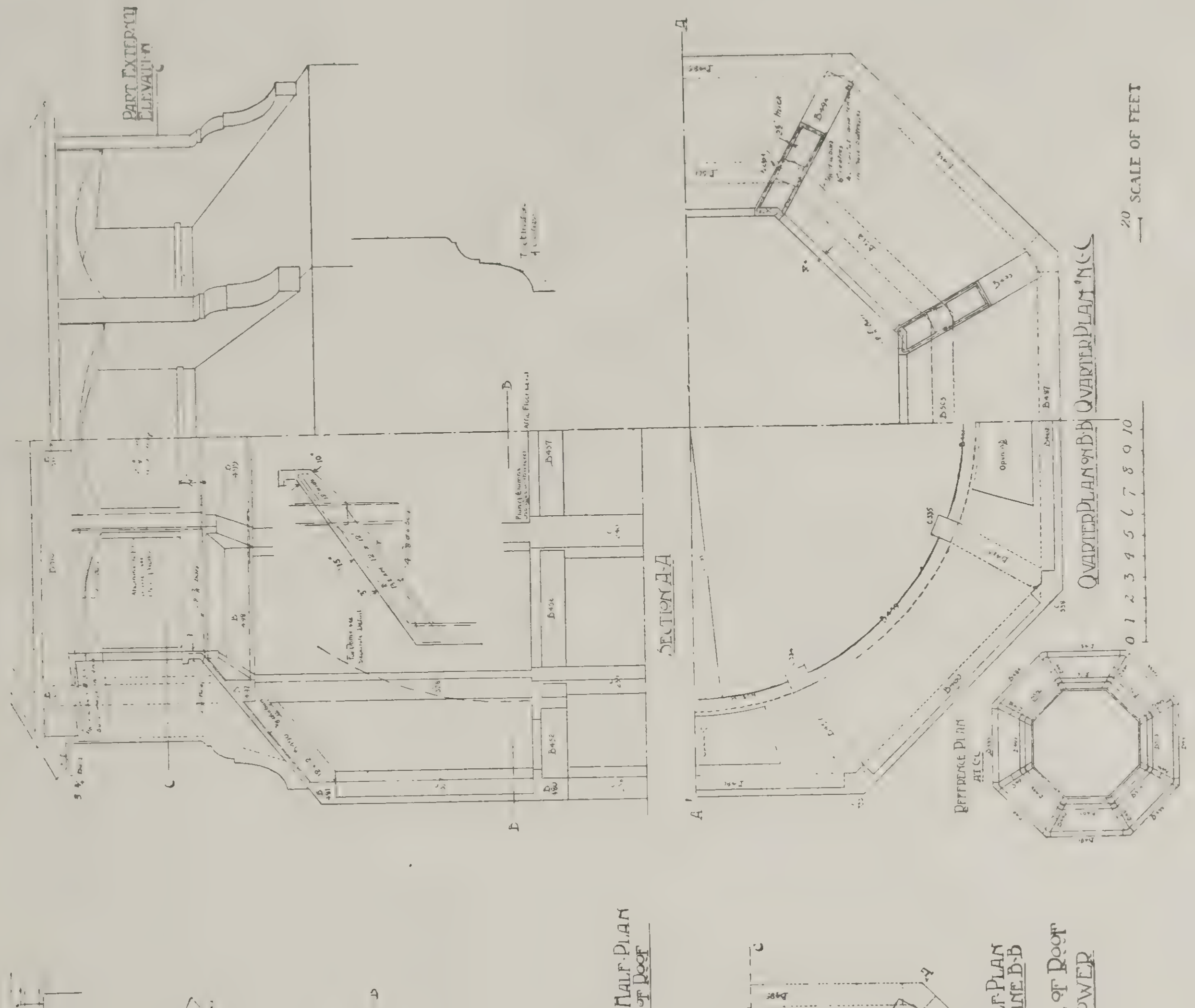
The best packing material undoubtedly is quarry waste of the size—if procurable—adapted to the purpose for which it is required. The more bulky the concrete, the larger it may be; and being usually irregular in shape, it obtains a firm grip of the concrete. It is also clean, which is an important consideration. If old stones and bricks are used, it is necessary to cleanse them thoroughly from mortar or other substances, not simply knocking off the looser portions with a trowel or hammer, but clearing them as thoroughly as if they were going to be re-used in building new work.



THE ROYAL MAIL STEAM PACKET CO.S PREMISES, KINGSTON, JAMAICA: NEARING COMPLETION. LIONEL U. GRACE, A.R.I.B.A., ARCHITECT.

If not disposed of in this way, the brick and stone débris from buildings in course of demolition may have to be carted away; whereas they could more economically be partly crushed for concrete and partly used for packing for new buildings to be erected on the same site. In my own experience I have been in this way able to dispose of the entire walls and chimneys of buildings being demolished, and in so doing have effected a considerable saving. The size of packing may be roughly determined by allowing no portion to be nearer than 2 or 2½in. of the faces of walls and foundations. The depth or thickness and shape are immaterial; for if they are irregular in this respect, the better they tie or bond to the concrete. The largest surface area of packings, if they vary in shape, should form the bottom or bed side, and be well rubbed into the concrete as the latter is being deposited, similarly to the way in which bricks are rubbed into the mortar beds of brick walling. Violently dumping them into the concrete, or dropping from a height, is not advisable, as this would disturb their beds. Packings should either be well saturated with or soaked in water, more especially when they are of an absorbent nature.

For 9in. walls, or other forms of construction of a similar thickness, packings can be used but sparingly; but the thicker the work or the broader the base, the more advantageous it becomes in every way. The distance between the packings is to some extent a question of the amount available, but should never be less than from 3 to 6in. in order that the concrete may readily find its way between and around them without leaving voids; nor does any



THE ROYAL MAIL STEAM PACKET CO.'S PREMISES, KINGSTON, JAMAICA: DETAILS.
LIONEL U. GRACE, A.R.I.B.A., ARCHITECT.

increase of the spacings increase the strength of walls or foundations to any appreciable extent, any more than extra thick cement joints increase the strength of brick walls.

In packed concrete walls that had to be removed, the packing was found to be inseparable from the concrete, and the labour of taking down a packed wall was as much as with walls where no packing had been used

No hard-and-fast rule can be laid down as to the amount of packing that should be allowed, as the wider the base or the thicker the foundation or wall, the greater the proportion admissible Perhaps 20 and 40 per cent. of the amount of concrete would represent the minimum and maximum proportions. The concrete may be looked upon as a rough mortar uniting the irregular and larger solid masses together.

Packed concrete, from a constructional point of view, is not far removed from the common Roman method of forming thick walls by building a skin of masonry or brickwork on both sides, roughly filling up the space between with waste stone and mortar, and grouting the mass with liquid lime and sand. More comparable still is the Continental method of forming foundations with béton, consisting of lime and sand made into a thin mortar and mixing it and the aggregate together, but this is not practicable with Portland cement as a matrix. The béton is deposited in the trenches a foot more or less in thickness, and upon this a layer of stones, then another layer of béton, and so on to completion.

The formula of Mr. Tall, who, in 1865, invented an apparatus for building monolithic walls, was 100 per cent. of packing in ordinary house walls, and upon this he based his estimate for the cost of concrete in a general way. Practically as much as 40 per cent. may be used in foundations and heavy work, and 30 per cent. in walls over 9in. in thickness, with no loss of strength. Even in 9in. walls packing may be used to advantage if of a small description, and this is available at times in screening the aggregate, which may contain a portion too large for use in the aggregate. Dr. John S. Owens says that packing—called in the United States "plums"—may be considered as forming a part of the aggregate, and is quite admissible when proper precautions are observed; and Mr. H. F. Porter, a consulting engineer, of Bridgeport, Connecticut, writes that in the construction of a new concrete bridge across the Rocky River at Cleveland, huge masses of rock as large as could be swung into place with a derrick, were introduced into the piers and abutments at intervals.

It is claimed by some who have used packing in concrete construction, that it forms a bond-tie, and therefore strengthens foundations or walls, or any other form of concrete construction. Theoretically, this should be so, especially if it is of ample size. It is also claimed that packing prevents the slignt cracks which often occur in concrete walls through variations of temperature. I know of a concrete building, one of the walls of which has an unbroken length of 180ft., except for a few windows. It was built in 1869, and considerably packed, and has never developed cracks. Iron hoop to a moderate extent was, however, used laterally for reinforcement.

Packing concrete offers a strong inducement where the work is being done by contract to exceed the proportion specified, and for this reason probably is not looked upon very favourably. It means constant surveillance, and possibly some friction between the clerk of works and contractor's foreman. But when the work is not being performed by contract, and no object is gained in evading instructions, packing is a factor in reducing the cost of concrete, with no corresponding disadvantages.

Obviously, it is unsuitable for floors, beams, etc.

To ensure freedom from voids, and to obtain cohesion of the concrete and packing, a sloppy consistency of the former is preferable to a sticky condition. It has been assumed that only as much water should be used in mixing concrete as would enable the materials to adhere to each other; but United States experiments have proved that a sloppy condition causes a quicker movement of and sliding together of the particles, causing homogeneity, which the slow movement of concrete of a sticky nature is unable to obtain.

CONCRETE NOTES.

A Moist Closet for Cement Tests. A moist closet, designed expressly for maintaining a constant temperature and a constant degree of moisture for setting tests of cement, has been in use by the Department of Railways and Canals, Canada, on the Lachine Canal, where especial importance is attached to time of setting because the cement is used under water. With other types used the temperature and moisture are apt to be materially changed in opening the closet to make tests. The new closet, therefore, was provided with an armhole, through which the test is made, the door being used only for placing the pats. The cuff of the coat prevents any air entering, and on the arm being withdrawn the hole is quickly closed. The closet is 3ft. high, 3ft. wide and 18in. deep, with walls of concrete 2in. thick. The bottom of the closet acts as a tank to hold about 2in. of water. The mix was rich and there is no leakage. The temperature inside the closet is usually 65 deg. in summer and winter, varying about 1 deg. Wet cement bags are placed on top during very hot weather, and repeated tests have indicated, it is stated, that the temperature can be evenly regulated. Water is seldom added to the pan forming the bottom of the closet, showing that little or no evaporation takes place inside the closet. The closet is carried on a base about 30in. high and two open shelves are built below it.

Reinforced Concrete Piers. Two reinforced concrete piers were recently built in the harbour of Genoa, Italy, in order to carry a light steel bridge of a grain unloading plant. Each reinforced pier is 35ft. high and carries a masonry pier 19ft. high above water level. The piers are 13ft. 11in. by 17ft. 3in. in plan and have a working chamber at the bottom 5ft. 11in. high, so that they could be sunk by the pneumatic process. The walls vary in thickness with the depth, the maximum being 7in. They transfer the pressure on them to vertical beams which in turn are stayed by horizontal reinforced concrete struts running to the beams in the opposite wall. Beam and strut sizes are also reduced with the diminishing water pressure. The walls of the working chamber are of solid concrete, reinforced in both faces, 23.6in. thick at the top and 7in. at the bottom, where they are shod with a cutting edge of channels and angles. This cutting edge is secured to the concrete by straps placed at intervals, looped over the reinforcing bars in the concrete and riveted to the upturned legs of the channel. The piers were built on shore, floated to place and then sunk.

An Ancient Concrete House. Important discoveries by Professor Ramon Mena in the ancient Texcocab city of Otumba, which is located about 5 miles from the present city of Otumba and about 15 miles from San Juan in Teotihuacan, are noted by "The Cement Age." Two houses were unearthed, the first of which is of stone, with the stone walls, or what is left of them, about 6ft. in height. The other house, probably the residence of some priest of very high rank, was of cement; floors of cement and walls of cement, the latter being frescoed in red and blue—the whole being in a perfect state of preservation. This house contains three rooms and a cellar. The cellar also contains several rooms, all with floors of cement.

Pouring Concrete Columns. In pouring concrete columns there is always a danger of the formation of pockets, due to large stones being caught between the reinforcing members and between the steel and the forms. Even with the greatest care this cannot be entirely avoided, especially when the columns are long and have spiral reinforcement. Such pockets, if large, may seriously affect the strength of the columns, and it would therefore seem desirable to make a thorough examination of them as soon as the forms are stripped, sounding them for holes beneath the surface, and not being satisfied with a mere superficial inspection. Such a plan was followed in the erection of the Minnesota State Fair grandstand. The forms were removed from the columns while the floor above was still supported by the falsework, and the columns carefully examined and sounded. As a rule the voids were enclosed by an apparently sound exterior shell. When pockets were found the concrete was cut out while still green, a form placed around the opening and the space filled to within an inch or so of the sound undisturbed portion above. The new concrete was allowed to set and the small space then carefully packed with cement mortar. By thus allowing the large mass of new concrete to set before effecting the closure it was expected that difficulties due to the shrinkage of the new concrete would be avoided. There is a very distinct advantage in making these inspections and repairs as soon as it is permissible to remove the column forms; the defective concrete is green enough to be removed with comparative ease, and the falsework still in place under the floor above saves the expense which might otherwise be necessary for shoring.

A Canadian Concrete Building. The new Jacobs building, now completed at Montreal, is notable as the largest reinforced concrete building in Canada. Despite difficulties encountered in the early stages of the work, the remarkably short time in which the building was erected demonstrates the rapidity of progress possible in the method of construction adopted. The building, which is seven storeys high, and designed to carry three additional storeys as the need for further accommodation might demand, has a frontage along St. Catherine's Street of 265 feet, and a depth on St. Alexander Street of 136 feet. The main façades, designed in the French Renaissance style, are of glazed terra cotta, with ornamental cast-iron store fronts, cornices and mullions; the entire space between the pilasters being devoted to windows, so as to provide an area in this respect, which will adequately serve to light all parts of the interior. The building is designed to carry a live load of 150lbs. per square foot on the ground floor, 125lbs. per square foot on the upper floors. The columns throughout the building are octagonal in shape, and vary in size from 32 inches in cellar to 20 inches in upper storey. When the additional storeys are placed on the structure the size of the upper columns will be 12 inches. The main girders, which span 17 feet 9 inches, are 12 inches by 24½ inches, and are reinforced with two 1¾-inch by 2¾-inch Kahn bars and one 1-inch cup bar. The intermediate beams which run opposite to and frame into the main girders are 8-inch by 18-inch size, and are reinforced with 1-inch by 3-inch Kahn and one ⅝-inch cup bars. All columns are reinforced with steel rods, hooped with 5-16in. and ⅜in. round steel hooping varying in pitch from 1¼ inch to 2 inch, according to loading; the concrete inside the hooping being figured for 750lbs. per square inch. The architects for the building were Messrs. Mitchell and Creighton, of Montreal, and all the concrete work was done in accordance with the standard specifications for reinforced concrete by the Trussed Concrete Steel Company of Canada, Ltd.

Concrete Aqueduct Linings. The linings of the aqeduct bridges on the Illinois and Mississippi Canal have been in service through two seasons, and, according to Mr. H E. Reeves, U. S. junior engineer, have given satisfaction. The concrete was a 1.4 mixture, using well-graded gravel, or 2.3.5 when fine crushed stone was used for the coarser aggregate. The bottom is 6in. and the sides 9in. thick. The depth of water is 7ft. The linings are practically watertight, the exterior at nearly all points being dry under a full head of water. The only place where seepage shows to any noticeable extent is on some of the sides, at the joint between two days' work. No seepage shows where the sides were carried up continuously.

A Reinforced Concrete Theatre. A theatre in reinforced concrete is being constructed at Norumbega Park, Waltham, Mass., to replace one destroyed by fire. The new theatre is made to fit conditons. Most important of all, it would be thoroughly fire-resisting. One hundred and seventy tons of steel will be used in its construction, spanning the auditorium without a post or column. The main trusses are said to be the most remarkable piece of construction attempted, and while unique are thoroughly practical. The stage and dressing rooms will reveal a Spanish effect in that the roofs will be of pure Spanish tile, while the walls inside and out will be decorative cement. The lattice work, casements, and ornamental window work will be artistically effective to the eye. The same general scheme of construction in the old theatre will be followed in the new, but greatly improved and beautified in every detail.

Wall Construction for Small Buildings. A number of concrete bungalows, each containing five large rooms and bath on the ground floor and two rooms on the first, have been designed and built recently at Carnegie, a suburb of Pittsburg. All of them have modern plumbing and heating systems, and cost complete less than 4,000 dollars each. The builder states that he can put up these bungalows at a cost of only 6 per cent. above that of a wooden-frame dwelling. The roofs and floors are of timber construction. The walls differ from the customary monolithic construction in that ordinary 2 x 4-inch studs are partially embedded in the walls, and serve during construction to support the inside forms. The studs are set up on 16-inch centres, and between them 1½-inch plank, 14 inches wide, are placed vertically with the outer side flush with the face of the stud. They are held in this position by simple spacing strips at top, middle, and bottom. The concrete, of course, fills the 2½-inch depth of pocket back of the plank, and when the forms are removed the studs project, 1½ inch from the wall surface. The lathing is nailed to these studs, and a 1½-inch air space is thus left between studs. The outside forms use conventional sizes of lagging supported by 2 x 6 inch studs opposite alternate studs of the inside forms, to which the outer studs are wired. The outer lagging is 3½ inches from the inside studs, so that with the 2½ inches of concrete between studs the concrete wall is 6 inches thick. This gives an 8½ inch wall when the inside and outside plastering are completed. Reinforcement is provided above all wall openings. A rather wet mixture of one part Portland cement, two parts sand and six of ½ to 1¼ inch slag is used. The outside is not trowelled, so that the cement plaster will have a good bond. This plaster is a 1:1 mixture of sand and cement, with sufficient slaked lime to make it work easily.

The Building Trade. It is to be hoped that Mr. A. G. White's optimism at the recent half-yearly meeting of the National Federation of Building Trade Employers will be fully justified. Most builders' meetings have taken a somewhat gloomy view of the state of trade. There are indications, however, that things are improving, but still very slowly. Many important contracts are coming in; and the "Competitions Open" list is again increasing. Among these, reinforced concrete will no doubt have its share. It is worthy of note that the preservation of the steel in steel-construction buildings is engaging closer attention, and that in our more recent big buildings the casing of the steel with concrete has been the general rule. This is a tacit admission, not only of fire-resisting methods, but also of the preservative qualities of concrete.

CONCRETE BRIDGE FAILURES.

AN ANALYSIS.

In order to learn whether there are any grounds for the disquieting opinion which he has frequently heard expressed by engineers antagonistic to concrete, that concrete is not a suitable material for the construction of bridges, Mr. C. R. Young, of the firm of Barber and Young, bridge and structural engineers, Toronto, has made an investigation of those failures of concrete bridges regarding which reliable data could be obtained. His object was to determine the actual causes of failure; whether the materials themselves were at fault, or the design, or construction. The results of his investigation were summarised in a paper read on March 30 before the convention of the Canadian Cement and Concrete Association, at London, Ont. Except where the information has been published in the technical press, the location of the bridges and the names of the engineers and contractors have been omitted. Some attention has been given to pronounced cracks in spandrel and wing walls, since Mr. Young regards these as impairing the appearance of the bridge, even if it remains in service. The paper is given below substantially as read by Mr. Young.

Case 1.—Reinforced concrete slab or flat-top bridge of 10ft. span, intended to carry a fill of 13ft.; slab, 12in. thick reinforced by longitudinal rods ¾in. in diameter, spaced 12in. centre to centre, and transverse rods of the same size, 2ft. centre to centre; spandrel walls, 2ft. thick at the bottom, reinforced by vertical ¾in. round rods, 2ft. centre to centre.

After the concreting had been completed nearly two months and some 10ft. of the earth fill had been placed, the centres were struck, with the result that almost immediately the slab collapsed under the weight of the fill alone, leaving the spandrel walls and wing walls intact.

An examination showed that the concrete was apparently of correct proportions, had set satisfactorily, and had evidently been placed with care. Computations based upon measurements of the slab taken after the failure showed a fibre stress of 41,500lb. per square inch in the steel and 1,100lb. per square inch in the concrete under a 10ft. fill. Apparently, no special care had been taken to anchor the longitudinal reinforcing rods properly, so that under this stress, considerably in excess of their elastic limit, they had pulled through the concrete, as was evidenced by the polished state of the concrete in contact with these rods. The failure can therefore be wholly attributed to defective design.

Case 2.—This structure, which is typical of a number of reinforced concrete girder bridges completed in a county in the State of Indiana, some 3½ years ago, was of 15ft. span in the clear and 16ft. clear roadway. Two longitudinal girders, 15ft. 10in. centre to centre, carrying a 7in. slab comprised the superstructure. Upon this slab was placed a 12in. earth fill and in addition it was supposed to carry a uniformly distributed load of 200lb. per square foot, or a 20-ton road roller. The slab was reinforced by transverse rods of a sectional area of 0.78 sq. in. each, 1in. from the bottom and 10in. centre to centre and by longitudinal rods ½in. in diameter and about 3ft. centres.

Before the striking of the centres, Mr. Daniel B. Luten, president of the National Bridge Company, in a communication to "Engineering News," pointed out the weakness of the design and questioned its safety. He showed that under dead load alone the compression in the concrete of the slab would be about 1,000lb. per square inch, and the tension in the steel would be nearly 20,000lb. per square inch, while for the specified live load consisting of a 20-ton roller these figures became 3,000 and 55,000lb. per square inch respectively.

Before Mr. Luten's letter had appeared the bridge collapsed, on the day following the removal of centres. The bridge gave way when the rear wheels were about in the centre of the span, and indications pointed to the slab as the initial source of failure. Careful examination of the wreck disclosed no broken steel, and failure was apparently caused by excessive compression in the concrete of the slab. Under the loading of the traction engine, which weighed about 16,500lb. and of which 9,000lb. were concentrated in the rear axle, this compression could not have been less than 1,800lb. per square inch, with the tension in the steel about 32,500lb. per square inch. The corresponding stresses in the girders were about 1,000lb. per square inch for the concrete and 20,000lb. per square inch for the steel. The compression in the concrete of the slab was therefore nearly equal to the ultimate strength of a good concrete one month old, and in excess of the strength of the material used, which appears to have been of poor quality, on account of the presence of dirt in the sand. Very bad design and lack of care in preparation of the concrete were, therefore, clearly responsible for the collapse.

Case 3.—Reference has been made to a number of girder bridges similar in design to that of Case 2, constructed during the same year as the latter, in the State of Indiana. One of these of 24ft. span developed a bad crack in one of the beams shortly after the striking of the centres, but managed to hang together and carry the traffic for about a year and a half. There was no load on the bridge when it finally fell, and no evidence could be discovered of any weakening or undermining action from floods or other causes. It therefore appears that its downfall likewise was due to the errors of an inexperienced or careless designer.

Case 4.—Plain concrete railroad culvert of 20ft. span and 10ft. rise, carrying a fill of about 10ft. over the crown; crown thickness about 18in.; foundations were carried 4 or 5ft. below the natural level of the ground. The situation of the bridge was on marshy soil and the foundation-bed was of soft clay with considerable organic matter present, but no piles were used.

As the filling was placed on the arch, cracks began to develop, in the case of the west wall, passing vertically up the wing walls near their junction with the spandrels, then crossing this corner and trending to the crown of the arch, reaching it at about one-quarter of the length of the barrel in from the face of the spandrel walls. In the east wall a large vertical crack passed from the footing up the soffit to near the crown, where it joined a large horizontal crack running along nearly the whole length of the arch barrel. In addition to these very prominent cracks many other tributary cracks of lesser extent developed.

Careful examination of the cracks in conjunction with the originally level mould board lines conclusively showed that the abutments had settled from 4in. to 6in. under the heavy load of the fill, and that the insecure foundations were wholly responsible for the failure.

Case 5.—A plain concrete railroad culvert 10ft. in span, carrying an embankment 52ft. in depth, was constructed in the winter. The foundation-bed was of soft clay and no piles were used. In the following spring when the frost came out, a portion of the barrel near the middle collapsed under the weight of the fill, and a part of one end, with one of the wing walls, gave away under the sliding of the embankment.

The explanation offered for this failure, and one that appears reasonable, was that the spring thaw had destroyed the even bearing of the culvert on the foundation-bed, and that the barrel had thus been resolved into a beam at several points, the wrecked end portion acting as a cantilever. Had reinforcement been used, which is particularly desirable in winter work of this class, the structure would no doubt have safely withstood the adjustment.

Case 6.—A reinforced-concrete arch highway bridge of about 30ft. span and of low rise was constructed with abutments resting directly upon a quicksand-bed and in a situation involving the excavation of a new channel for the stream. Shortly after the striking of the centres the arch ring collapsed, although subsequent computation showed the design to be sufficient.

While the early removal of the forms may have been to a small extent responsible for the failure, the excavation of the new channel appears to have precipitated the fall immediately. Under the considerable weight of the arch, and favoured by the removal of material between the abutments, lateral flowing of the quicksand with attendant settlement and tilting of the abutments naturally followed. Had the foundation-bed been piled, this development could not have taken place. Faulty design of foundations was, therefore, primarily responsible for the failure; but, unless some of the piles had been driven on a batter, bad cracking of the spandrels would have occurred under the conditions named.

Case 7.—Some seven years ago a Monier arch of considerable size and built at an extreme skew collapsed at Bendigo, Australia, with loss of life. The failure was sudden and unattended by any premonitory signs of distress, unlike the recorded character of failure of Monier arches, which had been tested to destruction in Europe and elsewhere. In view of the fact that the abutments were especially massive and securely founded on solid rock and that the materials were excellent, the contractor attributed the disaster to incorrectness in the received theory of skew arches, and retained the services of the late Prof. W. C. Kernot of the University of Melbourne, to conduct a thorough investigation and report upon the cause of failure.

By means of measurements of the deformation of loaded india-rubber models and by ingenious electrical experiments on a metallic model, corroborated by mathematical calculations, Professor Kernot was able to show that Rankine's theory of the skew arch,

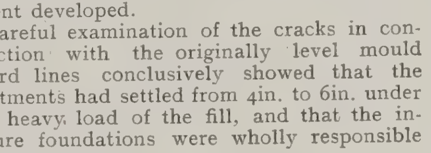

Fig. 1.

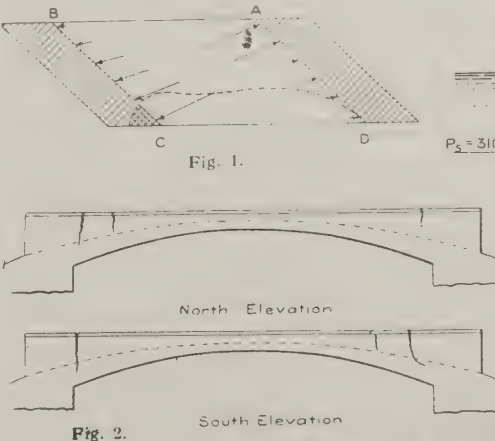

Fig. 2.

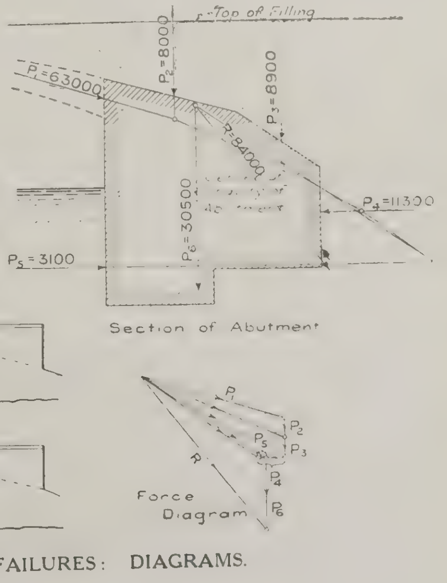

CONCRETE BRIDGE FAILURES: DIAGRAMS.

which had, up to that time, been universally accepted, was altogther erroneous. Rankine's view, as stated in his "Applied Mechanics," was that "the forces which act in a vertical layer or rib of a skew arch with its abutments, are the same with those which act in an equally thick vertical layer of a symmetrical arch with its abutments, of the same dimensions and figure, and similarly and equally loaded." It followed from this assumption, therefore, that the design of a skew arch is in no way different from the design of a right arch of the same span as the span of the former measured parallel to the longitudinal axis of the bridge. Professor Kernot, however, conclusively demonstrated that there is a great intensification of stress along the short diagonal AC of a skew arch, the actual stress being almost exactly double the stress along the lines parallel to AB. At the same time the stress along the long diagonal BD was excessively small.

The existence of such a stress condition is particularly serious since the acute angles of the abutments are of insufficient mass to properly resist the augmented thrust in the direction of the short diagonal, and if the skew be large, the factor of safety low or the test load unusually heavy, the abutments may give way at these points. This is precisely what happened at Bendigo, for the acute angle C of one of the abutments was literally pulverised over the double-hatched portion by the local intensification of the stress and the part of the arch enclosed by the irregular dotted line and the line CD had consequently fallen. (See diagram Fig. 1.)

The cause of this failure lies unquestionably in the lack of knowledge at that time of the true principles of proportioning skew arches and their abutments.

Case 8.—The most recent concrete bridge failure of magnitude occurred on Feb. 28, 1910, when a reinforced concrete arch highway bridge of three spans over the Flat Rock River near Edinburg, Ind., collapsed during a flood of exceptional height. The bridge had been open to traffic for about 8 months and during that time had stood one severe flood accompanied by an ice jam.

As designed, the structure consisted of one central span of 90ft. and two side spans of 75ft. each, all foundations to be on piles. Although the design was submitted by a well-known and responsible concrete bridge company, the County Commissioners decided to save money by omitting the piling and carrying the piers and abutments down to a somewhat greater depth than originally contemplated. Beyond furnishing the design, which appears to have been entirely satisfactory with the possible exception of insufficient provision for flood waters, the bridge company had nothing to do with the work, and the County Commissioners, for whom the bridge was built, had no engineer to advise them or supervise the construction. In spite of this, and to the credit of the contractor, the materials and workmanship were of excellent quality, many of the particles of stone and gravel of the concrete having split instead of being torn out of their places by the collapse.

Upon careful examination of the wreck, it was found that the scour actuated by a considerable quantity of lodged drift had undermined the upstream end and one side of one pier, causing it to tip forward and endwise, and resulting in the fall of the two arches which it carried. The other pier being thus left without support to counteract the thrust of the remaining arch, likewise tilted, allowing this span to drop vertically into the river. There was no evidence to point to any other cause of failure than undermined foundations, and the responsibility for this rests with those who altered the original plans and specifications.

Case 9.—The most extensive failure in reinforced concrete bridge construction, of which records are available, is that of the City Bridge across the Illinois River, at Peoria, Ill. On May 1, 1909, three spans and the two intermediate piers of a 6-span arch structure which had been opened to traffic only a few weeks, collapsed before the supporting centres had been struck. The wrecked spans were each a Melan arch 125ft. in the clear, of 13½ft. rise, and of the solid spandrel type. Practically all of the earth filling was in place at the time of failure. The two ruined piers were specified to be founded upon piles driven to bed rock, though subsequent investigation showed that probably most of the piles stopped at less stable material. In addition, the piles were to be enclosed by permanent water-tight tongue-and-groove sheet piling or Wakefield piling to safeguard the pier foundation against scour; but, in spite of repeated warnings on the part of the consulting engineers, this was not done, nor was any protection in the way of riprapping provided. As a result, during the high water of the spring of 1908, the scour was most serious, in the case of one pier reaching to 3.8ft. below the base of the pier, or 11ft. below the original bed of the river.

Since the design and construction of the superstructure was apparently entirely satisfactory, it was, therefore, not difficult to assign the cause of failure. The lateral support and the frictional resistance of the piles under the two piers in question having been largely removed by the excessive scouring action of the water, buckling and considerable settlement would naturally follow. This action was, no doubt, largely precipitated by a serious settlement and movement in a shoreward direction of one of the abutments, which began a year prior to the collapse of the structure.

Under such circumstances, there is little doubt that the failure was due to insecure foundations.

Case 10.—This is not a case of total or even partial collapse, since the bridge in question has been in constant service since its completion two years ago. It affords, however, an excellent example of spandrel wall cracking, and as such will be used to illustrate a general discussion of this defect, which, as has already been stated, constitutes failure to a limited degree.

This bridge, having a span of 60ft. in the clear, a rise of 6ft. and a crown thickness of 15in., showed cracks in the spandrel walls immediately upon the striking of the centres, although the spandrels are reinforced in the region of the springings by three longitudinal ¾in. round rods. One of these rods is in the coping and the others are located at distances of 1ft. and 3ft. below it. Each of the abutments rests upon a large number of vertical piles driven into quicksand.

With the object of explaining the existence of these cracks in spite of the longitudinal reinforcement in the spandrels, the writer obtained information concerning the dimensions of the abutments, and constructed the diagram shown in Fig. 2. In this diagram the various forces acting upon the east abutment are shown in magnitude, direction, sense, and point of application for a vertical longitudinal rib or strip, 1ft. in thickness. The thrust of the arch P1 is given for the weight of the arch ring and filling only, since the spandrel cracking occurred without any live load on the span. P2 and P3 are the weights of the two trapezoidal prisms of filling resting on the abutment; P4 represents the lateral pressure of the earth filling acting on the vertical projection of the abutment and tending to force it forward into the stream; P5 is the pressure of the water and the saturated material of the stream bed, acting on the face of the abutment; and P6 is the weight of a strip of abutment 1ft. thick reduced for buoyancy of the submerged portion. These various forces, when combined, produce a resultant action, R, on the base of the abutment having a magnitude of 84,000lb. and passing altogether outside of the base instead of cutting it near the centre as it should in a properly designed abutment.

Apart from the obvious effect of this serious error in the design, it is probable that spandrel cracks would have still occurred, although not to the same extent. The abutments, as has been noted, were founded on vertical piles driven into quicksand, and under the thrust of the unusually flat arch lateral yielding of the piles would in all probability have been followed by cracking of the spandrels. The practice of founding arch abutments on piles, none of which are driven on a batter, or where no abutment ties are employed, is in the majority of cases likely to result in dangerous cracks.

Spandrel cracks are so often found in concrete arches that their presence cannot always be attributed to badly designed abutments, or to yielding foundations. Mr. Young knows of one case where spandrel cracking occurred in an arch the abutments of which were founded upon solid rock and where, it is believed, the design was, in general, satisfactory. The spandrels, however, contained no longitudinal reinforcement, and the settlement of the crown when the centres were struck had induced sufficient negative bending moment in the spandrels near their junction with the abutments to overcome the tensile strength of the concrete and cause conspicuous cracking.

Mr. Young believes that the objectionable practice of inserting gas pipe or other metallic handrail posts in the spandrels of arches, strongly favours the development of spandrel cracks. Since the temperature of the exposed metal rises more rapidly than that of the concrete under the heat of the sun's rays, the posts expand more rapidly than the concrete and cause cracking of the latter at every post.

Case 11.—This is a badly cracked wing wall, typical of a great number of like cases. Such a development does not, of course, put the bridge out of commission; but, it necessitates the expense of shoring and repairs. The source of the trouble is generally in bad design, and sometimes in careless workmanship. In this case, the wing wall is about 24ft. high, 3ft. thick at the base, and 18in. at the top, with no reinforcement whatever. The workmanship and materials were good, and the failure is therefore entirely due to the absurd proportions of the wall. A number of cases of cracking of correctly designed wing walls at their junction with abutments are known to Mr. Young, where trouble might have been avoided by a small amount of horizontal reinforcement at the corners.

Conclusion.—Summing up the eleven cases cited, the principal, and therefore primary, causes of failure are found to be as follows: (1) Design of foundations originally defective or rendered defective by alterations not approved by the designing engineers, 6 cases. (2) Design of the superstructure defective, 5 cases.

It therefore appears that in the cases discussed over one-half of the failures occurred from defective design of foundations. Especially significant is the fact that in the case of the two most extensive failures described, the original designs and specifications for the foundations were satisfactory and that the disastrous results were caused by alterations in the plans made by persons in authority without professional advice. The time is coming, Mr. Young believes, when engineers, in self-protection, will refuse to allow their plans and specifications to go out and suffer interpretation and alteration by laymen, but will insist upon the same expert attention to the work under construction as in the designer's office.

A feature of the above summary, which may occasion some surprise, is the fact that in all of the cases considered failure was primarily due to errors in design, either of substructure or superstructure, and that the material, except to a limited degree in Case 2, was not in any way responsible for the unfortunate results.

Mr. Young stated that no special selection of cases was made for his paper; but, in every case had been included concerning which reliable data could be obtained in a short space of time. Since these cases are probably typical of most of the failures of concrete bridges, he believes that there is no ground for the disquieting statements which have been made.

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to architects practising in Coventry. Particulars given in our issue of March 16th.

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglican Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. D. O. Holme, Clerk of the Governors, Castle Chambers, Norwich.

SEPT. 1. CARNEGIE LIBRARY, KINGSTOWN, CO. DUBLIN.—The U.D. Council of Kingstown offer premiums of £50 and £20 respectively for the two best designs for the above to be erected at Lower George's Street. Particulars from Mr. J. Sherlock Vaughan, Town Clerk, Town Hall, Kingstown. Deposit one guinea.

SEPT. 5. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 5. SHERINGHAM COUNCIL OFFICES.—Architects desirous of submitting designs for the council offices proposed to be erected at Sheringham may obtain full particulars on written application, accompanied by a stamped addressed envelope, to Edgar C. Rolfe, Clerk of the Council, Church Street Chambers, Sheringham.

SEPT. 10. SECONDARY SCHOOL, FOLKESTONE.—Competitive designs are invited from architects (being Fellows, Associates, or Licentiates of the Royal Institution of British Architects or members of the Society of Architects. Particulars, together with site plan can be obtained from Mr. A. F. Kidson, Town Clerk, Folkestone.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, together with a plan of site and sections at ground level, may be obtained from the engineer and surveyor, Mr. Samuel J. Harpur, Town Hall, Maesteg. Designs must be deposited at my office by noon on Monday next, September 19th. Two premiums are offered, namely, 25 guineas and 10 guineas, as first and second respectively.

Oct. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., which it is proposed to erect at a cost not to exceed £10,000. Particulars of the accommodation required, and of the conditions of the competition, together with a plan of the site and the necessary levels, may be obtained on payment of a deposit of £1 1s., which will be returned on receipt of a bona-fide design. Three premiums are offered, viz., £75, £30, and £20, as first, second and third respectively. The competitor whose plans are considered most suitable will be awarded the first premium, and will be engaged to carry out the work, in which case his premium will emerge in his commission. Designs must be delivered to the office of J. Parry Jones, Town Clerk, Denbigh.

NO DATE.—TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan of the states of King's College, Cambridge, in the parishes named. The estate comprise 1,300 acres. Assessors: Sir Aston Webb, R.A., and Mr. Raymond Unwin. Premiums of £150, £100, and £50. Terms and conditions, together with a lithographed plan of the estate, may be obtained at the offices of the Company on and after September 1st. Deposit, one guinea.

CORRESPONDENCE.

"Buildings for Music."

To the Editor of The Architects' and Builders' Journal.

Sir,—It is gratifying to read Mr. H. H. Statham's very interesting article on "Buildings for Music" in a paper of the standing of the "Architects' and Builders' Journal." Too great importance cannot be attached to the question of a suitable position for the organ, and, generally speaking, far too little attention is given to this all-important matter in connection with buildings where music occupies a prominent place. This subject is frequently aired in musical journals, not always to the advantage of the architectural profession, and, if spoken of more often in papers such as yours, would surely lead to a better understanding between architect and organ builder. Although Mr. Statham deals principally with concert halls, where there can be but little excuse for improperly placing an organ, a far wider field is covered when one thinks of buildings intended for public worship. In nine cases out of ten a church or chapel sooner or later has an organ erected, and then begins trouble if sufficient thought has not been given to the organ question. A great factor in this case is the provision of ample head room for the pipes; and if architects realised that a very common length for a pipe is 16ft., they would think twice before giving less room than that. Many a fine instrument has been spoilt in effect by being boxed up in a space utterly unsuitable for it, destroying much of its quality of tone and complicating an already sufficiently complicated mechanism. After all, the organ is nowadays, with few exceptions, recognised as an essential aid to divine service; and if, in projected designs for buildings of a sacred character, the services of an organ builder of repute could be called in to the architect's assistance, a more satisfactory state of things would probably result. It sometimes happens that a prominent architectural feature in a building gets quite obliterated by a bank of organ pipes, when, if more thought had been given in the first instance, much soreness of spirit could have been avoided. It would be interesting to hear the views of your readers, many of whom are doubtless interested in the architectural and musical features of a building, if space could be found for a correspondence. In the hope of which I beg to subscribe myself,

An Interested Amateur.

London.

Finsbury Public Lighting.

To the Editor of The Architects' and Builders' Journal.

Sir,—My attention has been called to a paragraph appearing in your issue of the 3rd inst. relative to the contract recently entered into by the Finsbury Borough Council with the Gas Light and Coke Co. for the lighting of the borough. You state that "this decision was taken after the latest examples of gas and electric lighting had been carefully inspected and relative costs compared."

I am not in a position to say what were the latest examples of gas and and electric lighting inspected by the Council, but I do know that my Company offered to submit examples of electric lighting free of expense to the Council, but this offer was declined.

With regard to the question of relative running costs, my Company submitted a tender for lighting which gave an illuminating power three times as great as the existing gas lighting, and moreover, showed a saving in running costs as compared with gas, of over 14 per cent. In spite of this, however, the Company's offer was declined.

In view of the mistaken impression which the paragraph in question is likely to convey to your readers, I trust you will find space for this letter in your next issue.

H. B. Renwick,

General Manager and Secretary, the County of London Electric Supply Co., Ltd.

BUILDERS NOTES.

Mr. Alexander Howlett, Builder, of Bournemouth, has died at the age of 64, as a result of an accident, a collision between a motor cycle on which he was riding and a motor car.

The employees of Messrs. W. P. Hayter and Son, Builders and Contractors, of Westbourne, Bournemouth, had their annual outing recently, in the Isle of Wight; journeying from Lymington and taking boat to Yarmouth. From there they drove to Newport, where dinner was provided at Roach's Hotel. The party then walked to Carisbrooke Castle. Tea was taken at Lymington on the return journey.

A correspondence on "Scientific Bricklaying" has opened out in "The Morning Leader." A correspondent set the ball rolling by indicting the slow rate of laying bricks, saying that he had never seen more than 120 bricks laid in the day, and also by questioning the necessity for tossing each brick in the hand before laying, and for tapping bricks with the hammer when laying. This has drawn upon him remonstrances from various other readers, who give figures of 1,000, 1,100, 1,200 a day, and a writer who does not count himself expert, confesses to an ability to lay from 500 to 900 bricks per day. We were under the impression that trade union rules prohibited the laying of more than 400 to 500 bricks per man per day.

The report of Waring and White (1906), Ltd. for the year ending March 31st, 1910, presented at the meeting on Thursday last, shows a profit of £14,631, to which has to be added the balance brought forward from the last account, £11,026, making a total of £25,658. From this there is a deduction of £592 percentage to the staff under their various agreements, leaving a net amount of £25,065. The directors recommend that a dividend be not paid, but that the reserves should be strengthened by allocating £15,000, bringing the total reserve fund to £40,000; that £2,000 be allocated to a fund for staff purposes; and the balance of £8,065 be carried forward.

The rush contract for reconstructing and making additions to the older building of the Savoy Hotel, London, is now proceeding. In view of the heavy loss that must be incurred to the hotel during the operations, the work is being carried forward night and day. There are two shifts of men, each working 12 hours, under two foremen, and in all it is estimated that 900 men will be employed on the building. Two floors, containing 30 suites of rooms, are to be added at the top, and a large banqueting hall is also to be constructed on the site of the old Courtyard, with a seating capacity for 500 people. The floor is to be prepared for dancing. The whole work, estimated to cost £125,000, is to be completed in three months. Messrs. Leslie and Co., Ltd., are the contractors.

Statements have appeared in the Manchester papers that a strike is imminent among the operative carpenters and joiners in North-East Lancashire. These workmen have expressed their determination to strike unless the employers concede an advance of a halfpenny an hour. This demand is in substitution for an original request of one penny per hour. It is stated that both sides remain firm. After a strike of fourteen weeks the Leigh painters' dispute is to be submitted for arbitration to the Board of Trade. Pending a decision the masters have offered 8½d. per hour. It is since stated that the strike of joiners and carpenters at Burnley, Nelson, Colne and Padiham has been averted by the operatives accepting an advance of one farthing per hour forthwith, with the promise of another farthing per hour in January next. About 300 men were affected. This unrest in the building trade is probably only another symptom of the general labour unrest which is generally prevalent in the North of England just now.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, Architects' and Builders' Journal, *Caxton House, Westminster.*

Information from accredited sources should be sent to "The Editor," at latest by noon on Saturday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Ashton-under-Lyne.—For the works required in erection of the new savings bank, Ashton-under-Lyne. W. H. George and Sons, architects, 7, Warrington Street, Ashton-under-Lyne.

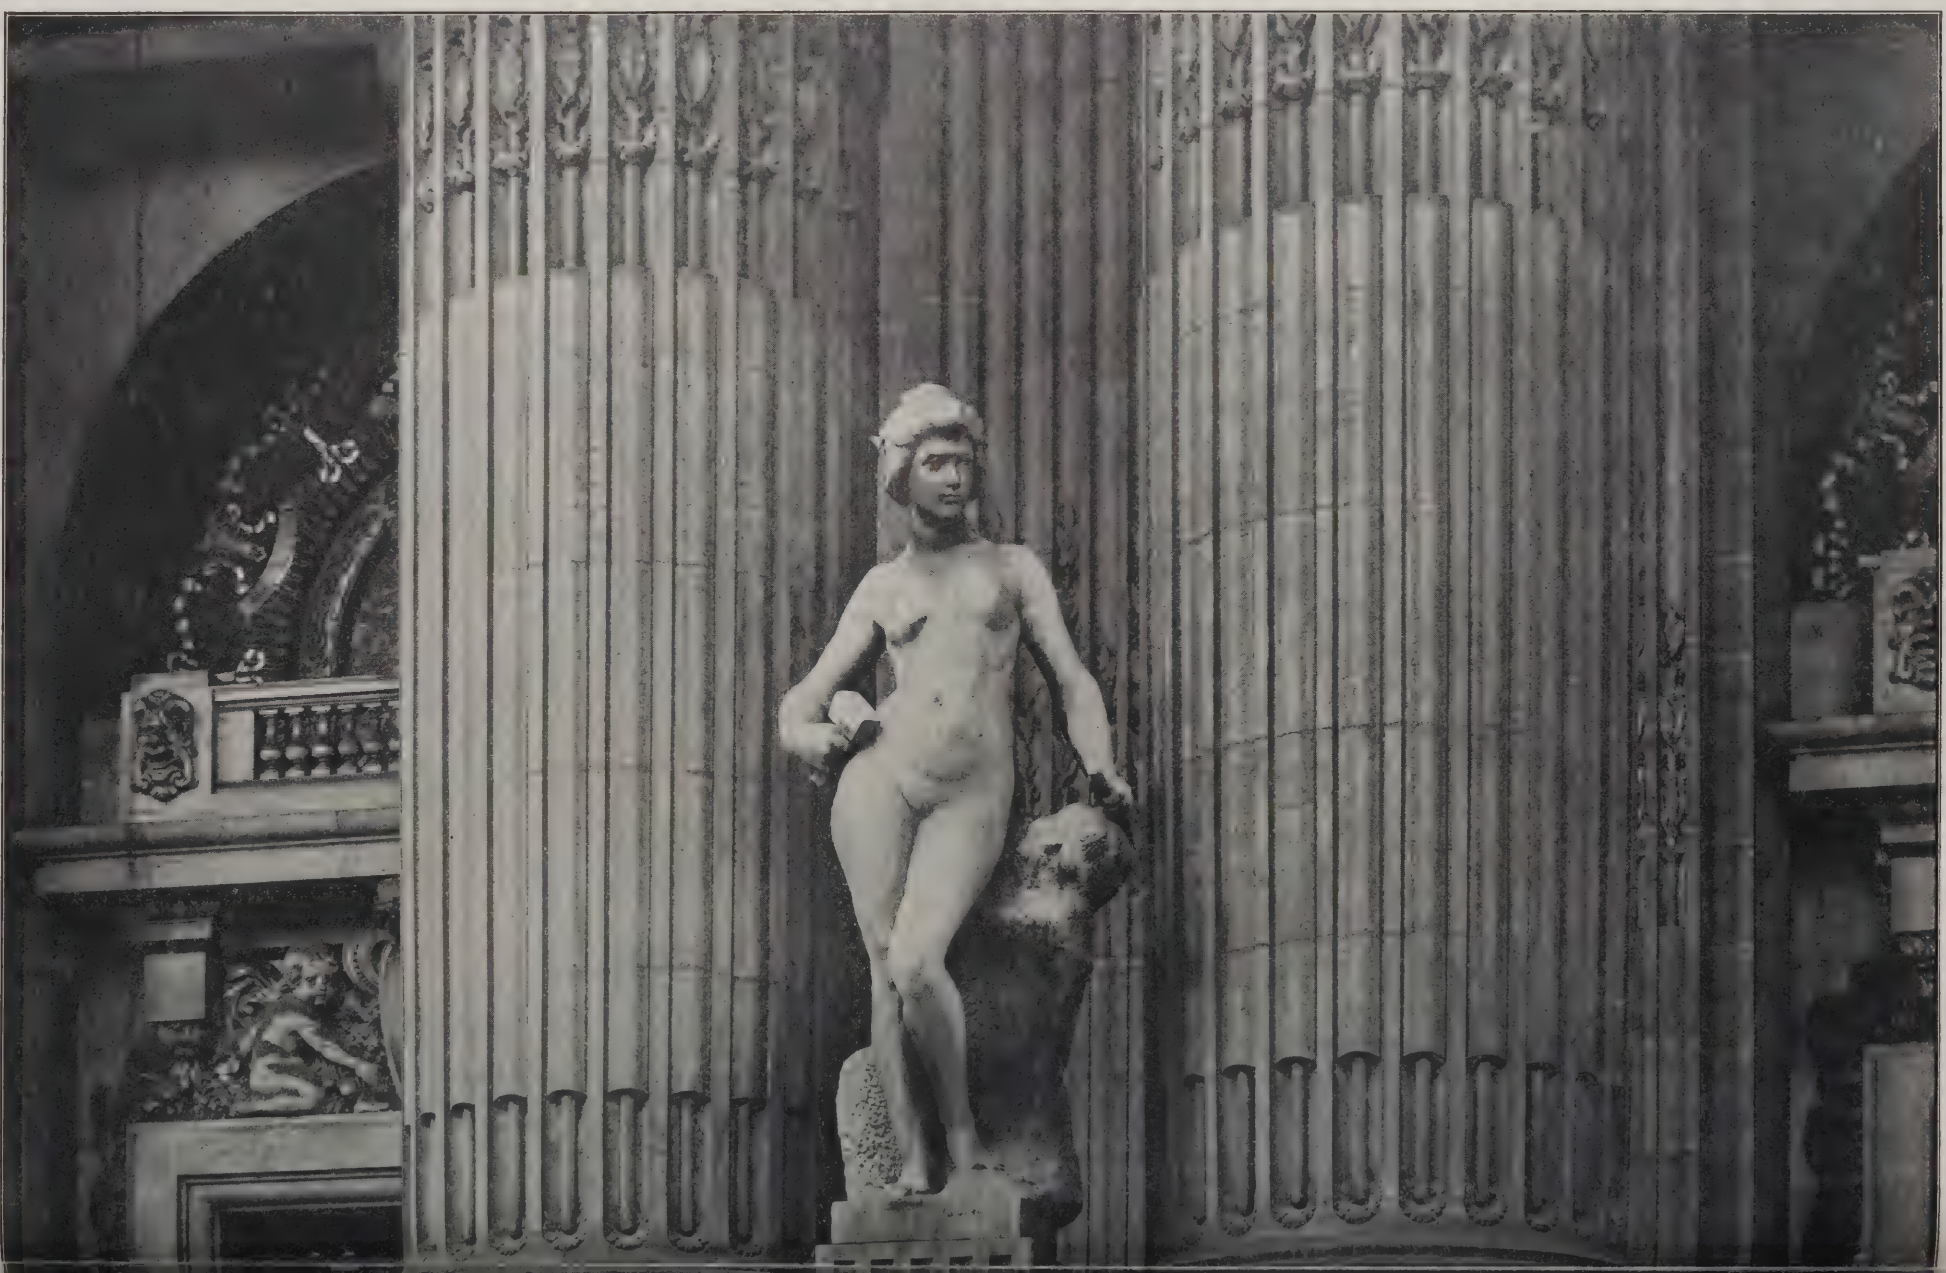
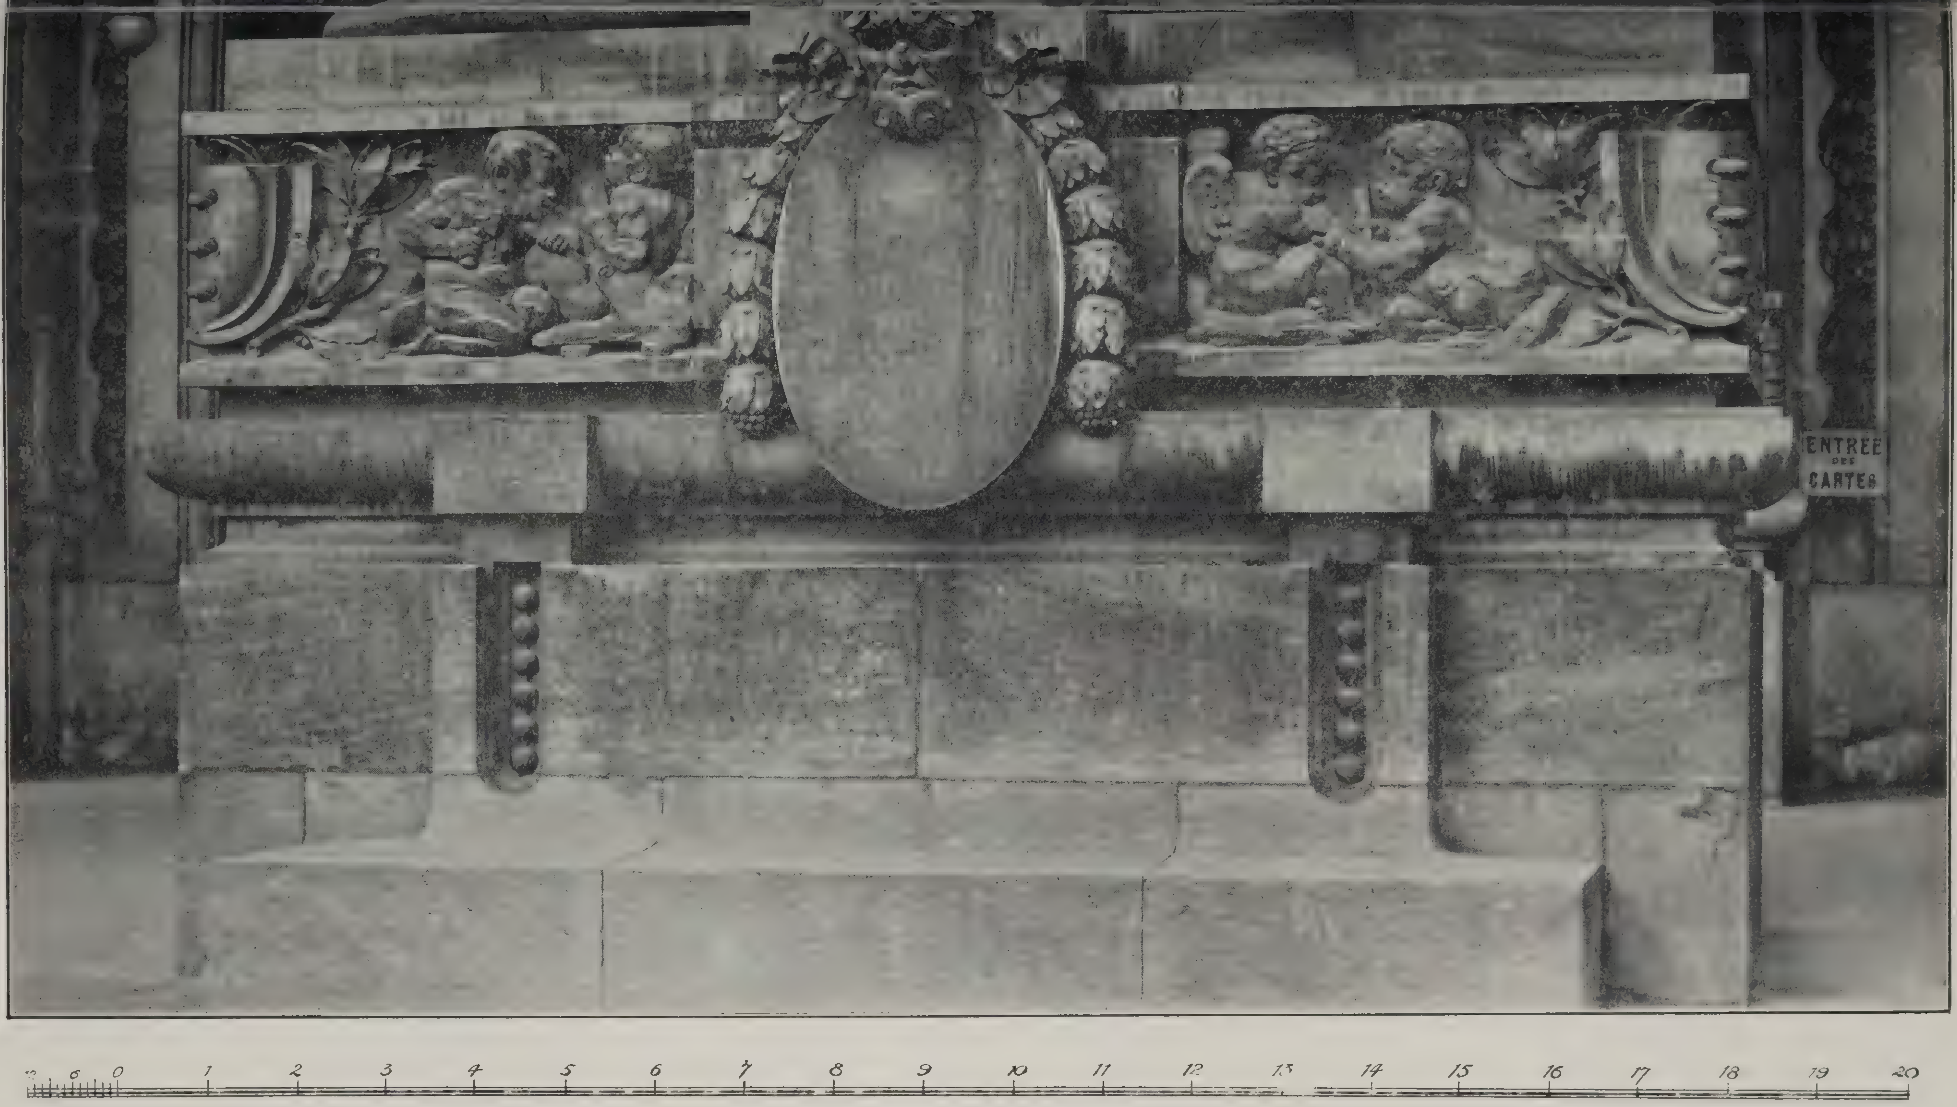
UNIVERSITY OF ILLINOIS





This detail is from the centre portion of the main entrance front of the Grand Palais facing the Petit Palais, and the beautiful figure of "Sculpture" is one of four that adorn this portion, the other figures being of "Painting," "Music," and "Architecture." The work is redolent of French feeling, and full of all the best qualities of the modern French schools of Architecture and Sculpture. The mouldings and the details throughout are vigorous and fresh, and the setting of the sculpture shows that grace and harmony of which, unfortunately, we posses so few examples in this country. All is in stone, now weathering to a fine tone, after ten years of exposure, for the Grand Palais is, like the Petit Palais, a permanent relic of the Exhibition of 1900.

The Garden Suburb House.

In our issue of August 10th we commented on a paragraph appearing in the "Westminster Gazette" under the above heading as follows:—

> THE GARDEN SUBURB HOUSE.
>
> A writer in the "Westminster Gazette" extols the merits of the garden suburb house by saying that the purchaser of a house in a garden suburb not only obtains a residence which is designed to his own wants, but he has neither the cost nor the trouble of discovering an architect, a builder, a surveyor, or a solicitor. He pays a stated sum, which may range from £300 to £400 for a modern cottage to £3,000 for a large mansion; and in that sum all other costs will be included. For the definite amount the house is designed, built, and finished ready for occupation. We presume that the next suggestion will be that the architect should be dispensed with.

Mr. Richard A. McCurdy, M.P., a director of the Garden Suburb Development Company (Hampstead), Ltd., writes to us that this paragraph has been brought to his notice, and he goes on to say that:—

> As this refers to the work of the Garden Suburb Development Company (Hampstead), Ltd., of which I am chairman, I hope you will permit me to correct an impression which I should be sorry should be created. The business of this Company is certainly not to dispense with the architect: it was formed for the opposite purpose. When the Hampstead Garden Suburb Trust acquired 240 acres adjoining Hampstead Heath, the speculative builder commenced to build upon it in his accustomed manner. He may have employed architects or he may not, I think the latter. The result was described by a writer in "Country Life" as follows:—
>
> "Without this Company (The Garden Suburb Development Company (Hampstead), Ltd.) as part of the machinery for creating the suburb, it seems likely that the brave hopes of the promoters would have sorely miscarried. At the start some few plots were leased to single builders, with results that we need neither describe nor illustrate. It was clear that there was a large chance of the labours of the consulting architects, in planning the roads, open spaces, and building sites, being smothered by an inharmonious jumble of unrelated designs, all, perhaps, admirable in themselves. Between the Trust Company and the man wanting to build there was need of a buffer state. Some friends of the Trust Company formed the Development Company to fulfil this function. The latter Company, by co-operating with the consulting architects, is able to build up groups of houses and create vistas and street pictures which would otherwise have been impossible. It employs about a score of architects of high repute to design for the willing purchaser, or it will work with the purchaser's architect, and it builds the houses through an official contractor. By this means the building trade is removed from the sphere of speculation, and the possibility of freak houses which offend the landscape is destroyed."
>
> This Company was formed to ensure that architects and contractors of repute should be employed in building houses of all sizes on the Hampstead Garden suburb. In the first year we paid over £2,000 in architects' and surveyors' fees. The following architects among others have done work for us:—
>
> Geoffry Lucas, A.R.I.B.A.
> E. L. Lutyens, F.R.I.B.A.
> Arnold Mitchell, F.R.I.B.A.
> Barry Parker and Raymond Unwin.
> M. H. Baillie Scott.
> C. Harrison Townsend, F.R.I.B.A.
> W. H. Ward, M.A., A.R.I.B.A.
> T. M. Wilson.
> Edgar Wood, A.R.I.B.A.
> Herbert A. Welch.
> Michael Bunney and C. C. Makins, AA.R.I.B.A.
> Courtenay M. Crickmer.
> E. Guy Dawber, F.R.I.B.A.
> Horace Field, F.R.I.B.A., and Evelyn Simmons.
> W. Curtis Green, A.R.I.B.A.
> P. Morley Horder, F.R.I.B.A.
> Joseph and Smithem.
> Langley & J. C. Baines, A.R.I.B.A.
>
> We leave the choice of an architect entirely to the client, but no house will ever be built for this company without it has been planned and supervised by a qualified architect working for proper professional fees.

We have not now the original paragraph of the "Westminster Gazette" before us; but our impression was that it was a generalisation, and referred to supposed advantages peculiar not alone to the Hampstead suburb, but to all similar projects. It is hardly necessary to say that we should not have thought of indicting the Hampstead suburb, which, as Mr. McCurdy points out, and as we are well aware, has very properly employed the services of many competent architects for the design of its houses. But Mr. McCurdy doubtless knows that it is becoming an habitual practice for estate development firms, especially of the speculative kind, to instance the saving of architects' fees as one of the inducements which the public obtains by dealing with them; and it is a practice which ought to be sternly reprobated, not merely in the interests of architects, but of Architecture. The "Westminster Gazette" paragraph, as it stands, expresses too much, or, in the light of Mr. McCurdy's explanation, too little. We do not think that a man should be saved the trouble, at all events, of discovering the artist who provides him with so intimate and personal a thing as his home. Rather should he be encouraged to feel that he is able to select the architect whose work appeals most sympathetically to him; and this without any additional expense to the projected cost of his dwelling. This, in effect, is what the Hampstead Development Co. enables him to do, and it ought to make the most of it. The builder, surveyor, and solicitor carrying out impersonal though necessary duties, may come in a different category; but the architect should never be obscured. From which Mr. McCurdy will understand that we were not quarrelling with the very excellent methods of this company, or of any other garden suburb development company on similar lines, but with the expressions and point of view by which the "Westminster Gazette" sought to extol them.

Temporary Exhibition Buildings.

THE catastrophe at the Brussels Exhibition naturally suggests some considerations as to the whole subject of the temporary architecture of exhibition buildings, both in regard to the question of security and that of suitable architectural treatment.

In regard to the first-named point, the fire at Brussels, especially when we consider it in connection with the recollection of the far more serious calamity of the fire at the bazaar in the Rue Jean Goujon at Paris, a good many years ago, ought to render it evident once for all that the erection of a number of inflammable buildings, containing often collections of very inflammable substances, under circumstances in which they are likely to be crowded with spectators, constitutes a public danger which ought never again to be incurred on such occasions. Happily the Brussels fire has not been accompanied, like the Paris one, by a holocaust of human lives, but this was perhaps only a fortunate accident, owing to the buildings not being crowded at the time. But a quantity of valuable property has been destroyed, along with works of art the loss of which no insurance money can replace, owing to the double risk of having buildings which would easily burn, and of not having, apparently, any adequate means on the spot for extinguishing fire. The latter provision is requisite in any case, and ought to be strictly seen to in future large exhibitions, for even if the buildings are fire-resisting, their contents may be inflammable; and in such a case the first few minutes are all-important; a very brief delay in getting to work to extinguish a fire may make all the difference between a merely local damage and the gutting of a whole building.

In regard to the buildings, every consideration points to concrete-steel, in one or other of its forms, as the material for temporary exhibition buildings; if properly made and every precaution taken to thoroughly isolate the steel from contact with the external air, it is the most fire-resisting material known, and nothing else ought to be countenanced for temporary exhibition buildings in future.

Then follows the question, not unimportant, of the architectural treatment of such buildings. There has been of late years far too much of the attempt to give to exhibition buildings a monumental character; to treat them, as many of those at the Chicago Exhibition were treated, as imitations of classical buildings of columnar style. The one argument that can be adduced in favour of this method is that it may have a certain educational value, and that those who have not seen any of the great classical or Renaissance buildings may thus get an impression of their effect. This imitative architecture at exhibitions seems to have been confined to classic forms; we do not remember any important attempt at Gothic imitations of the kind, probably because the broader forms and surfaces of classical architecture are more easy to reproduce in this way. The latest attempt we have heard of to reproduce classic architecture in an exhibition building was the design for the British pavilion for the forthcoming exhibition at Rome, a reproduction of a part of St. Paul's Cathedral, made for the odd reason that Rome was full of genuine Renaissance architecture and genuine classic remains, and that therefore an imitation of an English building of the same type was the most suitable thing for the English pavilion at Rome. One is tempted to put the double question—why, because a city is full of genuine Renaissance buildings, put a piece of sham Renaissance to compete with these? And secondly, why make exhibition buildings into sham monuments at all?

The two things to bear in mind, as a basis for the architectural treatment of exhibition buildings, are, first, that they are necessarily temporary; secondly, that they are properly of a festal character. An exhibition, international or national, is of the nature of a holiday resort, and its buildings should have a holiday appearance. And if we carry our recollections back to the two great Paris exhibitions of recent years, those of 1889 and 1910, it will appear that the French architects for the most part take this view of the matter, and that they produced buildings which were obviously both temporary and decorative, and which were not imitative of any existing monuments. M. Formigé's two large buildings, the Palais des Arts and the Palais des Arts Liberaux, which flanked the opposite sides of the Champ de Mars in the 1889 exhibition, were almost exceptional examples, æsthetically, of what temporary exhibition buildings ought to be. Practically, they were not what we should now consider sufficiently fireproof, as they were based on iron construction in which the iron, though much of it was covered, to the eye, by a decorative treatment of terra-cotta and coloured tiles, was not really protected in a fire-proofing sense, its main structural lines being in fact visible as the framing of the tiles and terracotta. But these buildings, which stood for some years, but were removed to make way for the 1900 exhibition, ought not be forgotten, for they were models of their kind for the purpose. They imitated nothing; they were perfectly new and original in design; they were obviously temporary; and they were essentially decorative and festal in character. The 1900 Exhibition contained nothing quite so good as these; there was rather too much of the pie-crust element about some of the buildings; but they kept mostly to the same ideal, of not imitating monumental architecture, of being obviously temporary, and of a decorative character of originality. They were, we believe, mostly of fibrous plaster on iron cores.

Supposing concrete-steel adopted as the material for exhibition buildings, there is nothing to prevent its being treated, architecturally, in a similar spirit. A certain amount of surface modelling in cement is quite feasible; but in addition to that there is the possible application of coloured materials, such as marble or tiles, on flat surfaces; and there is also the rather neglected resource of *sgraffito* design, a process peculiarly in keeping with a concrete building. Sculpture in plaster, in relief, or in the round, could also be introduced, though this should be introduced with judgment and restraint, and where it would have a meaning. In the 1900 Exhibition the French used sculptured figures rather too freely; you saw them on every cornice and coign of vantage, their limbs flying out in the air, as if they had been blown there by the wind, and had difficulty in maintaining their position. To toss figures about wholesale in this way is to lower the value of the figure as an adjunct to architecture, and reduce it to a commonplace. But in making up a fireproof architecture for exhibition buildings, there is plenty of opportunity for effect and for really original design, keeping in mind the two conditions named above—that it should have the character at once of temporary and of festal architecture. In the case of international exhibitions, also, there is a great deal of scope for special character in the design of the pavilions for different nations, by the use of ornamental detail derived from, or suggestive of, their respective schools of ornament. That is a much better way of doing it, gives much more scope for architectural invention, and would produce a much more interesting result, than making sham reproductions of architectural monuments.

NOTES AND NEWS.

Romford Garden Suburb Competitions.

In connection with a Town Planning and Modern House and Cottage Exhibition to be held at the Romford Garden Suburb in June and July of next year, we have received a preliminary announcement of competitions open to architects and builders in connection with the Exhibition. Mr. H. H. Raphael, M.P., is offering prizes, amounting to £1,050, for the best designed cottages erected in the Exhibition, for a site plan, and other designs. The list of competitions, which are open to architects, artists, and builders, resident in the United Kingdom, is as follows:—

COMPETITIONS OPEN TO ARCHITECTS.

CLASS I.—A detached house, to cost £500.—First prize, gold medal and £200; second prize, £100.
CLASS II.—A detached cottage, to cost £375.—First prize, gold medal and £200; second prize, £100.
CLASS III.-For the best internally fitted cottage in Class I.—First prize £50.
CLASS IV.—Ditto, in Class II.—First prize, £50
CLASS V.—Site plan of part of Gidea Park.—First prize £100; second price £50.
CLASS VI.—Garden Design for Cottage in Class I. or II.—First prize, £25; second prize £10.
CLASS VII.—Perspective drawing, suitable for reproduction of a cottage entered for competition in Class I. or II.—First prize, £10; second prize £5.

COMPETITION OPEN TO BUILDERS.

CLASS VIII.—For excellence of workmanship and construction in the erection of a cottage in Class I. or II.—First prize, gold medal and £100; second prize, £50.

The list of entries will close on the 30th October, 1910. Final date for competitive designs to be submitted, 1st December, 1910. Full particulars, forms of entry and conditions may be obtained from the Secretary, "Squirrels Heath Exhibition," 33, Henrietta Street, Strand, W.C.

The assessors will be Mr. E. Guy Dawber, V.P.R.I.B.A., Mr. H. V. Lanchester, F.R.I.B.A., and Mr. Mervyn E. Macartney, B.A., F.R.I.B.A., F.S.A.

We should explain here that it is the great desire of the promoters that these competitions should appeal particularly to architects, and the conditions have been specially framed with that end in view. Freak cottages or cottages whose main object is to exploit some particular building material are not desired. The desire is that the architect should be supreme, and that good architectural designs should be sent in, designs which express solely the ideas and feelings of the authors in regard to smaller domestic work. The prizes also are generous, and should make their appeal to men of good standing. The scheme is not without its importance from a national and social point of view. The eastern side of London has expanded and developed in a manner that is the despair of architects, town-planners, and social reformers. For the most part it will remain a hopeless problem for many years to come, but it is not too late to check the evil, and to show what can be done.

The Cost of Building in Australia.

Some interesting particulars as to the cost of building in Sydney are given by Mr. J. M. Pringle, Hon. Sec. to the Federated Master Builders' Association of Australia, in a letter to the "Sydney Daily Telegraph" of June 25th. His notes form a review of the prices obtained by builders during the last 25 years, and have been published in view of the sensational statements that have appeared in the Sydney Press. He says:—

"In considering the present cost of building, account should be taken of the tariff which imposed duties on building materials, of the more costly materials now used in their construction, in marble, ornamental iron, brass, and copper work, electric fittings, lifts, etc., and also that there was a gradual decline in the cost of buildings from 1885 to 1896.

"During the years immediately following the bank failures the building trade was practically dead, and the process of recovery has been extremely slow.

"The following percentages are based on the actual cost of work in different years, and will serve to show the unreasonable nature of the present criticism levelled at the assumed high cost of building. I have selected for illustration leading items in building construction with which everyone is more or less familiar, but other items show similar variations:—

Cost of excavation, 1887 to 1899, fell 20 per cent.
Cost of bluestone concrete, 1887 to 1899, fell 45 per cent.
Cost of brickwork, 1885 to 1896, fell 51 per cent.
Cost of stonework, 1887 to 1896, fell 54 per cent.
Cost of carpenter work, timber in roofing, 1887 to 1899, fell 69 per cent.
Cost of timber, joist and flooring, 1887 to 1900, fell 43 per cent.
Cost of corrugated iron (roofing), 1891 to 1900, fell 15 per cent.
Cost of plasterer (cementing), 1887 to 1901, fell 62 per cent.

Prices at end of May, 1910.

Excavation, 10 per cent. higher than in 1887.
Concrete, 25 per cent. lower than in 1887.
Brickwork, 30 per cent. lower than in 1885.
Stonework, 25 per cent. lower than in 1887.
Timber in roofing, 61 per cent. lower than in 1887.
Joisting and flooring, 26 per cent. lower than in 1887.
Corrugated iron, same price as in 1887.
Cementing, 42 per cent. lower than in 1887.
The price of brickwork recovered somewhat between 1896 and 1900, and during the last ten years has risen 13 per cent.

"I may point out that the carpenter trade is still in the doldrums, and that the common experience of builders is that it is almost impossible to get paying prices for woodwork. It is unfortunate that the cost of buildings has such a close connection with the price of land, the speculative element for building purposes lies in the latter, sometimes to the detriment of the former, and no doubt it is a matter of much concern to land agents and speculators to find that the legitimate cost of building is slowly recovering. The profits of the builders can be very safely left to the action of the extreme competition which obtains for building work; but it ought to be evident that the position of those engaged in the building trade, employers and employees, has its own troubles."

The Destruction of Welsh Monuments.

Mr. W. D. Caröe writes to the "Times" with some indignation concerning the apparent acquiescence of the Welsh Historical Monuments Commissioners to the contemplated destruction of Newport (Mon.) Castle and Great Camp in Penmaenmawr. "The River Front of Newport Castle," says Mr. Caröe, "is in one respect a unique example of mediæval skill in the erection of such a work upon a tidal estuary subject to quite unusual variations of water-level. The internal dock and the arrangements connected with it are as perfect as when erected, while the vaulted chapel door is a work of rare beauty. The whole front has been a stately and quite majestic construction, and, with the exception of the termination of the noble central tower, a portion of every detail of it still survives. Not the least valuable part is the double curtain wall south of the central tower, which it is proposed to destroy, not for the erection of a permanent, but of, what is more surprising, a temporary bridge. But by the removal of some hideous and unworthy modern red-brick houses, erected some few years ago, without respect to the castle upon its southern curtain, a grand river approach could be secured to the town. The castle would again become a feature in the town itself as well as when seen from the river, and all engineering difficulties (which, by the way, I do not admit the existence of) connected with the bridge would disappear.

"The language used by the Commission as regards the great prehistoric camp of Penmaenmawr is equally unintelligible. If so fine a survival of prehistoric times existed in any other civilised country, even in Ireland, it would long ago have been placed under national control. But because a trading company can make money out of the destruction of this once magnificent headland, in which Snowdonia meets the sea; nothing, not even this unparalleled survival, is to be held sacred. The Commissioners not only acquiesce, but even seem to compliment the company upon facilities so kindly given for survey and plans to be made—as if they were of any reasonable value. If the mountain must be cut to pieces for commercial gain, a small sacrifice would preserve something of its outline and the camp, by tunnelling out the rock in galleries."

"Big Ben."

"Big Ben" at Westminster is having his faces cleaned, and the spectacle of two men, apparently midgets from the ground level, dangling in a cradle, has excited much public interest. The famous clock is said to have been named after Sir Benjamin Hall, Commissioner of Works at the time of its erection in the middle of the eighteenth century. The great bell is cracked, a fact that is painfully apparent to many people's ears, and its immediate predecessor is also cracked. The "clock" tower in which it is housed is 318ft. high. The clock itself was designed by the late Lord Grimthorpe, and built by Mr. F. Dent, whose successors, Messrs. E. Dent and Co., still look after it. Its greatest error in time has not exceeded four seconds.

"King Edward Place."

The scheme outlined in the "Daily News" of August 12th for a national memorial to the late King at Victoria Station has been received with considerable favour. Briefly the scheme is to sweep away the block of buildings which stands between the new station buildings and the main road. Of this block the District Railway station forms a part. The site thus laid bare is to be laid out as a garden and as a fine approach, Victoria Station being the one at which most of the foreign royalties arrive and depart. If private advices are to be trusted, there is some scheme in the air for pulling down the present block and rebuilding one much higher, and if this is ever done there is little doubt that this corner of London, from an artistic point of view, will be permanently ruined.

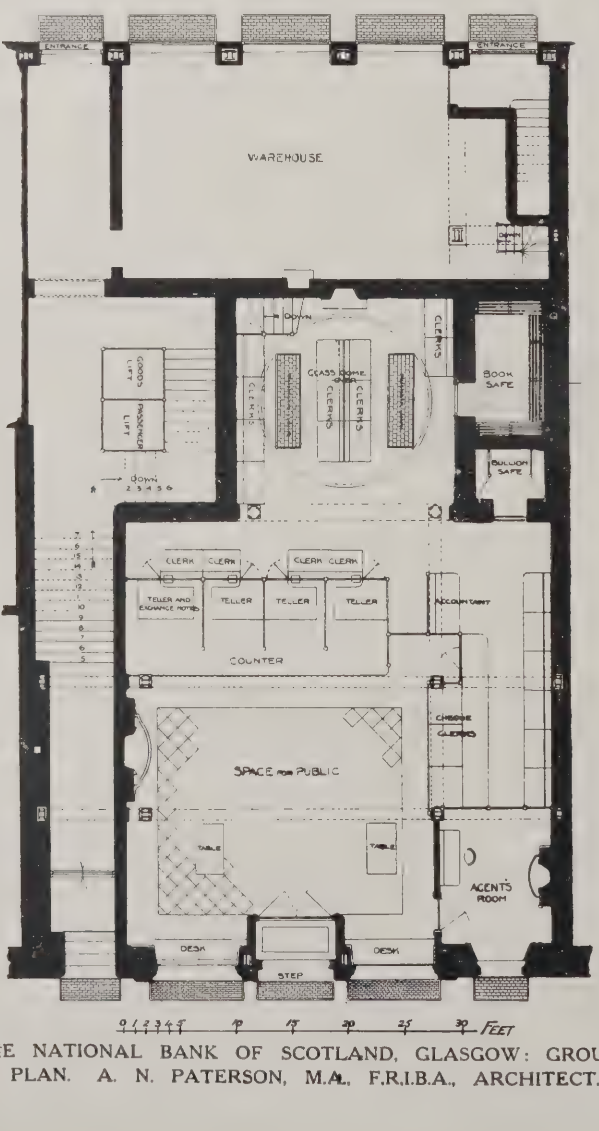
Street Improvements in the City of London.

The City of London engineer, in his annual report, refers to the various street widening works of the City, now in hand. In regard to the widening of Fleet Street he says that the London County Council have agreed to contribute £200,000, half of the net cost of setting back the 28 buildings still remaining. Progress had been made in settling claims for the widening of Bishopsgate Street Without. Arrangements had been made for removing the projecting corner of Bishopsgate Street Within, so that at its junction with Leadenhall Street the thoroughfare could be widened to 33 feet. The building line of Cornhill at that spot would also be straightened. The London County Council had agreed to contribute towards the cost. The widening of Tudor Street, begun in 1882, was continued, and steps were being taken to widen Kinghorn Street. The widening of the eastern end of Gresham Street between Basinghall Street and Coleman Street, and of the eastern end of Leadenhall Street, was under consideration. Notices had been served to effect a widening of Wood Street. The four ancient gates enclosing the parish of St. Bartholomew-the-Great had been removed, and compensation had been paid to the parochial authorities. The gates dividing St. Michael's Alley and George Yard, Cornhill, had also been removed.

The National Bank of Scotland, Glasgow.

The new building for the National Bank of Scotland, which has been erected as its principal branch office in Glasgow, occupies a site with a frontage of 46ft. on the west side of St. Enoch Square, and a depth of 83ft. 6in. to a narrow lane at the back. The ground floor and main portion of the basement are apportioned to the bank, and the remainder of the premises is occupied as offices and warehouses. These have separate entrances from front and back, with electric lifts for passengers and goods in the well of the main staircase, while, to meet the requirements of the Glasgow Buildings Act, there is in addition an emergency stair from all floors delivering on to the lane at the north-west angle. The whole of the building, with the exception of the main front, is steel-framed on a concrete foundation, which is spread over the whole site and reinforced with steel rods and wire mesh. Messrs. Redpath, Brown, and Co., Ltd., of Glasgow, were responsible for the steel construction and for the reinforced concrete in the foundations. All columns and girders are cased and hearted with concrete throughout the interior, and externally over the back elevation and central well with white glazed bricks, continued also between the columns from floors to sill-level of windows, the whole of the remaining space being filled in with glass in steel casements. The floors throughout are of concrete tubes on steel joists.

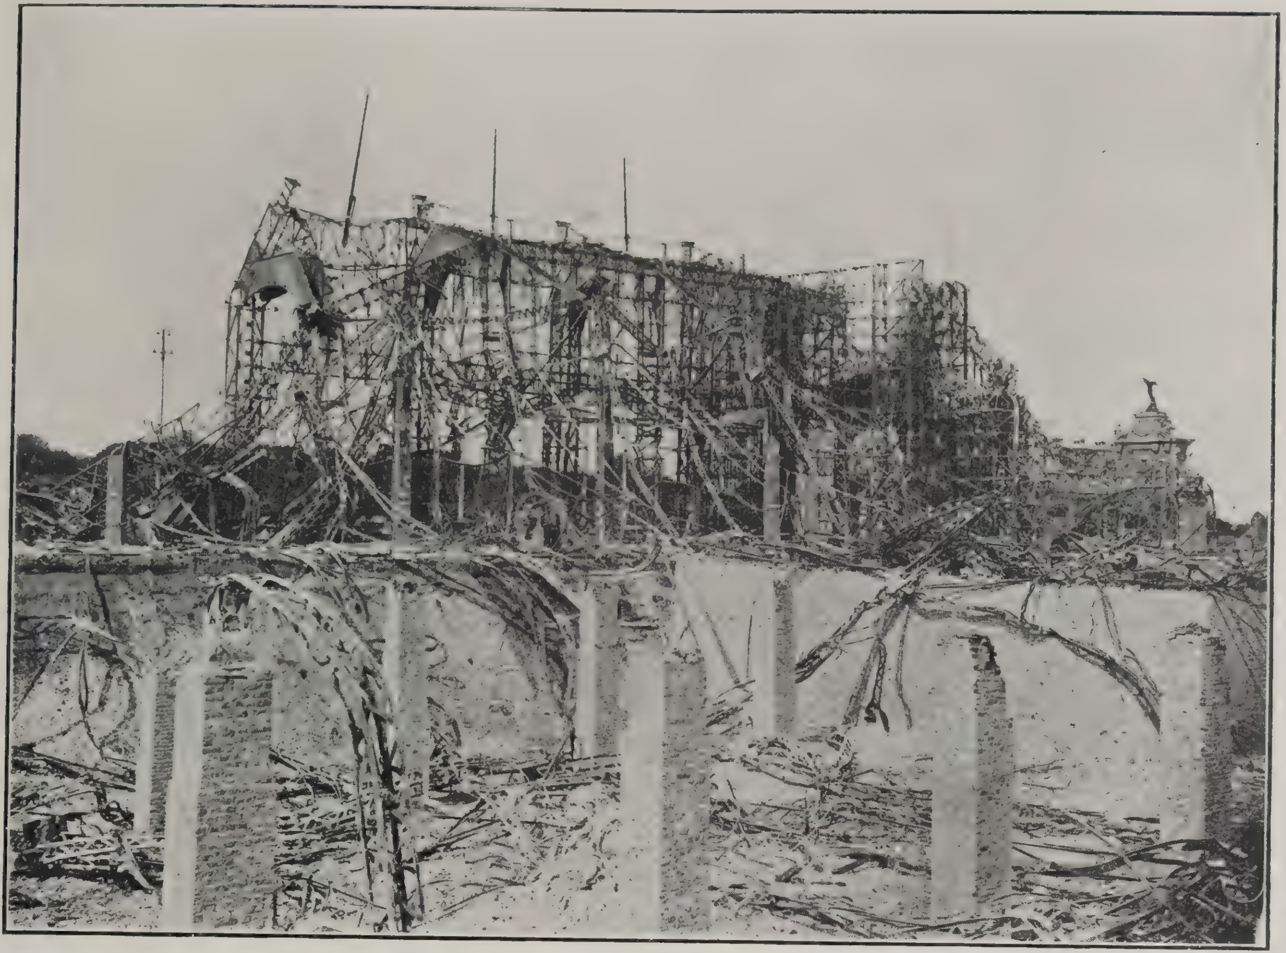
The sculptured figures on the façade are designed to symbolise the characteristics of banking, "Prudence" and "Adventure"; and its activities, "Commerce" and "Security," and are placed so as to emphasise the portion of the building occupied by the bank. With like object the ground floor is faced with pinkish-red granite, honed or dull surface, with lettering, armorial bearings, and ornamental studs or pateræ of cast bronze. The remainder of the façade is of white freestone. Roofs are covered with Coniston green slates, which were supplied by Messrs. The Buttermere Slate Co., of Keswick. The walls of the banking-hall are panelled in white oak, waxed and dull-polished, banded with mahogany inlay to link them up with the fittings, which, according to usage, are also of mahogany. Over the chimneypiece, of green Elterwater stone, with steel interior grate, the bank's coat-of-arms is set forth in inlay, while the pediment is surmounted by amorini, typifying "Cash" and "Credit," modelled, like the stone figures on the façade, by Miss Archibald. The tone of the oak lining is carried around the walls of the clerking space under the dome in panels of light drab dull-surface tiles, with enclosing bands of red to match the mahogany. The floor of the public space is in large squares of black and white marble mosaic, with a border of similar tones, and red, surmounted by a surbase, under the panelling and fittings, of the green stone employed on the chimney-piece. The walls are finished in "Duresco" of a quiet green tone, with ceiling and columns in ivory white. Bronze casements are fitted in the banking-hall, these having been supplied by Messrs. J. W. Singer and Sons, of Frome, who also supplied gates for the building. Electric-light fittings were supplied by the Artificers' Guild, Ltd., of London. The agents' room is panelled in oak, and has a barrel-vaulted ceiling with modelled enrichments in bands, carried out, like that in the banking-hall, by Mr. Thomas Beattie, of Edinburgh. The architect of the building was Mr. Alexander N. Paterson, M.A., F.R.I.B.A., of Glasgow. The general contractors were: Mason-work, Messrs. Alex. Muir and Sons; joiner-work, Messrs. Wm. McCall and Sons; both of Glasgow.



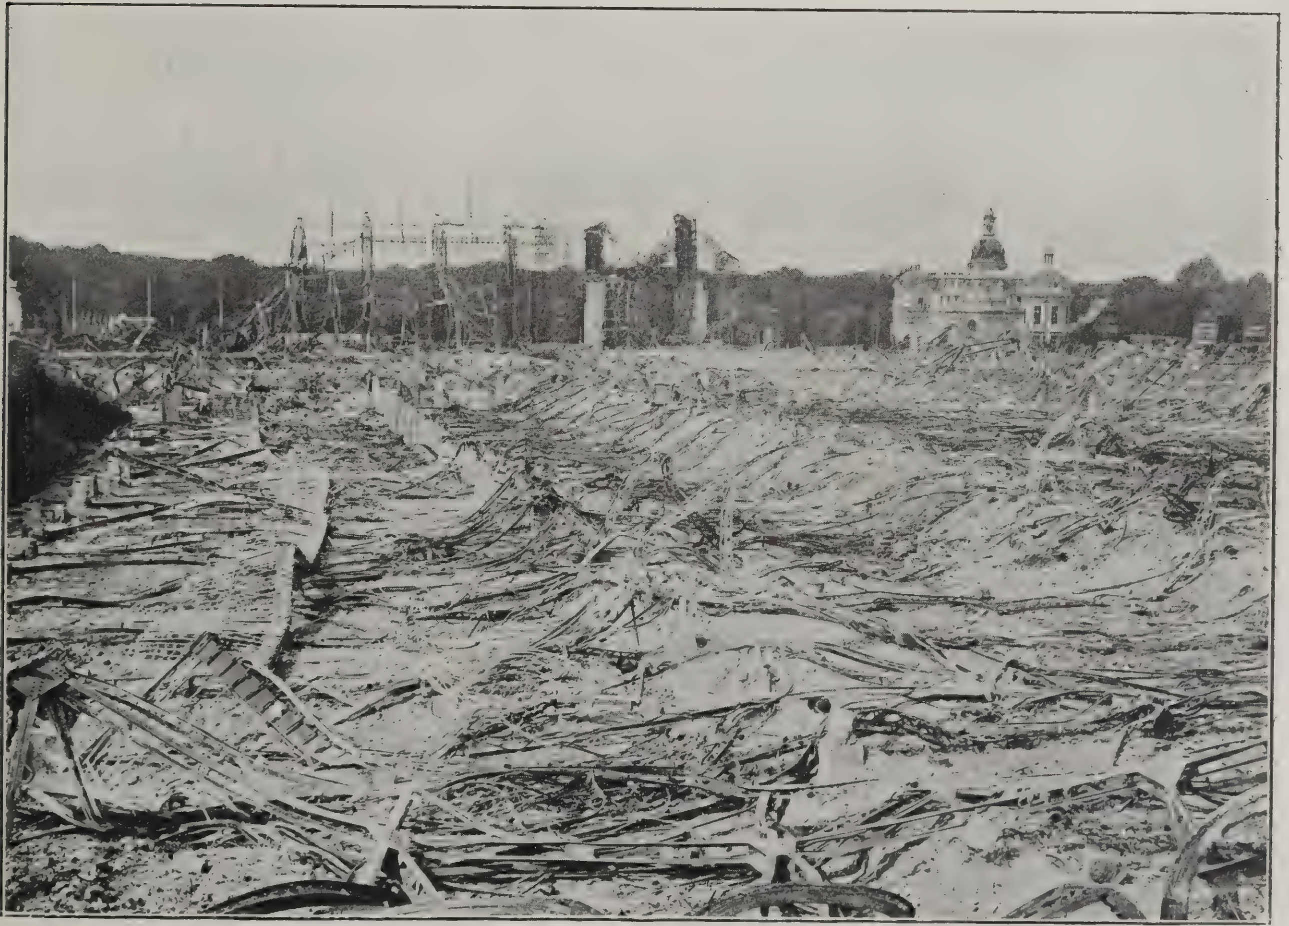
THE NATIONAL BANK OF SCOTLAND, GLASGOW: GROUND PLAN. A. N. PATERSON, M.A., F.R.I.B.A., ARCHITECT.

The British Building at Brussels Exhibition.

The building destroyed in the fire chronicled last week, compared favourably with those erected by other nations. It consisted of a main gallery 510ft. long and 98ft. wide, with four narrower parallel galleries, three on one side and one on the other. The main gallery was a steel frame building, the stanchions being encased in plaster Corinthian columns, and the roof was concealed by a pale blue velarium. The entrance from the main Belgian gallery was through a triumphal arch, flanked with groups of coupled columns, all in plaster, and the exit at the other end was by a spacious double staircase on to the bridge crossing the Avenue du Solbosch, the top of which was covered with a colonnade and bore a plaster cast of Mr. Thomas Brock's statue of Victory. The supports in the side galleries were similarly encased in plaster. The cabinets and show cases were uniform in style, and of nut-brown colour. Mr. G. C. Churchward was the architect for the interior. In the main hall the only objects of artistic character were examples of lace, modern pottery, bookbinding, etc.; but in the rooms at the east row of columns were many old works of art of considerable value. The exhibits sent from the Victoria and Albert Museum were merely electro reproductions of important originals belonging to the King, various colleges of Oxford and Cambridge, South Kensington itself, and other institutions. If there were few specimens of porcelain of the highest quality, yet several fine pieces were in the collection, notably those contributed by Lord Swaythling, Lady Stern, Mrs. Hansard, and Miss Lilian Colston. Of late years Old English pottery has been much in favour with connoisseurs, who will regret the loss of so many admirable "Toby jugs," "Drunken Parsons," "Country Gentlemen," "Jolly Good Fellows," and other quaint effigies of early Staffordshire manufacture, lent by Mr. J. A. Turner. The old furniture, arranged chronologically, comprised attractive pieces of sixteenth, seventeenth, and eighteenth century caraftsmanship. Of more recent date was the Arras tapestry, woven on the high warp loom by Messrs. Morris and Co. after a design, "The Passing of Venus," by Sir E. Burne-Jones. The rumour that pictures were destroyed was baseless. They are housed far from the main exhibition in the Palais du Cinquantenaire.



The Remains of the Belgian Grand Hall, where the fire started.



The ruins of the British Building, looking from the French section towards the ruins of the Belgian Grand Hall.

THE FIRE AT THE BRUSSELS EXHIBITION.

FOREIGN NOTES.

The administration of the Egyptian State Railways have instituted a competition for a new passenger station at Alexandria. Premiums of £E400, £E200, and £E100, will be awarded to the authors of the three selected designs. Enquiries should be addressed to the Administration Offices, at Cairo.

* * *

The Municipality of Valence will shortly apply for tenders for the construction of a public promenade on the sea front. The official project includes the construction of new streets, arrangement of squares, drainage and lighting.

* * *

In the competition for the Central Police Station and Criminal Court Building, Milwaukee, the design of Mr. Albert Randolph Ross, of New York, was placed first. In the competition for the Delgado Museum of Art, New Orleans, the design of Messrs. Lebenbaum and Marx, of Chicago, was accepted.

* * *

Plans, prepared by the Supervising Architect of the Treasury Department, for the Bureau of Engraving and Printing at Washington, have been approved by the Commission of Fine Arts. The new building will be 850 feet long.

* * *

Mr. Charles Niehaus, sculptor, of New York, has finished the model of the statue to Paul Jones, for which the U.S. Government voted a sum of £6,000. The work is to be cast in bronze, and will be erected at the entrance to the Potomac Park at Washington. The unveiling will take place next spring.

* * *

At the Académie des Beaux Arts the Prix Bailly (1,500 francs) has been awarded to M. Defrasse, architect, for his constructed works, and particularly for the Branch of the Bank of France at Orleans. M. Deverin, architect, has been awarded the Prix Rouyer of 1,000 francs.

* * *

M. L. Bachellery, architect-expert to the Tribunal of first instance of the Department of the Seine, and Hon. Controller-in-Chief of Public Buildings and National Palaces to the Minister of Public Instruction and Fine Arts, died recently at St. Germains.

* * *

The new bronze doors for the Capitol at Washington, the work of the sculptor Louis Amateis, are completed and will shortly be erected at the west entrance. The two doors are each 6ft. 9ins. wide by 13ft. high. Each is divided into four panels adorned with allegorical figures representing "Justice," "Science," "Art," "Agriculture," etc. At each corner of these panels is a medallion portrait of an American celebrity. The lintel over the doors has a decoration symbolical of the Apotheosis of the United States. On each side of this motif are medallions with portraits of Thomas Jefferson and Benjamin Franklin.

* * *

The widening of Forty-second Avenue, New York City, which work has for a long time remained in a state of chaos, is once more proceeding. When finished the street will be widened about 14ft. 6in., and will then have something of the appearance of Fifth Avenue, recently enlarged. Much work remains in setting back buildings to the new line, and among others the stone portico and court of the Manhattan Hotel is to have a new entrance, for which Mr. H. J. Hardenburgh has prepared plans. The Kinckerbocker Hotel, the West Presbyterian Church, and the Old Harmony Hall will also show important changes.

NEWS IN BRIEF.

The Metropolitan Water Board have decided to solve the problem of the future supply of water to London by an extension of their Staines Reservoir scheme in the Wraysbury district, close to Windsor, instead of going to Wales, as had been suggested. This is a matter which will probably affect seriously the whole neighbourhood adjoining Windsor Castle, inasmuch as the Board's proposals involve an engineering undertaking of great magnitude. It is understood that the Board will make application for the necessary powers in the next session of Parliament, and the owners and occupiers of land which will affected have already been interviewed on the subject. It is stated that the Board's whole scheme is eventually to cost six millions. We presume this is an alternative scheme to that proposed a year or two ago for the Newbury district. The strata there, we understand, were not found suitable for the formation of the large reservoir lake.

* * *

A correspondent of the "Morning Leader" appeals to the town-planners to refuse to recognise the bathless house—"where no provision is made for the personal cleanliness of the tenant." Which reminds us that landlords in South Africa are legally forced to provide baths in their houses.

* * *

The annual repair of Rotten Row, Hyde Park, has this year raised the usual question about the origin of its name. "The Daily Graphic" can get no further than the "rottenness" of the soil laid down on the famous track; but while interesting, this deduction is not conclusive. The row has a foundation of bricks—now being broken before laying—with a covering of two inches of Thames sand.

* * *

The prehistoric camp on the summit of Penmaenmawr, North Wales, is likely to be destroyed by quarrying operations carried on under a lease granted not later than 1899. "The Westminster Gazette" deplores the lease as a blunder that may lead to the destruction of what is believed was one of the strongest refuges of the ancient Britons, a place of impregnable strength, and hopes that something may yet be done to save what remains.

* * *

The arbitration proceedings over the cost of the site of the new Post Office at Dover have been concluded. The claimants asked for the site £11,189 with a further sum of £1,500 for loss of use during the three years since the Post Office had intimated its intention of taking the site. For the Postmaster-General valuations were put in of £3,220 and £3,900. The arbitrator, Mr. Leslie R. Vigers, reserved his award.

* * *

Lord Selborne complimented the Commissioners who chose the site for the new Union Government Buildings at Pretoria. The structure will be erected on the slope of a hill about a mile north of the centre of the town, and will give a dignified impression to the city on entering it through the Fountains Valley. The subsoil is rock. The buildings will be faced with local stone of a pinky-white colour, and the surroundings will be laid out in formal style with terraces and statuary. Messrs. Herbert Baker and Masey are the architects.

* * *

Following close on the decision to erect a beet sugar factory at Maldon, Essex, comes the news that a similar factory is to be erected at Kidderminster, capable of dealing with 30,000 tons of beet in a season. A site of 14 acres has been taken at Foley Park, and plans for the new buildings are being prepared.

* * *

The National Trust appeals for subscriptions under their scheme for the preservation of Borrowdale—which is to take the character of a memorial to the late King Edward VII. The President of the Trust, Princess Louise, has decided on the purchase of Grange Fell, a superb view-point, and there are several acres of the Fell that can be added to the memorial at a cost of £7 7s. per acre if subscriptions can be raised. About £750 remains to be raised to complete the purchase.

* * *

The Postmaster-General will, on September 12, formally hand over to the association which owns the Benenden Sanatorium, Kent, a pavilion of 20 beds which has been erected and equipped by Post Office subscribers at a cost of £900. Like the other buildings of the Sanatorium, this pavilion is constructed on the Frazzi system.

* * *

The Durham and Northumberland Archæological and Architectural Society will hold their fourth meeting this year tomorrow, August 25, at Chester-le-Street, Lumley Castle, and Finchale Abbey. Members assemble at 10 a.m. at the Infirmary Gates, near the Railway Station Durham, and drive thence to Chester-le-Street.

* * *

The late Mr. Henry Spalding F.R.I.B.A., of 38, Belsize Avenue, Hampstead, N.W., and of 36, King Street Cheapside, E.C., architect and surveyor left estate of the gross value of £15,075, o which the net personality has been sworn at £4,243. The late Mr. John Henr James, builder, of Braemar Avenue, Woo Green, N., left estate of the value o £125,632, of which the personality has bee sworn at £392.

* * *

On a stone coffin unearthed recently a Berwick there has been discovered th letter "E" on one side and the Roma numeral I on the other. This is believe to give support to the theory advanced b the vicar of St. Mary, Berwick-on-Twee that the coffin had been that of Edward before the removal of his remains to Wes minster.

* * *

Speaking in London on August 17, at th dinner of the Billposters' Association, M W. H. Lever, M.P., suggested that the should introduce architectural designs i their hoardings, and he offered four priz to be competed for next year of £50, £2 £15, and £10 respectively for the best bil posting stations constructed from an arch tectural point of view.

* * *

The Local Government Board has d cided to hold the following inquiries in proposed expenditure by public bodies :- *Sewerage and Sewage Disposal Wor and Plant.*—Abertillery Urban Distri Council, £10,673 (August 24); Ebbw Va Urban District Council, £28,850 (Augu 23); Manchester City Council, £1,1 (August 23). *Street Improvements, etc.* Surbiton Urban District Council, £3,7

August 21); Leeds City Council, £1,941 August 25); Manchester City Council, 7,600 (August 23); Southampton Borough ouncil, £11,395 (August 26); Caversham rban District Council, £1,660 (August 5). *Electric Lighting.*—Bury St. Edunds Borough Council, £1,465 (August), and Peterborough City Council, £2,10 August 23). *Various.* — Bolton-upon-earne Urban District Council, £9,475 for orking-class dwellings (August 24); Wath nd Bolton Gas Board, £17,296 for gas ndertaking (August 25); Coventry City ouncil, £1,282 for fire and police alarms August 25); Leeds City Council, £2,600 r gas works purposes, and £1,674 for fireen's dwellings (August 25).

* * *

St. Chad's Well, a once famous chalyeate spring at King's Cross, London, hose waters were famed for the treatment f dropsy, scrofula, and liver complaints, as just been rediscovered during the conruction of the foundations of a new buildg in Gray's Inn, the workmen coming cross an old vault which formed part of e well. The spring is still in existence nd it has been suggested that samples of e water should be taken and analysed to scertain whether it retains its ancient urative properties and whether it is commercially possible to utilise it.

* * *

Mr. Moisant, the hero of the Paris to ondon aeroplane flight on Wednesday nd Thursday of last week, is an architect f Chicago, where he was born 35 years go. He is of French extraction. It is oteworthy to relate that he went to the ontinent for a holiday, had only had his eroplane a month, and made six previous ights, and prior to this particular record ight had not previously traversed the ountry between Paris and Calais or visited ngland.

* * *

Preparations for the erection of the naonal memorial to the late Duke of Devonire are in a forward state, the contracrs, Messrs. Mowlem and Co., having ractically completed the solid foundation concrete and brick on which the superructure will rest. The site selected is at e Whitehall end of the Horse Guards venue. On the foundation now being id a massive pedestal of Derbyshire stone to be erected, and upon this the statue ill be placed. It is the work of Mr. Herert Hampton, and represents the late uke in his robes as a Knight of the arter.

* * *

The Chapel of the Ascension, Hyde ark Place, Bayswater Road, which was uilt by the late Mr. Russell Gurney as place for rest and meditation, will ortly be completed. The chapel buildg was designed by Mr. Herbert P. orne, and for the last ten years Mr. rederic Shields has been engaged on the ecorative scheme, paintings, depicting e story of the Divine Dispensation—atriarchal, Mosaic, and Christian. This heme he is now finishing.

* * *

The report of the Leeds Fireclay Co. ows that the working profit for the year nding June 30 was £12,829. After proiding debenture interest (£12,000) the dverse balance of last year (£62) is iped out, and the sum of £767 carried rward. The directors report that the ales exhibit a small increase over those f the previous year, but that there is still ttle improvement in the demand for uilding material throughout the country.

CORRESPONDENCE.

Paris and London.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

Sir,—I am obliged by the extract you give in your last week's issue from my article in the *Observer*, wherein I make a few comparisons between London and Paris architecture and municipal administration.

There is one question, however, which I did not raise, and that is, comparing the general lightness of Parisian street architecture with London façades, are we not getting too columnar?

Columns are splendid in their way—useful and adorning—but when one sees repetition after repetition of huge columns stuck on to the façades of small fronted premises, carrying nothing, and taking the place of what might have been more lighting area, one detects the mistake of applying to many buildings attributes only suitable for a few. This rage for columns entails also considerable unnecessary expense in building; it further accentuates the fact that directly an architect successfully adopts a feature—an appropriate feature—in a building, he is at once copied by men who have quite failed to grasp the distinction between what is and what is not suitable.

I should be sorry to see columnar architecture abandoned, but I think the sensible line should be drawn in this as in other matters.

I am, Sir,
Your obedient servant,
WM. WOODWARD.

13, Southampton Street,
Strand.

BOOKS.

Quantities.

The Quantities of a Detached Residence taken off, measured, and billed. By George Stephenson. Stanley Paul and Co.

The author apparently intends by this book to give a beginner in quantity-taking an object-lesson by giving the whole quantities and specification for a small house, of which the drawings are given on a sheet inserted in a pocket at the end of the book. The idea is a good one, but if the book is intended to open the subject to a beginner, the author seems quite to have forgotten that the first thing necessary was to explain clearly the system or principle on which his double columns of dimensions are arranged. As far as we can discover, there is not a word of explanation as to this, and in consequence the book would be no use to anyone who had not already some acquaintance with the system of quantity-surveying. Perhaps it was not intended for the actual beginner, but it might easily have been made serviceable to him by an explanation of the system, which could have been given in half a page. Some of the sentences of explanation which are given are expressed in very obscure language. We think the author understands his subject, but he does not seem to have the faculty of explaining it to others.

Roman Renaissance Tombs.

The Sculptured Tombs of the Fifteenth Century Rome; with chapters on the previous centuries from 1100. By Gerald S. Davies, M.A. London: John Murray; 1910. 21s.

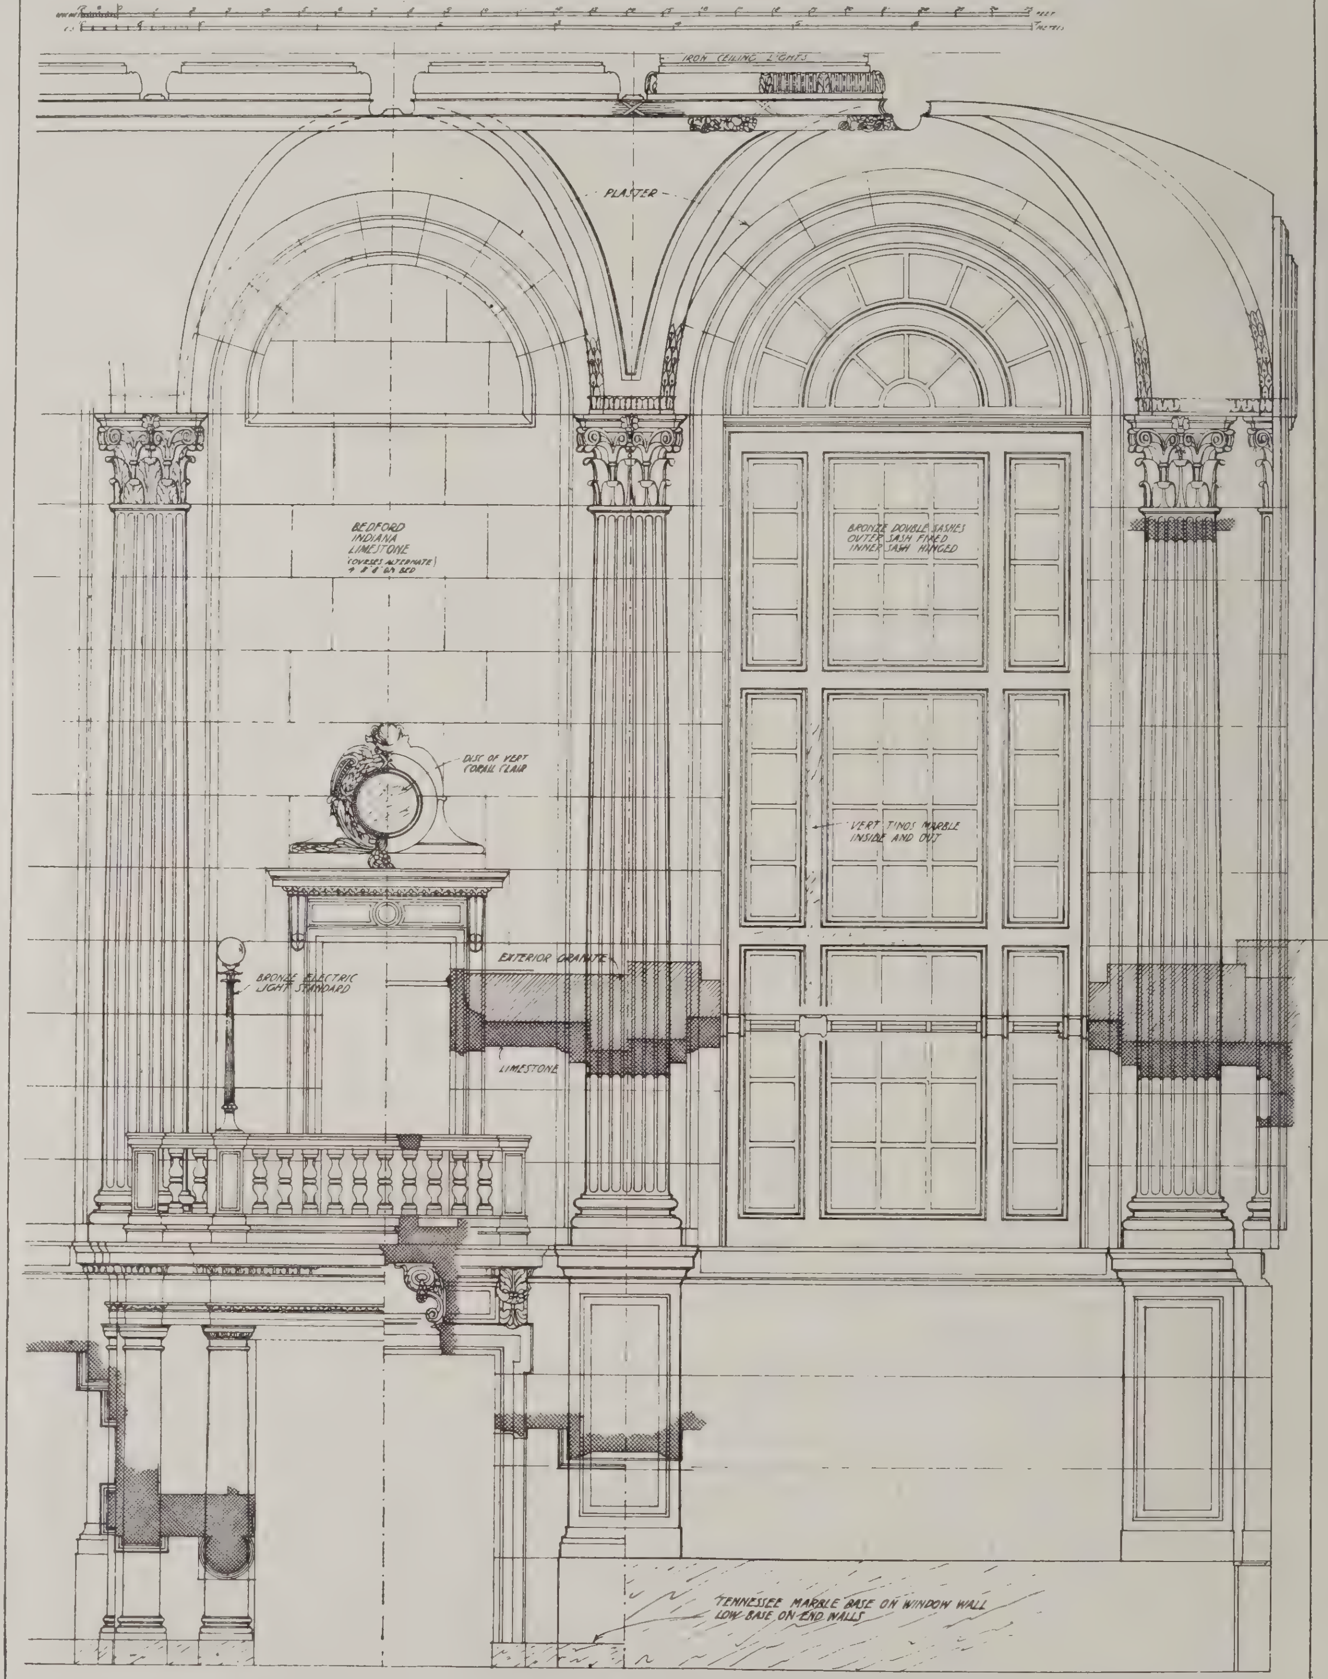
The object of this fine volume is to investigate the history and illustrate the art of the tombs of the fifteenth century which survive in the churches of Rome, and which the author regards, probably with reason, as being unequalled for historical interest by those of any other town in Italy, though he declines to claim for them the same high place in regard to purely artistic merit, in which Florence can show tombs superior to any in Rome. That there were many other such tombs in Rome which have perished without leaving a relic is only too probable; and it is affirmed that Bramante was one sinner in this respect, and removed existing tombs wholesale in making his preparations and clearing the ground for the commencement of St. Peter's. It is not at all improbable. Great architects, starting on a great work, have usually been rather masterful characters, and more concerned with their present ambitions than with relics of the past. And in those days there was by no means such a spirit of regard for existing monuments as there is in modern times.

The monuments illustrated in the book have, of course, a great deal of architectural as well as sculptural interest. All of them have an architectural framework, sometimes of considerable size and importance, the decorative details of which furnish a kind of résumé of the architectural taste of the fifteenth century of the Renaissance; the author writes always "Renascence," but we see no reason for altering a word which, in spite of its French form, has been generally accepted and has passed into the English language. They may be divided into the class which consists of the sarcophagus and recumbent figure, on an architectural base, and those in which a sculptured figure, either upright or recumbent, on a sarcophagus, is enclosed in an architectural framework of pilasters or columns and an entablature. Occasionally, as in the tomb of Alanus Cetivus in S. Prassede, the flanking architecture is a solid projecting pier with statues in niches, and sculptured panels, crowned by a deep coffered arch. A method of finish to the top of the monument which recurs in several instances is a kind of pediment in a segmental curve, filled in with a radiating fluting, a kind of ornament which suggests rather the period of Wren in England than that of the fifteenth century in Italy.

A great deal of the book is occupied with enquiries into the history of various eminent men of the period, Popes and others, and it contains a great deal of information of this kind, which is the result obviously of a good deal of study of the documents and history of the period. With this we are less concerned; but the collection of photographs from the tombs is in itself of value, and shows how much variety there was in the design and treatment of such works. The author has some good observations on the nature of the distinction between the work of the fifteenth and the sixteenth century sculptors in productions of this kind. The former were endeavouring to find their expression; the men of the sixteenth century had inherited a respect for certain forms, and found these ready-made to their hand. "It counted for nothing that the motives often came from the types and period of Roman art which, themselves the echo of a nobler day and nobler art, had long outlived their vitality, and, when taken over into modern work, expressed no idea either in heathen or in Christian art. They were Roman; it was enough. The griffons on the tomb of a Cardinal, that vomited graceful traceries or lashed their tails into unexpected but exquisite acanthi, were Roman; it was enough." It is the spirit that Browning has described with such truth and humour in the poem which tells how the bishop ordered his tomb in St. Praxed's church.

The author has added to the practical value of a most interesting book by giving an alphabetical list of the churches in which monuments of importance are to be found.

THE FIRST NATIONAL BANK OF BOSTON : INTERIOR DETAIL.



IRON CEILING LIGHTS
PLASTER
BEDFORD INDIANA LIMESTONE (COURSES ALTERNATE) 4" & 6" ON BED
BRONZE DOUBLE SASHES OUTER SASH FIXED INNER SASH HINGED

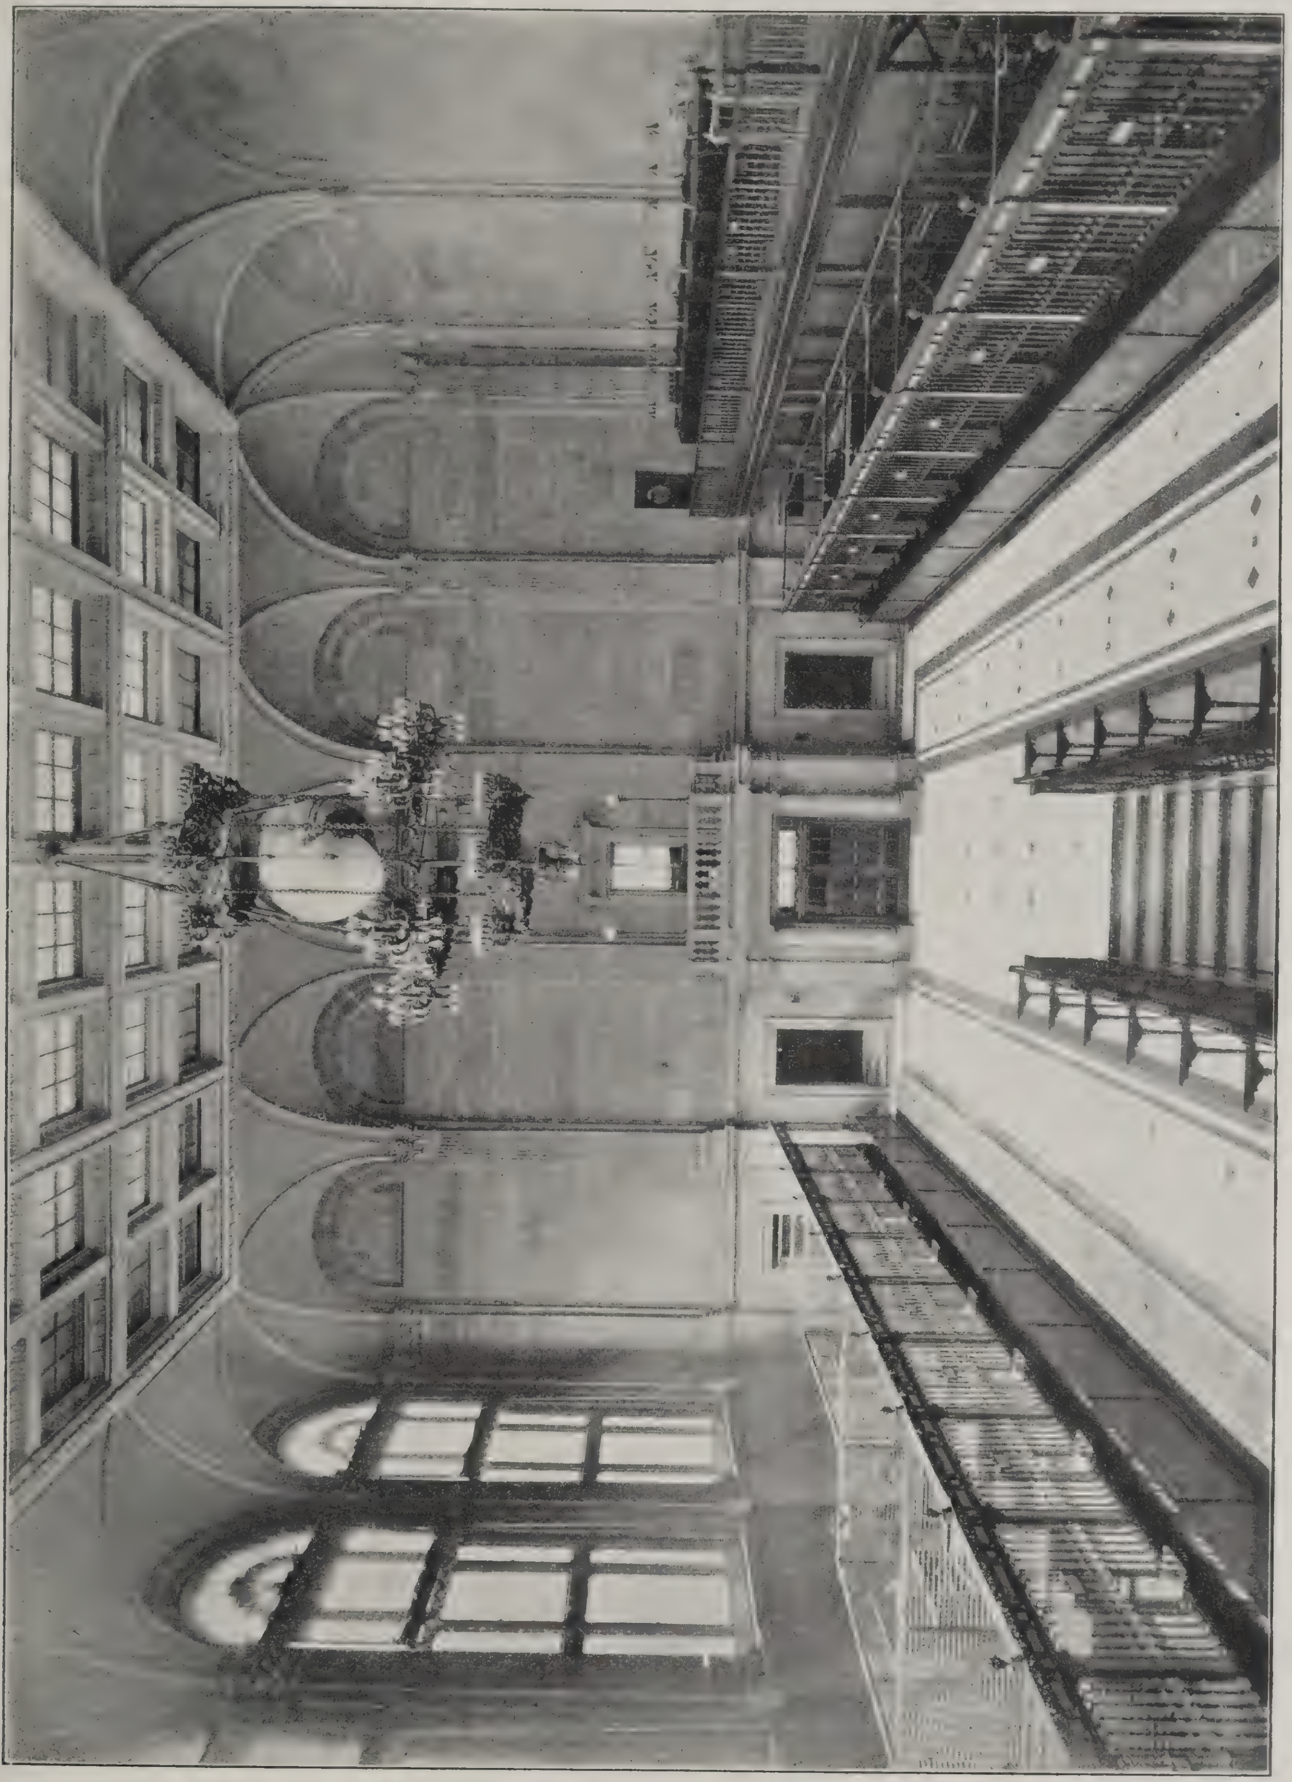
BRONZE ELECTRIC LIGHT STANDARD
LIMESTONE
TENNESSEE MARBLE BASE ON WINDOW WALL LOW BASE ON END WALLS

DRAWN BY EDWIN GUNN, A.R.I.B.A.



This is another good example of current architecture in the United States, and the detail of the scheme is well worth study. The walling is of Bedford (Indiana) limestone, and the ceiling is plaster. The counter screens are of bronze and marble, and the chandelier is a combination of carved wood and "stuff."

SURVEYING: THEORY AND PRACTICE.*

By ARTHUR BOWES, Assoc.M.Inst.C.E.

When the question of appointing a surveyor or engineer engages the attention of the members of a local authority it is invariably urged by someone that the successful candidate must be "a practical man," whatever that may mean. If he be but "practical" all the other virtues will be accorded him. No one has ever been known to suggest that the post should be given to a "theoretical man." Indeed, whenever the latter term is used it is usually held to convey at least a tinge of contempt and distrust.

Now, is there any just cause for this exaltation of the practical at the expense of the theoretical, or is it only another instance of the government of opinion by a popular cant term—an appeal to blind prejudice? Prejudice, as we are aware, plays a far more important part in the world than does reason or judgment. It was prejudice which made our forefathers object to the introduction of railways and gas-lighting, which declared the penny post to be a "wild and visionary project," and the Suez Canal a "futile and impossible idea." If there is anything more than a prejudice behind this preference for the "practical" man, let us try to find out in what it consists.

The "Practical Man."

When analysed to the bottom the term "practical man" appears to mean one who has a familiarity with material things rather than with books; who can work at some trade, and is not afraid of dirtying his hands; or, in its best aspects, it refers to a man who can get a job done in a workmanlike manner without spending too much money. Mainly, however, the essence of the popular meaning of the term lies in the idea that the "practical man" does not depend on book knowledge, while the theoretical man does.

Within certain limits, I think all of us will agree that knowledge obtained by personal contact with realities is to be preferred before that obtained at second hand from the reading of books, and there are certain fields of activity where such a practical knowledge is an absolute necessity. A man may study the theory of billiard playing, or swimming, or even stone-breaking, until he is grey, but without a practical experience of those arts he will be no more efficient at the end than when he started. At the same time, such knowledge as can be acquired by practical experience forms only a small part of the equipment of an efficient and intelligent man, and the so-called "practical man" has a few weak spots in his constitution. Take, for example, his ordinary dislike for knowledge obtained from a book. This is a mere foolish prejudice, handed down from the days of his mediæval ancestors, when books were not to be had. It is recorded of James Brindley that in the fourth year of his apprenticeship to a Macclesfield millwright he set off one Saturday night and walked twenty-five miles to a mill on the Irk at Manchester to look at some new machinery, and walked back again in time to resume his work on Monday morning. However commendable such an action might be in those days, I think that if Brindley were living to-day he would find his information in a less laborious way. He would either give a look in at the nearest free library, or, more probably, turn over the back numbers of his favourite weekly trade paper, and get the information he wanted with his toes on his own fender.

Rule of Thumb.

And yet there are hundreds of working men to-day who would rather trust the mere verbal, offhand opinion of a brother workman than they would the same advice given in print by half a dozen experts who had taken the trouble to put on record not only their own experience, but the best advice that could be collected from the written opinions of others. Such advice, if conveyed in black and white print, is to them merely "book knowledge," or theory. If conveyed in a free and easy conversation with a mate it becomes "practical" knowledge.

Perhaps it is a remnant of the same kind of fetish worship which leads to the habit of visiting works rather than reading descriptions of them and examining photographs and plans. Visits to engineering and municipal works are very excellent things in some ways, but as a means of acquiring a full knowledge of, say, the Forth Bridge or the Eiffel Tower a few hours spent in inspecting these works would not be half so effective as a perusal of the special issues of the engineering papers, with their multitude of illustrations and exact figures.

The practical man is apt to be too conservative in his notions. He lacks imagination; what has been good enough for him, and for his father before him, should be good enough for you. He lacks that vision which is "the art of seeing things invisible," and from the fact of his energies having been so much concerned with hard facts as to stunt his development on the speculative and poetical side of life he is often narrow-minded. It is such as he who, when called to ventilate a quiet little country church, amid a peaceful surrounding of trees and cornfields, blasts its beauty by surmounting the roof with hideous torpedo-shaped monstrosities of sheet iron. I suppose it was a town council of "practical men" who, not many years ago, wanted to pull down that noble West Gate which spans the main street of Canterbury in order that Wombwell's Wild Beast Show might enter the town. Heaven be thanked that by the casting vote of the humanitarian mayor the gate was saved.

When he attempts to explain some of the simple phenomena of nature the "practical man," from his want of training in logical thought, is sometimes a little at sea. I remember a few years ago one of the trade journals resuscitated the old problem as to why the top of a wheel moves quicker than the bottom, and the reason given, with all seriousness, was that "the upper spokes revolved with greater rapidity than the bottom."

When the "practical man" is called upon to design structures requiring some knowledge of stresses and strains he is occasionally thrown into considerable difficulties, for innate genius and rule of thumb are not always reliable guides in such matters. The less a man knows, the more he will guess at, and it follows that some very wild guesses are formulated, and sometimes materialised in brick and stone and iron. Of two actual designs for the guide framing of a gas-holder, both prepared by presumably "practical men," one would have weighed 128 tons, and the other 712 tons. A little theory would surely have formed a useful blend here.

Two Kinds of Theorists.

There are two kinds of theorists: first, the one whom the ordinary man in the street has in mind when he condemns the theoretical man—that is to say, the one who attempts to square every action by mathematical rule and formula—while the second class of theoretical men are those great leaders of scientific thought without whose efforts humanity would make little progress in knowledge or in social life. Science depends on the exact or mathematical statement of our knowledge of phenomena, and it is the delight of the theorist to construct a formula which shall correctly describe the sequence and correspondence of the phenomena of the universe. Such names as Newton, Faraday, Kelvin, and Clerk Maxwell are spoken of as theorists, but with a very different inflection of voice and meaning from that used in speaking of our hypothetical, non-practical candidate for a municipal post. There is much truth in the ordinary distrust of the theoretical man - if he allows his theoretical proclivities to run away with him, and has not sufficient practical knowledge to keep them in check. The "White Knight" in "Alice Through the Looking Glass" was a theorist pure and simple. So was the young man from college who, when the locomotive was stuck in the snow and short of water, shovelled snow down the smoke-stack.

One of the besetting weaknesses of the theoretical man is his assumption of a superlative exactness in matters which do not admit of a nicety of mathematical definition. A wire-edged precision binds all his thoughts and notions, however trivial. He is like the witness who stated that the prisoner at the bar said, "My dear Thomas—or words to that effect." In Sir Thomas More's "Utopia" we find that the ideal family was to be restricted to a maximum of sixteen and a minimum of ten—a very pleasant theory, but not sufficiently mindful of the human factor. In my younger days one well-known text-book on constructional ironwork worked out many calculations for riveted joints to the fourth place of decimals of an inch. Rankine, our mathematical high-priest, in dealing with certain hydraulic questions, gives a table of heights in feet due to certain velocities, and is careful to say that they are calculated for latitude 54¾deg. An impressive example of the super-exact formula is one recently published—to be sure, it was made in Germany—for calculating the heights of chimney stacks. I will not inflict it upon you, but content myself by saying that it fills a line of rather small print three and a half inches long.

The Fetish of Mathematics.

The absurdity of attempting to carry mathematical statements to such a pitch of refinement arises from two considerations. First, we do not know all the necessary factors with anything like accuracy, and a wrong assumption in any one factor vitiates the whole calculation. It is like trying to make mince-pies when we are not quite sure whether a certain white powder is sugar or carbonate of soda. The result is doubtful—it may come out right or it may not. Secondly, too much reliance is placed on the value of constants which have been copied year after year from one text-book to another, and in the first instance may have been based on very inadequate experiments. For example, the formulæ for the strength of wooden columns were until fairly recently copied from text-book to text-book, with, perhaps, some variation in the mode of statement, but all based on experiments made in 1840 on seven pieces of wood cut from one plank, the largest piece used in the experiments being about two inches square and five feet long. If a few sticks from another plank had been used, how would the constant have turned out?

(To be concluded.)

---

*A paper read at Manchester on August 10, before the Institution of Municipal Engineers.

COMPETITIONS.

Arthur Hill Memorial Baths, Reading.

In the limited competition for the above, the design of Mr. C. B. Willcocks, of Caversham, Oxon, has been placed first by the assessor, and selected. The accommodation includes, on the ground floor a heated swimming bath with a water area of 30ft. by 90ft., with 50 dressing boxes, and galleries over, superintendent's room, entrance hall, etc. On the first floor six private slipper baths, etc., are arranged. In the basement is the establishment laundry, heating chamber, etc.

LIST OF COMPETITIONS OPEN.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to architects practising in Coventry. Particulars given in our issue of March 16th.

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglian Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. D. O. Holme, Clerk of the Governors, Castle Chambers, Norwich.

SEPT. 1. CARNEGIE LIBRARY, KINGSTOWN, CO. DUBLIN.—Particulars from Mr. J. Sherlock Vaughan, Town Clerk, Town Hall, Kingstown. Deposit one guinea.

SEPT. 5. SHERINGHAM COUNCIL OFFICES.—Particulars on written application, accompanied by a stamped addressed envelope, to Edgar C. Rolfe, Clerk of the Council, Church Street Chambers, Sheringham.

SEPT. 10. SECONDARY SCHOOL, FOLKESTONE.—Competitive designs are invited from architects (being Fellows, Associates, or Licentiates of the Royal Institution of British Architects or members of the Society of Architects). Particulars, together with site plan can be obtained from A. F. Kidson, Town Clerk, Folkestone.

SEPT. 15. The QUEENS UNIVERSITY OF BELFAST.. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, etc., from the engineer, Samuel J. Harpur, Town Hall, Maesteg.

Oct. 1. ANTWERP. SCHEME FOR LAY-OUT OF SITE OF FORTIFICATIONS, ETC.—Premiums £1,000, £400, and £200. Conditions may be seen at Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C., or obtained from the "Commission d'études de l'aménagement de l'agglomération anversoise," Due du Jardin des Arbalétriers 57, Antwerp. Charge of 100 francs.

Oct. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., at a cost not to exceed £10,000. Particulars (deposit £1 1s.) of J. Parry Jones, Town Clerk, Denbigh.

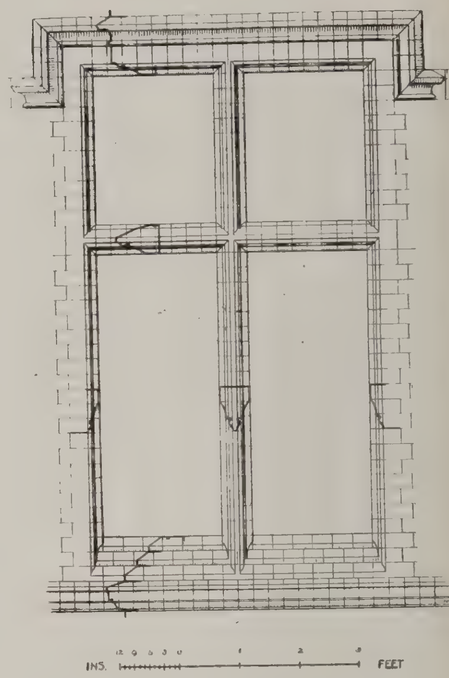
NOVEMBER 15. ROMFORD GARDEN SUBURB. Competitions in six classes for architects and in one class for builders for the best cottages, etc., erected in the Town Planning and Modern House and Cottage Exhibition, Gidea Park, to be held in June and July, 1911. Entries to be made by the date given. Prizes amounting to £1,050. Particulars of the Secretary of the Exhibition, 33, Henrietta Street, London, W.C.

Nov. 29. BANGOR (COUNTY DOWN). SEA-WATER BATHS.—The U.D. Council invite experienced architects to submit plans, specifications, and estimates for the erection of hot sea-water baths, at Pickie. Alternative schemes (plans, specifications, and estimates) to be sent in—(a) For erection of heated swimming pond, slipper and other baths, etc.; (b) scheme (a), omitting swimming pond, but providing for construction of same as an addition if thought desirable in the future, at a proportionately reduced cost. The cost of scheme (a), inclusive of all professional fees, not to exceed £7,050. Further particulars can be had on application to J. Milliken, Clerk to the Council, Town Hall, Bangor, Co. Down.

NO DATE.—MANCHESTER. LAYING OUT OF THE BLACKLEY ESTATE. The Manchester Corporation invite architects and others to submit competitive plans, specifications, and estimates for the laying-out of their Blackley Estate. Plans of the estate and all necessary particulars may be obtained from, and a model of the estate inspected at, the City Surveyor's office, Town Hall, Manchester, on receipt of a deposit of three guineas, which will be returned on receipt of a bone-fide scheme. The following premiums will be paid: £150, £100, and £50 to the first three schemes as selected. The selection to be made by assessors appointed by the committee.

NO DATE.—TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan in the parishes named. Assessors: Sir Aston Webb, R.A., and Mr. Raymond Unwin. Premiums of £150, £100, and £50. Terms and conditions of the Company on and after September 1st. Deposit, one guinea.

NO DATE. ALEXANDRIA, EGYPT. RAILWAY STATION FOR EGYPTIAN STATE RAILWAYE.—Premiums of £E400, £E200, £E100. Enquiries to the Administration Offices, Egyptian State Railways, Cairo.



BRENTWOOD GRAMMAR SCHOOL: DETAIL OF WINDOWS.
CHANCELLOR AND SONS, ARCHITECTS.

BRENTWOOD GRAMMAR SCHOOL.

During the last year an important block of new buildings has been added to this old school, founded by Sir Anthony Browne, in order to meet the requirements of the authorities under the regulations affecting Secondary Schools.

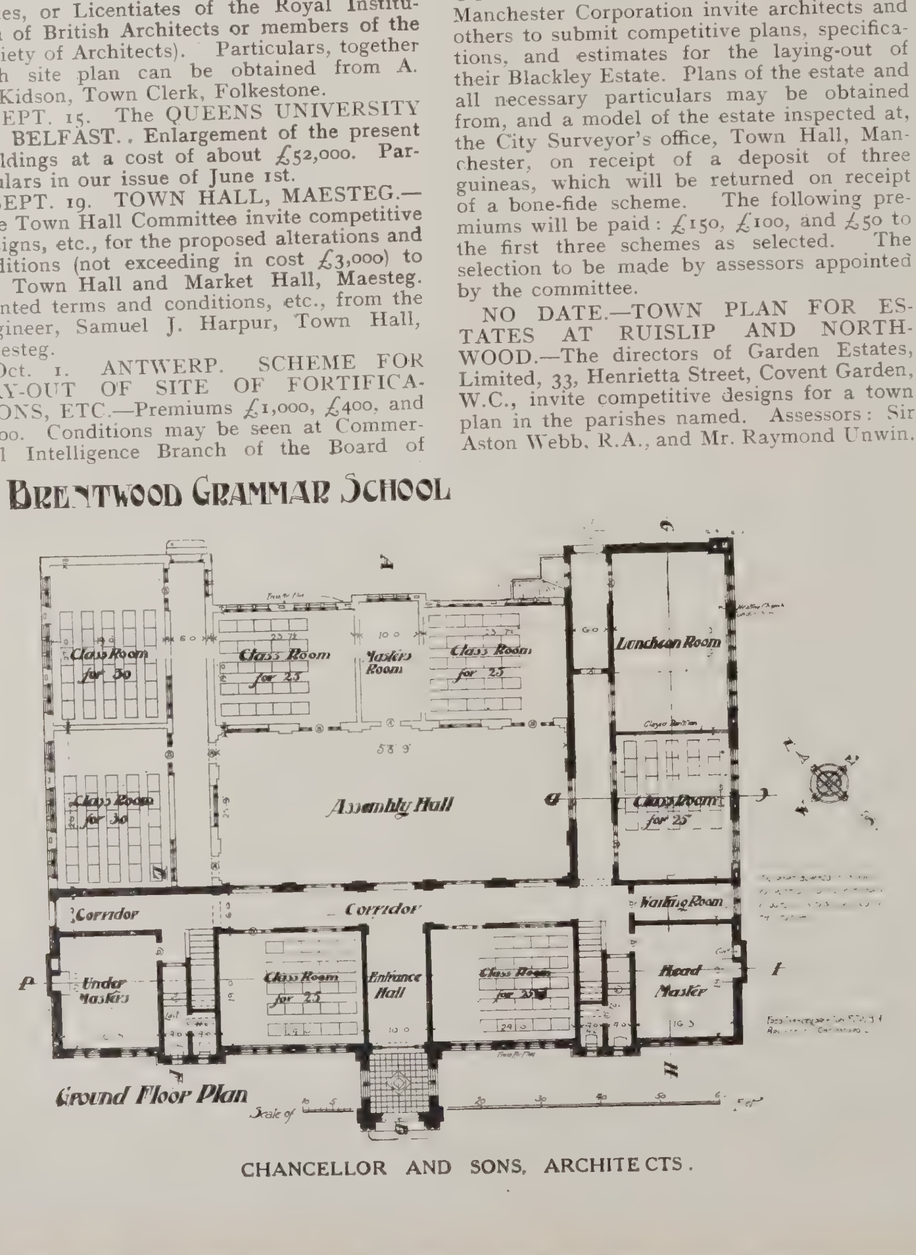
The ground floor consists of a tower entrance, three class rooms, affording accommodation for 25 scholars each, head master's study, and under masters' common room, with waiting room, also a large luncheon or dining-room for the use of the day scholars. The first floor consists of a chemical laboratory, with preparation room, dark room, and balance room attached, a class room for 25, lecture room, and library, and a large Art room.

The buildings are substantially erected in red brick of the period of the original foundation, the windows being of specially moulded bricks made to the architects' design, and the photograph shows the artistic effect of this treatment, of which also a detail drawing is given above. These bricks, as well as the red facings, were all made in Brentwood, at the works of Messrs. James Brown (London), Ltd., of Essex Wharf, Whitechapel.

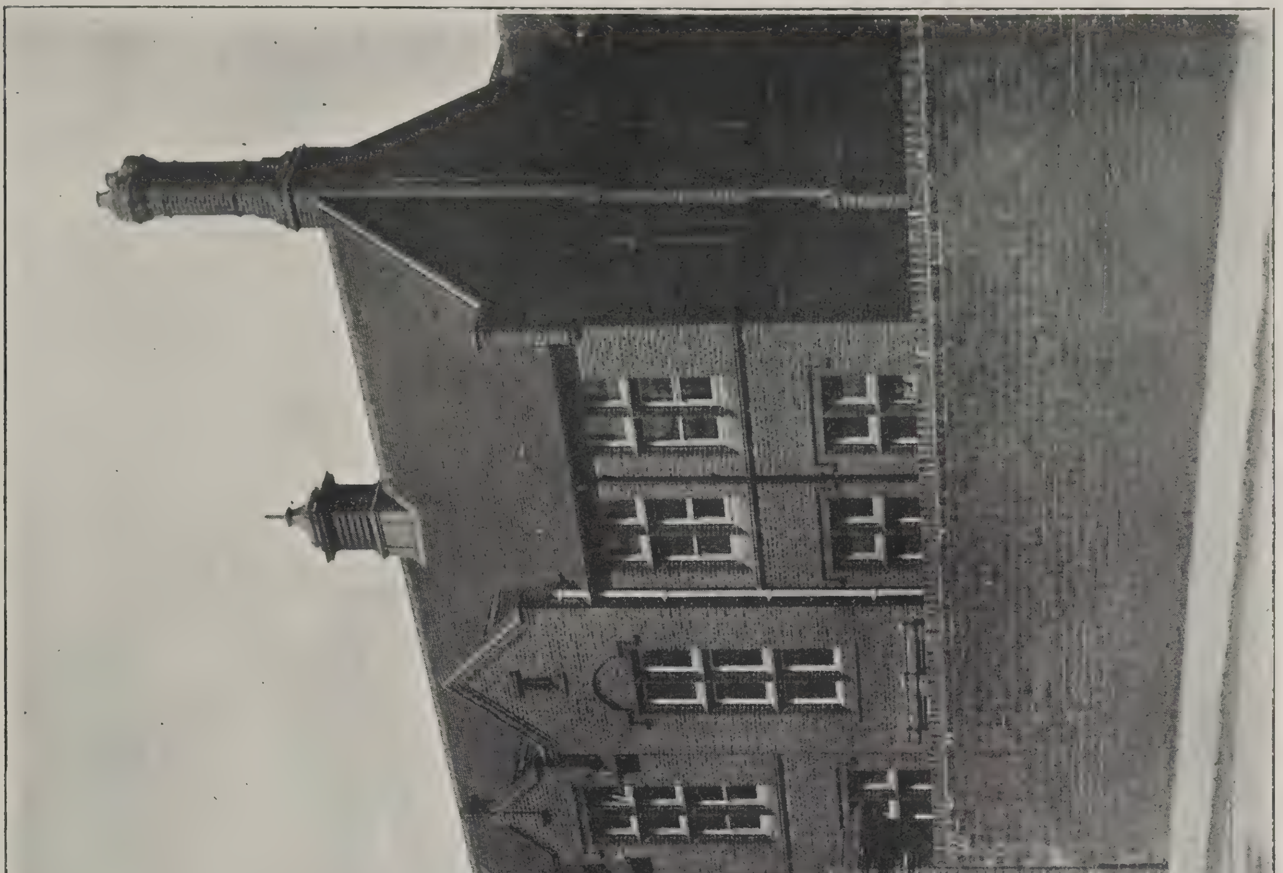
The first floor is constructed on the Armoured Tubular Floor Company's system. Close attention has been paid to the ventilation, the whole building being heated by Messrs. Werner and Company's Pulsial hot-water apparatus.

The dados throughout the students' rooms and corridors are lined with glazed tiles. A sanatorium has also been added to the head master's house

The architects are Messrs. Chancellor and Son, of Chelmsford, and the builders are Messrs. Clark and Sons, of Cambridge. The Chairman of the Governors, Mr. Evelyn Haseltine, has taken a great interest in the work from its commencement, and has contributed the whole cost of the tower and clock, and the lavatories and sanatorium.



CHANCELLOR AND SONS, ARCHITECTS.



The buildings are erected in red brick in colouring similar to those of the period of the original foundation, the windows being of specially moulded bricks made to the architects' design.

BRENTWOOD GRAMMAR SCHOOL NEW BUILDINGS: GENERAL VIEW. CHANCELLOR AND SONS, ARCHITECTS.

ITALIAN SCAFFOLDING.

BY A. G. H. THATCHER.

SECOND ARTICLE.

Continued from page 98, No. 808.

So far, whatever the demerits, the scaffolds noted have been built of fairly substantial timbers. What will be thought, then, of the example taken near Cape Posilipo, just outside Naples (Fig. 12), and this may be considered a typical sample of many others of like character? It is a new building. The holes are so slight that the wooden ties cannot be used, and cordage of a kind has been resorted to. The needle and strut carry everything, and the weight was not negligible. As an exhibition of risky construction it may be commendable, but no other praise can be accorded.

The predilection for needle scaffolding was also exemplified in the structure erected for the repair of a dome on the church of S. Maria della Salute, Venice. It is the English practice, in work of this description, to use any level surfaces on which to erect standards as a basis for the platforms. Not so with the Italians. Needles are run out in circular rings and in lieu of struts beneath, external ribs of poles are brought from the top of the dome to afford the necessary support.

In Northern Italy the scaffolding varies considerably from that in the South. The wooden tie band disappears and in its place hoop iron about ½in. in width is used extensively as means of connection. This does not apply only to poles, but also to square timbers. Figs. 13 and 14 are illustrations of how this is effected, both for splicing and for carrying the ledgers. The municipality of Milan have a code of building regulations in force, one of which reads as follows: "The pieces of timber must be joined by means of nailed iron bands, or in some similar way, hemp rope being excluded; the use of brackets must be fixed in a similar manner, the use of nails only being considered insufficient." Altogether in the Northern towns a greater regard is given to safety. Another regulation from Milan reads: "The front of the platform facing the street will be provided with screens of reed matting, or some other contrivance, so as to prevent the fall of objects or materials into the street."

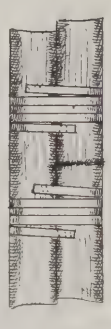


Fig. 13.

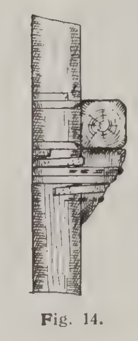

Fig. 14.

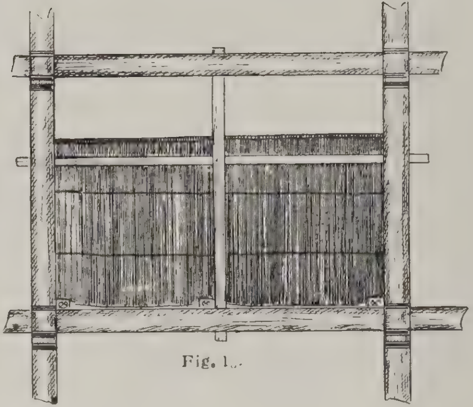

Fig. 1..

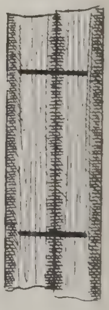

Fig. 16.

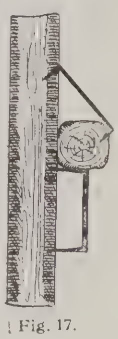

Fig. 17.

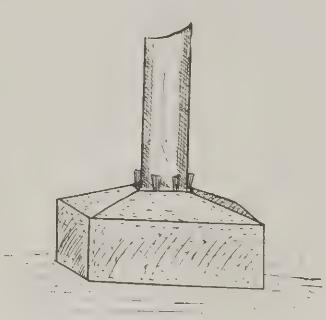

Fig. 18.

Fig. 19.

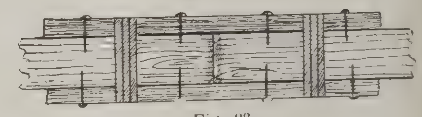

Fig. 23.

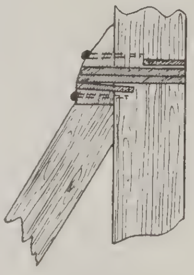

Fig. 20.

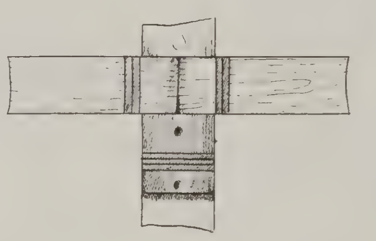

Fig. 22.

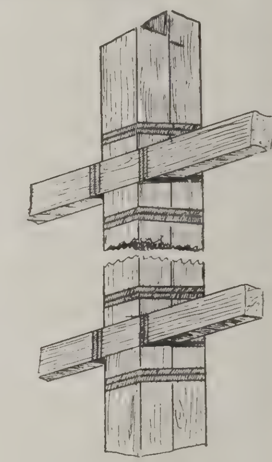

Fig. 21.

In the Southern towns the guard rail and one edge board are usually seen, a provision for safety which it may be remembered the proposed Home Office regulations seek to enforce. The matting is nailed to light rails and uprights, by which means it is kept in position, see Fig. 15, which shows one bay in detail.

The hoop iron bands are not absolutely imperative as before stated, and iron dogs are occasionally seen doing similar duty. Figs. 16 and 17 show how they were arranged on a scaffold near Padua to connect the standards and ledgers.

Poles used as standards have at their feet a neatly struck concrete block, into which they are wedged to provide a base and secure greater stability (Fig. 18). The rubbish filled tub in favour with our builders seems common in comparison. Scaffold boards are of our ordinary type, that is, 12ft. by 9in. by 1½in., but are strapped differently. See Fig. 19. The method cannot be recommended as being liable to cause trips when worn, and therefore possible falls.

Balk timbers are used for heavy work, and different methods are in use for their fixing. If each timber is used singly the transoms rest upon cleats, in a similar manner to Fig. 20, and similar bearings are provided for struts, etc., Fig. 20. In some instances, short puncheons were used from ledger to ledger, carried as shown on Fig. 21. The ledgers butt and not lap. If possible the joint is arranged to occur over a cleat, Fig. 22, but if this cannot be so arranged they are spliced by short lengths as shown by Fig. 23.

Some slighter forms of scaffolding are arranged by the use of flat timbers, practically boards. They are of considerable

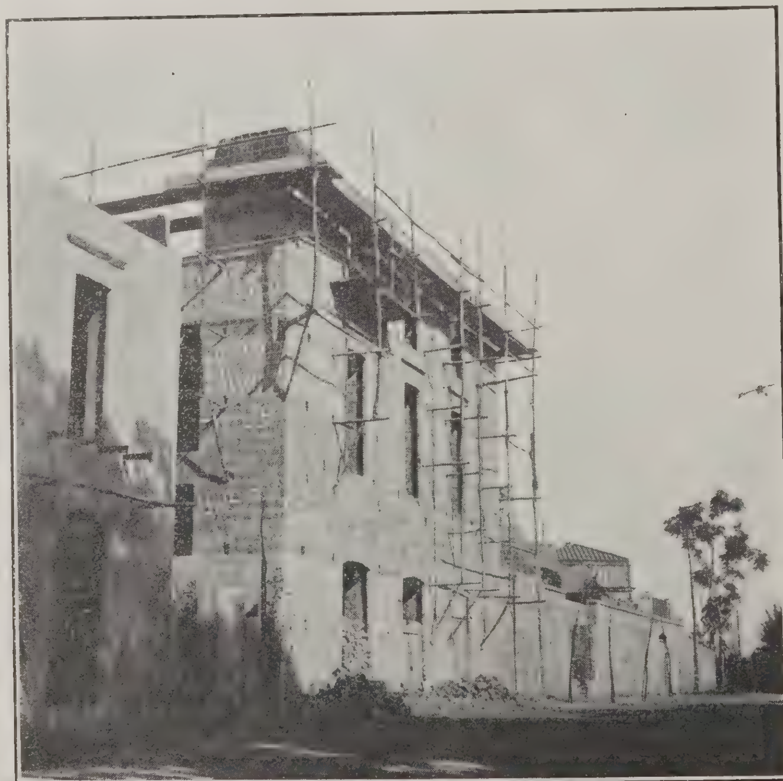

FIG. 12. EXAMPLE FROM CAPE POSILIPO, NAPLES. IT IS AN EXAMPLE OF DANGEROUS SKILL.

adaptability, the corner standards, of course, being more substantial. Fig. 24 gives one side of such a scaffolding in detail. It was seen in Venice.

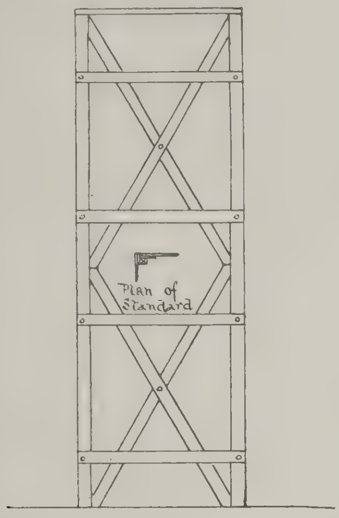

Fig. 24.

BUILDERS' NOTES.

State of the Building Trade. Sir Charles Scotter, speaking at the South-Western Railway meeting recently, stated that his line was carrying more Portland stone, bricks, slate, and other building materials than in recent half-years. From this he deduced the fact that things in the building trade were looking up. The "Pall Mall Gazette" thinks that while this may be true in some districts, it is by no means the general experience, and adds:—"The building trade has been very depressed, in the London district especially, for the past four or five years, so that a recovery is about due, but this particular industry usually follows well-defined principles. It is generally one of the last to feel depression, and one of the last to experience a revival. As the revival in other trades is really only just beginning, builders may have to wait some time yet." The report of the Leeds Fireclay Company, a summary of which we publish this week, states positively that there is still little improvement in the demand for building materials throughout the country.

Brassworkers' Wages. A largely attended meeting of employers in the brass trade was held at Birmingham on Monday week, under the presidency of Mr. R. H. Best, to consider the application made by Mr. W. J. Davis on behalf of the men for an increase of wages. After some discussion the following resolution was passed: "That this meeting, while in sympathy, owing to the general rise in the cost of living, with the demand of the men for an increase of wages, regrets that owing to the fact that the Brassworkers' Society does not control a large number of the men who are the worst paid, it is unable to grant their demand until Mr. Davis is able to control a larger proportion of the men, and also to enforce the present minimum." The resolution affects seven or eight thousand men in the Midlands, Lancashire, and Yorkshire.

Newcastle Plumbers' Outing. The Newcastle, Gateshead, and District Master Plumbers' Association, visited Manchester on Friday, August 12, as guests of Messrs. Baxendale and Co. Leaving Central Station, Newcastle, in the early hours, the party arrived at Exchange Station, Manchester, at 8 a.m., and were met by representatives of the firm. Breakfast having been taken at the Victoria Hotel, the party were conveyed to the extensive works, and warehouses in Miller Street. Much interest was evinced by all during the tour through the numerous departments, and it was generally felt that the oldest friends of the firm had learned something from the visit. A drive was then made through the principal streets to the Midland Grand Hotel, where luncheon was served. Representatives from the Manchester and District Associations joined the party, and with them gave expressions of appreciation to their hosts for the day's excursion. Subsequently the party visited Baxendales' Albion Lead Mills, at Trafford Park, and witnessed a demonstration of the up-to-date methods of lead manufacturing. A visit to the Manchester School of Technology concluded the programme arranged for the day. Individual members of the party visited the numerous places of interest and amusement in the city, and at midnight commenced the return journey. Newcastle was reached at 6 a.m. on Saturday morning.

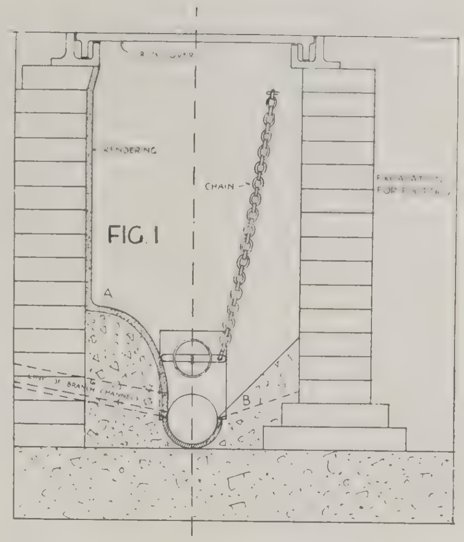
SOME COMMONPLACES OF DRAIN CONSTRUCTION.

BY EDWIN GUNN, A.R.I.B.A.

It is surprising to find how often the obvious essentials of drain construction are missed in practice, and money wasted by thoughtless use of material and labour. In laying stoneware pipes upon concrete, three methods are available for making the cement joint all round the collars. By the first, the barrel of each pipe is supported on bricks laid flat on the concrete, which is supposed to be filled in around and below the pipes after jointing. This a risky method, likely to provide unsound bedding and lead to fractured joints or collars in filling in the trench. By the second, a pocket for each collar is cut in the concrete after laying, and after jointing the pipes this is filled in with fine concrete. This method allows the barrel of each pipe to bear continuously on the concrete, taking all weight off the collars and is quite satisfactory but expensive. By the third method, when the concrete is laid, a series of bricks are bedded flat at 2ft. intervals corresponding with the spacing of the drain collars, sunk 2in. in the concrete, and standing up 1in. above its surface, which enables them to be withdrawn as soon as the concrete begins to set, leaving a series of pockets ready formed. This method has all the advantages of the last, and is considerably easier in practice.

Manholes are often constructed with little thought for the conditions under which they are used. First, as to the structure; under any ordinary conditions footings to a manhole are quite unnecessary. Their purpose being to spread a weight over a large bearing area, manholes (which carry their own weight only) do not require them. In a manhole 3ft. by 2ft. 3in. (the common internal size) the omission of footings saves more than half the quantity of excavation. In forming the benchings two objects must be attained. Since the purpose of a manhole is for inspection and clearing of branch drains, a suitable foothold must be provided for workmen who have to decend with that object. This may, of course, be effected by forming very flat benchings as shown in Fig. 1 by the dotted line at B, but reference will show that any discharge from branch channels opposite is almost certain to deposit a portion of its solids on the benching, which in a short time becomes very foul. This may be partially rectified by steepening the slope as shown, but on this it is almost impossible for a workman to stand.

The form of benching shown on the other side combines the two objects of preventing splashing and giving a good foothold at A. Three-quarter-round channel bends should always be used.



In the event of a stoppage in the sewer interceptor, drains and manholes become charged with sewage, and in that case it is important that manholes should withstand water pressure and remain watertight. An internal rendering of Portland cement, worked with a steel trowel to a perfectly smooth surface, is the most reliable means of accomplishing this. The rendering should be executed continuously from beneath the frame of the cover, over the benching on to the top of the channels. This is a better and less expensive finish than the use of glazed facings in a manhole, the joints of which are a source of weakness. All manholes should be built in hard stocks, to give a good key to the rendering. When drains become charged it is desirable that means should be provided for letting off the sewage, which otherwise would have to be baled out and conveyed to the sewer by hand before the obstruction could be removed. The provision of a stopper on the inspection arm, which can be released by a chain from the top of the manhole overcomes this difficulty by allowing escape to the sewer via the inspection arm.

The advantages of the various forms of covered channel gulleys for bath, lavatory, and other wastes which have to discharge into the open air 18in. distant from the drain trap, do not appear to be sufficiently realised, and one often sees such wastes discharging into roughly made enclosures of brick-on-edge, from which overflow and splashing result. The side of the inlet below the grating is increasingly used for rainwater pipes, owing to the obvious advantage that when the grating is blocked with leaves, its efficiency is unimpaired. This advantage equally attaches to these disconnecting channels, with the added convenience that several wastes of different sizes may be neatly connected parallel with a wall, while the trap is set at any angle to suit the direction of the drain as shown in Fig. 2. If the branch d does not connect directly with a manhole, it is advisable to place an inspection pipe next the trap, for removing obstructions.

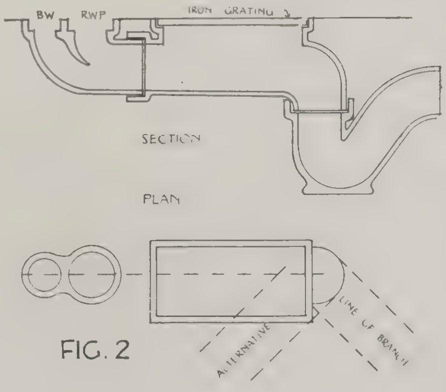


FIG. 2

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries embodying questions which have been set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

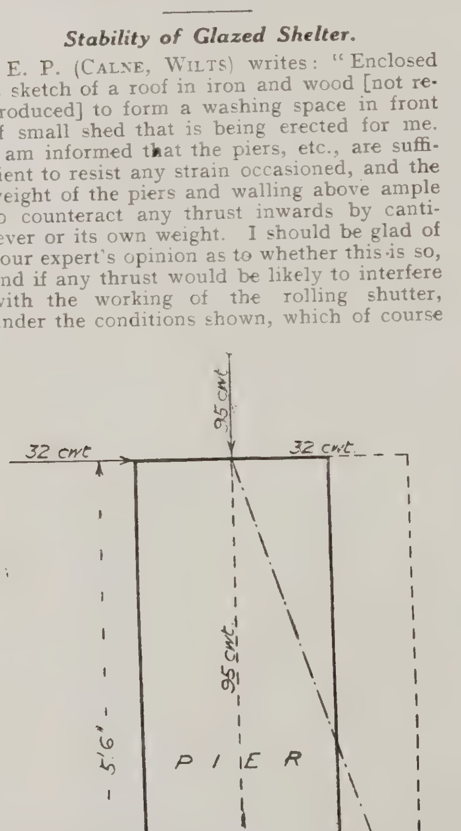
Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Stability of Glazed Shelter.

E. P. (Calne, Wilts) writes: "Enclosed is sketch of a roof in iron and wood [not reproduced] to form a washing space in front of small shed that is being erected for me. I am informed that the piers, etc., are sufficient to resist any strain occasioned, and the weight of the piers and walling above ample to counteract any thrust inwards by cantilever or its own weight. I should be glad of your expert's opinion as to whether this is so, and if any thrust would be likely to interfere with the working of the rolling shutter, under the conditions shown, which of course would occur if the piers, etc., were insufficient. If not perfectly secure, what would be the best method to adopt to counteract any strain likely to occur?"



STABILITY OF GLAZED SHELTER.—REPLY TO E. P. (CALNE, WILTS).

—The total load on the overhanging roof at 28lbs. per ft. super inclusive, which is the least allowable, will be $12.6\times15\times\frac{1}{4}=47$ cwt., or $\frac{47}{2}=23{\cdot}5$ cwt., on each bracket. As the depth of the braced cantilever supporting this roof is 5ft. 6ins., the outward pull at top of bracket $=\frac{23{\cdot}5\times15}{5{\cdot}5\times2}=32$ cwt., and the total load from gable wall and main roof, together with the load from bracket down to the joint at bottom of bracket = say, 95 cwt. These two forces should be combined as in the accompanying sketch, whence it will be seen that the resultant cuts the joint level at 2ft. 9ins. from centre of joint. Then $\frac{W}{A}+\frac{M}{Z}=\frac{95}{1{\cdot}75\times2}+\frac{95\times1\frac{5}{6}}{\frac{1}{6}(2\times1{\cdot}75^2)}=27\pm175=$ 202 cwt., or 10·1 tons per sq. ft. compression and 148 cwt. or 7·4 tons per sq. ft. tension. The brackets must, however, be held back by a $\frac{7}{8}$-in. bolt attached to a riveted cleat on top flange, The structure may then be just safe.

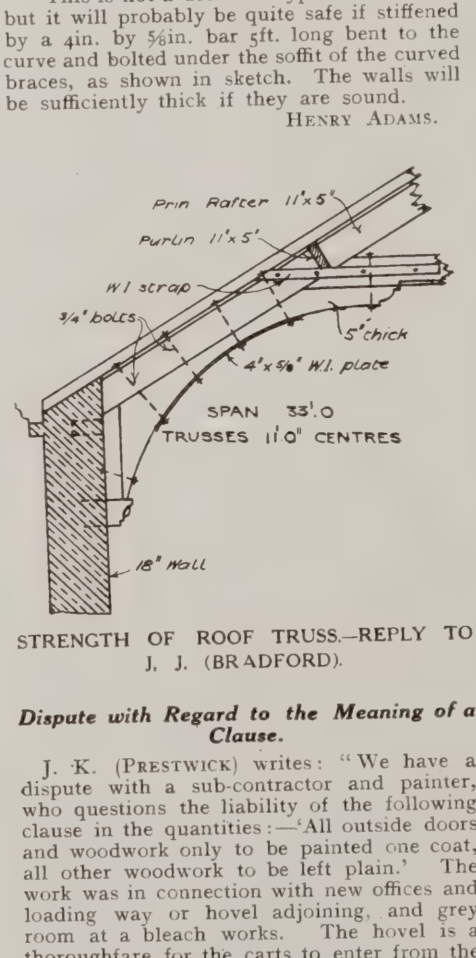
Henry Adams.

Strength of Roof Truss.

J. J. (Bradford) writes: "I herewith enclose you a tracing of a collar-beam roof (not reproduced) that is proposed to be put over an old building, and shall be glad of your opinion as to whether you consider it is of safe construction. Do you think the walls of sufficient thickness, or will it be necessary to put in a tie rod? I do not want to do this if it can be avoided."

—This is not a desirable type of roof truss, but it will probably be quite safe if stiffened by a 4in. by ⅝in. bar 5ft. long bent to the curve and bolted under the soffit of the curved braces, as shown in sketch. The walls will be sufficiently thick if they are sound.

Henry Adams.



STRENGTH OF ROOF TRUSS.—REPLY TO J. J. (BRADFORD).

Dispute with Regard to the Meaning of a Clause.

J. K. (Prestwick) writes: "We have a dispute with a sub-contractor and painter, who questions the liability of the following clause in the quantities:—'All outside doors and woodwork only to be painted one coat, all other woodwork to be left plain.' The work was in connection with new offices and loading way or hovel adjoining, and grey room at a bleach works. The hovel is a thoroughfare for the carts to enter from the roadway into the works yard. The ceiling of this hovel is boarded; and the dispute arises as to whether the true meaning of the clause is inside or outside"

—The answer to this question depends upon practical rather than legal considerations. If the matter were to come before a court, it is probable that the judge would be guided by the evidence of persons familiar with the custom of the building trade. It is manifest that there is much to be said on both sides. For instance, suppose a man had contracted to do all outside painting at St. Pancras Station, would he feel called upon to paint the ironwork under the glass of the great roof? So far as is known, there is no legal decision which throws any light on the matter. Upon the whole it is probable that the ultimate decision would be that everything under a roof, and therefore not exposed to the rain and the winds of Heaven, is inside work.

X.

Book on Farm Buildings.

E. W. (Newport) writes: "We should be glad if you could inform us where we may obtain illustrated books showing plans and elevations of farm houses and farm buildings."

—Clarke's "Modern Farm Buildings," published by Mr. B. T. Batsford, 94, High Holborn, W.C., at 6s. net, post free, will probably meet our correspondent's requirements. Following is a summary of its contents:—Introduction—Arrangement and General Construction of Homesteads—Remodelling of Old Homesteads—Food Department—Cow Houses—Feeding Stalls and Boxes—Open Stockyards—Covered Yards—Stables—Piggeries—Cart Shedding and Miscellaneous Buildings—Dutch Barn and other Roofing—Farmhouses—Homesteads for Small Holdings—Cottages—Dairies—Poultry Houses—Repairs and Materials—Drainage and Water Supply—Model Regulations relating to Dairies, Cowsheds, and Milkshops—Index, etc.

Standard Notation of Concrete Institute; Books on Reinforced Concrete; Card Index System; Velocity and Acceleration of a Moving Point.

J. O. (Cheltenham) writes: "Please give me some information about—(1) the standard notation of the Concrete Institute; (2) the latest and most realistic work on reinforced concrete work at a price that would command it to bricklayers and artisans generally who desire to become foremen. This should at the same time possess a simplified formula for beams, colours, and slabs; (3) an enquiry was answered in your issue of May 11th, 1910, on the best card index system, or methods of filing correspondence, etc., by asking the enquirer to write to the editor; (4) a point is moving in a place. Three successive positions at intervals of 1-50 of a second are given by X Y Ordinates as follows:—

Position.	1	2	3
x feet	0	0·264	0·477
y feet	0	0·266	0·435

Plot these points to a scale of 1 inch to 0. foot. Find approximately the velocity an acceleration of the point when in the middl position."

—(1) The Notation proposed by the Concrete Institute is published in Vol. 1, part of the "Transactions" of the Institute, whos address is 8, Waterloo Place, S.W.; (2) "In spectors' Handbook of Reinforced Concrete, by Walter F. Ballinger and Emile G. Perro Published by Archibald Constable and Co Ltd., London, price 4s. net; (3) we can onl refer our correspondent to Roneo, Ltd., 2 Holborn Viaduct, E.C., who pay particul attention to the systematising of the means filing correspondence; (4) the point is r garded as moving along a path with a vel city which is the resultant of two velociti at right angles to one another. The vertic velocity is the "y" component. The horizont velocity is the "x" component. Each veloci is subject to modification by an independe acceleration. If the position of the point estimated at the end of consecutive equ intervals of time, its distance from the sta ing point, measured along the vertical and horizontal axes, will be given by the equation.

$$S = Vt + \frac{1}{2} a t^2$$

where V = initial velocity in feet per second,
a = acceleration in feet per second gained in each second,
t = the stated interval of time.

(i) Velocity along axis of 'x'

$$S = \cdot 264 \text{ ft.} = \frac{1}{50} V + \frac{1}{2} a \left(\frac{1}{50}\right)^2$$

$$S^1 = \cdot 477 \text{ ft.} = \frac{2}{50} V + \frac{1}{2} a \left(\frac{2}{50}\right)^2$$

clearing and reducing

$100\,V + a = 1320 \qquad a = -127 \text{ ft. pr sc. pr sc.}$

$100\,V + 2a = 1192\cdot5 \quad \therefore V = 14\cdot475 \text{ ft. per sec.}$

(ii) Velocity along axis of 'y'

$$\text{as before } \cdot 266 \text{ ft.} = \frac{1}{50} V^1 + \frac{1}{2} a^1 \left(\frac{1}{50}\right)^2$$

$$\cdot 435 \text{ ft.} = \frac{2}{50} V^1 + \frac{1}{2} a^1 \left(\frac{2}{50}\right)^2$$

whence $V^1 = 15\cdot725$ ft. per sec.
$a^1 = -242\cdot5$ ft. per sec. per sec.

The point has two velocities
along 'x' of 14·475 ft. per sec.
along 'y' of 15·725 ft. per sec,

$$\text{The Resultant 'R'} = \sqrt{(14\cdot475)^2 + (15\cdot725)^2}$$

$= 21\cdot373$ . . . . .

It has also two accelerations
along x of $-127\cdot5$ ft. per sec. per sec.
along y of $-242\cdot5$ ft. per sec. per sec.

$$\text{The Resultant 'A'} = -\sqrt{(127\cdot5)^2 + (242\cdot5)^2}$$

$= -273\cdot975$ ft. per sec. per sec.

The direction of 'R'
making an angle θ with the axis of x

$$\tan\theta = \frac{V^1}{V} = \frac{15725}{14475} = 1\cdot086 = \tan 47^\circ 22'.$$

The direction of A making an angle of ψ with the axis of x.

$$\tan\psi = \frac{a^1}{a} = \frac{242\cdot5}{127\cdot5} = 1\cdot902 = \tan 62^\circ 15'.$$

At the end of the first interval of $\frac{1}{50}$ sec.

The velocity $v = V + a\,t$

$$= \begin{cases} 11\cdot925 \text{ ft. per sec. along } x \\ 10\cdot875 \text{ ft. per sec. along } y. \end{cases}$$

The resultant of which is 16·14 ft. per sec. along a line making an angle of 43°40′ with the axis of x.

The acceleration remaining constant is $A = -273\cdot975$ ft. per sec, per sec. in a direction making an angle of 62°15′ with the axis of x.

The graphic representation of the problem will give results approximating to the above, but it has not been thought necessary to show both,

B. and B.

Stress Diagram for Large Roof Truss.

S. B. W. (URMSTON) writes: "Could you inform me how I can take off the stresses for the roof truss, of which I enclose an outline to scale [not reproduced]. I have tried to get out a diagram, but seem to be lost somewhere. The roof is a boarded and slated roof over a chapel, and ordinary loading may be assumed with the addition of a ceiling. The truss is in iron. Would the sizes figured be the safe sizes? The trusses are bolted down to stanchions, size 10in. by 6in., of a considerable height, say, 30 or 35ft. How could I determine if the stanchions are strong enough to resist the thrust imparted by the trusses?"

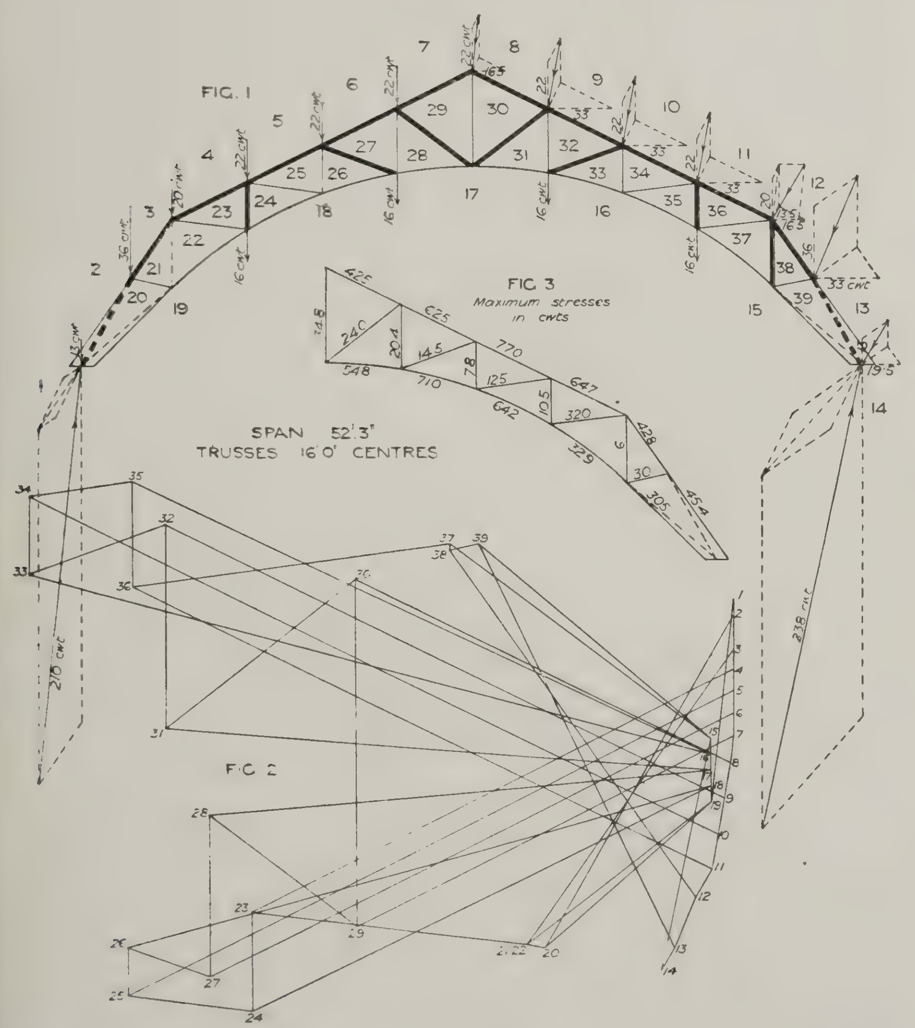
Our correspondent, replying to our request for further information, writes: "The ceiling is an ordinary lath and plaster ceiling, carried on 3in. by 2in. ceiling joists running between 9in. by 2in. wood bearers placed 8ft. centres. These 9in. by 2in. bearers run from R.S.J. No. 3 to No. 2, and from No. 1 to a similar joist on opposite side. Between R.S.J.'s Nos. 1 and 2, there is a ceiling light running the whole length of the roof, which is four bays long, the principals being placed 16ft. centres. The ceiling light is a heavy one, with iron bars, and may be reckoned at about 5lbs. super. R.S.J. No. 3 is vertical, because the ceiling is here carried over to the wall with a flat soffit and cornice. The roof is boarded 1in., felted, and slated with 20 by 10 green slates. Above the ceiling light, i.e., between purlins A and B, is a skylight of Hope's patent glazing running the length of the roof, on each side. The stanchions are, I find, cased in cement, forming a column 1ft. 6in. diameter, and are stayed at the top by struts fixed to cross joists 12in. by 5in., but not in the line with the stanchions."

—The frame diagram of truss will be as in Fig. 1, and in order to work out the stress diagram the plate must be replaced by the dotted members. Assuming the structural load to be 28lbs. per foot super, ceiling 11lb. per foot super, and horizontal wind pressure 42lb. per foot super, the loads will be as shown, and the reactions obtained by producing all the loads to the base line and calculating the reactions as for a beam with irregular loading. The load line 1 to 14 and the reactions may then be set off, and the stress diagram, Fig. 2, completed. The stresses should then be scaled off and the maximum stresses will be as marked on the half frame diagram, Fig. 3. The members in compression should be calculated by Gordon's formula

$$W = \frac{fS}{1 + \frac{m}{nq}\left(\frac{l}{d}\right)^2}$$

where f = load upon material, say, 6½ tons per sq. in. for mild steel; S = sectional area in sq. ins.; $m = 1$ for both ends fixed, 2.5 for one end fixed and the other rounded, 4 for both ends rounded, 16 for one end fixed and the other free; $n = 1\tfrac{1}{2}$ for hollow cylinder section, 1 for solid rectangle, ¾ for solid cylinder, ½ for + L.H.T. sections; $q = 3750$ for mild steel. The members in tension should be calculated by allowing 6½ tons per sq. in. on the net section of member.

HENRY ADAMS.



STRESS DIAGRAM FOR LARGE ROOF TRUSS.—REPLY TO S. B. W. (URMSTON).

R.I.B.A. Examination Questions.

STUDENT (GLASGOW) writes: "Please let me know if the questions set in the final examination held in June last by the R.I.B.A. have been published, and where; and if the answers are likely to be published in the 'Architects' and Builders' Journal" as heretofore."

—The examination questions will be printed in the R.I.B.A. "Kalendar," to be published in October next. The Institute does not permit their publication in the Technical Press, as this would affect the sale of the "Kalendar." Our correspondent's only course is, therefore, to purchase the forthcoming edition of the "Kalendar."

Laying Out Estate Under Town Planning Act.

BUILDER writes: "Please give full particulars of the proper procedure in order that a building estate may be laid out and taken over by the local Council under the recent Town Planning Act. The estate plan was approved by the local Council some time since, and some houses have been built and the roads partly formed. It is now proposed to make the roads with grass margins, and we require to know the proper procedure in order to get the local Council to take over the roads when laid out in this way."

—The only course that our correspondent can adopt is to negotiate with the local Council with a view to coming to some agreement in the event of the Council adopting a town planning scheme for the area. The Act does not prescribe any procedure for negotiations between estate owners, etc., and the local authority prior to the adoption of a scheme; but there is nothing to prevent some kind of understanding being arrived at. Otherwise, our correspondent can only proceed in the ordinary way under the existing by-laws and Public Health Act, which would not necessarily prevent the construction of streets with grass margins.

Interior Treatment of Rooms in 1700.

G. L. C. (Keighley) writes: "How were the walls of reception rooms, etc., in the larger class of house, treated in the year 1700?"

—The internal finish of rooms as executed in the year 1700 would be Renaissance wood panelling in broad, simple panels, with bold mouldings such as may be seen in Wren's work at Hampton Court. The panels stand out in advance of the stiles. The material might be oak, but little carving would be introduced unless the building was one of considerable importance, when festoons of fruit and flowers would be disposed at points of interest such as the overmantel. A great deal of panelling in pine painted was used in houses of lesser importance. The usual treatment in either case was with basemould or skirting, panelled surbase surmounted by a dado rail, and large single panels above reaching to below the wood cornice of simple classical profile. The plastered ceiling was usually plain but might be divided by soft mouldings into simple panels around a central circular or oval wreath of modelled fruit and flowers in high relief. The fireplace opening would probably have a plain marble wave-section jamb moulding. Representative details are given in "English Interior Woodwork of the Seventeenth and Eighteenth Centuries," by Henry Tanner jun., published by B. T. Batsford, High Holborn. Robert Adam did not commence to practise before 1758, when he returned from his travels abroad. G.

Books on Screw Pile Driving.

F. B. R. (Portsmouth) writes: "I am very anxious to secure a book on screw pile driving work and its branches, and should be obliged if you could give me any information as to how and where I can obtain one."

—The writer does not know of any book on Screw Pile Driving. His paper on "Timber Piling in Foundations and other Works," is obtainable through E. and F. N. Spon, 57, Haymarket, but this does not deal with screw piling. There is a short reference to screw piles in Cassell's Building Construction, part 3, Cassell and Co., price 3d., postage 1d. Usually the blades are cast upon a short length which is bolted to the next length above. A wooden frame is made like a large horizontal sprocket wheel to take the capstan rope. A large sheet of iron is placed on each side at the centre through which the various timbers are bolted to keep them in position. Other bolts then connect this frame to the head of pile column for the screwing.

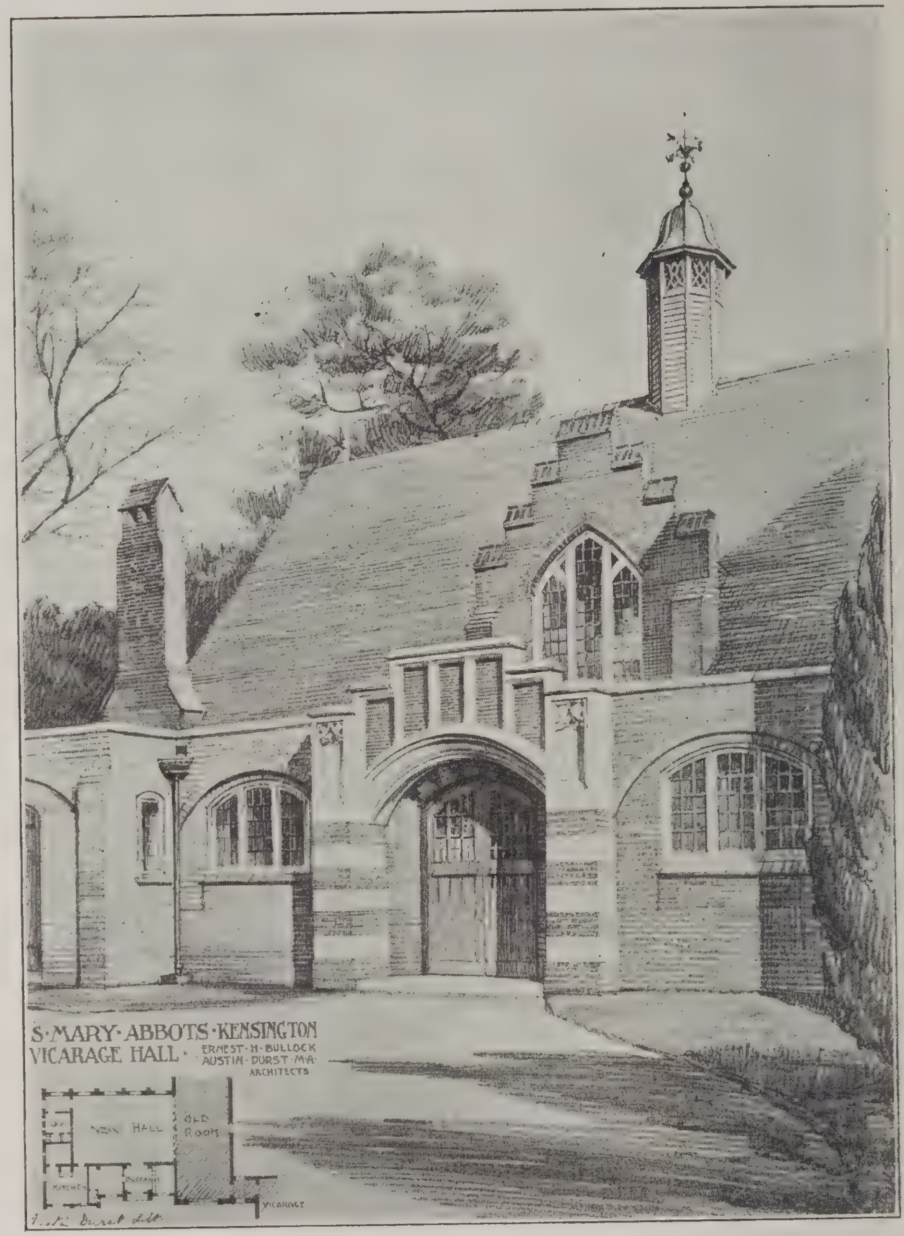
Henry Adams.

How to Become a Reinforced Concrete Expert.

A.R.I.B.A. (Birmingham) writes: "I should be greatly obliged if you would kindly give me information as to the best ways and means of becoming an expert in reinforced concrete construction; I am desirous of going into the matter thoroughly, studying all different systems, and also being able to work out the stresses and strains on same."

—We advise you to attend the course of lectures on "Reinforced Concrete," which will be given by Mr. H. Kempton Dyson, secretary, Concrete Institute, at the London County Council School of Building, Ferndale Road, Brixton, S.W., next session, commencing in September. The cost of this course will be 10s., to those earning over 30s. per week, and 4s. 6d. to those earning less than that wage. Particulars can be obtained at the School of Building. If, however, you are unable to attend London for lectures, we do not quite know what you can do, as the subject has not been dealt with adequately before. The only thing to be done is to study books on the subject, but that is rather an unsatisfactory way, being tedious and not practical enough, and affords liability to error.

D.



This new Hall, adjoining the old Gothic structure, was erected about two years ago, increasing the seating accommodation by 150. Arranged on either side of the vestibule are cloak-rooms with lavatories; there is also a service kitchen for parochial use. The new Hall, which has a panelled dado, can be cut off from the old Room by a movable partition. It is heated by hot water radiators and lit by electric light. The roof, spanning 27 feet, is open, of purlin construction, and the timberwork left untouched. The old Room has been plastered and finished with dado to harmonise with the new Hall. The architects for the work were Mr. Ernest H. Bullock and Mr. Austin Durst, M.A., 3, Raymond Buildings, Gray's Inn. Messrs. T. W. Dickens and Sons, of Ealing, were the builders.

Responsibility for Adding to Boundary Wall.

Heaton writes: "A is a private residence, B is a new council school just commenced. The boundary wall between the two, belonging to the private residence, is only about 5ft. high. (1) Can A compel B to build the wall to a further height? (2) Has B any right to use this wall, or ought they to build one of their own?"

—As to (1), it is clear that the school authorities can have no right to make A alter his wall by adding to it. The height of a wall is a matter for him to decide upon. As to (2), if (as stated) the wall stands entirely on A's property, his neighbour has no right to make the slightest use of it. Any such user would constitute a trespass for which damages could be claimed. Further than that, if A came to know that this use was to be made of his wall, he could apply for and obtain an injunction to stop it.

X.

Colonial Architectural Journals.

Colonial (Sunderland) writes: "Could you oblige me with the addresses of the principal Colonial architectural periodicals—particularly in Canada? I should be glad also if you could give me some idea of the charges for advertisements for situations required."

—There are really very few publications issued in the Colonies devoted to architectural matters. Below we give particulars of two or three, which we think might serve our correspondent's purpose, but we think his better plan would be to advertise in the leading daily papers of whichever Colony or State he particularly entertains. For these papers, the general charge for an advertisement, "Situations Vacant," would be 5s. for 40 words. The charges for similar advertisements in the following papers are as follows: "Canadian Architect and Builder," Ontario, 10s.; "Canadian Cement and Concrete Journal," 10s.; "Builder, Engineering and Mining Journal," Sydney, N.S.W., 5s. Should our enquirer desire further information, or wish to place instructions for any Colonial publications, Messrs. Gordon and Gotch, of 15, St. Bride Street, E.C., should be communicated with, as they are in a position to carry these matters through without any difficulty.

NEW BUILDINGS.

PROPOSED.

Barnes.—The District Council has approved the following plans:—Two houses, Temple Sheen Road, Mortlake; motor shed, Feldholme, Queen's Ride, Barnes; house, Hillersdon Avenue, Barnes; four houses, Rosslyn Avenue, and four houses, Tudor Gardens, White Hart Lane, Barnes; six semi-detached villas, Deanhill Road, Mortlake; one pair semi-detached villas, Temple Sheen Road, Mortlake; one pair semi-detached villas, Temple Sheen Road, Mortlake; and a ballroom, Mill Lodge, Lonsdale Road, Barnes.

Basingstoke.—The Hampshire County Council have approved of an agreement with the county boroughs of Bournemouth and Southampton for the building of a second asylum for the county, the present one being inadequate for the demands made upon it. The site of the new building will be Park Brewett Farm, Basingstoke, and accommodation will be provided for 1,300 patients.

Bolton-upon-Dearne.—The Local Government Board have communicated with the Bolton-upon-Dearne Urban Council relative to their housing proposals and the borrowing of the sum of £9,475, to the effect that an inquiry would be held as soon as the engagements of their inspectors would permit.

Bournemouth.—An inquiry has been held by the Local Government Board into an application of the Bournemouth Town Council for sanction to the borrowing of £9,500 for alterations and extensions to the refuse destructor in Iddesleigh Road.

Doncaster.—The Local Government Board have been in communication with the Doncaster Corporation with respect to the housing scheme under their Act of 1904, and the Sanitary Committee, in order to meet the requirements of the Board, have recommended that the borough surveyor be instructed to formulate a scheme for erecting on the surplus land in Marsh Gate, which was acquired in connection with the New Bridge scheme, about 144 houses for occupation by the working classes.

Fort Matilda (on the Clyde).—It is reported that the Admiralty has decided to carry out an important extension of the new torpedo factory just completed at Fort Matilda, on the Clyde. The estimated cost of the extension is £25,000, and it is expected that the work will shortly be commenced.

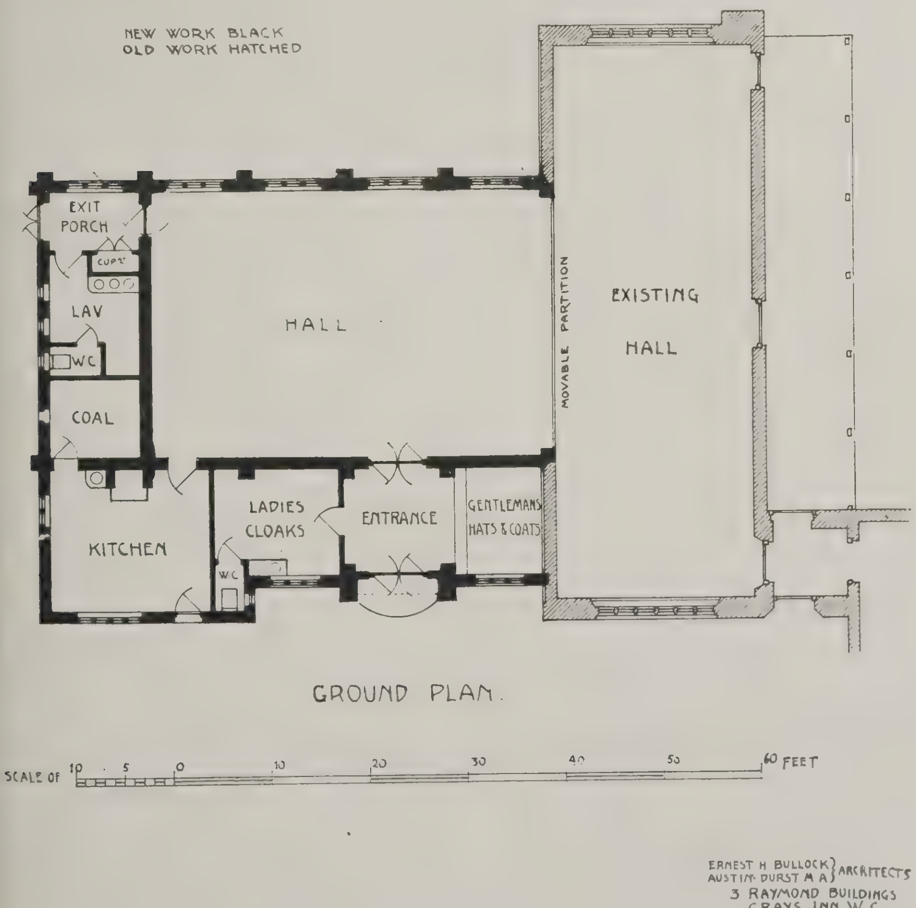
Hartlepool.—The Town Council has decided that as there had been no applications to take up leases of land belonging to them in Northgate, Corporation Road, and Warren Street, they would themselves build workmen's dwellings thereon. It is estimated that the amount required to carry out the scheme will be £4,000.

Lancaster.—The Postmaster-General has selected the site for the new Lancaster Post Office in Fenton Street and Cawthorne Street, Lancaster. The proposal to erect the new building in Dalton Square, alongside the new Town Hall, was opposed by the Chamber of Commerce. Another proposal to utilise the old Town Hall was not approved, and the site chosen is opposite the Storey Institute, near the Castle and the London and North-Western Station.

London, W.C.—Proposals are being considered by the Holborn Borough Council for a big building scheme on the site of the Italian colony. The consent of the Council is being sought for the closure of the courts, which were recently the subject of litigation.

Maidstone.—The lowering of the wall on the north boundary of All Saints Churchyard, Maidstone, has been approved by the Town Council, and it will be shortly taken in hand. The object is to show the church in its proper proportions, which are at present partially hidden when viewed from Mill Street and the Palace Garden.

Margate.—Preliminary steps have been taken for erection of an open-air concert hall and shelter on the greensward known as the Fort, to the east of the pier at Margate. From the shore a slipway is to give access to a low promenade, which will extend from the Point to Clifton Baths. The concert hall and shelter, which are to be completed next season, will accommodate 2,500 people, and the cost of the building and alterations to the Fort will amount to about £20,000.



VICARAGE HALL, ST. MARY ABBOTS, KENSINGTON.

Nelson (Lancs.).—A new church is to be built in Burnley Road, Nelson, at an estimated cost of about £5,000.

Otley.—The Urban District Council has decided to apply to the Local Government Board for sanction to obtain a loan of £3,000 to carry out private street works.

Oxford.—The report of the Oxfordshire County Council Committee entrusted with the authorised scheme for providing new buildings for office accommodation and a Council room on the site of the motor garage next to the county police station at Oxford, have approved the design for the elevation and detailed plans prepared by Mr. Stallard, the County Surveyor. Possession of the site will be obtained at Michaelmas next. The estimated cost of the buildings is £7,750, and of furnishing £1,000, and architect's commission, etc., £450, and for the new police stables and incidental matters, £800—and the committee recommend the Council to make application to the Local Government Board to sanction a loan not exceeding £10,000, and to give the committee general instructions to obtain tenders, and proceed with the work.

Pontefract.—The Town Council has decided to advertise for sites for building workmen's dwellings, and not to proceed with the Horsefair improvement scheme on account of the expense already incurred by owners on property involved.

Troon.—The Duke of Portland has promised £10,000 towards the cost of erecting new municipal buildings at Troon, Ayrshire.

Wednesbury.—The General Purposes Committee of the Wednesbury Town Council, in a report issued recently, state that they have considered an offer contained in the will of the late Mr. John Guy of £2,000 to initiate a subscription fund for the erection of almshouses in the borough at a cost of not less than £4,000, and of a further £1,000 for starting an endowment fund of not less than £2,000. The committee, after obtaining and considering information relating to the income and expenditure of almshouses in various parts of the country, and also putting themselves in communication with one of the executors under the will, had decided to recommend that the executors be informed that the Town Council regret they cannot see their way to inaugurate or to accept the administration and management of the scheme upon the terms and conditions contained in the will.

West Hartlepool.—The West Hartlepool Town Council are considering a proposal to construct a new direct road between West Hartlepool and Middlesbrough. By the existing road the distance between the two towns is 17 miles. By the new road it would be under eight miles. Over the greater part of the distance there would be, in addition to a footpath, a 24 ft. road for motor and light traffic, and a 22 ft. road for heavy traffic, and a strip of road 14 ft. wide would be retained for a light railway. The estimated cost is from £47,000 to £50,000. It is intended to arrange a conference of the surveyors of the authorities interested to discuss the whole scheme.

Wolverhampton.—The Town Council have received a formal intimation from the Local Government Board sanctioning the loan of £18,435 for the erection of a secondary school for girls.

IN PROGRESS AND COMPLETED.

Aberdeen.—Tenders from the following contractors have now been accepted for the new buildings which are in course of erection for the Royal Insurance Company, Limited, in Union Street:—Mason work, Mr. Alexander Anderson, Bieldside; carpenter, and joiner work, Messrs. D. Macandrew and Co., Loch Street; slater work, Mr. George Davidson, Thistle Street; plaster, tile, and cement work, Messrs. J. Bannochie and Sons, Belmont Street; painter and glazier work, Mr. B. Copland, Union Terrace; plumber work, Mr. John Dean, Queen Street; heating, do.; steel beams, Mr. George Bisset, Sugarhouse Lane; reinforced concrete (Hennebique system), Messrs. J. Scott and Son, George

Street. -The contracts for electric lighting and office fittings have not yet been arranged. The total cost of the building, including value of site, will be about £20,000.

Beglinog (S. Wales).—The foundation stones have been laid of the new Methodist Chapel, which is in course of erection at a cost of £2,450, and will provide accommodation for 600 persons. Mr. W. D. Morgan, Pentre, Rhondda, is the architect, and Mr. John Lloyd, Ystrad Mynach, the builder.

Bolton.—The new premises of the National Provincial Bank of England, in Bradshawgate, have been completed, and are constructed of stone in the Renaissance style. Messrs. George Temperley and Son, were the architects, and Mr. Richard Mosley the contractor, both of Bolton.

The Borough Council has approved the following plans:—11 houses in Baber Street, and 3 houses in Major Street, Astley Bridge; 23 houses off Alexander Road, Tonge; 2 houses and shops in Mirey Lane, Lostock; house in Church Road; 7 houses in Thornley Avenue; 10 houses in Melrose Avenue, Smithills; addition to premises in Deane Road; rebuilding premises in Sr. George's Road, and Vernon Street (conditionally); rebuilding shops in Deansgate and Howell Croft (conditionally); timber storing shed in St. George's Road; new meter house in Gas Street; 17 houses in Hawthorn Road; shop in Deansgate; skip store in Coe Street; workshop in Blackhorse Street; outbuildings on Chorley Old Road; 13 houses in Melbourne Road; 14 houses in Willows Lane.

Boscombe (Bournemouth).—The opening and dedication has taken place of the new Mission Hall, which has been erected in connection with St. John's Church, in Shelley Road, Boscombe, at an estimated cost of £1,925. The building is constructed of red brick with Bath stone dressings, and provides seating accommodation for 420 persons. Mr. C. T. Miles, F.R.I.B.A., Bournemouth, was the architect, and Messrs. J. and W. Hayward, Boscombe, the contractors.

Bristol.—The new Kingsdown Council School, erected between Southwell Street, and Walker Street, is constructed of blue pennant walling with rubble facing and freestone dressings. The main building has two storeys, provision being made for 620 scholars. The floors are of reinforced concrete, laid with wood blocks. All the rooms are lofty, and ventilation is provided by an electrically driven fan in a ventilating tower. The school is warmed entirely by hot water on the low-pressure system, the heating chamber being placed in the basement. Electricity is the illuminant in all parts of the building. Mr. W. S. Skinner, F.R.I.B.A., was the architect, and Mr. William Foster the contractor.

Cannock.—The Urban District Council has approved the following plans:—Two houses, Belt Road, Chadsmoor; 6 houses, Cemetery Road, Cannock; alterations to Cannock Infants' Schools; 6 houses, off Belt Road, Hightown; 2 houses, Green Heath Road, Hednesford; 2 houses, High Mount Street, Hednesford; 6 houses, High Mount Street, Hednesford; 6 houses, Littleworth Road, Hednesford; additions to house, Hednesford Road, Heath Hayes; alterations, Hednesford Road, Heath Hayes; 2 houses, Lloyd Street, Cannock; 2 houses, Belt Road, West Chadsmoor.

Croydon.—The new variety theatre, to be known as "The Croydon Hippodrome," has been completed, and was erected by Messrs. J. Smith and Sons, South Norwood, from the designs and under the superintendence of Messrs. Frank Matcham and Company, architects, London. The building is of concrete and steel construction, and occupies an island site, with a frontage of 40 feet to Crown Hill, 180 feet to the public thoroughfare of Priddy's yard, and 100 feet to a private road.

Elton-on-the-Hill.—An extensive scheme of restoration and renovation has been undertaken in regard to the parish church of Elton-on-the-Hill, which is an ancient edifice of considerable interest. The nave, which is probably Jacobean in date, contains remains of Early English pillars and arches. The tower was built about sixty years ago.

Exeter.—The Lord Bishop of Exeter has laid the foundation stone of a new church, which is in course of erection in the Polsloe Park portion of the parish of Heavitree. The first portion of the church will consist of three bays, and will cost about £1,200. The building will be of local brick, with Bath stone windows and dressings, and a slated roof. There will be seating accommodation for about 500, and a parish room and vestries will be provided. The dimensions of the building will be 31 ft. by 81 ft., with a chancel 31 ft. by 38 ft. Mr. E. H. Harbottle, F.R.I.B.A., Exeter, is the architect.

Faceby (Yorks.).—The foundation stone has been laid of a new chancel, which is to be added to the parish church of Faceby, at the foot of the Cleveland Hills. Mr. Temple Moore, F.R.I.B.A., has prepared the plans, and the sum to be expended on the addition is £1,000.

Gosforth.—The foundation stone of St. Charles's Roman Catholic Church at Gosforth has been laid by the Bishop of Hexham and Newcastle. The building, which has a frontage in Rothwell Road, is Gothic in design, and cruciform on plan. Mr. C. J. Menart, of Glasgow, is the architect, and Mr. W. C. Fleck, Gosforth, the contractor. The church is being built of Kenton stone, with dressings and mouldings of Pasture Hill stone. Its length is 85 ft., width of transept 62 ft., width of nave 38 ft., height 50 ft., height of towers 80ft. It is planned to seat 510 persons, the estimated cost being between £4,000 and £4,500.

Grangemouth.—The memorial stone of the new Parish Church at Grangemouth, situate in Ronaldshay Crescent, has been laid by the Grandmaster of Stirlingshire. The church will accommodate 800, and the hall 400 persons, the total cost being between £7,000 and £8,000. The design is Perpendicular Gothic, Messrs. Wilson and Tait, Grangemouth, being the architects.

Greenock.—The Dean of Guild Court has approved the plans of the houses which are to be erected at the foot of the Lyle Road, immediately west of the bridge at Fort Matilda Station, and the work will be proceeded with at once. The scheme consists of a block of ten self-contained dwelling houses, eight of which are of five apartments, and the two end houses are each of six apartments. The houses are to be constructed of stone for the first storey, with brick and rough-cast on the second storey, and will have, in addition to a good garden at back, the advantage of being set back from the public road by no less a distance than 30 ft. The site commands an extensive view of the Firth, and extends to over 100 poles. Mr. W. H. Kirkwood, Greenock, is the builder.

Halifax.—Good progress is being made with the erection of the new church of St. Hilda, situate at the Hopwood Lane end of Gibraltar Road, and the work of putting on the roof will shortly be commenced.

It is anticipated that the building operations in connection with the proposed new St. Paul's Church, will commence towards the end of October, the fund for the purpose having reached the £7,000 required to justify the work of actual building. The church is to be erected on a site in Queen's Road, near to the Constitutional Club.

Hampton Court.—The work of restoring the ancient moat and bridge opposite the west front of Hampton Court Palace, is expected to be finished in October. There were sufficient flat red bricks, of which the palace is built, recovered from the excavations to complete the walls of the moat where they were defective, and the freestone copings and embrasures are being made to harmonise with the rest of the buildings.

Hedworth (Durham).—The foundation-stone has been laid of the new chancel south transept and chancel aisle of St. Nicholas's Parish Church, Hedworth. The work also includes the erection of vestries and organ chamber, and will cost about £1,700, provision being also made for a future parish room, which will entail an additional expense of £315 19s. 9d., the contract price for the whole of the scheme being £1,808 0s. 9d. Mr. C. Hodgson Fowler, F.R.I.B.A., F.S.A., Durham, is the architect, and Mr. Grayson the contractor.

Immingham (Grimsby).—Good progress has been made with the Great Central Railway dock works at Immingham, and the whole area has now been excavated to the full depth. The foundation difficulties at the entrance to the dock have been successfully overcome, and no further exceptional trouble is anticipated. Some of the lock gates are in course of erection. The general equipment of the dock is proceeding satisfactorily, and the coal hoist on the Western Jetty is now ready for the shipment of coal. Good progress has been made with the electrical railway between the Alexandra Dock, Grimsby, and Immingham, and it is expected that it will shortly be ready for opening.

Jarrow.—The new building for the Kino is constructed of pressed brickwork, with stone dressings, and covers over an eighth of an acre. The hall is approached through a decorated foyer of more than 50 ft. in length, from which are approached the stairs to the circle. The picture hall has decorated ceiling and walls, and is accessible from all parts of the house. Mr. Harry Barnes, A.R.I.B.A., and Mr. Charles F. Burton, M.S.A., Newcastle-on-Tyne, are the architects, and Mr. T. Lumsden, Jarrow, the contractor. The decorations have been carried out by Mr. Dixon, Jarrow; the plumbing by Messrs. W. Scott and Sons, Jarrow and Newcastle; and the electric lighting by Messrs. Robson and Coleman, Newcastle.

London, W.C.—The Savoy Hotel is being considerably enlarged, by the addition of two storeys, which will include 30 suites of rooms and a banqueting hall. The two floors and the decorations of the new suites will cost over £80,000. When the alterations are completed, the hotel will be capable of accommodating over 600 visitors, while the banqueting hall, which is to cost £30,000, will be able to seat 500 people. The latter is to be built on the site of the old courtyard, and entrance from the street will be obtained by a flight of marble steps. The whole work is to be completed in record time, and to this end 900 men will be engaged on the construction, working in three shifts night and day. The total cost of the work is estimated at £125,000.

Morecambe.—The cost of the construction of the new conveniences has been about £1,800, and the work has been carried out by Mr. A. M. Macdonald, of Westminster, from the designs of Mr. J. W. Hipwood, A.M.I.C.E., Borough Surveyor.

Mull.—The first portion of the scheme for extending and rebuilding the Hull Corporation's Madeley Street Bath has been completed. The total cost of the bath is about £8,300. The swimming tank is 90 ft. by 30 ft. The size of the building is 110 ft. by 76 ft. 6 in. Fifty-four folding dressing boxes have been provided along the side walls, and thirty-four fixed boxes on the end galleries. Under the north side gallery provision has been made for eighteen dressing boxes. The estimates provide for a removable wood floor over the swimming tank, so that the baths may be used during the winter months as a public hall. The firms responsible for the carrying out of the work are Messrs. G. Jackson and Sons, contractors for buildings, with sub-contractors: Mr. Drury, mason; Mr. Hunter, slater; Mr. Abba, plumber; Mr. Torr, painter; Patent Indented Bar Company: Messrs. F. C. and J. Keay, Birmingham, steel roof; Mr. J. E. Railton, hardwood dressing boxes; Northern Art Pavement Co., Manchester, mosaic floors and tilework; Messrs. J. Jones and Sons, Manchester, gallery railings; Messrs. Prockter and Kenyon, Manchester, pipes, fittings, etc. Mr. A. E. White is the City Engineer.

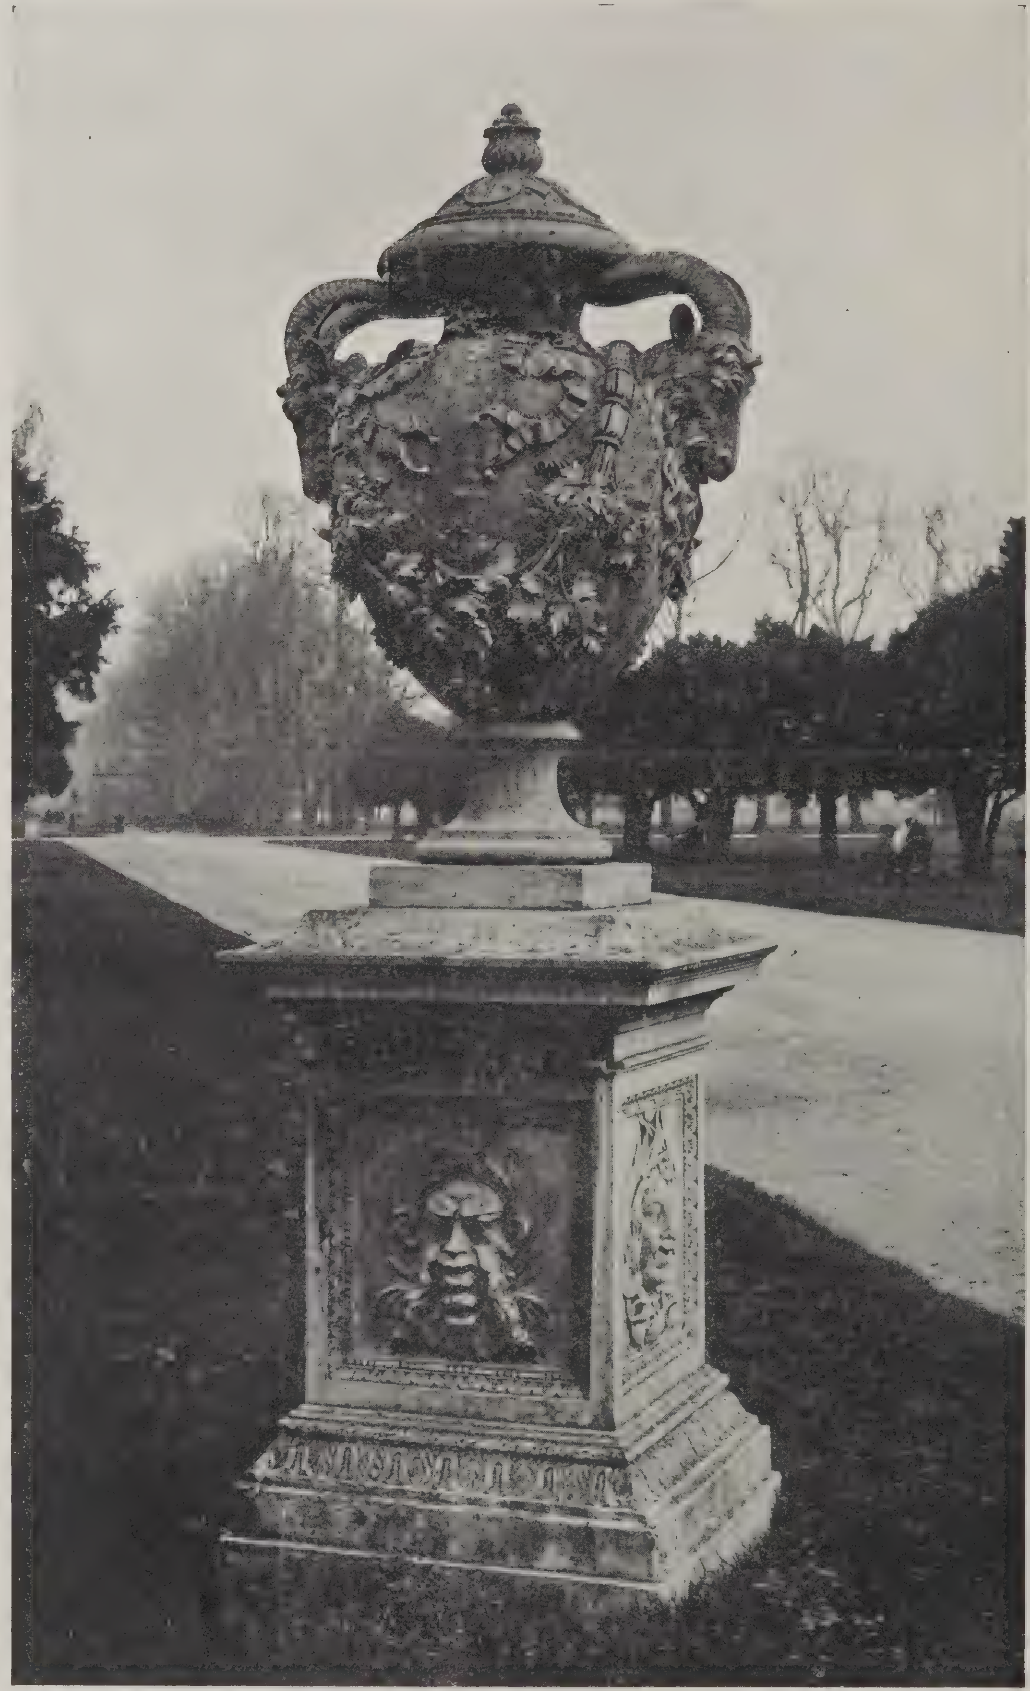
(See also pages 225-227.)



The vase is one of two placed on either side of the main walk facing the centre of the great east front of Hampton Court Palace. Careful inquiry has elicited the fact (which will be new to most people) that the pedestal, of Portland stone, is original work of the time of Wren, whereas the vase itself is of some composition having cement as its basis, and was brought to the Palace (we believe from South Kensington) about forty years ago. The vase or figure—whatever it may have been—which originally stood on the pedestal was removed to Windsor Castle some time during the last century. The present work, as it stands, offers a suggestive comparison, both in the treatment appropriate to two different materials, and in the weathering quality of each.

A GARDEN ORNAMENT AT HAMPTON COURT.

Supply and Demand in Art.

THAT, in this country, joy in beautiful things is not so pervasive as it should and might be is a safe thesis. Mr. W. Robert Colton, A.R.A., adopts it in a long letter to the "Times," headed "Education and Art." Issue is joined when any attempt is made to assign the reasons and appoint the remedies for the conditions that are deplored; and in this respect Mr. Colton probably neither wished nor expected to escape criticism. He protests against "the radically wrong aims of our educational authorities in regard to art matters, and the foolish expenditure of public money in encouraging the wrong side of the balance of supply and demand in art production." He thinks that a wider distribution of our energies and resources is necessary to the right economic equilibrium. He therefore condemns such congestion as is represented by the storing of antiquities "in our pantechnicons called the British Museum, the National Gallery, and the South Kensington Museum." These pantechnicons are in the next sentence transformed into "universities established before their time and at a period when elementary schools of appreciation are alone needed." To keep on multiplying examples of the old masters until we are compelled to enlarge the old galleries or build new ones in the same centre, is, Mr. Colton holds, to spend the nation's wealth "in a very mad and foolish way." He concedes that the capital city should have moderate collections "made up of single examples of all schools"—when, we fear, they would be very inadequately representative—but "the starved designers and workers in metal, pottery, textiles, lace, etc., must have the finest examples of design in their respective trades brought home to where they live and work, to such places as Birmingham, Sheffield, Staffordshire, Bradford, Ireland, and a hundred other districts. South Kensington methods excite his ironic wit. "A few indifferent examples of surplus designs are lent to certain technical schools and local museums—probably embroidery designs to a wood-carving centre." South Kensington Museum, having served Mr. Colton's turn as (a) a pantechnicon, and (b) a university, now becomes (c) a white elephant — as commodious as the Trojan horse, "pretentious, very costly to keep up, full of policemen and officials, and a very few students who are not allowed to approach anything near enough to copy it without a special permit. What was simply a students' museum is now on the same footing as a foreign fortification which is approached at one's peril." There is, in short, "nothing done in England to produce an artistic public." The Government, bettering the example of France, should place in every district a small temple of art—"a small museum that shall be a criterion of taste. Builded by skilled architects, adorned and decorated by famous sculptors and painters, it shall contain the most choice examples, according to the trades of the district, and shall be a standard of taste in every particular," and the cost should be supplied from funds released by stopping the craze for collecting works of ancient art, whose rarity seems to be a stronger recommendation than their beauty. Mr. Colton's protest has called forth in the "Times" a leader which is evidently from the pen of that ready writer on æsthetics who is doing such excellent work in imparting common-sense views on art to a section of the public that is peculiarly likely to profit by them. He does not adopt Mr. Colton's view that the supply of art is greater than the demand for it, but rather seems to contend that the terms should be reversed. There is, indeed, "too much demand for art—a demand, in fact, so urgent that, when it cannot get good art, it will put up with bad." And the writer goes on to argue that the supply does not and cannot equal the demand. "That is the reason why art always declines in rich and luxurious ages. A nation may increase its income and its demand for art to any extent; but it cannot increase its supply of artists. If it insists on demanding more art than can be produced, it will get spurious art; and the prevalence of that spurious art will so demoralise taste that most people will prefer the imitation to the reality." When every well-to-do Roman wanted statuary, sculpture almost ceased to be an art, and became an industry. It is further urged that the true artist now cannot make a living because he cannot compete in a market that is flooded with adulterations which the consumers usually prefer to the genuine article. All this seems rather to smack of a kind of fatalistic resignation. Nevertheless, it may be profoundly and woefully true up to precisely the point at which Mr. Colton's argument for distribution becomes valid. If the public confuse good with bad, there are ways and means of training them to greater discrimination, and the ways and means suggested by Mr. Colton seem to us to be distinctly promising, always supposing that it is possible to correct the habit of glutting the wood-carvers with designs for embroidery. Apparently believing that "We needs must love the highest when we see it" is a saw of might, Mr. Colton simply urges the desirability of increasing our chances of "seeing it." It may be that you cannot create an artist and that you cannot create taste; but surely there are influences which tend either to foster or to quench the one or the other, and these influences are to some extent under control, and may even be brought into existence, swaying the balance for or against art. Otherwise how should the excessive popular demand be so deadly to genuine art? Yet we must sorrowfully admit the truth of the statement that spurious art gluts the market. Thousands upon thousands of "pretty-pretty" suburban villas put it beyond doubt or question. The "Times" writer's seeming paradox that the greater the popular demand for art, the scantier will be the supply of really artistic products, must necessarily include within its wide sweep the outlook for architecture; and it seems, incidentally, to involve the question of copyright, to which attention is given in a separate note; for would not copyright tend to check the multiplication of spurious imitations? But we must agree with Mr. Colton that Education and Art are really able to assist each other, rather than with the somewhat pessimistic assumption that the former brings the latter to the verge of starvation by encouraging the manufacture of shoddy imitations.

"No More Street Statues."

SOME strong—or at least strongly worded—objections to street statuary are expressed in homely fashion in the "Manchester City News" under the minatory heading, "No More Statues," in which the first sentence is, "Whatever form Manchester's memorial to King Edward the Seventh may take, it is to be hoped the city will be spared the infliction of another statue in its streets." The fault, it appears, is not always with the statues. "Two or three of the baker's dozen of statues which obstruct our streets possess artistic qualities of more than average merit, but none of them makes that appeal, or incites that measure of delight which its fine conception and clever execution warrant. Noble's Oliver Cromwell, at the foot of Victoria Street, is not only overshadowed and dwarfed by the great grimy buildings in its neighbourhood, but we have planted around it a small forest of tramway wires, and spun across it a network of electric wires almost hiding this fine work from view." We deeply sympathise. The ugly building may abuse the lovely statue, the ugly statue may ruin the lovely building; the network of electric wires impartially outrages both; having, however, more opportunities for the desecration and disfigurement of buildings, on whose very roofs it is as a loathsome parasite. All electric wires should be forthwith decently buried, and probably they would be but for the sordid consideration that it comes much cheaper to stick them up on poles. Apart from the admittedly very important question of suitability of environment, it is evident that, in most cities, existing street statues suffer cruelly from neglect. Remarking that a certain Irish statue of Goldsmith has been allowed to gather a green mould on its head, and that therefore the figure, instead of receiving respectful attention, provokes derision, the Manchester writer adds: "In our own still dirtier atmosphere, grosser disfigurations occur; streaking the marble cheeks with roulets of sooty tears, and hanging greasy, grimy stalactites from ears and nostrils, to say nothing of the defilement caused by stray pigeons and perky sparrows." In London there are statues in which the birds of the air have been undisturbed in the building of their nests, which is a monstrous pretty, but withal an inappropriate, juxtaposition of art and nature. These considerations may, perhaps, prevent the undue multiplication of statues to King Edward VII.; but, in any case, the street statues already in existence should at least be kept free from the defilement of grime and filth.

Architectural Copyright.

IN the columns of a lay contemporary four letters bearing the signatures of well-known architects, and a fifth letter that simply carries the initials "G.C.," discuss the question of architectural copyright. Mr. E. L. Lutyens thinks that while the general idea of protecting architects from the plagiarism now prevalent is a good one, it is doubtful whether a workable Act can be produced. He foresees, for instance, some considerable difficulty from the proposed dual ownership. "Having designed a mantelpiece for A's house, shall I need his permission if I wish to use the same design for B's?" Mr. Arthur T. Bolton thinks we cannot do better than proceed on the idea that difficulties exist in order to be overcome; and he cites, as instances of the kind of iniquity for which the law should provide a remedy the wholesale reproduction of a certain single-storey residence, and the caricaturing of an architect's own house in a building put up next door to it. Mr. E. Guy Dawber thinks that the proposals are obscure, but that if anything can be done to prevent speculative builders, and even some architects, from reproducing work of others without acknowledgment, the Bill contains "the kernel of an excellent Act." But the dubious points in the Bill must be thrashed out before it becomes law. Mr. C. F. A. Voysey says, *more suo*, that by claiming protection for architectural production you drag it down to the level of commercialism. "The artistic temperament must ever be producing, putting forth and giving; generosity of spirit is essential. It is the selfish commercial instinct that would wish to limit the production of beauty for personal gain. Therefore architecture as an art must be dishonoured by encouraging the artist to regard his productions of beauty from a commercial point of view. Nothing so degrades the artist as the thought of reward while at his work. When done, let him by all means attend to the commercial side of his life as a necessary consequence of his labour. But the production of beauty must be his main and primary concern, and he should welcome all the benefit his fellow-creatures are able to derive from his labour, even the influence for good that the feeble imitator may glean." This, like all Mr. Voysey's utterances, is very noble and beautiful. It recalls the rainbow splendours of Plato's Republic, Sidney's Arcadia, More's Utopia, and Ruskin's Fors Clavigera, to say nothing of the Fabian Essays. We are always grateful for Mr. Voysey's Pisgah views, and are always very willing to forgive him any little exaggeration of the æsthetic and altruistic side of architecture. But most of us, unlike Peter Pan, have been unable to refuse to grow up, and we are fortunate if in the process the visionary is not wholly eliminated. But among the stern realities before which the golden dreams of youth are so apt to fade like the baseless fabric of a vision, leaving "not a wrack behind," is—as, indeed, Mr. Voysey rather grudgingly admits—the necessity for making a living out of one's profession. The commercial side of architecture is in almost as much need of cultivation as the æsthetic; and there appears to be no earthly reason why the eminent architect should not be also a keen man of business, alert to insist on his rights as a citizen. And as a good citizen, he certainly will not—maugre the artistic temperament — disdain consideration of any legislative measure which, whatever its practical defects, is obviously designed for the furtherance of justice and equity. It has been shown in this journal—which was the first to present clearly and authoritatively the case for copyright—that on the Continent the architect's work is apparently protected without difficulty of administration, and without detriment to the profession and its art. At all events, the Bill deserves the close attention of all whose interests it affects. Whether its provisions, so far as they concern architects, are good, bad, indifferent, or merely impracticable, is for the profession to determine; and, for our part, we trust that they will grapple with the question with such determination and skill as shall prove once again that they are fully capable of paying due regard to both the business and the artistic side of their profession. For in the Bill both are undoubtedly involved.

New Use for Clock Towers.

SOME association of motorists has conceived the very businesslike idea of supplying to local authorities a most useful indicator of direction and distance. Incidentally, the indicator includes an advertisement of the association, which is perhaps admissible as a fair *quid pro quo*, although it might perhaps be urged that the convenience to members should have been a sufficient compensation. Our complaint, however, is not against the device of the motorists' association, but against the occasionally deplorable misuse of it by local authorities. In one flagrant instance that has been brought to our notice, a very respectable Jubilee clock tower, standing at the cross-roads of a London suburb, has been gravely disfigured by fixing to it some of these direction tablets. The effect is exasperating in the extreme. The occasion for regret does not begin or end with the disfigurement of the monument. It is symptomatic of indifference to art, and it perpetuates and propagates that indifference by the force of bad example. It is plain that there is a crying need for the formation of properly constituted committees who shall relieve borough councils and other local authorities of responsibilities which they are so ill able to bear. As a first step special committees might be formed, with the addition of architects.

NOTES AND NEWS.

London Fountains.

The Metropolitan Drinking Fountain Association have moved the fountain, formerly standing at the foot of the steps leading to the Royal Exchange, but now too small for the position, to a new position at the top of the steps leading to the landing stage by Blackfriars Bridge. For this purpose the remaining pylon of the old bridge at this point has been remodelled. Architecturally speaking, this remodelling is very far from good. The new fountain at the Exchange is to be 15ft. high and 13ft. wide. Its centre will represent a woman's figure holding a Roman lamp, and the stone used will be red granite. Who looks after these things we wonder.

Sir Thomas Lawrence's House.

According to a paragraph in the "Daily Graphic" of August 17th, the proprietors of the Imperial Hotel, Southampton Row, are taking No. 65, Russell Square, under a scheme of extension. This is the house in which Sir Thomas Lawrence, the great portrait-painter, lived for the last twenty-five years of his life, dying there on January 7th, 1830. In addition some part at least of the next house is also said to be included in this extension scheme.

"The Neglected Art."

A correspondent of the "Manchester Guardian" applies the above tribute to Architecture after the London correspondent of that paper had applied it to sculpture. He believes that "we have as fine an architectural and its allied sculptural power as ever was known. One need only point to Street's Law Courts, with its enchanting detail, chiefly from that great man's own hand, and the truly noble interior of the Roman Cathedral at Westminster. These are specimens in two different styles at their highest. Then there are countless modern houses of great beauty and fine style." Well, this betokens a discriminating taste. But the reason for the lowering "in architectural quality," in our new city buildings is then disclosed. "It is," the correspondent avers, "the rigid iron skeletons which are now in use everywhere. Everything is conditioned by this grim rigidity, and how the great professions of sculpture and architecture are going to encase these frames in the future with anything like the delightful exteriors of the best in the past remains to be seen. I could point to a score of recent buildings in our own city [Manchester] where the ghastly ugliness of exterior is obviously owing to the unyielding mass behind or within. It is seldom that a finely gifted architect gets his full chance. The opinionated committee, the desire for cheapness, the dirt and grime of the atmosphere, and now this all-prevailing structural demon, are enough to kill anything. Opinions differ as to whether the new metal skeletons are cheaper and safer than the old tried methods. That they are ruinous to the play, the dignity, of what we know of architecture, and the crafts that cluster round it, there is no doubt. We are in a grim, materialistic age, and this is shown with tremendous and deadly force in most of our modern buildings and their decorations." We are afraid that the rigid iron skeleton (apart from the fact that it has come to stay, and must be endured) is not responsible for faults of the outer skin. Too often we fear the hidden steel frame is the only part in a building which is true, direct, and architectonic.

Against Back-to-Back Houses.

In the Local Government Board Report by Dr. Darra Mair on back-to-back houses, which was issued last week, this method of building is again condemned as being relatively insanitary. The same broad conclusion had been reached in 1887 by Dr. Barry and Mr. Gordon Smith, whose evidence was derived from Salford; in 1903 by Dr. Herbert Jones, whose investigations refer to Shipley; by Dr. Niven, who dealt with nine Manchester districts; and by Dr. Evans, Medical Officer of Health of Bradford. Dr. Darra Mair's investigations cover a much wider area, include a much greater variety of factors, and exhibit a good deal of scientific refinement on the mere collection and tabulation of crude statistics, and he finds that even relatively good types of back-to-back houses, when compared with through houses, have a death-rate from all causes which is fifteen to twenty per cent. greater than the death-rate in through houses. This excess, however, is not evident in back-to-back houses built in blocks of four, which, unlike those built in continuous rows, possess some degree of cross-ventilation. The corrected death-rate for the three types of houses compared was as follows:—Through houses, 15.51; back-to-back houses, with side ventilation, 15.69; back-to-back houses without side ventilation, 17.94. The mean annual corrected death-rate per 1,000 at all ages was found to be as follows: (a) Pulmonary diseases, excluding phthisis, 3.16 (100) in through houses, 4.44 (141) in back-to-back houses, excluding those having side ventilation; (b) for infectious diseases, the relative figures, given in the same order, are 1.35 (100) and 1.60 (119); and (c) for phthisis, 1.15 (100), compared with 1.29 (112). It is admitted that the rent of back-to-back houses is materially less than that of through houses; but it is observed that "as much of this cheapness of back-to-back houses seems to depend not only on the fact that there are fewer walls to build, but also on the fact that, on a given area of land, it is possible to erect a greater number of back-to-back houses than through houses, the advantage is perhaps of doubtful value." The Report, of which a summary appears on p. 219, justifies the attitude on the subject that has been consistently assumed in this Journal, often in face of somewhat vehement opposition.

Granite Memorials.

An interesting account of the Scottish granite industry appears in the August issue of "Cassier's Magazine," in which Mr. William Diack remarks that while importing granite to Aberdeen may seem like carrying coals to Newcastle, nevertheless the amount of foreign material—from Norway, Sweden, Russia, etc.—which entered the stoneyards of Aberdeen in 1908, a normal year, was no less than 27,000 tons. The stone may be brought to Aberdeen from Sweden and Norway with less trouble and expense than from inland Scottish quarries, some forty miles distant. The first statue cut in granite since the days of the Ptolemys, the author asserts, was that of the last Duke of Gordon, which stands in the Castlegate of Aberdeen, and was cut more than thirty years ago by Messrs. Alexander Macdonald and Co.

The Mistress Art and the Handmaiden.

Those who regret always the separation of sculpture from architecture will not be particularly grateful to Mr. C. Lewis Hind for his adulation of Donatello, who is alleged to have procured the divorce. "In Egypt and Greece they loved a statue for its own sake; but the mediæval cathedral builders, those nameless craftsmen, were content to let their figures and reliefs blossom from the stone, until a wonder-child was born in 1836—Donatello. He is the founder of sculpture in its modern sense, divorced from architecture, and the oftener one sees his work, the more one wonders. Explain Donatello and you explain that over-used word—genius." He thinks that, if Mr. Colton's Artillery Memorial may be taken as an augury, it may be that in the Mall architecture and sculpture may be again wedded. He thinks that while much modern British work, as exemplified in specimens at the Japan-British Exhibition, is dull and uninspiring, there are, on the other hand, a few delightful things there, such as those statues and reliefs that are the work of Mr. F. Derwent Wood. Mr. Hind, therefore, does not despair of British sculpture; and it is obvious that, despite his worship of Donatello, he is still free to admire sculpture which, as he says, was, ages ago, "the handmaiden of architecture, growing graciously from the fabric." Such sane and catholic-minded criticism as that with which he is popularising Art among such of the readers of the "Evening News" as have the good sense to turn to his occasional column, is a gratifying portent.

A New Type of School?

The London County Council Education Committee have just inaugurated their new scheme of Central Schools, which are "to serve as a bridge between the elementary and the secondary school," suitable pupils being drafted from the elementary schools for instruction in such subjects as may give them a definite bias towards some kind of industrial or commercial work. Provision has been made for ten such schools, which are situated in Kensington, Brixton, Mile End, Haverstock Hill, Hackney, Deptford, and St. Pancras. If the scheme turns out to be successful, a new type of building may be required to meet conditions that, if there is any vitality in the movement, are certain to diverge from stereotyped precedent.

The Architectural Steelwork Problem.

Mr. Walter J. Pearce writes from Vron, Bull Bay, Anglesey:—"As a logical lover of fine architecture, I am hoping that architects will seriously set themselves, as one or two have done already, to the real problem that confronts them. This, in my opinion, should be to compel modern structural methods to their own peculiar possibilities of line, grace, dignity, and beauty. To attempt to 'encase' steel construction in a preposterous veneering that pretends to the world that the structure is built of something other than its real material is not, in my opinion, architecture at all. I believe it to be quite possible to invest the meanest and cheapest of iron construction with interest and beauty. Proofs that this can be done are constantly cropping up. Note, for instance, some of the detail of the Franco-British Exhibition temporary buildings—say the towers of the Palace of Women's Work, in which the ironwork was overlaid with plaster in such a way as to emphasise the principles of construction and not disguise them. It gave the observer intense satisfaction, reminded him of no particular precedent or style, but seemed as fitting as the skin and muscle that overlay the bones of the human structure. When architects cease to leave the design of the framing to the engineer, who is too often bounded by the tee-square and plumb-rule, and put their own vigorous conception into the very bones of the structure, we shall see a real improvement in the exterior appearance of steel-constructed buildings." This letter appears in the "Manchester Guardian" of August 20th. There is nothing in it that can be regarded as aggressively novel; and one cannot withhold admiration for the sanguine courage with which the writer associates beauty with ironwork that is mean and cheap even unto the superlative degree. Doubtless Mr. Pearce's superlatives are merely rhetorical; and that point being waived, we are, as our readers are very well aware, quite willing to concede that structural ironwork can be made interesting and beautiful, although this admission does not commit us to unreserved approval of Mr. Pearce's instance.

Ivy and Architecture.

The enormous growth of mean architecture during the last 60 or 70 years is the reason, according to a "Times" leader-writer, for the enthusiasm lavished on ivy and other climbing plants, since "the most unattractive dwelling-house or tastelessly ornate church or public building becomes comparatively inoffensive" if "sufficiently masked by a hanging ivy-bush or a tight-fitting uniform of ampelopsis. At the same time, the writer protests against the concealment of many architectural features in the historic ruins of Britain even by a picturesque but confused growth of verdure; and he takes occasion to point out the damage to old and mouldering walls which may result from neglecting these overlying encumbrances. In many cases the unchecked growth of ivy not merely conceals but destroys our old ruins. It is doubtful if the younger and thinner shoots do any real harm; but when the ivy plant becomes a veritable tree, and drives sinuous stems, as thick as a man's arm, into the joints and interstices, the stems act as living wedges, and prise the wall asunder as they grow. Serious damage may result from the growth of trees or shrubs on the top of the walls, the result of bird sown or wind blown seeds; and not less harmful are trees which obtain a foothold close to the foundations of old walls, and undermine them at the base. As an example of the intelligent use of climbing plants upon ancient ruins the work of Commendatore Boni in replanting the Forum at Rome is mentioned. "Ivy and flowering plants have here been used to beautify bare corners and to conceal the supports and buttresses of new masonry which it has been necessary to insert in various places. On the other hand, nothing is allowed to grow where it can either hide or injure any existing feature of interest, or might impede future excavation at any likely point. It is to be wished that all our own famous architectural sites were watched over with equal providence and good taste."

The New Admiralty Buildings.

The First Lord of the Admiralty has decided to retain as his official residence the old building in Whitehall which for so long a period has been the political home of many rulers of the Navy. The premises, which have access to the Horse Guards Parade, had at one time a tiny garden, which, however, has been completely swept away to make room for the new Admiralty buildings. The residence nearest the offices of the London County Council will be tenanted in due course by the First Naval Lord. The remainder of the new buildings at the end of Processional Road are already occupied by the Director of Works, hitherto in Northumberland Avenue; the Royal Marine Office, also removed from the same thoroughfare; the Medical Department, until the present time in Victoria Street; the Superintendent of Contracts; and the Library, wherein is housed a valuable collection of books relating to the naval history of the country.

John Dobson's House.

A writer in the "Northern Echo" draws attention to the lamentable state of the house of John Dobson, the architect who designed the Central Station and many other notable buildings in Newcastle, and also this house in New Bridge Street. "Like all his productions," we are told, "it was very solid, and in its erection only big, fine stones were used for the exterior. Long ago the house disappeared from view. An enterprising bill-sticker had filled in the windows and doors with wood, and on three sides the once noble house now does duty as a bill-posting station. A further indignity has lately been offered to it, in that the railings which ran along the front have also had boards attached to them, and now also do duty in displaying posters. As the interior is now also used as what the proprietor euphemistically terms a "Temperance Hotel," with beds—good beds—at 6d. per night, it is not likely that the premises can fall any further in the social scale." Our contemporary appropriately heads its paragraph: "Departed Glory."

A Georgian Engraver.

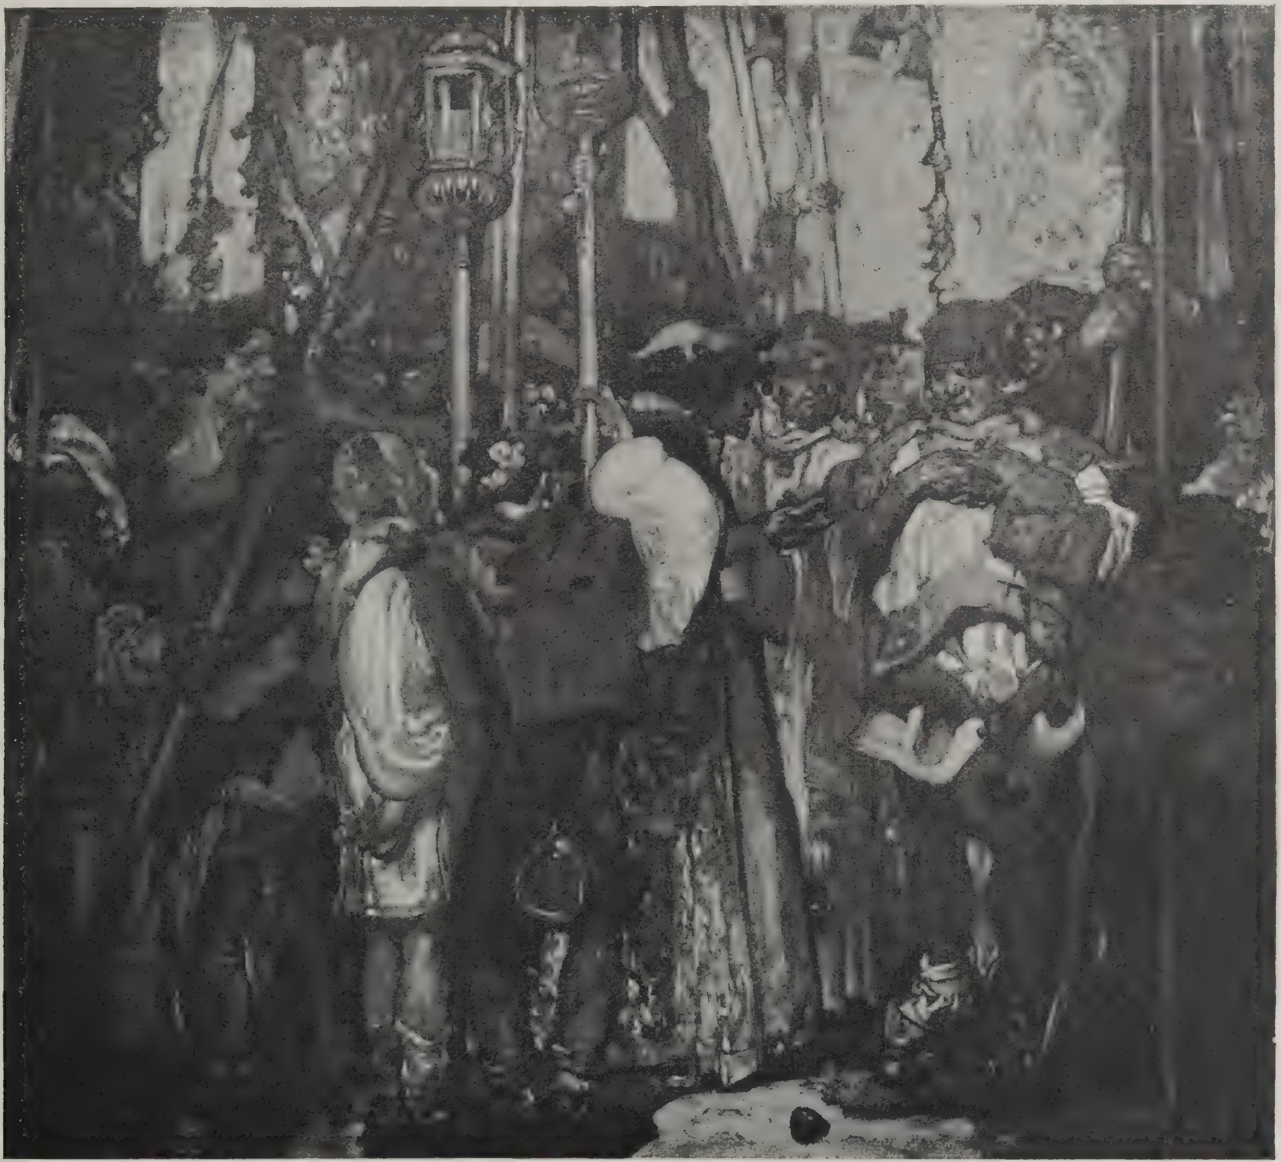
The old building on the north side of Chiswell Street associated since 1735 with the famous type-founding firm of the Caslons has been handed over to the house-breakers, the business having been transferred to new premises nearly opposite. William Caslon, the first of the line, was born in 1692 at Cradley, Worcestershire. He served his apprenticeship to an ornamental engraver of gun locks and barrels, and in 1716 set up in that business in Vine Street, Minories, and added tool-making for bookbinders and silver-chasers. In the same year an eminent printer, John Watts, recognised Caslon's skill in cutting binders' punches, and employed him for that purpose as well as for cutting type-punches. He also gave him the means to fit-up a small foundry and introduced him to other printers. Caslon's business grew, and in 1735 he removed to Chiswell Street, where he carried on work so successfully that he eventually surpassed all his Continental competitors, and was called by them "the English Elzevir," being particularly famed for his beautiful execution of Roman, italic, and Hebrew type. He was noted for his hospitality, and was fond of entertaining his guests to musical evenings at Chiswell Street, where Handel frequently delighted the company by his playing. Dying at his "country residence" at Bethnal Green in 1766, William Caslon was succeeded by his sons, and since then the business has been carried on uninterruptedly in the building which Londoners will know no more.

The Romford Garden Suburb Competition.

Referring to our note under this heading last week, we desire to add some further necessary particulars which were not then available. In the first place, Mr. John Burns, M.P., President of the Local Government Board, has consented to become President of the Exhibition next year. The dates for the sending in of designs have also been amended. In Class I. (a detached house to cost £500) and Class II. a detached house to cost £375) the designs must be submitted by October 31st, 1910. In Class V. (garden design for house or cottage in Classes I. or II.) and Class VI. (Perspective drawing, suitable for reproduction of a house or cottage entered for competition in Classes I. or II.) designs must be submitted by the 30th of November, 1910, and in Class IV. (town plan of Gidea Park) designs must be sent in by March 31st, 1911. The directors of the Romford Garden Suburb will purchase 12 of the houses and cottages erected by exhibitors. Arrangements are also being made by which at least three-quarters of the cost of the erection of all competition houses will be advanced to competitors.

The Decoration of the Skinners' Hall.

Mr. Frank Brangwyn has during the past few years built up a great reputation for himself as a decorative painter, and it will be further enhanced by the fine series of decorative paintings which he has executed for the Skinners' Company's Hall. In all there are eleven canvases, five on each side of the hall, each 9ft. 6in. high, and one at the end over the minstrel gallery. Ten of them memorise striking incidents in the history of the ancient and worshipful company; the eleventh is a figure painting of purely imaginative character. The following is a list of the paintings in chronological order as they are placed. I. Skin merchants or Skinners selecting furs and pelts at the City mart in the days before the Guild of Corpus Christi received its charter. II. The granting of a charter to the Skinners' Company by Edward III., March 1st, 1327. III. A river procession of the City's and the companies' barges to Westminster, A.D. 1453. IV. The opening of the strife between the Skinners and the Merchant Taylors, A.D. 1484. V. The founding of Tonbridge School by Sir Andrew Judd, A.D. 1553. VI. An incident in the defence of London Bridge by Sir Andrew Judd, A.D. 1554. VII. A City pageant in the Olden Times. VIII. The departure of Sir James Lancaster for the East Indies, A.D. 1594. IX. Reception of General Monk at the Skinners' Hall, April 4th, 1660. X. Sir Thomas Pilkington's Banquet to King William III. and Queen Mary, A.D. 1684. XI. "Harmony." In deciding the merits of these works one must recognise that Mr. Brangwyn makes no attempt at archæological accuracy in costumes or scenes. One cannot tick off their exactitude like photographic records in a museum. But in their main purpose, the decoration of the



THE OPENING OF THE STRIFE BETWEEN THE SKINNERS AND THE MERCHANT TAYLORS. A.D. 1484. ONE OF THE SERIES OF DECORATIVE PAINTINGS IN THE HALL OF THE SKINNERS' COMPANY, BY FRANK BRANGWYN, A.R.A.
(Reproduced by permission of the Skinners' Company.)

hall, they succeed magnificently, and the Skinners' Company are to be congratulated on the possession of so fine a scheme of decoration so worthily commissioned.

The Scottish System of Tendering.

The Scottish system of dividing a contract into several trades, and making each tradesman directly responsible to the proprietor, seems to be gradually yielding place to the English practice of placing the job in the hands of a single contractor. A "Glasgow Herald" correspondent deprecates the change. In some cases, he admits, and in very small contracts, it may be necessary; but with such a splendid system of specification and measurement as has been evolved and made nearly perfect by the architects and measurers of Glasgow, single contracting is in most cases not necessary. "Suppose," he argues, "a mason has taken over the whole contract; can he be expected to take all the details of the plumber work from the architect? The technical knowledge required for each trade is such that a mason cannot be expected to judge of the best manner of carrying on plumber work." He objects, further, that the single contractor generally proceeds to set one sub-contractor to bid against another until "the sub-contractor's prices are so cut that either he is going to have no profit or the work and material used are going to be inferior." Nevertheless, the cost of building is bound to be greater, for "off each trade there are going to be two profits taken, viz., the main contractor's profit and the sub-contractor's profit." Whether or not there is any force in these contentions we prefer to leave it to our Scottish readers to decide. We would remind them, however, that, south of the Tweed, an innovation of which fears have been expressed is almost the reverse of that which is alarming our Scottish friends. The complaint here is that there is a marked tendency to make too much of the specialist. The conditions, however, as between England and Scotland, present so much variation, that any attempt at comparing them might easily give rise to false impressions, and we therefore do not insist on the comparison. It may be, however, that the two systems are on the eve of becoming more closely assimilated.

The House-breaking Nuisance.

Holborn Borough Council has not seen fit to adopt the proposals submitted by its Public Health Committee with regard to the rendering less inconvenient the demolition of buildings; and the "City Press" comments that "it is permissible to house-breakers to pull down buildings how and when they please, irrespective altogether of the inconvenience or the comfort, to say nothing of the health, of residents and passers-by." Our contemporary further remarks, with a perhaps pardonable tone of self-righteousness, that in the City there have been in operation by-laws upon this subject which are much more drastic and far-reaching than those which Holborn has just rejected, and that they have worked admirably all round, causing inconvenience to none, and adding immensely to the amenities of living in the "one square mile." One specially beneficent provision of the City by-laws is that which secures comparative — and indeed almost total — immunity from what is perhaps the chief nuisance of house-breaking—namely, the scattering of dust. No matter how occasioned, floating dust, acting, as it does, as a vehicle for the dissemination of disease germs, as well as a mechanical irritant, is always a serious menace to health; and when it comes from the partial pulverisation of old houses in which generations of people may have suffered and died from all kinds of loathsome and deadly diseases, there is an imperative necessity for minimising its creation and spread. And the ruination it causes to goods in adjacent property, as well as the custom it drives away where the neighbouring premises are in business use, are surely considerations that should not have been lightly ignored; nor should the health and comfort of the house-breakers themselves, who, while they certainly have the remedy in their own hands, are but little likely to adopt it unless they are compelled.

DISCOVERY OF THE PLANTAGENET TOMBS AT FONTEVRAULT.

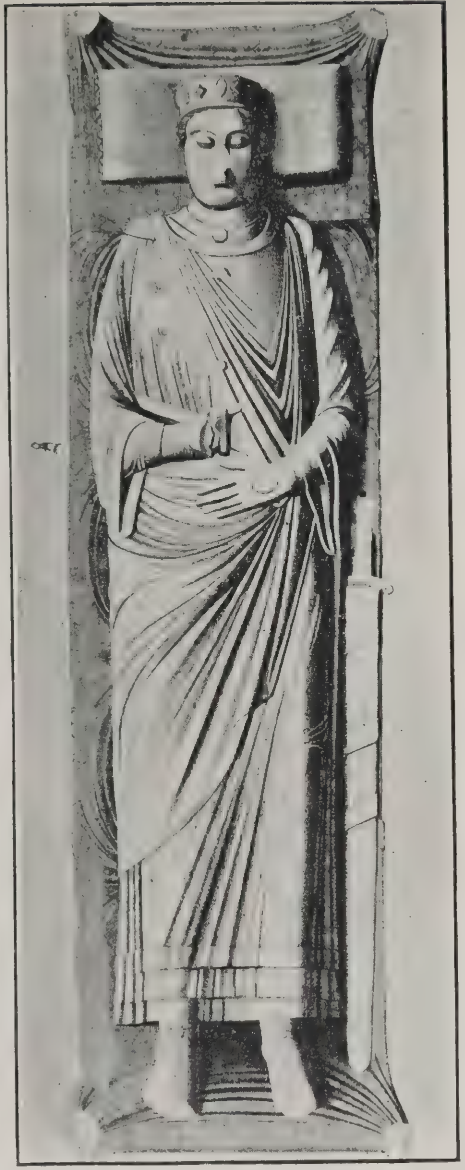
In an article by Mr. Cecil Hallett, which appeared in the "Architectural Review" for June, 1902, attention was drawn to the vicissitudes of the ancient abbey of Fontevrault, once one of the wealthiest monastic churches of France, which was dissolved with much sacrilege and violence at the great Revolution, and under Napoleon I. became a house of correction, in which state it still remained at the date of the above-mentioned article.

The chief interest to English readers in the church, besides its interest architecturally, lies in the fact that it was the burial place of the remains of several of our Plantagenet kings. We say remains advisedly, as, though only the kingly bodies of Henry II. and Richard I. were there interred, the hearts of John, Henry III., and, it is believed, of Edward I., also found sepulture at Fontevrault. Eleanor, Queen of Henry II., Joan, Queen of Sicily, sister of Richard I., and her son, Raymond VII., Count of Toulouse, and Isabella, Queen of King John, were among the other Royalties buried there; and it is believed that there were cenotaphs of Berengaria, Queen of Richard I., and of Eleanor, Queen of Henry III. The six splendid royal tombs, with effigies, were disturbed in 1504, and again in 1638, when the figures of Raymond and Joan were renewed, and the six effigies were placed against the north choir wall in a grandiose classical sculpture. Fortunately the effigies of Henry II., Richard, Eleanor, and Isabella have survived, and though moved about many times since the great Revolution—once even to Paris—and after repeated fruitless negotiations on the part of the British Government to acquire them for Westminster Abbey, they were at last allowed to rest in the apsidal chapel of the south transept, where they lie behind an iron grille with their feet to the west. One (that of Isabella) is of wood; the rest are of stone, and all are life-size and coloured. The four sovereigns are represented as lying in state on draped biers, and as wearing royal robes and crowns.

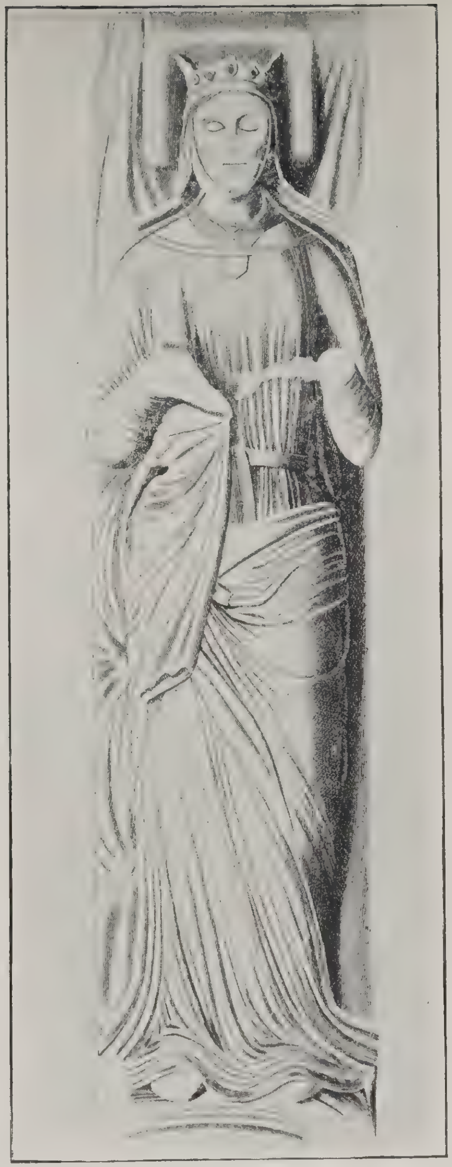
Since the date of Mr. Hallett's article, and possibly in consequence of conversations he had with Government officials, and of representations then made, the French Government began to take an interest in Fontevrault, and in a further note which Mr. Hallett contributed to the "Architectural Review" in December, 1903, he mentioned that the French Government had decided upon and commenced the task of restoring Fontevrault, the work being carried out by the Administration des Beaux Arts. At that time the exact position of the Royal tombs was unknown.

They have now been discovered by M. Lucien Magne, Government Inspector-General of Historical Monuments, and the "Times" Paris Correspondent, under date August 21st, gives some details of the discovery. The nave floor has been lowered to its original level, and the seventeenth century partition that had been built up against the wall of the transept has been pulled down. Traces of inscriptions and paintings were then discovered in an arched recess of the north-west wall of the transept. This ornamentation consisted of gold crosses, six escutcheons, and traces of heraldic devices in gold representing leopard's paws. Under this ornamentation there remained traces of names inscribed in a line, the first name ending in "T." The names of "Richard," "Alienor," and "Henri" were clearly decipherable. Under the floor below these inscriptions were found the tombs of Richard I. and of Queen Eleanor, protected by a sort of vaulted roof composed of debris. Next to them were the tombs of Henry II. and of Isabella of Angoulême.

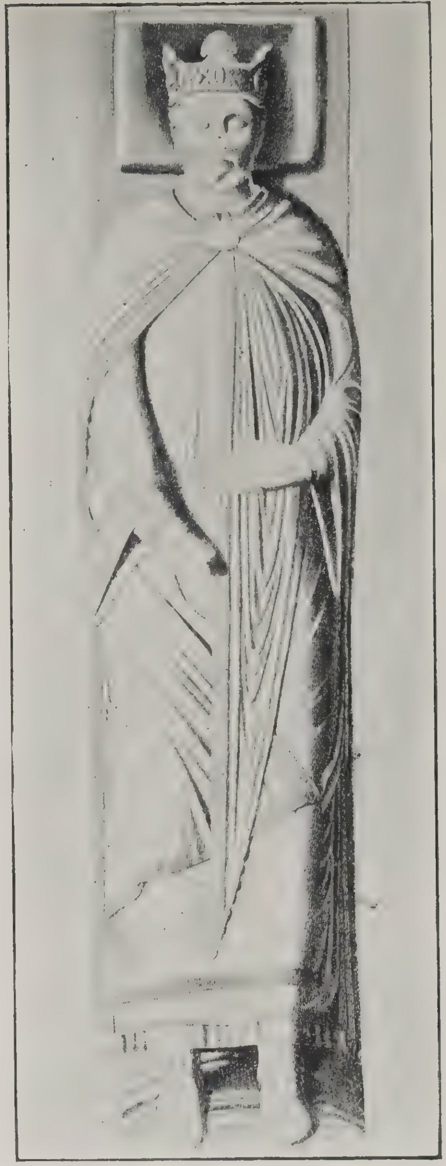
The skeleton of Henry II. was doubled up in order to shorten the tomb so that it might serve to support the vaulted arch designed to protect the second pair of tombs. It is thought that this was done by the sixteenth century builders when they transferred the tombs to the side chapel. The "*Journal des Débats*" holds out some hope that the tombs may ultimately be moved to their original place at the entrance to the choir.



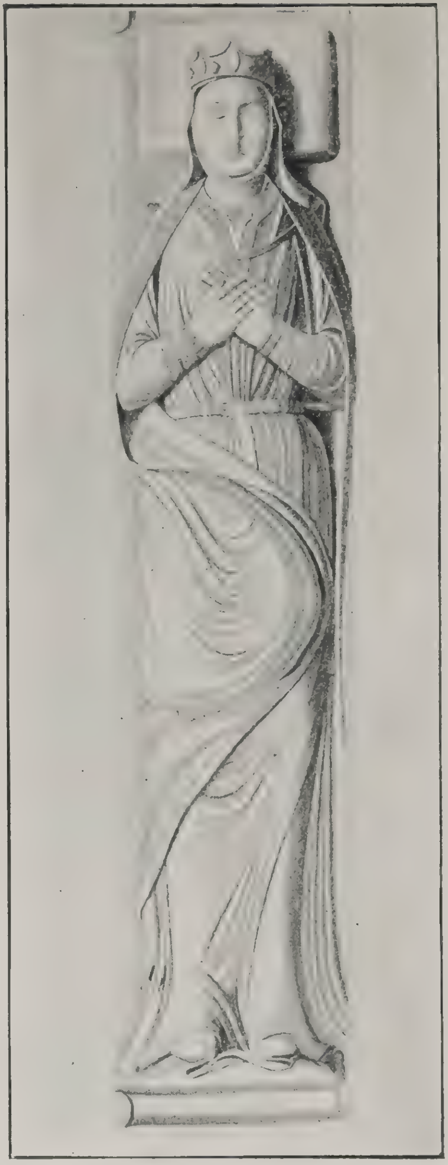
Henry II.



Eleanor, Queen of Henry II.



Richard Cœur de Lion.



Isabella, Queen of King John.

EFFIGIES ON THE ENGLISH ROYAL TOMBS AT FONTEVRAULT ABBEY, FRANCE.

(*From Stothard's "Monumental Effigies."*)

CORRESPONDENCE.

R.I.B.A. Town Planning Conference.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Owing to recent legislation, a new era of town planning and reconstruction is about to open in the United Kingdom. That there is no danger of the legal and public health aspects of the question of receiving inadequate attention is already clear. But it is equally important in the interest of our own future generations alike, that the artistic side of such improvements, with its lasting result in beauty and convenience, be not less fully and authoritatively considered.

With this object, the Council of the Royal Institute of British Architects have made arrangements to hold an International Town-Planning Conference, of which His Majesty the King has graciously consented to be Patron, on a comprehensive scale in the second week in October, and we are glad to state that we are already assured of the participation and assistance of many of the most distinguished experts on the subject, not only of our own country, but of Europe and the United States, as well as of others from the overseas Dominions of the Crown.

By an act of disinterested generosity on the part of the president and members of the Royal Academy, the Galleries at Burlington House have been placed at the disposal of the Royal Institutute for the display of the notable designs and illustrations of town planning and remodelling which have been collected from all parts of the world.

In order that the proceedings of the Conference may be of the widest utility, and that the welcome offered to our numerous foreign guests may be of the most representative character, we desire, by your courtesy, cordially to invite the presence and co-operation of all those who are concerned in order to secure the best results from a movement of not merely local, but national, and even imperial, importance.

Forms of membership, and all particulars, may be obtained from the secretary of the Royal Institute.

We are, Sir,
Your obedient servants,
JOHN BURNS,
Honorary President of the Conference.
LEONARD STOKES,
President.
ASTON WEBB,
Chairman of the Executive Committee.
JOHN W. SIMPSON,
Secretary-General.

Temporary Exhibition Buildings.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Those of us who have been associated with exhibition work, as I have for several years, in England and elsewhere, must have read with peculiar pleasure your interesting article on this subject. The only point one would venture to criticise is the idealistic declaration that nothing else but concrete-steel ought to be countenanced for temporary exhibition buildings in future. Even governments do not willingly spend more money on exhibition buildings than they hope to get back, and certainly semi-national exhibitions instituted primarily by companies or private individuals would be very rarely promoted if the cost were so largely increased as the article suggests. Large exhibition buildings constructed of steel, the whole of which had to be enclosed in concrete and modelled in cement, would probably cost nearly as much as so-called permanent construction, and would, in fact, not be temporary buildings at all, if the expression has any reference to the time they would last if permitted to remain. Plaster has made exhibitions possible all the world over, and in spite of your authoritative verdict, I think that steel buildings with wood studding to receive fibrous or ordinary plaster is amply sufficient for safety, if efficient fire protection is provided, and assuming sensible control of all interior fittings and decoration of stalls and partitions.

The article was wholly admirable in emphasising the temporary and decoratively festal character of exhibition buildings, and that essential idea is always present, no doubt, in the minds of exhibition architects, though the dominant views of clients are not always to be evaded, however much mistaken and unæsthetic or even imitative. French architects seem to have a natural genius for delightful novelty in exhibition design, and are perhaps allowed a freer hand, though possibly the Glasgow Exhibition had done work worthy almost of as much praise as your article so rightly awards to the Paris Exhibition of 1889.

Yours faithfully,
A. O. COLLARD.

Courses in Reinforced Concrete.

In reply to a Birmingham correspondent in our last issue on the question of lessons in reinforced concrete, we recommended him to attend a course of lectures in reinforced concrete construction to be given in London next session, failing which we were at a loss what to recommend. The Embankment Engineering Institute, of 64, Victoria Street, Westminster, S.W., draw our attention to the fact that they have been conducting a course of correspondence tuition on the subject for some years past.

MEMORIALS TO THE LATE KING.

Sunderland.

It is suggested that the memorial here shall take the form of a fund to furnish and equip the Children's Hospital. The building has already been erected, but cannot be opened because the £5,000 required to equip it is lacking.

London.

Fresh suggestions for a suitable memorial continue to reach the Mansion House Committee. Among the latest is one for the building and equipment of a National Institute of Medical Research on the lines of the Rockefeller Institute, New York, also one for the purchase of the Crystal Palace for the Nation.

The following names have been added to the Lord Mayor's Committee of the Mansion House Fund for providing a memorial to King Edward in London:—Lord Stalbridge, Sir Trevor Lawrence (President of the Royal Horticultural Society and late treasurer of St. Bartholomew's Hospital), Sir William Crump, Sir Walter Johnson, Mr. George Alexander, Brigadier-General Henry N. C. Heath, C.B. (Master of the Grocers' Company), and Mr. G. H. Ryan (President of the Institute of Actuaries).

Chester.

It has been decided to reconstruct the Chester Infirmary at a cost of £25,000, and towards this it is proposed to appropriate the surplus resulting from the recent Chester Pageant.

SOCIETIES' REPORTS.

Royal Sanitary Institute.

The preliminary programme has been issued of the twenty-fifth congress of the Royal Sanitary Institute, to be held at Brighton from September 5 to 10. There will be a reception of the members and delegates in the Royal Pavilion on *Monday September* 5, at 1 p.m., by the Mayor of Brighton (Councillor Edward Green), and this will be followed, at 1.30, by a public luncheon in the Pavilion, at which the Mayor will preside. Afterwards, at 3 p.m., the Mayor will open the exhibition, and between 7 and 8 p.m. he will receive the members and delegates in the Royal Pavilion, where the inaugural address to the Congress will be delivered by the Hon. Sir John A. Cockburn, K.C.M.G., M.D. On *Tuesday, September* 6, at 8 p.m., in the Royal Pavilion, Dr. Arthur Newsholme, Principal Medical Officer, Local Government Board, will deliver a lecture. On *Wednesday, September* 7, at 8 p.m., there will be a conversazione and reception in the Pavilion, at the invitation of the Mayor. The meeting of the Engineering and Architecture Section will be held at 10 a.m. on Wednesday, September 7, when Mr. Baldwin Latham will introduce the subject of "The Influence on Health of the various levels in Subsoil Waters," and "School Planning" is also set down for discussion. On *Friday, September* 9, at the same hour and place, Dr. Alex. Hill will deliver a popular lecture, illustrated with lantern slides, on "The Bricks with which the Body is Built." At 3.30 of the same day, there will be a garden party at the Royal Pavilion.

Glasgow and West of Scotland Technical College.

The Calendar for the one hundred and fifteenth session (1910-11) of the Glasgow and West of Scotland Technical College is a stout volume of more than five hundred pages, giving full particulars of the rather multifarious activities in which this institution is engaged. These include the operations of the Glasgow School of Architecture. The director of architectural studies and professor of architectural design is Professor Eugène Bourdon, B.A., and the subjects are divided between the Technical College and the School of Art. In the former, Professor C. Gourlay, B.Sc., A.R.I.B.A., deals with the History of Architecture; and Mr. James S. Boyd deals with Constructive and Historic Design; while among the assistants are Mr. Vernon Constable and Mr. A. G. Henderson, who are both associates of the R.I.B.A. In the same college, the teaching of mechanics, mechanics of structures, natural philosophy, chemistry, and geology, is in the hands of well-qualified experts; and the same observation applies to the School of Art, in which the subjects are—Architectural Design (Prof. Alex. McGibbon, A.R.I.B.A., with an instructor and assistant); Drawing, Antique and Ornament; Modelling—Life, Antique, Ornament; and Design and Decorative Art; while the Life School has for its professor so accomplished an artist as Mr. Maurice Greiffenhagen. It is noted that, on the recommendation of the Glasgow Institution of Architects, December 12, 1906, the Royal Institute of British Architects granted that: "The Diploma or the Senior Certificate of the Glasgow School of Architecture (the latter with the full preliminary examination of that school) exempts from the Preliminary and Intermediate examinations of the R.I.B.A." There are day and evening courses, and bursaries are awarded in both.

BOOKS.

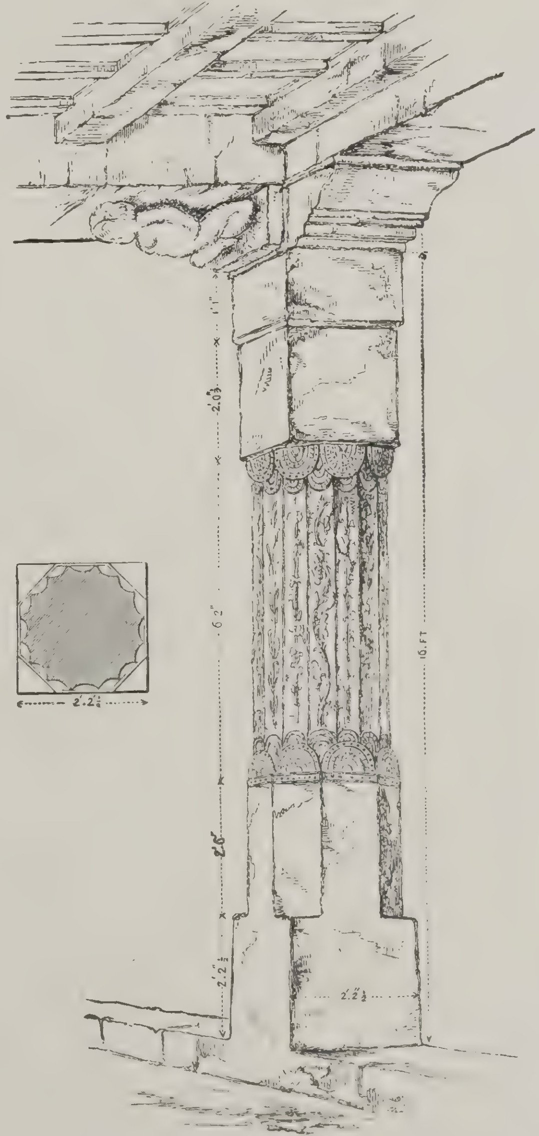
History of Indian and Eastern Architecture. By the late James Fergusson. Revised and edited, with additions, by James Burgess, C.I.E., and R. Phené Spiers, F.S.A. Two vols. London: John Murray, 1910. 42s.

It is thirty years since Fergusson's treatise on Indian and Eastern architecture made its first appearance, occupying what was at that time almost absolutely new ground to the majority of architectural students. It was only natural that an author making the first intelligent and comprehensive treatise on a subject that he had studied for many years and made his own should have attached an importance to it which few of his readers were quite prepared to accept. To those accustomed to regard architectural history as the study of the Greek, Mediæval, and Renaissance styles, with all their intellectual interest and artistic beauty, it seemed almost monstrous that we should be asked to follow out the misshapen forms and barbarous detail of many of the objects delineated in this book, as if they belonged to serious architectural history. To those who accused him of dogmatising in regard to the history and relations of some of these styles, on insufficient data, the author had a satisfactory answer in the preface to his own second edition. No one, he said, could direct his mind for forty years to the earnest investigation of any department of knowledge, and not become acquainted with a host of particulars, and acquire a species of insight which neither time nor space, nor perhaps the resources of language would permit him to reproduce in their fullness. "I possess," he added, "to give a single instance, more than 3,000 photographs of Indian buildings, with which constant use has made me as familiar as with any other object that is perpetually before my eyes, and to recapitulate all the information they convey to long-continued scrutiny would be an endless, if not an impossible, undertaking." That is a perfectly reasonable claim, and we have no doubt that Fergusson's knowledge of the details and the historical relations of the structures described in his treatise were quite exceptional, and such as entitled him to express decisive opinions on the subject.

But as to Fergusson's exaggerated views on the architectural merits of the great mass of the architectural monuments of India which he had, in a sense, discovered for the European world, opinion at the present day will hardly differ much from what it was thirty years ago. The historical study of man is important on the principle of *humanum nihil a me alienum puto*; an immense population, over an immense tract of country, had for successive centuries built thus and thus, and the mere fact that they had done so makes part of the study of human history. But to class a great deal of this as architecture of any artistic interest is absurd. A great proportion of it is barbarous stuff, ugly and abnormal in outline, deficient in any refinement of moulding (which is one of the great tests of architectural taste), and covered often with grotesque ornament applied without any sense of selection or artistic restraint. It is only when we come to the Indo-Saracenic architecture that we find anything that really deserves the name of architectural art. Much of that is of the highest class, and of the greatest beauty. But in its architectural forms and relationship it has closer connection with Persia than with India.

Although the book in its present form fills two volumes, each of the apparent size of the one original volume, the additions are not so extensive as this increased size would imply. The paper appears to be thicker, which probably makes the difference. The history of Indian architecture has, however, been extended from 610 to 785 pages, and the illustrations in the text increased by 98, besides 34 plates from photographs. These last are an important addition, as the system of printing illustrations direct from photographs was hardly in use when the original work was issued, and they are, of course, far more trustworthy as giving the most truthful representation of the state of a building. On the other hand, many of the original engravings in the text are by no means so well printed as in the original work. Whether this is the difference in the paper, or whether the blocks are worn, or have been reproduced by a process which has taken something from their effect, we do not know; but anyone who compares, for instance, the illustration of the tomb of Sher Shâh, Fig. 381 in the new edition, with the same illustration on page 517 of the second edition, or the "carved pillars in the mosque at Fathpur-Sikri" (cut 423 in the new edition), with the same illustration on page 579 of the second edition, will see what we mean. It is not surprising to find that the spelling of nearly all the Indian names has been altered; there appears to be a new theory as to the spelling of Indian names in English characters about every ten years; and we hardly recognise our old friend "Minar, Kutub," under the guise of "Qutb Minâr"; and so on throughout the book. This seems rather unnecessary, as we do not know after all whether the new spelling comes any nearer the actual sound than the old one.

Mr. Burgess, who for many years was closely connected with Fergusson, besides knowing India well, has edited the Indian portion (much the greater part) of the book, Mr. Spiers editing and partly rewriting the part dealing with Further India, Java, and China. A certain amount of new information has been available for settling dates and other points of fact, since the original publication; and it is a testimony to Fergusson's insight that although some of the actual dates as given by him have had to be altered, his relative dates, *i.e.*, the chronological order of buildings, have been found mostly correct. It is stated, however, that the Archæological Surveys have collected vast stores of draw-



PILLAR IN VIHÂRA AT AJANTÀ.

From Fergusson's "History of Indian and Eastern Architecture."

ings, only a fraction of which have yet been published. We observe that a bitterly satirical foot-note of Fergusson's (page 513 second edition) about the vandalism of government officials in respect of ancient monuments has been suppressed in the new edition—let us hope because it is thought to be no longer necessary.

The architecture of the topes and of the chaitya caves is no doubt interesting in a way; the chaitya caves partly because they are examples of rock-cut imitation of timber structure, and partly from the curious resemblance of their plans to those of the Latin basilica churches; a resemblance of course purely accidental. But the first things in the book that seem to be interesting from the point of view of architectural art are the columns with bracket capitals in the caves at Ajantâ. One of these, which was sketched by Fergusson himself, is quite an architectural design, and the hint which it gives might be worked out into a new form of column with little modification. The Jaina system of bracketing and roofing also has its points. The ruined temple or pagoda at Chidambaram (Fig. 223), which is a new illustration, has a curious resemblance to a Greek columnar temple, only with the columns covered with carved ornaments, reminding one that the difference between barbaric and educated architecture lies precisely in the fact that the former does not know where to stop in the application of the ornament; everything must be ornamented all over, whatever its architectural function. As to the monstrous and quasi-phallic erections of what is called "the Northern or Indo-Aryan style" (as if such stuff could be called a "style"), it has about as much relation to rational architecture as the Hindu mythology has to a rational religion, and so far is no doubt characteristic.

It is into another world that we come when we get to the Indo-Saracenic architecture, with its beautiful pointed arches and fine mosque plans. Most of this is really worth study and illustration; and its crowning glory, the Taj Mahal, shows how elaborate ornament can be grouped and arranged so as to have its greatest effect, without crowding the structure with a meaningless mass of decoration.

The new edition, as a whole, is a credit to the two editors, and has given fresh value to a remarkable and monumental publication.

Painters' Work.

Staining, Varnishing, and Enamelling. By J. H. Galloway, London: The Trade Papers Publishing Co., 1910. 3s.

This is a small book intended to explain the operations required to be gone through by the house decorator in order to obtain the best results in staining, varnishing, and enamelling. It is an entirely practical book on such matters as the making of stains, the preparation of wood previous to staining, the application of varnish, and enamelling, etc. It seems to be exceedingly complete, giving a great deal of information, in a small space, on the subjects of which it treats.

The Training of a Municipal Engineer.

How to become a Municipal Engineer. By the late J. Freebairn Stow. Second Edition. London: The St. Bride's Press; 1910. 1s.

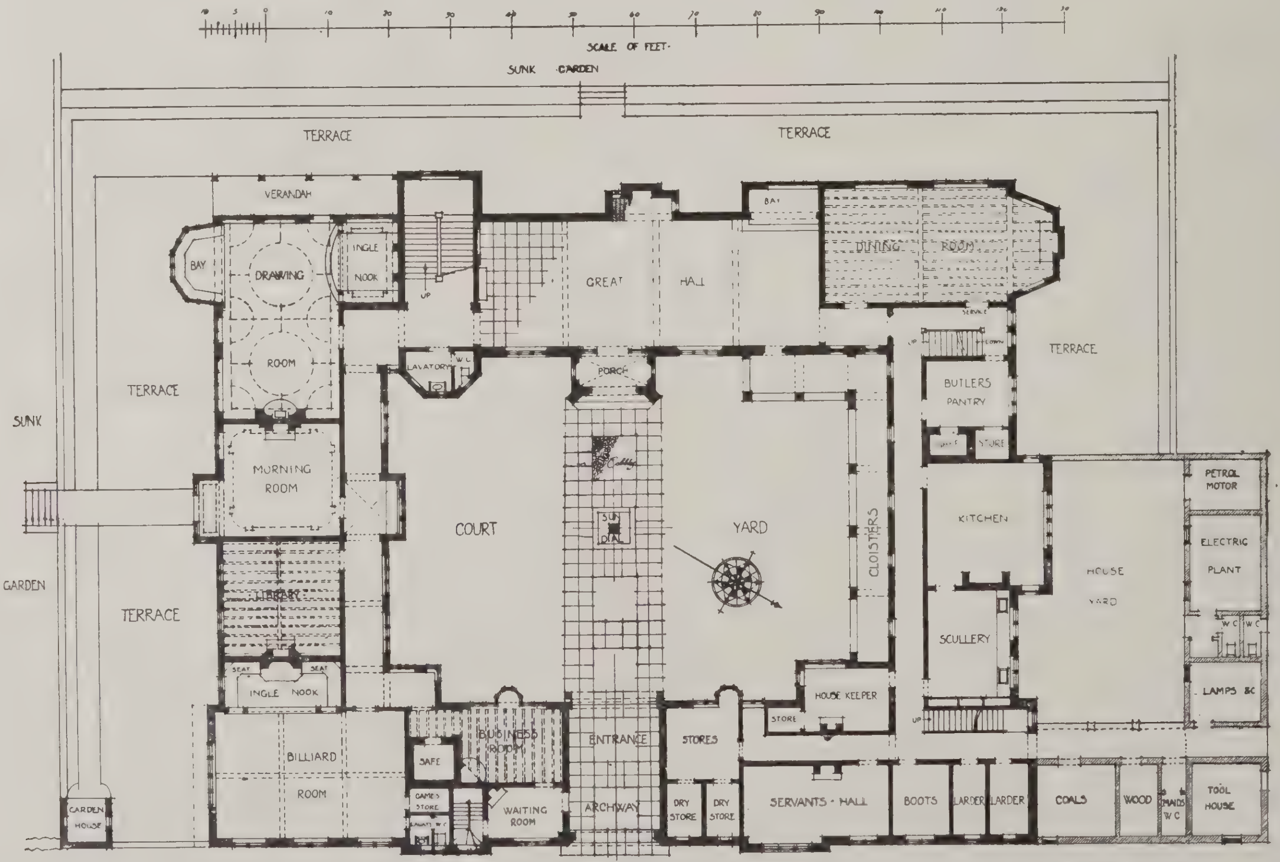
This is only a paper-covered pamphlet of 48 pages, but it is a most useful one for any young man who thinks of training himself, or getting trained, with a view of ultimately filling the position of a municipal engineer. It contains advice as to the preliminaries for entering into the position of a pupil, followed by a series of short sections giving a summary of the various branches of knowledge with which he will have to become acquainted, an account of the requirements for entering on one of the examinations of the Association of Municipal and County Engineers, and a series of short specimen examination papers in various branches of the subject, compiled from the contents of papers which have actually been set, so as to give the student an idea of what he has to work up to. The late author, in his preface to the first edition, said he believed the publication was the first of its kind, and that it was written "in as practical language as possible"; a claim fully justified by its contents.

Cement and its Uses.

The Atlas Portland Cement Company, of 30, Broad Street, New York, which appears to be the largest firm of cement manufacturers in the United States, is very enterprising, and realises that in popularising cement and assisting manufacturers generally this broad policy will lead to their own advantage as they secure their proper share of increased business. The Atlas Company go out of their way to provide useful information in a handy form that will appeal to each class of user of Portland cement, and we have recently received a set of their publications, namely:

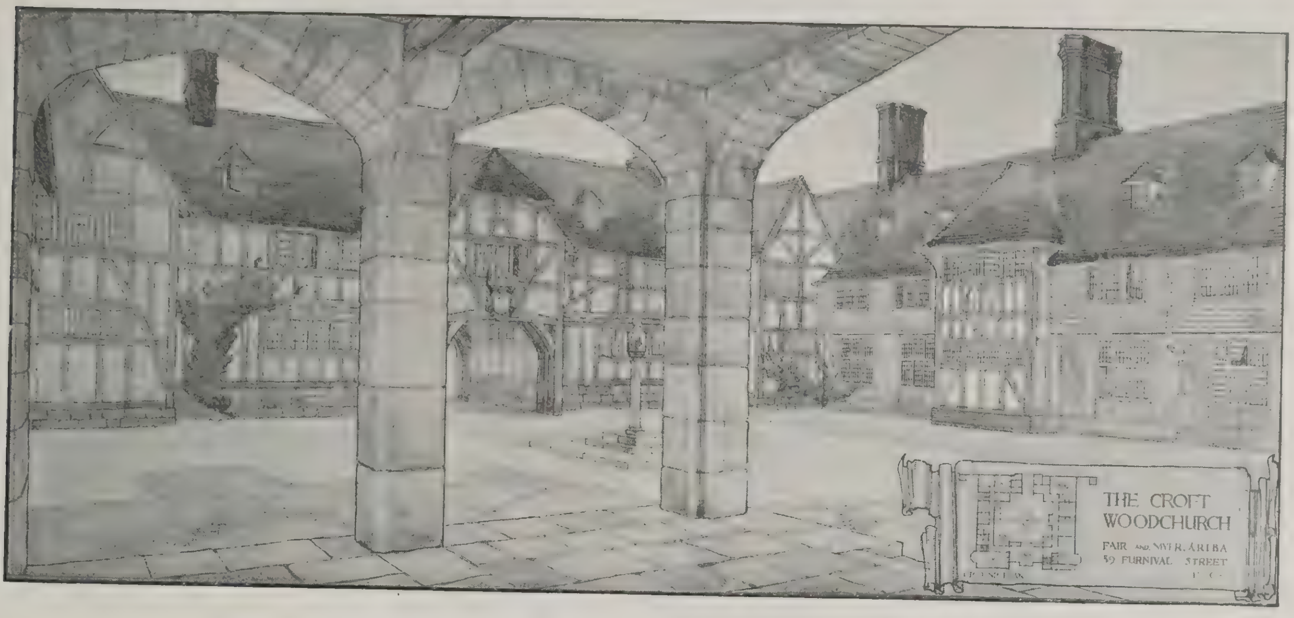
"Concrete Construction about the Home and on the Farm," 25 cents; "Concrete in Highway Construction," one dollar; "Concrete in Railroad Construction," one dollar; "Reinforced Concrete in Factory Construction," 50 cents; "Concrete Houses and Cottages," vols. i. and ii., one dollar each; "Concrete Cottages," free; "Concrete Garages," free.

All these books are most valuable. They contain numerous illustrations—photographs of completed works, sketches, and working drawings. They are proper treatises on their respective subjects, and provide information of great value to the concrete expert as well as the layman.



GROUND FLOOR PLAN

THE CROFT, WOODCHURCH.



THE CROFT, WOODCHURCH: THE COURTYARD FROM THE CLOISTERS.

THE "CROFT," WOODCHURCH.

The design of "The Croft" has been based so far as possible upon local tradition, the materials used being selected from those obtainable in the neighbourhood.

The main entrance to the property is through a half-timbered gate-house, partly weather boarded with rough elm boards, the garage and stabling being both grouped up with this building. A long curved drive leads up from this entrance to the house, where a Tudor archway with a timbered gable over it leads through into the central courtyard. The quadrangle is paved with cobble stones, and has intersecting paths of squared stone and a raised sundial in the centre. Along one side of this yard stone cloisters with oak beams across the ceiling, supported on carved corbels, make a cool and shady retreat in the hottest weather. The great hall is 55 feet long, with an open timber roof of great oak principals and beams. The lighting of the hall has been arranged to come entirely from one side, in order to show to the best advantage some fine old Norman tapestries which are to be hung on the opposite walls, the mullioned windows being filled with Heraldic stained glass. At the far end of the hall is the minstrels' gallery, leading out of the main staircase. The wide, open Gothic fireplace also makes an interesting feature; it has wrought-iron dogs and basket grate. A good view of the garden is obtained from the large bay window here, which overlooks the lily pond.

The archway at the Southern end of the hall leads to the main staircase. This has richly carved newels and balustrade, the lighting being from a mullioned window on the half-landing. Beyond the staircase hall, a wide panelled corridor leads through to the other reception-rooms. Upon the brackets supporting the beams of the ceiling of this corridor are carved various episodes from Chaucer's "Canterbury Tales," the lighting being through leaded lights to the mullioned windows. Half-way down the corridor is a recess or bay to hold a settee.

The drawing-room, 32 feet by 20 feet, has been kept much later in character than the rest of the building, and has white panelled doors and an enriched ceiling in "Adam" decoration. The room is warmed by two fireplaces, one of which is arranged with a deep recess raised up two steps. The door from this room leads out to a wide verandah on the south-west of the building. The morning-room has panelled walls and an enriched ceiling, the modelled frieze, showing various figure groups, being of special interest. From this room also, a door leads into the garden.

The library is surrounded with special book-cases designed in walnut wood, and has a fireplace built of small bricks and old Dutch tiles, the grate having an old Sussex cast-iron fire-back and wrought-iron dogs. The billiard-room is rather larger than usual, in order to leave plenty of space for onlookers without interfering with the players. The walls are finished with timber framing with plaster in between, and the ceiling intersected with stout cross beams. The ingle-nook, finished in old bricks and tiles, has been kept up two steps, so as to give a good view of the game, and a fine old pair of fire-dogs have been secured for this fireplace. The carvings on the timbers represent various sports and pastimes. The billiard table, etc., is specially designed to be in keeping with the rest of the room. The business-room is so placed as to allow the proprietor to consult with his steward and at the same time to be close to his library. By an underground passage from the servants' quarters, one of the footmen is able to attend to tenants and business visitors. The dining-room has been placed on the north-west corner of the building, to be on one side next to the great hall, and on the other adjoining the kitchen quarters for convenience of service. This room is panelled in oak, with a dark beamed ceiling and a large recessed fireplace.

The servants' and domestic portions of the house have been made complete and kept throughout in the most convenient positions possible, the housekeeper's room being so arranged as to have complete control over this department. On the first floor, there are 14 bed-rooms, sewing-room, three bath-rooms, housemaid's cupboard, etc., the principal bed-rooms having very simple enriched ceilings. On the top floor are aranged 14 more bed-rooms, six of which are intended for the use of the maid-servants.

The erection of the house will shortly be commenced.

BACK-TO-BACK HOUSES: L.G.B. REPORT.

A Local Government Board Report on Back-to-Back Houses, prepared by Dr. L. W. Darra Mair, with an introduction by Dr. Arthur Newsholme, Medical Officer of the Board, was issued last week (Cd. 5314, price 3d.). The problem has been studied, Dr. Newsholme states, as in previous enquiries on the same subject, by instituting comparisons between death-rates in back-to-back and in through houses of similar class. Dr. Mair's comparison, however, has not been limited to one town, but has extended to thirteen industrial towns in the West Riding of Yorkshire; and the comparison of the two types of houses has been limited to houses in good structural condition situated in healthy areas, in order that, so far as practicable, the issue might not be confused by influences other than that of through ventilation. In order to avoid accidental statistical error, the vital statistics have been taken for a period extending over ten years. Lastly, and most important of all, the death-rates were corrected for variations in the age and sex constitution of populations.

Dr. Darra Mair's summary and conclusion are as follows:—

1. The comparison which has been made between through houses and back-to-back houses has been carried out so as to bring under review good types only of back-to-back houses, situated in healthy areas.

2. The through houses and back-to-back houses thus compared were situated in 13 industrial towns in the West Riding of Yorkshire.

3. Every care was taken to select strictly comparable through and back-to-back houses, occupied by the same class of people, with similar occupations and wages. Nevertheless, the rent of the through houses was, on the average, appreciably higher than that of the back-to-back houses—the average rent of the former being 5s. 6d., and of the latter 4s. 6d. per week.

4. The vital statistics which have been obtained regarding these areas, cover a period of 10 years (1898-1907); and, on the basis of a special detailed census of each area, corrections have been made, through-

out, for difference in the age and sex constitutions of the populations concerned.

5. The corrected average annual death-rate from all causes was greater in the back-to-back houses than in the through houses, to the extent of 15 per cent.

6. The excess of mortality in back-to-back houses built in continuous rows was greater still, amounting on the average to a little more than 20 per cent.

7. The corrected average annual death-rates from all causes in through houses and in back-to-back houses possessed of means of side ventilation (blocks of four), were about equal.

8. The outstanding causes of death which produced the excess of mortality in back-to-back houses were:

- (*a*) pneumonia, bronchitis, and other pulmonary diseases (exclusive of phthisis), and
- (*b*) diseases of defective development and of malnutrition in young children.

The corrected excess of mortality from each of these two groups of diseases, in back-to-back houses, approached 40 per cent.

9. There was also some excess of mortality (10 per cent.) in back-to-back houses from infectious diseases, and a small excess (5 per cent.) from diarrhœa.

10. Mortality from phthisis showed an excess, amounting to 12 per cent., in back-to-back houses houses built in rows, but not in back-to-back houses built so as to admit of side ventilation (blocks of four).

11. Although the average rate of mortality from all causes was about the same in through houses and in back-to-back houses built in blocks of four, there was a large excess of mortality in the latter from pulmonary diseases (exclusive of phthisis), as was the case in back-to-back houses, in rows, and also a large excess of mortality from the diseases (except premature birth) of defective development and malnutrition in children.

12. Approximately, the ages at which the excess of mortality in back-to-back houses occurred were the early ages of life from infancy up to 15 years, and the late ages of life from 65 years and upwards. At both of these periods of life, the predominating cause of the excess was mortality from pulmonary diseases, and at the early ages, as well, from diseases of defective development and malnutrition.

13. At the age periods intervening between these two extremes, the relative excess of mortality in back-to-back houses was comparatively small.

On the whole, therefore, it is reasonable to infer from the data given in this report that, even in good types of back-to-back houses situated in healthy areas, the mortality from all causes is higher by 15 to 20 per cent. than in comparable through houses; but that this excess is not evident in back-to-back houses built with means of side ventilation.

Furthermore, it may likewise be inferred that the chief sufferers from residence in back-to-back houses are infants, young children, and old persons, in consequence, principally, of the greatly increased liability of both young and old to death from pulmonary diseases (other than phthisis), and, of the young, to death from diseases resulting from defective development and malnutrition.

[The thirteen towns in which Dr. Darra Mair's investigations were made were: Leeds, Morley, Batley, Bradford, Huddersfield, Halifax, Keighley, Cleckheaton, Brighouse, Dewsbury, Linthwaite, Heckmondwicke, and Pudsey. Dr. Mair counts it as among the indirect disadvantages of back-to-back houses that they are comparatively devoid of sunshine.]

OXFORD'S RECENT BUILDINGS.

No English city, not even London, has seen more rebuilding in proportion to its size than that which Oxford has experienced during the last fifty years. With the Commission of 1854 there began that reorganisation of studies and that increase in the number of undergraduates which has been proceeding ever since; and the improved values of some estates and the better management of all has made it possible to provide a large number of new and imposing buildings. Many old Oxford men (a writer in the "Times" remarks, in a long and interesting article from which these extracts are taken) remember the time when there was no University Museum, no Keble College, and no Examination Schools, when Christ Church, Balliol, Merton, and Magdalen had no new buildings, and when the growing University had not called into existence the vast residential suburb which now reaches from the Parks to Summertown. More recent buildings, some of them not yet completed, show that the transformation of the old University town is still proceeding. These are numerous, and some of them are important, both from the point of view of architecture and from that of study.

The Electrical Laboratory.

The Electrical Laboratory is the second important gift made to the Museum by the Drapers' Company. The first was the new building for the Museum Library, which liberated the room formerly occupied by the Radcliffe Librarian, and allowed it to be converted into an Electrical Laboratory. Within a few years the Drapers handed over a further £20,000 to the University, to build a new Laboratory. The work was placed in the hands of Mr. T. G. Jackson, R.A., who, since his first great success with the Examination Schools, more than thirty years ago, has been popularly regarded as the Oxford architect *par excellence*. The Electrical Laboratory, carried out by Mr. Jackson in close accord with Professor Townsend, is believed to be one of the most perfect of its kind existing. It will easily accommodate 150 students at a time. There are three floors, with large and small class rooms on each; a very large room at the top for elementary students; and a lecture theatre, with seats and desks most simply and ingeniously arranged, to hold about 120 persons. Professor Townsend has provided that spaces which are to support his tables for sensitive instruments such as galvanometers, etc., shall be concreted, and shall rest upon the piers of the building and not in any sense upon the walls. They are thus as firm as human skill can make them, and 100 students can move as they please over the wooden floors without shaking the concrete. The external appearance of the building has been much discussed in Oxford. It is close to the other buildings of the Museum—Ruskin's freakish Venetian front, the Clarendon Laboratory, and all the rest; and these are all of stone. But Mr. Jackson's building is only of stone on the ground floor, with charming stone decorations about and above the doorway. The remaining floors are built of hard and very bright red brick. There are, of course, plenty of precedents for this in English Renaissance architecture, and if it stood by itself we (says the writer in the "Times") should have no criticisms to make; but as the Laboratory is grouped with a number of stone buildings, it would surely have been better to build it entirely of stone.

St. Aldate's and the Front of Christ Church.

A part of Oxford that has been, or is being, very much altered is St. Aldate's. Here the Corporation some fifteen years ago pulled down their shabby and inconvenient town hall and replaced it with a new and excellent block of municipal buildings from the designs of Mr. H. T. Hare, more or less in Mr. Jackson's seventeenth-century style. Even more important work had to be done a little lower down. The noble front of Christ Church, faced apparently with that Headington stone which crumbles so badly in the Oxford climate, has for generations divided the palm of beauty, in the eyes of Oxford men, with Magdalen Tower. The colour of the decaying stone was especially lovely; but the time came when the claims of safety and permanence had of necessity

THE CROFT, WOODCHURCH: THE GREAT HALL. FAIR AND MYER, ARCHITECTS.

THE CROFT, WOODCHURCH: THE ENTRANCE GATEWAY. FAIR & MYER, ARCHITECTS.

to be preferred to those of beauty and old association. The front, and the famous gateway which Wren built in 1681, "to harmonise with Wolsey's Tudor Gothic," were found to be in a condition absolutely demanding a thorough restoration. The governing body voted £10,000, and entrusted Mr. Caröe with the task of refacing the front and the tower, which in the latter case, implied replacing the rich old carving with new. Everything seems to have been done with care and exactness; and doubtless fifty years hence people will take as much pleasure in the renewed building as our generation has taken in the old one.

Changes in "The High."

He who had not seen Oxford since 1870 and were to walk down "the High" to-day, would find the famous street changed almost beyond recognition. But the new schools, Mr. Bodley's new buildings at Magdalen, and the restored St. Mary's and All Saints, are an old story by this time. So is that part of Brasenose which Mr. Jackson built some years ago. This, however, was incomplete, and it was only last year that the foundation-stone of the remaining portion was laid—a worthy commemoration of the 400th birthday of Brasenose. The builders have worked quickly since that day, and now it is possible to see what the completed front will look like—very harmonious, very academical, and as perfectly in keeping with the place as with the needs of future undergraduates. Nearly opposite are rising the walls of the new buildings of Oriel, provided by Mr. Rhodes's will. These are the work of Mr. Basil Champneys, who is to be praised for the care with which he has preserved as much as possible of the old quadrangle of St. Mary Hall, incorporated several years ago with Oriel College. So far as can be judged at present, the buildings will be creditable to Mr. Champneys's scholarship and academical experience. He has built much at Cambridge; and, at Oxford, Mansfield College, the Indian Institute, the new small quadrangle at Merton, and, across Merton Street, the large new house for the Warden, are his.

The New Chapel of Hertford.

The new chapel of Hertford College was opened in 1908, in lieu of an older structure with no pretensions to beauty. Old Hertford College was demolished about 1770. Plain and dull Magdalen Hall was built on its site; and about 35 years ago the late T. C. Baring refounded the college, endowed it richly, and revived the name. The new chapel, in the south-east corner of the quadrangle, may fairly be called Mr. Jackson's masterpiece, with its perfect proportions, its well-designed windows (as yet waiting for their stained glass), and the admirable carving of the stalls. With respect to this chapel, Mr. T. G. Jackson writes to the "Times" correcting a slight misapprehension with respect to the executants of some of the work. "The joinery," he explains, "as well as the general fabric, was done, and done admirably, by Messrs. Long, of Bath, but the carving was done in the workshops of Messrs. Farmer and Brindley, in London, principally by Mr. Childs, their foreman, with whom I have worked for more than a quarter of a century, mutually learning from and, I trust, improving one another."

NEWS IN BRIEF.

The Society of Architects has now moved to its new premises at 28, Bedford Square, London, W.C. The members' rooms (reading rooms, etc.) will not be available for use until after the annual general meeting in October, notice of which will be given in the Society's journal.

* * *

The Lord Lieutenant, High Sheriff, Chairman of Quarter Sessions, and Chairman of County Council of Middlesex, announce officially, in a jointly signed letter, that the question of a Middlesex memorial to King Edward is receiving attention, and will be carefully gone into by an influential and representative committee as soon as the holiday season is over.

* * *

The alterations and improvements at Buckingham Palace have been started by overhauling the water mains in the forecourt, which have given a good deal of trouble at times. When this and the other outside work has been completed, a start will be made with the works inside.

* * *

A memorial to Signor Francisco Ferrer, in commemoration of his execution by the Spanish Government, was unveiled at Brussels on Monday week. The memorial, which was initiated by the International Freethought Congress, consists of a large marble slab, with suitable inscription, which has been let into the pavement at the foot of the steps of the historic Maison du Roi.

* * *

Mr. Albert C. Hill, managing director of Messrs. Pinchin, Johnson and Co., Ltd., Minerva House, Bevis Marks, E.C., was presented by the staff with a gift of silver, on Saturday week, to mark the occasion of his silver wedding.

* * *

Excavations have been begun at Ealing Station in connection with the construction of a Great Western Railway line from Ealing to Shepherd's Bush. A new section will be laid from Ealing to Park Royal, where trains will pass to the existing line and run to a point near North Acton. There the line will branch off beneath the present main line, skirt Wormwood Scrubs on a new section, and form a direct communication with the Central London Railway at Shepherd's Bush.

Mr. George Batty, a well-known Northumberland contractor, has died at Brighton at the age of 60 years. He was formerly a member of Berwick Town Council and Sheriff of Berwick. He was also a churchwarden and overseer of Berwick parish, and a prominent Unionist.

* * *

The manufacturing quarter of Jersey City was swept by fire on August 17, and the damage is estimated at from £200,000 to £400,000. One person has been killed, and one fatally injured. The fire broke out in the factory of Messrs. Truslow, Tulle, and Company, makers of cork products, and also destroyed the establishment of Messrs. Ames, Spike, and Company.

* * *

Mr. Campbell Douglas, F.R.I.B.A., of Edinburgh, a former Vice-President of the Royal Institute of British Architects, a member of the Glasgow Institute of Architects, and designer of several public buildings in Scotland, who died on April 14, at the age of eighty-one, left personal estate valued at £8,023.

* * *

A marble tablet, in memory of the late Mr. Godfrey Wedgwood, has been placed in the little church at Moddershall, built by him in 1903. It consists of a portrait shown nearly in profile, carved in low relief from a block of Serravezza marble, framed in alabaster; the whole mounted upon a slab of Trieste marble. The sculptor is Mr. Albert Toft.

* * *

Mr. W. T. Hampton, an architect, of Loughborough, has died as the result of a motor accident. He was found lying unconscious beside his car. It appears that he was driving to an appointment in the country, when his hat blew off. He lost control of the car, which ran up a bank and capsized.

* * *

The Epping Board of Guardians have adopted plans for the proposed extension of the workhouse buildings at a cost of £11,000. This decision has been arrived at after a prolonged controversy with the Local Government Board, who have for several years been urging the extension.

* * *

Chetwynde House, in Greengate Street, Stafford, built by a member of the Chetwynde family in the middle of the eighteenth century, has been chosen by the Government as the site of the new post office.

* * *

Having had plans prepared for the erection of new Municipal Buildings on the site of the old Corn Exchange and for new buildings on the site of the present Municipal Chambers, the Stirling Town Council has resolved to get an estimate of the respective costs, and then to have a plebiscite of the ratepayers as to which scheme they prefer.

* * *

Leeds, with an area of 21,572 acres, is contemplating the extension of its boundaries so as to include Roundhay and Shadwell. The points for and against the scheme are being keenly discussed. The rateable value of Leeds exceeds two millions sterling; that of Roundhay and Seacroft is over £40,000, and that of Shadwell is between £5,000 and £6,000.

* * *

The Coldingham Schools, N.B., are being supplied with Shorland's patent Manchester stoves by Messrs. E. H. Shorland and Brother, Limited, of Failsworth, Manchester.

In a communication which he has addressed to Mr. Ellis W. Davies, M.P., Mr. Masterman states that the question of the large number of accidents in Welsh slate quarries is engaging the attention of the Home Office.

* * *

It is understood that Messrs. W. Pattinson and Son, of Ruskington, have secured the Government contract to build the administrative block and the surrounding walls, eight feet high, of the new criminal lunatic asylum, at Rampton, near Retford. The work has to be completed in eighteen months, and the contract amounts to some £80,000. It is contemplated making a light railway from the Great Central line to the asylum works.

* * *

Mr. George Careless Trewby, M.I.C.E., of Fenton House, Hampstead Heath, N.W., formerly in charge of the Sultan of Turkey's gas works at Constantinople, and afterwards of the Brentford Gas Company's works, who died on July 19, aged 71, left estate of the gross value of £120,118 14s. 6d., of which the net personalty has been sworn at £110,253 13s. 6d.

* * *

The Local Government Board has decided to hold inquiries into proposed expenditure by public bodies as follows:—*Sewerage and Sewage Disposal Works and Plant.*—Horsham Rural District Council, £3,530 (August 30); New Sarum (Salisbury) City Council, £4,176 (September 1); Poole Borough Council, £1,927, for surface water drainage, and other amounts for sewerage (September 2). *Water Supply.*—Okehampton Rural District Council, £1,200, for North Tawton (August 30); Tiverton Borough Council, £2,800 (including construction of 236,250-gallon reservoir) (August 31). *Street Improvements, etc.*—Hastings Borough Council, £3,411 (August 30). *Various.*—Camberwell Borough Council, £1,195, for public baths (August 30); Tiverton Borough Council, £4,000, for gas undertaking (August 31); Stalybridge, Hyde, Mossley, and Dukinfield Tramway and Electricity Board, £22,268, for electric supply purposes (August 31).

* * *

Mr. W. Rees Jeffreys, secretary to the Road Board, has sent to county councils and other highway authorities of the United Kingdom a circular letter informing them that the Board will proceed to consider and deal with applications for grants in November, and intimating that any applications to be then considered should be sent in not later than October 31. The Road Board's circular has been considered by a large number of local authorities, and the course of action most generally adopted has been to nominate delegates, including the council's surveyor in almost every instance, to attend a conference convened by the county council. A conference of the surveyors of local authorities in the county of Buckingham has already been held, at which a resolution was adopted affirming that, "owing to the inadequate amount which it is estimated the county of Bucks will receive from the newly formed Road Board during the immediate future, grants applied for should be towards surfacing work by approved methods on roads which already have suitable foundations, and to improve dangerous corners, as suggested in clauses 3 and 4 of the Road Board's circular letter of July, 1910."

* * *

The public statues in Bradford are being freed from the accumulated grime of many years. "Now at last," says the "Bradford Daily Telegraph," "shall Peel be purified, our long Town Hall line of kings shall be cleansed, and Forster shall forswear his grimy coat. . . . the hands of Peel shall become clean literally as they were figuratively in life—and, indeed, cleanliness shall abound amongst the lot of them, to the very tip of Forster's argumentative finger." Our contemporary thinks it a debatable point whether, in such a town as Bradford, the erection of statues is a worthy method of doing honour to great men.

As regards the competition for laying out the site of the dismantled fortification of Antwerp, noted in our list of competitions open, the premiated plans will become the property of the Belgian Government, and the Commission will be at liberty to use the details of any scheme on payment of £40. The general conditions laid down include plans for a circular boulevard, a circular metropolitan railway, the widening of existing streets, open spaces with public buildings, educational establishments, such as an Academy of Fine Arts and "a Palace of Industry, Commerce, and Navigation," parks, lakes, squares, and playing fields, spaces for hospitals, and the indication of appropriate spots for statuary. Not more than 40 per cent. of the zone thrown open must be used for buildings and garden cities, and no level crossing on the railways will be permitted. Plans and details are provided on payment of £4. The competition will close on October 1. Finished schemes must be sent to the President of the Commission, Rue du Jardin des Arbalétriers, 57, Antwerp.

Messrs. Turner, builders, of Cardiff, who have for many years past owned extensive quarries in the Forest of Dean have now sold them to the Forest of Dean Quarries Company.

* * *

A deputation of some sixty delegates from the German Garden City Association are visiting various points of interest in the United Kingdom. Letchworth, Hampstead, Birmingham, and Bourneville are among the places already seen. Professor Martin Dulfer, President of the German Institute of Architects, is one of the members of the deputation.

* * *

The Commons and Footpaths Preservation Society, 25, Victoria Street, Westminster, is offering its services to landowners and local authorities in regard to difficulties in connection with footpaths, etc., in filling up the land taxation forms.

* * *

An appeal has been made on behalf of the funds for the erection of the Church of St. Jude-on-the-Hill, Hampstead Garden Suburb. The proposed cost of the church and vicarage, for which Mr. E. L. Lutyens, F.R.I.B.A., is the architect, is £13,000. It is desired to put up a really meritorious building, for as the Dean of Westminster has said. "It would in the garden suburb be a scandal to the Church of England if you put up a cheap building."

* * *

We understand that Messrs. William Moss and Sons, Ltd., of Queen Anne's Chambers, Westminster, who are the owners of the Pohlman system of concrete reinforcement in the United Kingdom, have, owing to the success of this system of reinforcement, found it necessary to establish a branch office in the Liverpool and Manchester districts, and have therefore appointed Messrs. Mould and Brown, of Devon House, 19, Whitechapel, Liverpool, as their local representatives.

A discovery of considerable interest has been made within the last few days on the estate of Mr. A. S. Boucher, Sharpcliffe Hall, Ipstones, Staffordshire. Some workmen, while cutting through a gravel pit, exposed the remains of buildings, which on examination by experts are pronounced to be prehistoric. They are of stone, and form two distinct chambers. Further investigations are being made, and discoveries of great interest are anticipated. The announcement of the find was made at a meeting of the North Staffordshire Field Club.

* * *

A statue to the Emperor Francis Joseph of Austria-Hungary has been erected at Ischl, to mark the occasion of His Majesty's 80th birthday. The monument has been subscribed for by the huntsmen of the Monarchy.

* * *

The work of widening Bishopsgate Street Without, which has been undertaken by the City Corporation, has already begun, and the housebreakers are now busy in several of the buildings on the west side. The improvement will involve the disappearance of some 30 houses, including four taverns, on this side of what is at present the narrowest portion of the thoroughfare, and will extend from No. 137, opposite the Bishopsgate Congregational Chapel, to the quaint old building on the face of which a sculptured tablet indicates the boundary between the City and Norton Folgate. Fortunately nothing of historical or architectural note is to be found in the doomed buildings, although some of them are wainscoted from top to bottom.

* * *

Professor Meister, of Leipzig, has delivered an opinion on the alleged discovery of the orginal shrine of Aphrodite Astarte in Cyprus by Dr. Ohnefalsch Richter as follows:—"I should be prepared to confirm his hypothesis to this extent, that all syllabaric inscriptions found at Rantidi are in very ancient Paphian characters, while alphabetic inscriptions, so far as I am aware, have not been found there at all; the few inscriptions which have so far been deciphered go to show that Aphrodite under many names, Apollo, and a deity designated as *φίλος θεός*, were worshipped there, that a very ancient Altar of Incense stood there, and that there were also tombs near the places of worship. It follows that what has been discovered at Rantidi is not in the nature of a single *τέμενος*, but a great place of worship, which will perhaps prove to be the ancient Paphos."

* * *

Work is being actively pushed forward night and day in connection with the new additions to the Savoy Hotel. In the evening a number of huge flare lights are to be seen on the scaffolding lighting up the Embankment and the river, and a small army is busily engaged. Inside, however, everything proceeds as usual. It is a triumph of the modern system of construction. As originally designed, the building had seven floors, but the seventh consisted merely of attics for the sleeping accommodation of the servants. This is now being reconstructed so as to convert it into suites of rooms for visitors, with windows and balconies commanding magnificent views of the river, and in fine weather of the far-off hills of Surrey and Kent. Above this will be an entirely new, or eighth, floor, which will also consist of suites of apartments. Among other important new features will be a banqueting hall of large proportions. It is expected that the work will be finished by the beginning of November.

SURVEYING : THEORY AND PRACTICE.*

By ARTHUR BOWES, Assoc.M.Inst.C.E.

(Concluded from page 197, *No.* 812.)

Pile-driving, on its theoretical side, affords some good examples of the highly useless formula. A writer took the trouble to compare eight different formulæ, and found that they gave results varying from 20,000lb. to 399,840lb. The old-fashioned rule of guessing at the quarter and multiplying by four would seem to be about as practical a way of arriving at the truth. It is the function of practical common sense to guard us against placing too much trust in a formula without making sure that all the elements of the formula are reliable. You are aware that the Board of Trade prescribes a limit of stress of five tons per square inch on any part of the iron of a railway bridge, and all the stress calculations are made with this limit in view, yet Sir Benjamn Baker—who was, perhaps, the happiest combination of practical and theoretical knowledge since the younger Brunel—proved by experiment that in a well-riveted joint the rivets were subjected by their own contraction to a stress of twelve tons per square inch.

Theory versus Practice.

It is no wonder, then, that actual facts in the engineering world do not always square with a theoretical expectation. Sometimes a structure fails when by all the rules of arithmetic it ought to stand safe and sound; sometimes it refuses to fail when mathematically it has no right to exist ten minutes. When the Bouzey dam collapsed, a few years back, there were at once dozens of experts who proved satisfactorily why it failed, but no one could account for its having stood so long. And again, in designing arches of brick or stone, the law of the "middle third" is an institution of which we would no more speak slightingly than a nautical man would speak disrespectfully of the equator, yet Sir Benjamin Baker has ventured to say that "the middle third is merely an assumption made to facilitate calculations, and has led to a great deal of waste" in the design of arches. In another place he has said that 90 per cent. of the arches now standing in the kingdom do not fulfil the theoretical requirements.

Another example of the non-accordance of theory with practice is to be found in the strength of egg-ended boilers. In such boilers the ring seams are theoretically twice as strong as the longitudinal seams, and yet in cases of explosion the former are often the first to yield. It is the consideration of such anomalies as the above that lead one to agree with Sir Benjamin Baker in declaring that "writers of textbooks may properly suggest formulæ, but it is for practical men to decide whether they can or cannot be accepted as reliable."

General Conclusion.

The general conclusion to which the above remarks tend has been pretty clearly anticipated. It is the old conclusion of the Greek philosophers, that the truest wisdom lies in the happy medium. Practice and theory are both good in their way, and the wisest and cleverest engineer is he who combines as far as possible both in his mental equipment. A modicum of theory will save him from some disastrous and wasteful blunders, but his theory must be controlled by what Locke calls "a large, sound, round-about sense," or he may be led into equally foolish and extravagant blunders by his over devotion to the rule of figures and formulæ. Practical knowledge without theory is only half an equipment for an engineer, as George Stephenson recognised when he decided that his son Robert should be well educated in theory; while theory without practice leads to a rigid conception of things, bounded by red-tape rules, which is very far from a true reflex of the reality. All knowledge is useful, but the attainment of all knowledge is impossible for us, and the limitations of our little lives make it imperative that we should concentrate our efforts on those particular departments which will be of most use to us in our individual work. We cannot expect to attain proficiency in many branches of practical handicraft—no man can be at once a skilled carpenter, stonemason, bricklayer, slater, mechanic, and plumber. All that he can do is by constant observation to make himself as familiar as possible with the methods and details of such handicrafts and with the properties of the materials used in them, and at the same time furnish himself with a large and comprehensive view of engineering principles by studying the written records of works already executed and the results of experiments carried out by others.

---

* A paper read at Manchester on August 10, before the Institution of Municipal Engineers.

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to architects practising in Coventry. Particulars given in our issue of March 16th.

AUG. 31. GORLESTON-ON-SEA. The Governors of the East Anglian Institution for Blind and Deaf Children invite plans and designs for a new building to be erected at Gorleston-on-Sea. D. O. Holme, Clerk of the Governors, Castle Chambers, Norwich.

SEPT. 1. CARNEGIE LIBRARY, KINGSTOWN, CO. DUBLIN.—Particulars from J. Sherlock Vaughan, Town Clerk, Town Hall, Kingstown. Deposit one guinea.

SEPT. 5. SHERINGHAM COUNCIL OFFICES.—Particulars on written application, accompanied by a stamped addressed envelope, to Edgar C. Rolfe, Clerk of the Council, Church Street Chambers, Sheringham.

SEPT. 10. SECONDARY SCHOOL, FOLKESTONE.—Competitive designs are invited from architects (being Fellows, Associates, or Licentiates of the Royal Institution of British Architects or members of the Society of Architects). Particulars, together with site plan can be obtained from A. F. Kidson, Town Clerk, Folkestone.

SEPT. 15. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, etc., from the engineer, Samuel J. Harpur, Town Hall, Maesteg.

Oct. 1. ANTWERP. SCHEME FOR LAY-OUT OF SITE OF FORTIFICATIONS, ETC.—Premiums £1,000, £400, and £200. Conditions may be seen at Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C., or obtained from the "Commission d'études de l'aménagement de l'agglomération anversoise," Due du Jardin des Arbalétriers 57, Antwerp. Deposit 100 francs.

Oct. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., at a cost not to exceed £10,000. Particulars (deposit £1 1s.) of J. Parry Jones, Town Clerk, Denbigh.

OCTOBER 31, ETC. ROMFORD GARDEN SUBURB. Competitions in six classes for architects and in one class for builders for the best cottages, etc., erected in the Town Planning and Modern House and Cottage Exhibition, Gidea Park, to be held in June and July, 1911. Entries to be made by the date given. Prizes amounting to £1,050. Particulars of the Secretary of the Exhibition, 33, Henrietta Street, London, W.C.

Nov. 29. BANGOR (COUNTY DOWN). SEA-WATER BATHS.—The U.D. Council invite experienced architects to submit plans, specifications, and estimates for the erection of hot sea-water baths, at Pickie. Further particulars can be had on application to J. Milliken, Clerk to the Council, Town Hall, Bangor, Co. Down.

NO DATE.—MANCHESTER. LAYING OUT OF THE BLACKLEY ESTATE. The Manchester Corporation invite architects and others to submit competitive plans, specifications, and estimates for the laying-out of their Blackley Estate. Plans of the estate, etc., from the City Surveyor's office, Town Hall, Manchester. Deposit three guineas.

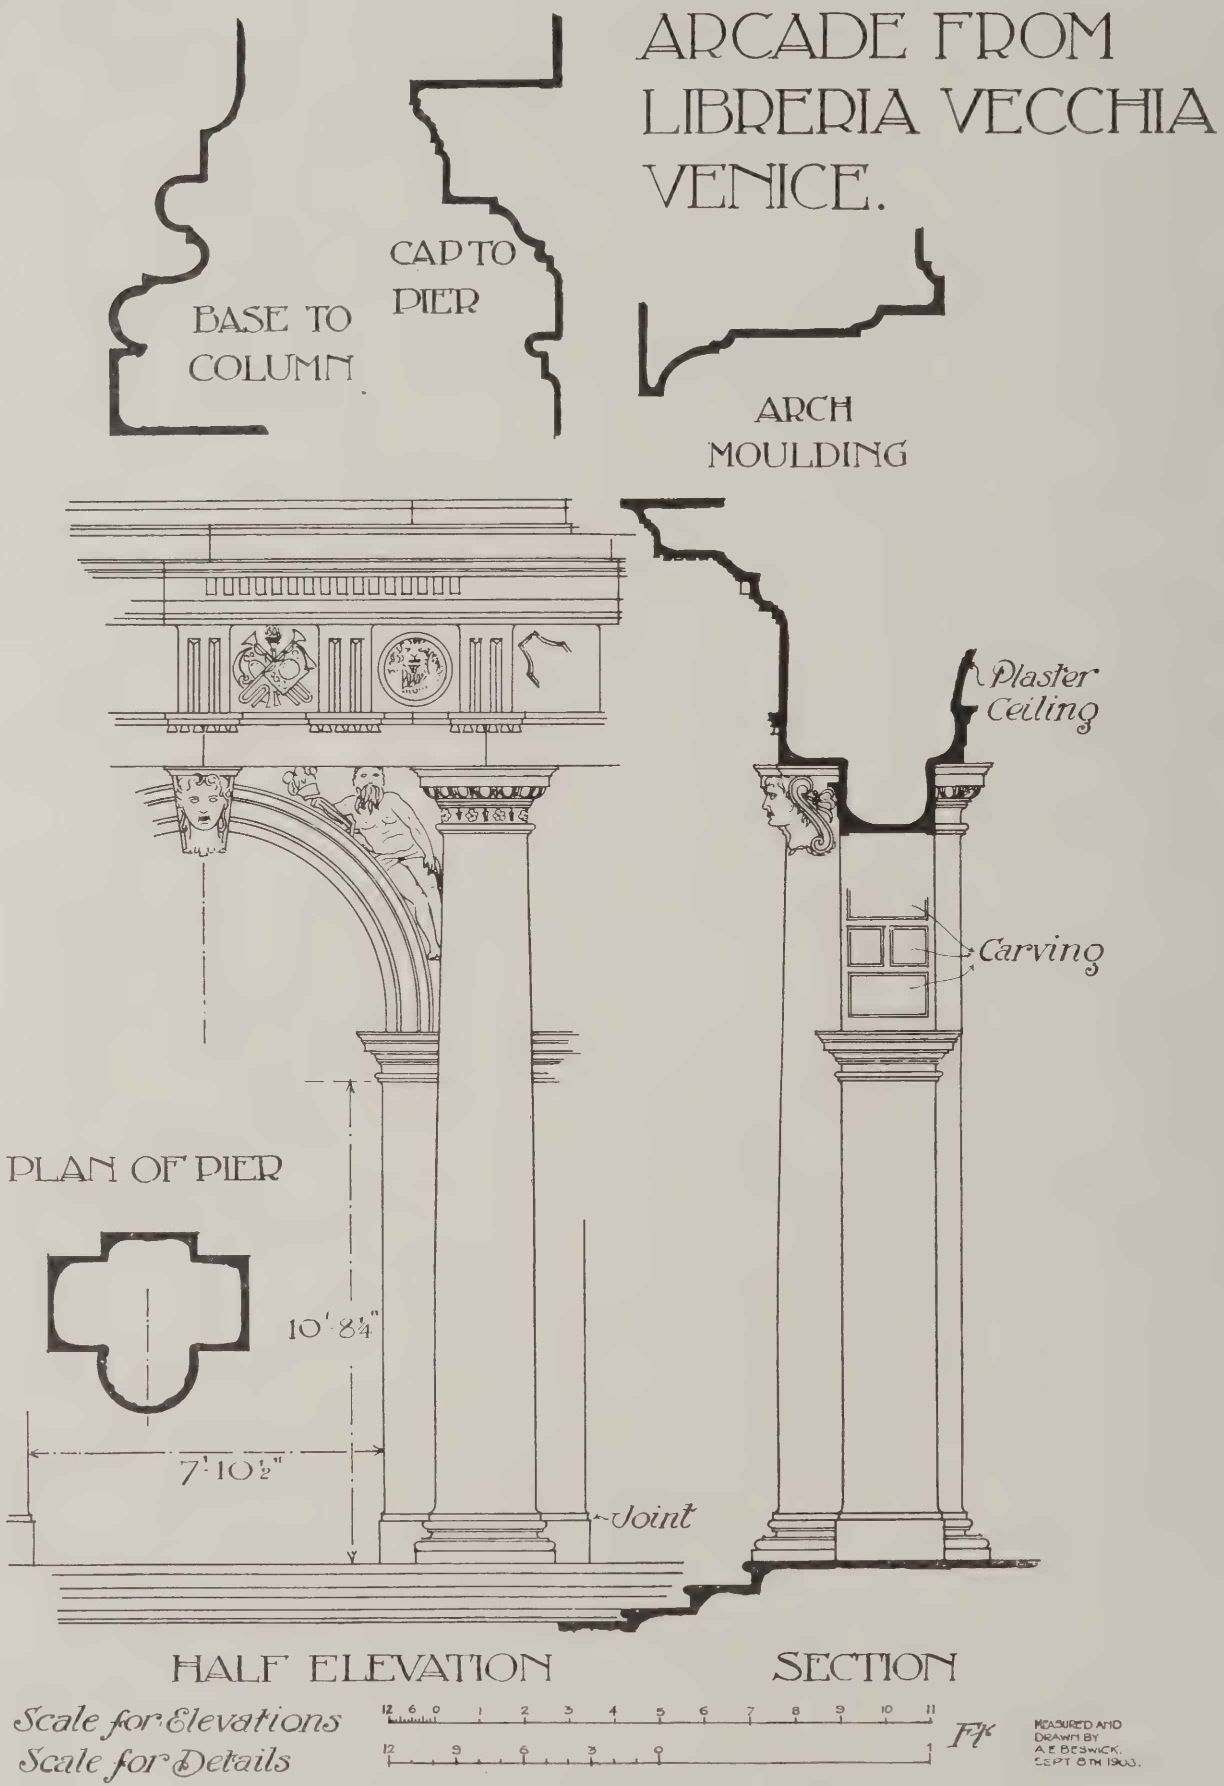
NO DATE.—TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan in the parishes named. Assessors: Sir Aston Webb, R.A., and Mr. Raymond Unwin. Premiums of £150, £100, and £50. Terms and conditions of the Company on and after September 1st. Deposit, one guinea.

OBITER DICTA.

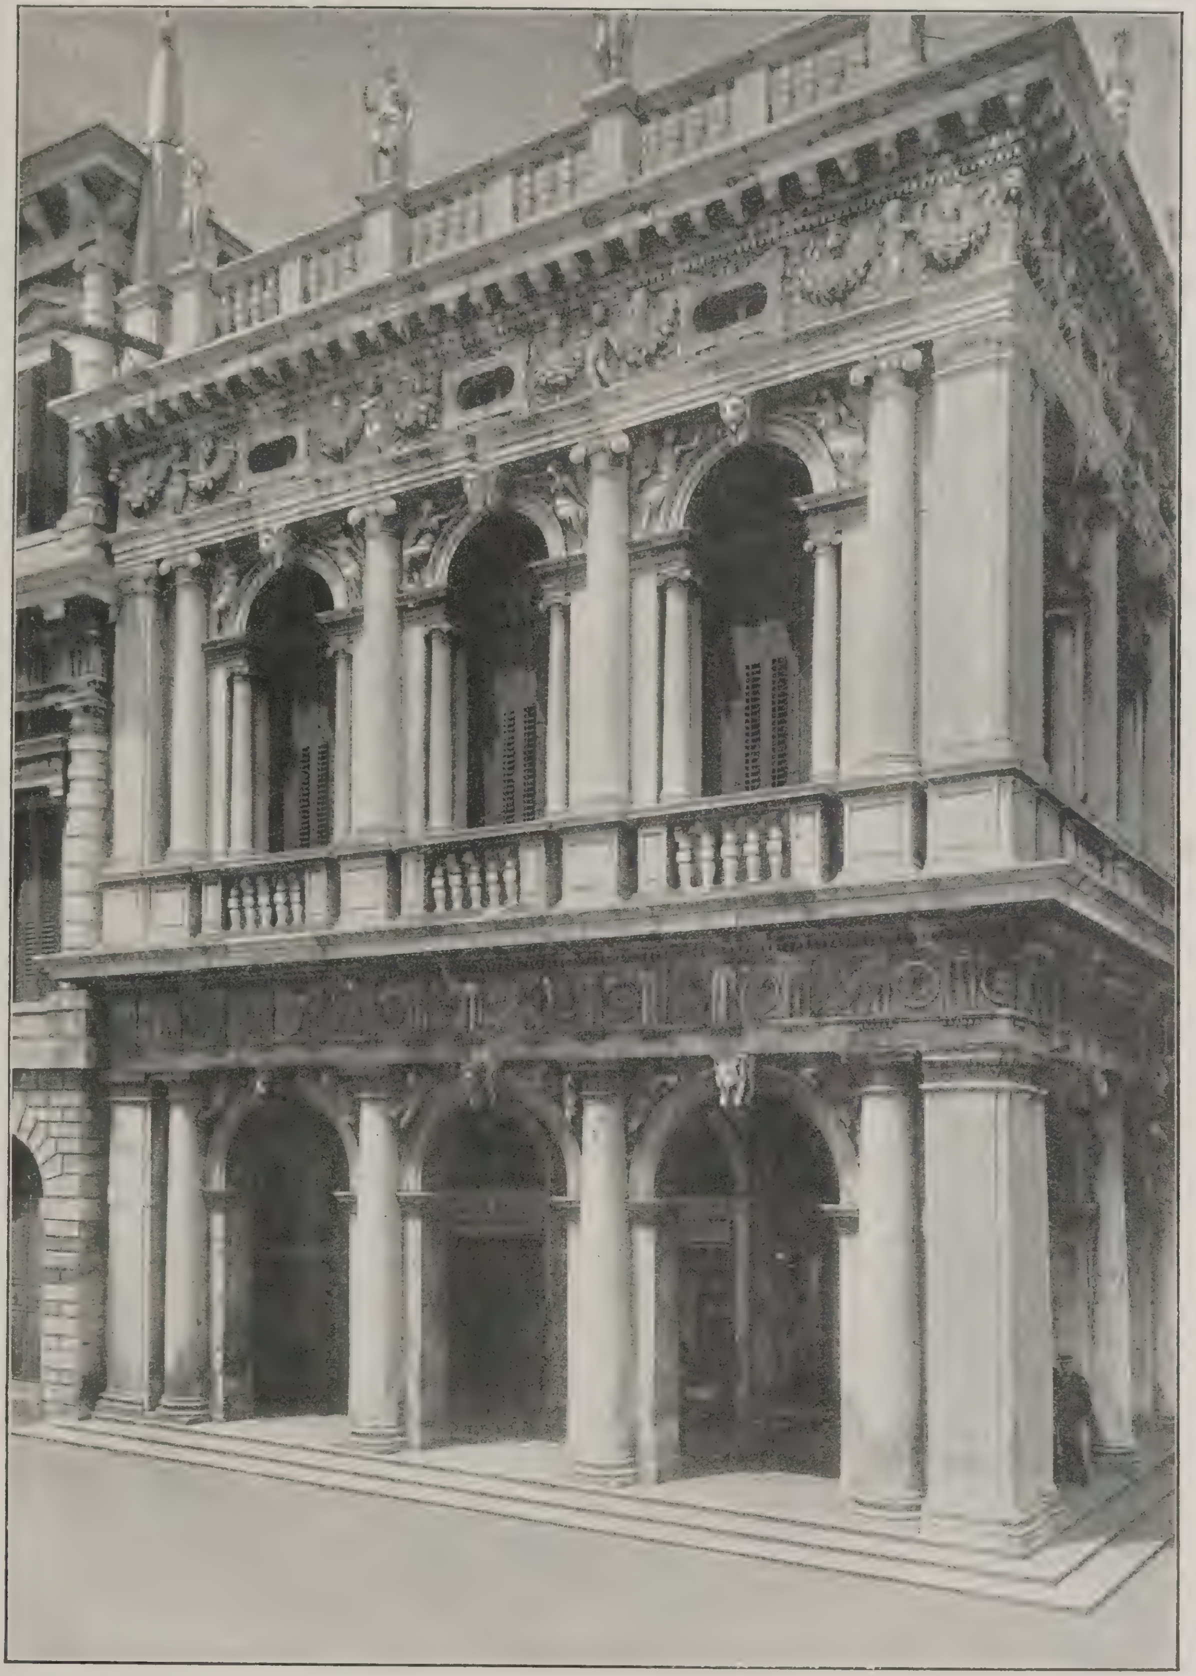
The Bane of Abounding Art. Art among the Romans, and with it architecture, was almost killed by overproduction; and it revived in Rome only when Rome was impoverished by barbarian invaders and the demand for art no longer exceeded the supply. But our demand for art seems to be more inordinate even than that of the wealthy Romans. We want it everywhere, all over our houses. We want it cheap and abundant, and we have got it. But the abundance of our spurious art has blunted our understanding of the significance of art. We no longer see that art is nothing unless it is excessive. Indeed, we have lost the power of distinguishing art that is expressive from art that is not.—"*Times.*"

Engineers and Town Planning. In some respects it is to be regretted that the list of vice-presidents and contributors of papers, as it stands at present, is so singularly unrepresentative of engineering, since the real spadework in the improvement of cities is essentially a task for engineers. Nevertheless, so long as the architects keep the conference under control, with a determined check upon irrelevant contributions, engineers will not be disposed to grumble. Very short papers by acknowledged specialists, followed by open discussion under rigorous restraint, is now becoming the rule, and it should work well in this instance. Briefly, the town-planning problem, apart from technical detail, must follow two lines of advance towards that great object—the betterment of the citizen. The first is the improvement of the relationship between municipal bodies and public and private owners and enterprises, whereby reforms may be carried out at reasonable cost and within reasonable time. The second depends upon closer accord between engineers and architects, so that strength and art may go together.—*The "Times" (Engineering Supplement) on the R.I.B.A. Town Planning Conference.*

ARCADE FROM LIBRERIA VECCHIA VENICE.



MEASURED AND DRAWN BY A. E. BESWICK.



The finest portion of this building (built 1536) is the open arcade at the ground level of which a detail is shown on the opposite page. The proportions are extremely fine. Above this the building falls somewhat under the criticism of being "Sculptors' Architecture." Nevertheless, it has been universally admired and frequently copied, notably in the Carlton Club, London.

UNIVERSITY OF ILLINOIS

THE NEW GERMAN STANDARD SPECIFICATIONS FOR CEMENT

As is well known, sevral commissions nominated by the Association of German Portland Cement Manufacturers have been co-operating for a number of years with the Royal Testing Laboratory at Gross Lichterfelde in investigations regarding changes in the old standard specifications for Portland cement, because some of the clauses were obsolete, others no longer in accordance with the spirit of the age or not sufficiently accurate.

The work of this commission had proceeded so far that in 1909 a draft of the new standard specifications could be presented to the Prussian Minister of Public Affairs by the above-named association. The minister has by a decree of March 16, 1910, agreed to these specifications and at the same time to the new standard specifications for iron-Portland (Eisen-Portland) cement, presented by the Association of German Iron-Portland Cement Works.

The two specifications are similar except the paragraphs on "Definition" and "Packing and Weight." The requirements of the specifications are given below.

Portland Cement Specifications.—Definition.—Portland cement is a hydraulic cementing material with not less than 1.7 parts by weight of lime to 1 part by weight of soluble silica (SiO_2)+alumina (Al_2O_3)+oxide of iron (Fe_2O_3), prepared by fine grinding and intimate mixing of the raw materials, then burning at least to sintering, and another fine grinding. To the Portland cement shall not be added more than 3 per cent. of other materials for special purposes.

The maximum content of magnesia shall not exceed 5 per cent. and that of sulphuric anhydride shall not exceed 2½ per cent.

Essential Principles and Explanations.—Portland cement differs from all other hydraulic compounds by its high content of lime, which requires an intimate mixing of the raw materials in quite distinct proportions, such as can be obtained (very few natural products excepted) with safety only in an artificial way, by the finest grinding or dredging and most intimate mixing under chemical control. In the interest of the users it must be demanded that similar products, made of natural rock by simple burning, are marked "Natural Cement."

By burning to sintering (incipient fusion), the product acquires great density, which is an essential property of Portland cement. The content of 5 per cent. magnesia, which it can have when dolomitic limestone is used, has proved harmless, if the content of magnesia is taken into consideration when adding the lime. In order to make Portland cement slow setting, it is customary to add raw gypsum when being ground; in addition nearly all Portland cements contain sulphurous combinations from the raw materials and the fuel.

Additions for special purposes, particularly for regulating the time of setting, which cannot be avoided, are, however, to be limited to 3 per cent., in order to exclude the possibility of additions solely for increasing the weight. A sulphuric acid content up to 2½ per cent. has proved harmless.

Packing and Weight.—Portland cement is generally packed in bags or barrels. The package should show, besides the gross weight and the term "Portland Cement," the name of the firm or the mark of the factory distinctly printed thereon. Loss by sifting out as well as variations from the standard weight are admissible to the extent of 2 per cent.

Explanation.—As various weights are in use with bags as well as with barrels, it is absolutely necessary to give the gross weight on the bags or barrels. By the term "Portland Cement" the purchaser shall be assured that the product is in accordance with the definition given below.

Agreement.—The Association of German Portland Cement Manufacturers binds and controls the members to maintain the standard specifications given above and the therein specified properties for Portland cement. This obligation reads: "The members of the association are permitted to bring into the market under the name 'Portland Cement' only such a product as is obtained by burning an intimate mixture of finely powdered calcareous and clayey materials or lime-alumina-silicates to sintering, and subsequently grinding to the fineness of flour. They bind themselves not to recognise as Portland cement any material which is manufactured otherwise than above stated or which during or after the burning has been mixed with foreign substances, and to look upon the sale of other material under the name of Portland cement as deceiving the purchaser. These requirements do not forbid the addition of not more than 3 per cent. of other material to the Portland cement for the purpose of regulating the time of setting. The members of the association further bind themselves to furnish Portland cement which will in all respects meet the requirements of these specifications. If a consumer requires cement for a particular purpose, ground coarser than required or coloured, the delivery of such cement is permissible. If a member of the association violates the above given obligations, he shall be excluded from the association. His exclusion is made known publicly." The products of the members of the association are tested yearly in the laboratory of the association at Karlshorst, near Berlin, and the results are presented at the general meeting of the association.

Setting.—The initial set of normal Portland cement shall not take place in less than one hour after gauging. For special purposes a quicker setting Portland cement can be prepared; such cement is to be marked on the package accordingly.

Explanations.—The initial set of normal Portland cement should require at least one hour, because the beginning of the setting is important; on the contrary, if a definite interval of time is required for the hard set, it is of less value in the use of Portland cement if the process of hardening is completed in a shorter or longer time. If possible specifications concerning the setting time should therefore not be limited too closely. The initial set and the time of setting are determined by use of the Vicat needle.

As the setting is influenced by the temperature of the air and water used for gauging, high temperature accelerating, and low temperature delaying the setting, it is necessary, in order to obtain comparable results, to make the tests with the same temperatures of cement, water and air, and also to bring the apparatus and sand to this temperature. The opinion that Portland cement decreases in quality during storage is erroneous, assuming that the Portland cement is stored dry and free from draft. Specifications prescribing fresh material only should be abandoned.

Constancy of Volume.—Portland cement must be volume constant. It shall be recognised as decisive proof of this when a pat of neat cement, prepared on a glass plate, protected from drying out, and placed under water after 24 hours, shows no sign of curvature or cracking on the edge, even after a long time.

Explanations.—For this test the pat made for judging the setting process is, with slow setting cement, put under water after 24 hours, but in any case only after being hard set. With quick setting cement this can be done after a shorter time. The pats, especially those of slow setting cements, should be protected from drying out by storing in a covered box until the setting is finished. If the pats, while under water, curve or show cracks on the edge, this indicates undoubted expansion of the cement, i.e., in consequence of the increase of volume disintegration of the cement occurs by gradual loss of coherence, leading to complete crumbling.

The signs of change in volume are generally shown after three days; in any case an observation of 28 days is sufficient.

Fineness of Grinding.—Portland cement shall be ground so fine that it leaves a residue of not more than 5 per cent. on a sieve of 900 meshes per square centimetre, the width of the mesh being 0.222 mm (corresponding approximately to a sieve having 76 meshes per linear inch, width of the mesh being 0.0087 in.).

Explanation.—For the test 100 g. of cement are to be used. Correct sieves are not to be had on the market, and therefore differences in the width of the meshes between 0.215 and 0.240 mm shall be admissible.

Strength Tests.—Portland cement shall be tested for compressive strength with a mixture of Portland cement and sand, according to uniform methods, in cubes having a 50 sq. cm. (7.75 sq. in.) surface.

Explanations.—As experience shows that the results of strength tests of Portland cement without the addition of sand do not allow of uniform conclusions on the binding property with sand, especially if Portland cements from various factories are to be compared, it seems wise to make tests of Portland cement by the addition of sand.

As mortars in practice are first subjected to pressure and the compressive strength can be determined in the most reliable manner, the test of compressive strength only is decisive.

In order to secure uniformity in tests it is recommended that such apparatus and tools be used as are used by the Royal Testing Laboratory at Gross-Lichterfelde. [The Royal Laboratory, on request, tests and compares tools and apparatus for testing materials.]

Strength.—Slow setting Portland cement shall show a compressive strength of at least 120 kg. per square centimetre (1710lb. per square inch) when tested with 3 parts by weight of standard sand, after 7 days' hardening, 1 day in moist air and 6 days under water; after further hardening of 21 days in the air at room temperature (15 degrees to 20 degrees Cent.), the compressive strength shall be at least 250 kg. per square centimetre (3,570lb. per square inch). In cases of controversies, only the test after 28 days is decisive.

Portland cement which is intended for use under water shall show a compressive strength of at least 200 kg per square centimetre (2,850lb. per square inch) after 28 days hardening, 1 day in moist air and 27 days in water.

For controlling the cement at the place of construction a test on tensile strength can be made. The cement shall show a tensile strength of at least 12 kg per square centimetre (171lb. per square inch) when tested in a mixture of 1 part by weight of cement, and 3 parts by weight of standard sand, after 7 days' hardening, 1 day in moist air and 6 days in water.

The strength of quick setting Portland cements after 28 days is generally less than that given above. On this account, besides the strengths, the time of setting should also be noted.

Explanations. — As different Portland cements behave very differently with regard to their binding capacity to sand, which point is of most importance for judging their availability for practical use, the test with the addition of a high proportion of sand, principally in comparing several Portland cements, is absolutely necessary. The normal proportion accepted is 3 parts of sand to 1 part of Portland cement, because with 3 parts of sand the degree of the binding capacity of the various Portland cements is sufficiently indicated.

If, however, the binding capacity of Portland cement is to be fully learned, it is recommended that more tests be made with larger additions of sand.

Portland cement showing a greater strength in many cases admits of a higher addition of sand and has, viewing it from this point, and in consideration of its greater strength with an equal addition of sand, a right to a comparatively higher price.

NEW PUBLIC LIBRARY, DUDLEY: GENERAL VIEW. GEORGE H. WENYON, ARCHITECT.

As by far the largest quantity of Portland cement is used out of water, and the hardening capacity cannot be sufficiently determined within a short time, the deciding test adopted as to the compressive strength after 28 days' hardening is the placing of the specimens for 1 day in damp air, 6 days under water and then 21 days in the air of room temperature (15 degrees to 20 degrees Cent.). This is adapted to practical conditions.

The test of Portland cement to be used under water is made on cubes stored to resemble practical use, after hardening under water for 27 days.

As from the tensile strength of the cement conclusions cannot be drawn in all cases as to the relative compressive strength, it is recommended with very high tensile strength figures, to especially determine the compressive strength of the cement after 7 days' hardening.

In order to obtain corresponding results, sand of equal size of grain and equal quality (standard sand) must always be used.

The German standard sand is taken from the tertiary quartz layer of the brown coal formation in the neighbourhood of Freienwalde a. Oder. The nearly white raw sand is washed in a machine and dried artificially. The sifting of the sand is done on swing sieves suspended like a pendulum. One sieve is used for sifting off the coarse part, while the other is destined for the finer sand. From every day's output a sample is examined as to size of grain and purity by the Royal Testing Laboratory at Gross-Lichterfelde.

For controlling the size of grain sieves, made of yellow metal sheets, 0.25 mm thick, with circular holes of 1.350 and 0.775 mm are used. [The sieves are made by the Royal Testing Laboratory.]

The standard sand found good after repeated tests is put in bags and sealed with a lead seal of the Royal Testing Laboratory. [The sale of this seal has been taken over by the laboratory of the Association of German Portland Cement Manufacturers at Karlshorst.]

Test Specimens.—As it is important to obtain corresponding results when testing the same Portland cement in various places the rules given hereafter must be carefully adhered to. In order to get correct average figures, at least five specimens must be made for each test.

The mixing of the mortar of one part by weight of Portland cement and three parts by weight of standard sand should be done in the mortar mixing machine designed by Steinbrück-Schmelzer, in the following manner: 400 g. of Portland cement and 1,200 g. of standard sand are first mixed dry, with a light spoon in a dish, for one minute. To the dry mixture is added the quantity of water determined beforehand. The moist mass is then mixed another minute and then distributed equally in the mortar-mixer and worked by 20 revolutions of the dish.

The roller of the mixing machine is 3,15in. thick, 7.90 to 7.94in. in diameter weighs 42.42 to 42.68lb. without the axle, and 47.30 to 48.46lb. with the axle in place. The distance of the roller from the mixing dish is 0.20 to 0.23in.

The addition of water for the standard mortar is determined by using square moulds in the following manner: Dry mortar mixtures of the quantities given above are gauged with 128 g. (8 per cent.) and then if necessary with 160 g. (10 per cent.) of water, and mixed in the mortar-mixer as indicated; 850 to 860 g. of the mixed mortar are placed in the mould, the upper part of which is provided with two notches, as illustrated.

and rammed in the Boehme hammer-apparatus with 150 blows. The behaviour of the mortar when rammed indicates about the right quantity of water to be added; accordingly the tests with different quantities of water may be continued. The percentage of water is correct if between the 90th and 110th blow water or mud-water begins to flow out of one of the two notches. The average of three specimens with the same addition of water is to be taken as the standard.

The water flows from a new upper box slower than from one already used once, and therefore the first test with a new upper box is unsafe.

Specimens of standard mortar shall be made as follows: 850 to 860 g. of mortar mixed as prescribed are put into the standard moulds and into the Boehme hammer apparatus and rammed with 150 blows. [The moulds should be well cleaned before using, and be slightly oiled. A mixture of two-thirds linseed oil and one-third petroleum gives the best results.]

The specimens so made are struck off with a knife, polished and marked.

The quantity of mortar made with 400 g. Portland cement and 1,200 g. standard sand suffices for two compressive test specimens.

The hammer head of the apparatus is 4.37in. long, 2in. wide, and 2in. thick, and has a fall, a, of 6.55in. The length of the tailpiece, f, is 3.32in., its height, g, 2.76; the distance h, is 2.38in. and i, 6.63in. Distance b is 9.75in.

The specimens are placed with the mould on a non-porous bed in boxes kept moist and covered, and are taken out of the moulds after about 20 hours; 24 hours after the manufacture the specimens are taken from the boxes and placed under water at a temperature of 15 degrees to 18 degrees Cent.

The specimens of cement to be used under water must be taken out of the water only shortly before the test. The water should not stand more than 2 cm. above the specimens, and should be renewed every 14 days.

The specimens of cement destined for use in the air must be placed standing on triangular wood slats in a closed chamber kept at room temperature.

In order to obtain uniform results when testing the pressure must always be exerted on two sides of the cubes, but not on the bottom surface and the worked top surface.

The average of five specimens shall be considered the compressive strength.

Specifications for Iron-Portland Cement.—Only the first two sections of the specifications for iron-Portland cement differ from those for Portland cement, and therefore only these two are given here.

Definition.—Iron-Portland cement is a hydraulic compound which consists of at least 70 per cent. Portland cement clinker and at most 30 per cent. granulated blast-furnace slag. The Portland cement is prepared according to the definition of the German standard specifications for Portland cement. The furnace slags are lime-alumina-silicates.

They shall contain at least one part by weight of lime and magnesia to one part of weight of soluble silica (SiO_2)+alumina (Al_2O_3). The Portland cement and the slag must be ground finely. Additions for particular purposes, especially for regulating the time of setting, are admissible, limited, however, in amount to 3 per cent. of the whole mass, in order to exclude the possibility of additions solely for increasing the weight.

Essential Principles and Explanations.—It is stated as a result of long-time official tests that if proper granulated slag up to 30 per cent. is thoroughly mixed in factories with Portland cement the iron-Portland cement thus obtained is considered equivalent to the Portland cement and can be judged according to the standard specifications for this cement.

Iron-Portland cement is under the regular control of the Association of German Iron-Portland Cement Works, the members of which have bound themselves to furnish iron-Portland cement exactly according to the specifications given above.

Packing and Weight. — Iron-Portland cement is generally packed in bags or barrels. The package should show distinctly, besides the gross weight and the name, "Iron-Portland Cement," the name of the firm or the mark of the works, as well as the brand of the association. Loss by sifting out as well as variations from the standard weight are admissible to the extent of 2 per cent.

Essential Principles and Explanations.—As various weights are in use with bags as well as with barrels, it is absolutely necessary to give the gross weight. By the term "Iron-Portland Cement" and the brand of the association the purchaser shall be assured that the product is in accordance with the definition given in the specification above.

NEW PUBLIC LIBRARY, DUDLEY.

This building, the gift of Mr. Carnegie, was opened to the public last September. The accommodation on the ground floor comprises a lending library of 20,000 volumes, a large general reading-room, a magazine-room, and staff room. On the first floor are the reference library (with accommodation for about 7,000 volumes), and a ladies' reading-room. In the basement are the heating-chamber, fuel-store, and a large general store-room. When the building was nearing completion it was decided to have the "open access" system in the reference library. This necessitated placing book stacks in the public room, and also allowing the public free access to the stack-room. A special feature is being made by Mr. Timmins, the secretary, and Miss Southall, the librarian, of giving the public absolute freedom in consulting works of reference.

The façade of the building is faced with Hollington stone (coarse quality), which is relieved by a small amount of brickwork. The whole of the bricks used for external facing are 2in. dark red sand stocks with ½in. weathered joints. The two figures surmounting the pediment over the main entrance represent "Literature" and "Science" respectively; while the centre is crowned by a figure symbolising "Philosophy." This sculpture is by Messrs. H. H. Martyn and Co., of Cheltenham, who also executed the decorative plasterwork in the building.

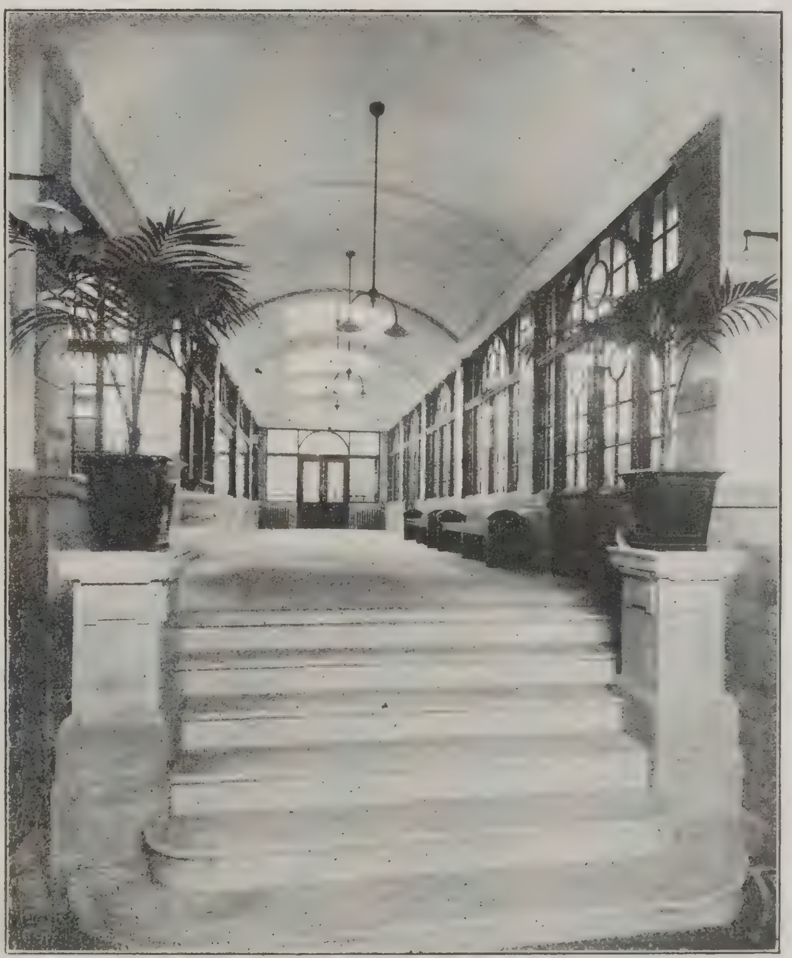
The public staircase is constructed of concrete and steel, and the steps and walls are lined with Hopton-Wood stone (supplied by Messrs. the Hopton-Wood Stone Firms, Ltd., of Derbyshire). A dado of Hopton-Wood is also carried round the hall and borrowers' space.

It will be seen from the plan that a flight of steps is placed in the hall near the main entrance. This arrangement was adopted owing to the difficulty arising from the steep slope of the street, and also to obtain sufficient head-room in the main porch.

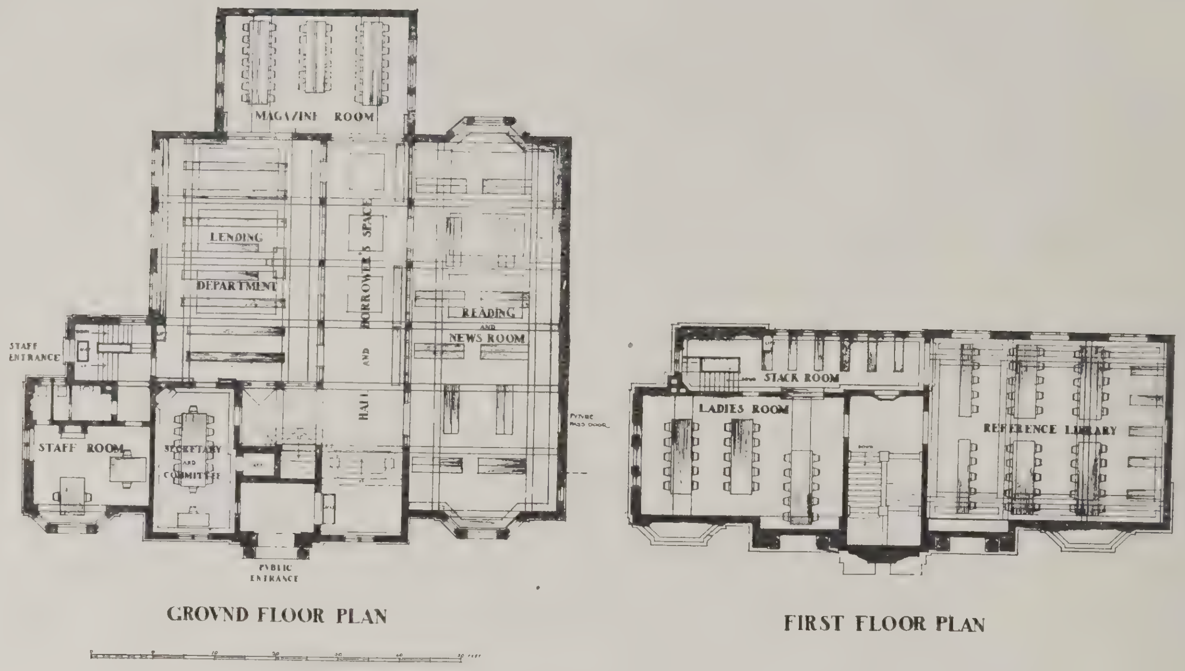
The porch is groin-vaulted and has a marble floor, the hall floors being in terrazzo mosaic with cube borders. The ground-floor rooms are laid with pitch-pine blocks, and the first-floor rooms with oak blocks, the latter being polished. The walls of the first-floor rooms are panelled in mahogany to a height of 8ft. 6in., with furniture and fittings of mahogany also. Roofs are covered with Delabole slates, and flats with asphalt. Warming is effected by radiators and pipes on a low-pressure hot-water system. Inlet ventilators are provided behind the radiators which are fitted with baffle plates. Two electric fans serve for extract ventilation.

The general contractors were Messrs. Mark Round and Sons, of Dudley, and among the sub-contractors, in addition to those already mentioned, were the following: Wood-block floors, Messrs. Hollis Bros. and Co., of Hull; bronze memorial table and mahogany vases, Messrs. the Bromsgrove Guild, of Bromsgrove, Worcestershire. The book lift was supplied by Messrs. J. E. Lucas and Co., Ltd., of London

The clerk of works was Mr. E. Seckerson. The architect was Mr. George H. Wenyon.



PUBLIC LIBRARY, DUDLEY: THE HALL. GEORGE H. WENYON, ARCHITECT



GROVND FLOOR PLAN

FIRST FLOOR PLAN

PUBLIC LIBRARY, DUDLEY: PLANS. GEORGE H. WENYON, ARCHITECT.

NEW BUILDINGS.

PROPOSED.

Devizes.—The following plans have been passed: (1) Proposed alterations and additions to Southbroom House. (2) New w.c.'s in Short Street. (3) Tennis Pavilion in Brickly Lane, for Mr. Cole.

Goldthorpe (Rotherham).—It has been decided to erect a new Primitive Methodist Chapel at Goldthorpe, to provide seating accommodation for 500 persons, at an estimated cost of £1,600.

Halifax.—A new drill hall for the West Riding County Association Territorial Forces, 4th Battalion West Riding Regiment, is to be erected at Blackwall. The site selected is in the corner of the field opposite the Friendly Wesleyan Chapel. The new hall is to be built entirely of stone, and will be two storeys high, with a frontage abutting on to Burnley Road, 88ft. 6in. long, by 45ft. wide. In the basement there is to be a miniature range 60ft., and also the heating apparatus. On the ground floor there will be a drill hall 60ft. by 30ft., an armoury, orderly room, lecture room, bar, and kitchen, parlour, scullery, etc., for the steward. Mr. A. E. Kirk, A.R.I.B.A., of Leeds, is the architect.

Hamilton.—The plans of Hamilton New Academy have been passed by the Dean of Guild Court. The plans show elementary, secondary, and technical schools, the estimated cost of which, including equipment, will be about £40,000.

Harrow.—It is proposed to erect new Congregational Church buildings in Hindes Road, Harrow. The architects are Messrs. Mould, of Victoria Street, E.C., and Bury, Lancashire.

Horden Colliery (Durham).—A new church is to be built at Horden Colliery from the design of Messrs. Potts and Son, of Sunderland.

Lincoln.—The cost of the proposed building of a side chapel under the tower of St. Martin's Church, Lincoln, as a memorial to the late Bishop King, will be about £600. A faculty for carrying out the proposed work has been granted, and tenders will shortly be invited.

Liskeard.—The Chancellor of the Diocese of Truro, has held a Consistory Court to hear an application for a faculty for the removal of the gallery in the parish church. It was stated that a gallery was erected in 1793 at a time when pews were placed in the church and the screen removed. Evidence was given that the gallery was not needed for seating purposes, and that it was objectionable from an architectural point of view. The Chancellor reserved judgment.

Mansfield.—It is the intention of the governing authority to widen Albert Street, and to do so it is necessary to acquire land on the south-west side. The Mayor has a site there, and the Corporation desire a strip, for the improvement of the thoroughfare, varying from 11½ft. to 1½ft. The award made by the Arbitrator of Nottingham is that the Corporation shall pay £456 for the land, to include interest on the capital outlay, cost of the preparation of plans, and in fact all expenses of any kind.

'Maritzburg, S.A.—Before the late Government of Natal went out of office, a substantial sum was allocated towards defraying the costs of extensive improvements at Grey's Hospital, 'Maritzburg, and between £6,000 and £7,000 represents the outlay at present being incurred in connection with an admirable scheme of alterations. The main features of the undertaking are: (1) The provision of a new operating theatre; (2) the erection of a new house for the resident medical officer; (3) the building of additional isolation ward accommodation; (4) a wholesale extension and improvement of the sanitary installation; and (5) a general improvement of the institution grounds.

Mexboro'.—The following plans have been approved:—Fourteen houses, Ferry Boat Lane; two houses, Wellington Street. The amended plan for seventeen houses in Lorna Road, for Mr. S. Jackson, has also been recommended for approval.

Newmarket.—The following plans have been recommended for approval:—Those deposited by Messrs. Holland and Son on behalf of the Exning Conservative Club for the conversion of a building at Exning, subject to satisfactory drainage plans being submitted. Plans deposited by Mr. Potter on behalf of Lord Derby for the re-drainage of Falmouth Cottage into cesspools. Plans deposited for alterations to the servants' apartments at the Kremlin, and for certain drainage work at Kremlin Stud, for Sir R. W. Jardine, provided (with regard to the latter) that the down pipes are connected with the surface water system and not the sewerage system.

Ormskirk.—The Guardians of the Ormskirk Union have decided to apply to the Local Government Board for sanction to borrow £900, which is part of the total of £1,015 required for the extension of the south block of the workhouse infirmary. The total of the various loans outstanding for extensions now stands at £19,993.

Redruth (Cornwall).—The Local Government Board has held an enquiry at Redruth into an application of the Urban Council to borrow £100 for street improvement at Westend, and £400 for works of water supply. The Clerk stated that the population of the town was 10,451, the assessable value £31,800, and the total outstanding debt £7,276.

Rhyl.—A special committee has been appointed to inspect the seawall at the end of the West Promenade, where, owing to the ravages of the sea, the defences are considered to be in a dangerous condition. As a result the Council have instructed the Town Surveyor to prepare plans and estimate of cost for extending the promenade westward to Foryd.

Woolacombe (Devon).—A new church is to be built at Woolacombe, in the parish of Morthoe, near Ilfracombe, at a cost of about £6,500, and the foundation-stone will shortly be laid. The church, which is to accommodate 500 persons, will be of a plain and severe type, and have only a low tower, on account of the winter storms from the Atlantic.

IN PROGRESS AND COMPLETED.

Bacup.—A new Council school in Burnley Road, Bacup, built at a cost of over £6,000, to accommodate 400 scholars, has been opened by the Mayor of Bacup. Messrs. Butterworth and Duncan, Rochdale, were the architects.

Benwell (Newcastle-on-Tyne). — Building operations in Benwell at present include the erection of two picture halls—one at the corner of Condercum Road and Benwell Lane, and the other on Elswick Road. With the latter, considerable progress has been made, but with the other little more than the foundations have been completed. Close by the extension of St. James's Parochial Hall is also in progress.

Brighton.—The foundation-stone of a new church at Preston Park, Brighton, has been laid by Bishop Amigo. The edifice is to be in the perpendicular style of Gothic architecture, and will consist of a nave and one aisle. The length of the building is estimated at 87ft., while the frontage is to be 45ft. The scheme is to build a crypt, which will be used as a parish hall, and it will be so made that it can be enlarged as necessity requires. The portion now in course of erection forms the foundation to the nave of the church, it not being deemed advisable to build the chancel until sufficient funds are available.

Cheadle Hulme.—The foundation stone has been laid of the new parish room in connection with All Saints' Church, Cheadle Hulme. The present contract, let to Messrs. W. L. Atknson and Son, of Bramall, is for the main hall, 50ft. by 25ft., with a large gallery at the west end, and a permanent raised stage or platform, 16ft. by 25ft., at the east end, with retiring-rooms, lobbies, lavatories, heating chamber, store cellars, and kitchen. The complete scheme, which is estimated to cost about £1,800, comprises the addition of a church parlour, crushroom, and cloakrooms. The work is being carried out from plans prepared by Messrs. John Newton, Son, and Bayley, of Manchester, and under their supervision. The heating is being carried out by Messrs. J. Constantine and Son, and the ventilating by Messrs. E. H Shorland and Bros., Ltd. Messrs. John Newton, Son, and Bayley, Manchester, are the architects.

Clifton Campville (Staffs.).—The work of restoration of the parish church is now in active progress, Mr. W. D. Caröe, F.R.I.B.A., being the architect. Many interesting features are being disclosed in the fabric, which proves to be in a more unsafe condition even than was at first believed.

Doncaster.—Plans have been passed by the Doncaster Sanitary Committee for the development of the extensive estate known as Fisher's Park. The estate has recently been put into the market, and some local agitation in favour of its acquisition by the Corporation as an open space has produced no effect. Altogether the estate, when fully built up, will be occupied by over 500 houses, providing accommodation, on the usual calculation basis of five persons per house, for a population of over 2,500.

Dawdon Colliery (Durham).—The new schools at Dawdon Colliery, erected by the Education Committee of the Durham County Council, at a cost of about £9,000, have been opened. There are three departments, with accommodation for 300 children in each. The boys' and girls' departments are contained in a two-storey block on the north of the site, the boys occupying the ground floor and the girls the upper floor. The infants' department is placed in a one-storey block at the south end of the site. All the departments are designed on the central hall system, and each is divided into six classrooms for fifty scholars, and one central hall. The exterior is of brick, with terra-cotta dressings. Mr. J. Eltringham, Sunderland, was the architect.

East Molesey.—The foundation-stone has been laid of the new hospital at East Molesey. The architects are Messrs. Foster, Lovell, and Lodge, of Old Queen Street, and the contractors Messrs. J. Appleby and Sons, of Silwood Street, Southwark Park, whose accepted tender was £3,336.

Gosforth.—The foundation-stone of the new church, which is being erected at the corner of Rothwell Road and Church Road, Gosforth, was laid recently. Gothic in design, the new edifice will be built of stone, and accommodation will be afforded for 510 people. The estimated cost of the scheme is over £4,000.

Harrogate.—The Town Council has approved the following plans:—House at Vernon Road and Kenilworth Avenue; additions to Roughstone, Cornwall Road; house at Warwick Crescent; bungalow at Bilton Lane; alterations to 39, Kent Road; greenhouse at Franklin Mount; greenhouse, Belfort House, Leeds Road; 8 cottages at Regent Street; alterations to Grove Cottage, at Forest Lane.

Herne Bay.—The new Pier Pavilion has been completed, Mr. Percy J. Waldram, F.S.I., and Messrs. Moscrop-Young and Glanfield, London, being the architects. The design was selected in public competition, the assessor being Mr. Edwin T. Hall, F.R.I.B.A.

L.N.A.

The view, taken from the roof, shows the remains of the bedroom in which the female assistants slept.

THE RECENT FIRE AT A BRIXTON DRAPERY STORE.

Kirkby Lonsdale.—The parish rooms at Casterton, near Kirkby Lonsdale, Westmorland, for the Rev. Canon Burton, are now being erected at a cost of £650, from the design by Mr. Tom M. Banks, of Kendal.

Leeds.—Extension of St. Chad's Church, at Far Headingley, is making rapid progress towards completion. The tiling of the extension to the main building has been completed, roofing operations have been commenced on the western transept, and the walls of the eastern transept have been raised almost to the roof level. It is probable that the new portions of the building will be ready for opening within the next six weeks.

The Dewsbury Road Wesleyan Church, which was destroyed by fire some nine months ago, has been rebuilt at a cost of about £3,700. The new building conforms in external appearance to the old structure, but contains many internal improvements. Mr. G. F. Danby, who designed the original building, was the architect, and Messrs. H. Atkinson and Sons, of Leeds, were the contractors.

Christ Church, situate in Meadow Lane, is undergoing extensive renovations, at a cost of £2,000. Some time ago, the tower was found to be cracked and the south wall bulging out. Mr. Sydney D. Kitson, the architect, reported that the only safe course would be to pull down the three most westerly bays of the south aisle, and rebuild them with the old material upon a wide concrete bed or "raft." The whole of the south wall is now down, and during the process of demolition the keystone of the old choir vestry archway was found to be displaced and useless, the structure being held together by a thin iron clamp. Christ Church was built in 1823, in what was then a popular residential part of Leeds. The old stone flags on the floor of the church were put there in 1825.

Leigh-on-Sea.—The Urban District Council has approved the following plans:—House and stable in Theobalds Road; house and cowshed in Tankerville Drive; house in Lymington Avenue; two houses in Burnham Road; house in Salisbury Road; four houses in Leighton Avenue; addition to house (conservatory) in Leigham Court Drive.

Lichfield.—The City Council has approved the following plans:—Cottage, St. Chad's Road; two houses, Birmingham Road; two houses in Leomansley Lane.

FIRE-PREVENTION NOTES.

Drapery Fires.

Yet another devastating fire at a huge linen-drapery establishment, following at no very long interval three or four other great fires, at least one of them involving heavy loss of life, emphasises the need for exceptional treatment of such inflammable premises in the matter of construction and in the equally important matter of such frequent inspection as may ensure reasonable precaution against fire. The fire which consumed the premises of Messrs. Morley and Lanceley, in the Brixton Road, late on Friday night of last week, was luckily unattended by loss of life, although the staff, numbering about seventy, most of them, apparently, young women, were abed when the alarm was given. They were able to get away by means of a back staircase; and their immunity from accident was largely due to the cool capacity of a male assistant who happened to be outside the premises, and who, as soon as the fire was discovered, broke into the premises, awoke the inmates, and lit all the gas jets along the corridors through which they could get away. The flames spread so rapidly that the firemen, although they arrived with the utmost promptness, were unable to prevent the building becoming an utter wreck, as shown in the accompanying illustration. They took great risks, however, in their strenuous and successful endeavours to save adjacent premises. The damage to the drapery is estimated at about £40,000.

Another large drapery establishment fire is reported from Buenos Ayres, where the block of buildings known as the Ciudad des Londres has been totally destroyed, with an estimated loss of £250,000 to insurers.

* * *

Train Fires.

A collision that occurred on the Grand Trunk Railway last week, when a Grand Trunk train crashed into the rear of the Chicago and Montreal express at a spot not far from Durand, was horribly complicated by the usual fire. A sleeping car was wrecked, and immediately burst into flames. Eighteen passengers were killed, and twenty injured. The catastrophe emphasises the necessity for the adoption of more effectual means of fire prevention than railway authorities usually assume to be essential. Not only should the rolling stock be as far as possible constructed of, or lined with, incombustible materials, but the lighting and heating arrangements should be contrived with more regard to contingencies which are, unhappily, not sufficiently rare to warrant general neglect.

Forest Fires. The forest fire of which "settlers" live in such constant dread is easily started, and soon assumes enormous magnitude where the woods are extensive; and they sometimes, as a "Times" writer reminds us, stretch over hundreds, sometimes thousands, of square miles. Such a fire was that which broke out last week in Western Montana, where several townships have been destroyed, and many lives have been lost, and it was stated in a cablegram that "a solid wall of fire was extending for fifty miles from Thompson to the Idaho boundary." A small army was sent to endeavour to cope with the flames. It is a matter, however, in which, for the moment, pigmy mankind seems utterly powerless in face of the stupendous forces of nature. The problem would no doubt ultimately solve itself by the disappearance of the forests, which were in itself a tremendous calamity, independently of the other interests involved. Perhaps it is beyond the wit of man to devise any very effective means of preventing such calamities; yet it should surely be possible to create safety areas that should protect important townships from being completely at the mercy of a mere spark. The "fire breaks" that are commonly made round inhabited districts near forests are sometimes effective; but often they have proved to be entirely futile—worse than useless, because they have given a sense of security that has turned out to be disastrously illusory. Nothing—not even a fairly broad river—can stop a many-miles-long wall of fire driven forward by a strong wind.

Exhibition Fires. The fire at the Brussels Exhibition, to which reference has been already made in this journal, seems to have orginated in the ignition of a curtain in the needlework hall. One of the attendants and a soldier at once tore down the curtain, but the flames had already spread to the roof, and the lath-and-plaster building, stocked with flimsy materials, was entirely destroyed within a few minutes, and, as already recorded, the British section and the Belgian section, forming the main front of the exhibition, were mere ruins within an almost incredibly short space of time. The loss to English insurers, it is now believed, will not much exceed £150,000, although it had been estimated at a million and a quarter. It would have been much greater but for the fine efficiency of some English-made safes in which were deposited a great deal of valuable jewellery. If the fire had occurred earlier in the day, when the gems were on exhibition, these must have perished, to the enormous loss of the underwriters. The British and Belgian sections are being rapidly rebuilt, and the offers of Messrs. Merryweather and Sons to send a steam fire engine of the latest type, and of Messrs. Mather and Platt to supply a complete installation of sprinklers, have been accepted. Although it cannot be said that these precautions are a day after the fair, they are being taken some time after a fire that possibly they would have prevented or restricted. It is further announced that a fire brigade is to be organised to ensure the safety of the new section in the Salle des Fêtes. The lessons of the fire will not, it is to be hoped, be lost upon the promoters of future exhibitions.

BUILDERS' NOTES.

Aberdeen Building Trades. A joint conference of plumbers, painters, carpenters, plasterers and others in the building trade was held recently at Aberdeen with regard to encroachments by the different trades. It appears that complaints have been made of tradesmen doing work which really does not belong to their particular branch of business, and the purpose of the conference was to arrive at some agreement by which the grievance could be stopped. It was decided that the matter should be laid before the different unions in order that a definite settlement might be come to on the question.

The Leigh Painters. Mr. A. A. Hudson, the arbitrator appointed by the Board of Trade to enquire into the painters' dispute in the Leigh district, has delivered his award. The painters struck 16 weeks ago to resist a reduction in wages of from 9d. to 8½d. per hour. Mr. Hudson has decided that the men shall receive 9d. per hour, that the hours of work shall be from 6.30 a.m. to 5.30 p.m., that further disputes shall be submitted to him, and that men taken on during the dispute by the employers shall be retained, about 70 or 80 men have been affected, and work has now been resumed.

Firemen as Painters. A Sheffield painter writes to the "Sheffield Independent" commenting very strongly on the employment of firemen to painting at the local fire stations. He asks: "I should like to know how we are going to be able to pay our rates if our living is taken out of hands in this manner." Two or three years ago the same correspondent complained of a similar state of things. "It is not only of the present I am thinking," he adds, "but by the time our firemen have earned a pension they may blossom out as full-blown painters, while we, who have had to serve an apprenticeship, can retire to the workhouse.—Yours, etc., G. H. H."

The Osborne Judgment and After. The Labour party finds itself in grave difficulty as a result of what is known as the Osborne judgment, by which Trade Unions are debarred from making a compulsory levy on their members for the maintenance of representatives in Parliament. The first case, initiated by Mr. Osborne, a railway signalman, against the Amalgamated Society of Railway Servants, was carried to the House of Lords, and since the decision of that house, twelve other injunctions have been obtained against various Unions, affecting the position of sixteen members of Parliament. The number of applications for injunctions, also, seems likely to increase. The Unions then made an appeal for voluntary subscriptions; but this has been a complete failure. A meeting of the Joint Board, representing the various recognised labour organisations, has therefore been held in London to consider the situation, and the following resolution was passed:—

> That the Joint Board, representing the Parliamentary Committee of the Trades Union Congress, the Labour Party, and the General Federation of Trade Unions, having considered the events which have followed the Osborne decision, resolves:—
>
> (1) That the decision does not merely affect Parliamentary representation, but make it impossible for Trade Union branches to join in the work of local trades councils, and also strikes at the freedom of discussion and of resolution which has always been enjoyed by the Trade Union Congress in so far as that Congress has taken action of a political character in the interests of wage-earners;
>
> (2) That the decision denies the right of Trade Unions to carry out their nominal statutory purpose of "regulating the relations between employers and employed" in so far as modern conditions of industry and the highly organised state of capital render Parliamentary action necessary for this purpose.
>
> (3) That the decision deprives the Trade Unions of the freedom and the right which they have enjoyed for nearly fifty years, and which they have exercised only with the approval of their members and to the advantage of the community.
>
> The Board therefore claims: That these rights be restored at once so that the Trade Unions may be put in a position to fulfil their statutory functions in such a manner as the members of the respective unions according to their rules shall decide.
>
> The Board therefore regrets the decision of the Government not to grant facilities for the consideration of the Bill introduced in the early part of the session to carry out their object, nor even to give definite guarantees as to their frequently repeated pledges to provide for the payment of members and returning officers' expenses; and having regard to the injustice of the decision and of the urgency of the matter the Board calls upon all affiliated organisations, in view of the misrepresentations of the position which have appeared recently in the Press
>
> (1) to co-operate in enlightening public opinion as to the issue, (2) to approach their Parliamentary representatives on the subject, and (3) to urge their members to make this a test question at all elections.

According to the daily Press, the injunctions point to a revolt on the part of Trade Unionists against the capture of their organisations by the Socialist party. Opinions as to the course to be pursued are at present divided. It has been urged that the legalisation of payment of members and of election expenses would solve the difficulty; but the Labour leaders do not agree that this would be a complete alternative to an alteration in the law which they desire. Mr. Arthur Henderson, M.P., put the matter in a nutshell in the course of an interview:—"If it is right for us to be governed by majorities (as we are in most things) we see no reason why a Trade Union should be deprived of the right of the majority of its members to decide for what purpose its funds should be applied." As the Government seem to be lukewarm on the subject of further legislation, there is a fairly certain prospect of a big electioneering campaign by the Labour members during the coming autumn.

A Lost Tender. At a meeting of the Rotherham Board of Guardians, the loss of a tender for some work at Badsley Moor Lane, was reported and discussed. It appears that five firms of builders applied for the particulars, but only four tenders were received. The architect thereupon wrote to the fifth firm, enquiring why they had not sent in a tender, and received a reply that the firm had duly tendered, their tender having been deposited in the clerk's letter-box on a given date. The clerk, however, informed the Finance Committee that neither he nor his staff had seen the tender. The Committee decided to ask the firm in question to supply a duplicate tender, and this being received, was found to be the lowest of the five, and was accordingly accepted, subject to some amendments to reduce cost.

FEDERATION NEWS.

Barnsley.

The monthly meeting of the Barnsley Federation was held at the King's head Hotel on Wednesday, August 10th, Mr. E. Broley (president) occupying the chair, supported by twenty members.

The usual preliminary routine business having been disposed of, the chief business of the evening was the proposed formation of a "Builders' Exchange." The President submitted why Barnsley should have an Exchange, and the pros and cons were duly considered by several of the members present, one of the main objections being the question of selling intoxicants, without which it would be practically impossible for the Builders' Exchange to pay its way. A deputation composed of the President, Councillor W. G. England, J.P., Councillor G. Hough, along with the secretary, had visited the Huddersfield, Halifax, and Keighley Exchanges, and the President submitted that they had been very courteously received at each Exchange, and from what they had seen there there was no reason why Barnsley should not support an Exchange. Ultimately the discussion was adjourned to the September monthly meeting, in the meantime the Barnsley Traders' Association to be approached with a view of enlisting their co-operation in the formation of a combined Builders' and Traders' Club.—J. Denton, Secretary.

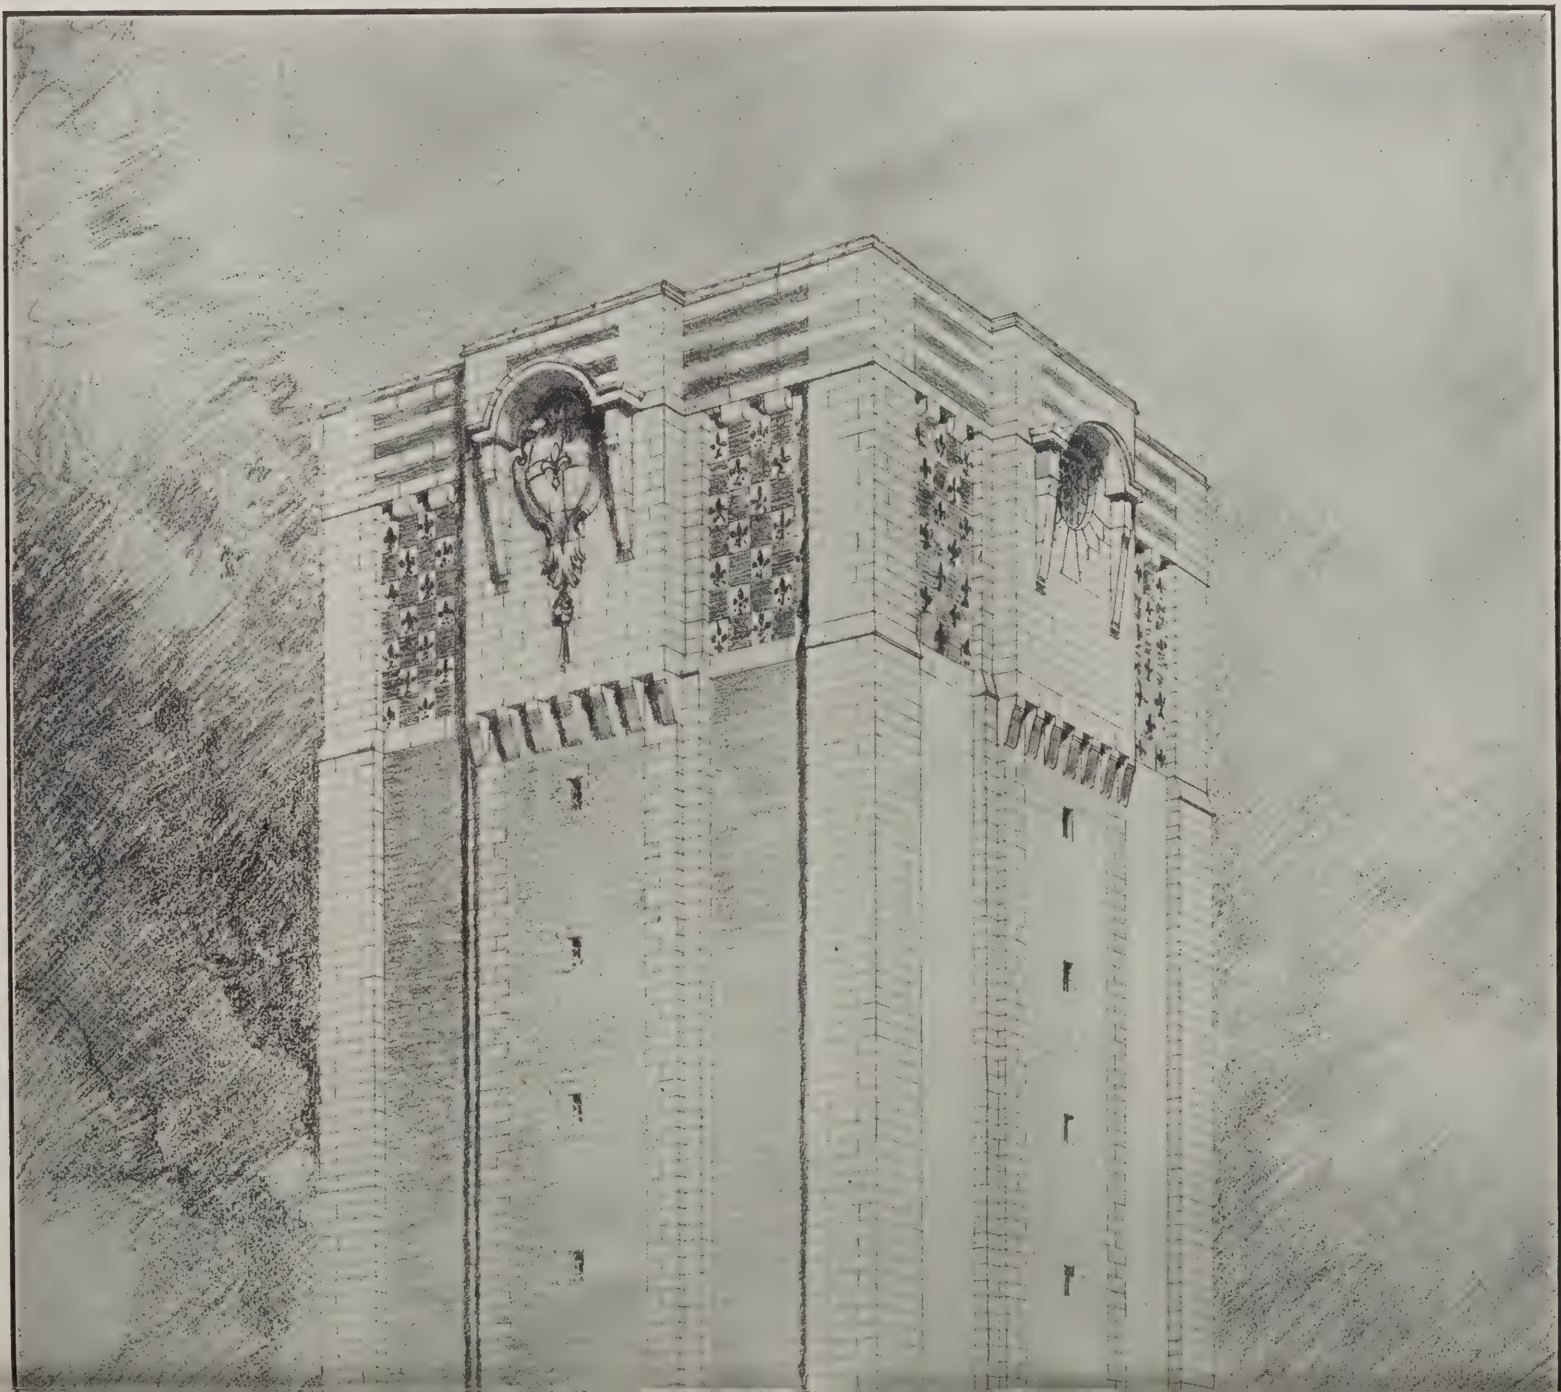
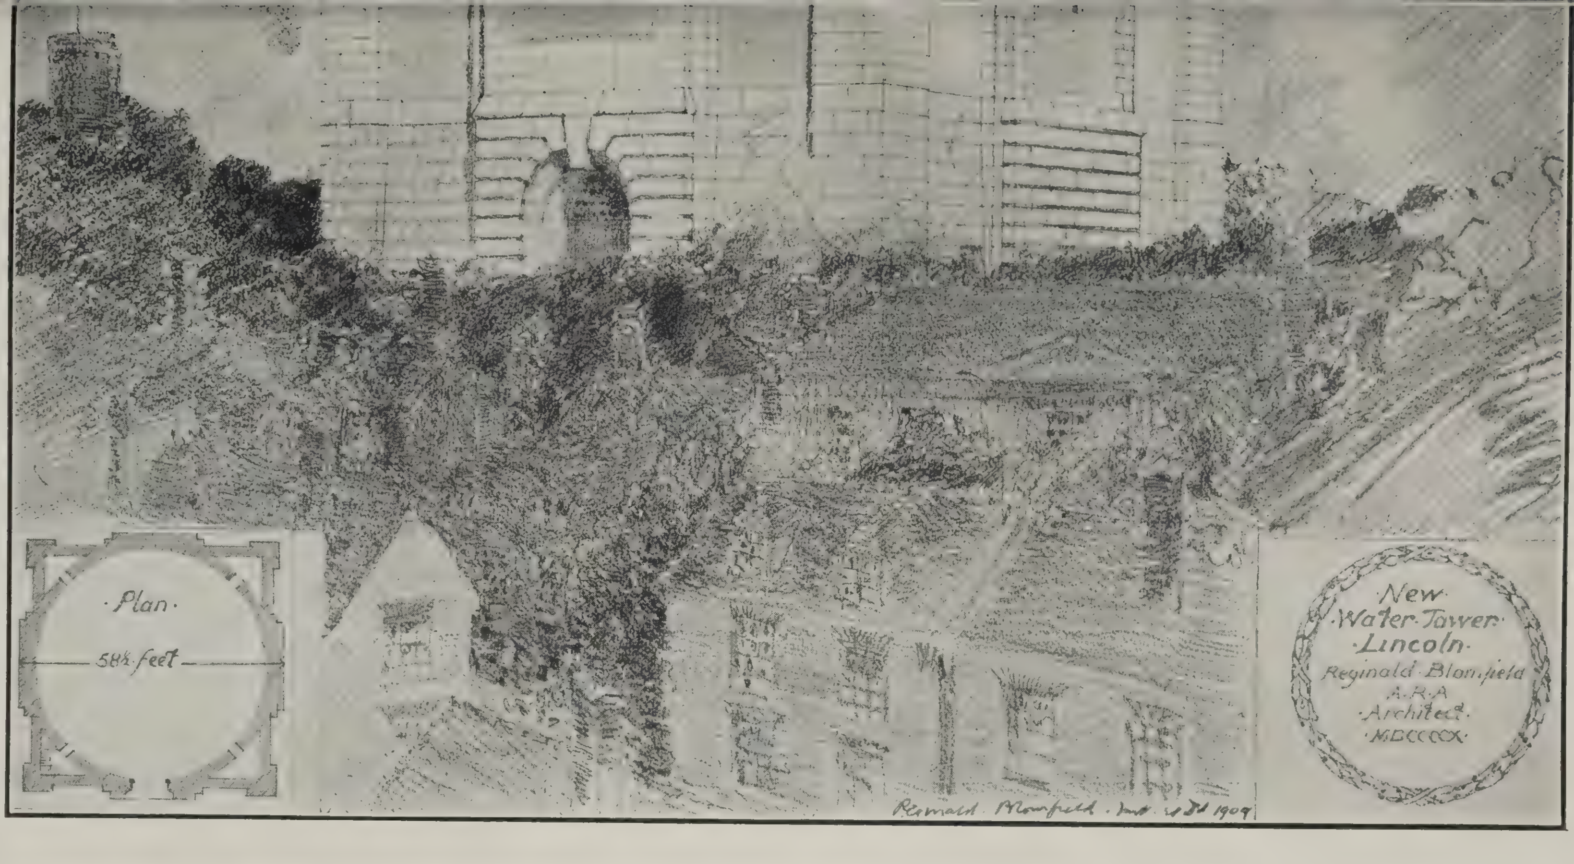
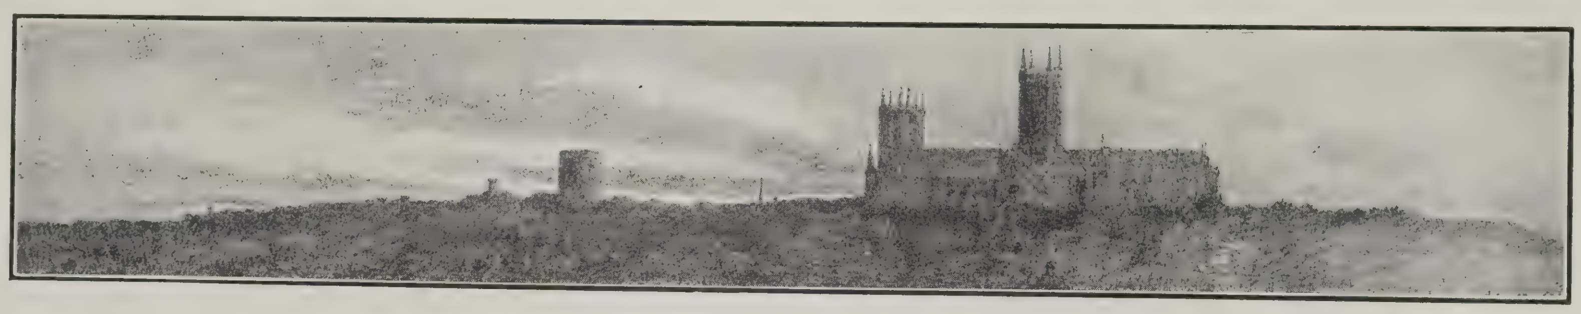
Supplement to The Architects' and Builders' Journal, Wednesday, *September 7th*, 1910.





Plan
58½ feet
New Water Tower Lincoln
Reginald Blomfield A.R.A. Architect
MDCCCCX
Reginald Blomfield. inv. et del 1909



The new Water Tower at Lincoln is being erected on the ridge of Lincoln about a quarter of a mile to the west of the Cathedral; and as it is of considerable size, the problem was to design a building which would not clash in any way with the west towers of the Cathedral, and which would also embody the unusual proportions necessitated by practical conditions. On these grounds, the idea of a lofty keep was taken as the motive of the design. The fleur-de-lys on the cartouches and on the inlay squares is the crest of the City of Lincoln. In the squares the fleur-de-lys are to be formed with local iron stone inlaid flush. The main tank is carried on a circular brick tower within the square, which is faced externally with Darley Dale stone. The tower has been designed by Professor Reginald Blomfield, A.R.A., of New Court, Temple. The Engineer for the whole of the water works is Mr. Neil McK. Barron, and the Contractors for the work are Messrs. Henson and Son. In excavating the foundations, some interesting remains of Roman pottery, glass, etc., of the first century have been discovered, which were noted in the "Times" of August 15th.

"The Neglected Art."

"THE Neglected Art" of architecture is to some extent losing its claim to this distinction, by reason of the rather extensive correspondence under this head that is appearing in the Welsh Press. Mr. G. A. Humphreys, F.R.I.B.A., welcomes this publicity, and has ensued it. Referring to the letter to which attention was given in these pages last week, he says that it is clear that the writer's artistic feelings have been shocked, and adds: "Would that many more were similarly shocked, and wrote their views as clearly as he has done! It would be in the highest degree educative, and in time we might advance beyond the present degenerate position, with its ineptitude of admiring the antique, without regard to its merits or demerits, and arrive at a state where the true nature and functions of architecture are understood." It is undeniable that much of the interest in architecture is undiscriminating and factitious; and it turns to ancient architecture as offering objects for admiration that, being old, are presumably safe. Conversely, what is new is suspect, and is therefore avoided or contemned—usually in expressions that are too vague to admit of traversing. Mr. Humphreys thinks that if the public could be "taught to think of architecture architecturally, there would be added a large interest to daily life." It would be so; but there is always the danger that the public is usually addicted to admiration of the wrong things, and that the point at which they would ultimately arrive under any teaching process would not find them thinking architecturally, but thinking themselves to be thinking so, and, in the fulness of their ignorance, doing much to debase an art that perhaps, after all, would be the better if it escaped their too particular attention. One's attitude on this matter of interesting and instructing the laity in architecture is apt to be governed by moods; and for the moment we are disposed to doubt whether architecture would greatly benefit by the keen and probably pragmatical public that is conjured up in the mind's eye by the charming phrase "thinking of architecture architecturally." Knowledge comes, but wisdom lingers; and it would be more advantageous to have a wise rather than a knowing public—a public that knew enough of general principles to delegate its architectural thinking to the men in whose knowledge, skill, and taste it could place implicit trust. Much, as Mr. Humphreys points out, is being done to bring them to this desirable state of mind, or at all events to inspire them with confidence that they can trust the architect, even as they trust the duly qualified physician. "There never was," we are told—and we are very anxious to believe it—"such a definite and sincere desire on the part of architects to improve the position of art as exists at the present day; and the Board of Architectural Education, working in conjunction with the Royal Institute of British Architects, is doing a great work. The special degrees in architecture given by the old and modern universities, together with the systematic training carried out by numerous colleges, is all evidence of the modern movement by the profession itself." Agreed; and without losing sight of the common and discouraging, and withal drearily commonplace, objection that the artist is born and not made, we rejoice in all these educational activities and in some of the fruits thereof; because even native genius is all the better for the discipline of training and scholarship, wild fire being mischievous unless properly restrained. And if systematic education is necessary for the genius, it is perhaps even more essential to the rank and file, who, after all, will be called upon to do the great bulk of the work, and on whose behalf education is mainly organised. We want, then, an educated, a qualified, and hence a reputable and respected body of architects, and a public who will know enough to refrain from vexatious suggestion and interference. It is this consideration—of the best method of conspicuously and palpably investing the profession with the dignity, authority, and status that properly belong to it—that leads so many of its members to believe in Registration by Act of Parliament; which might or might not have the desired effect.

Contract Systems and Locked-up Capital.

SINCE our reference to this subject in last week's issue, several more letters have appeared in the "Glasgow Herald" with respect to the innovation (as regards Scotland) of placing the several works of large buildings in the hands of one contractor. One correspondent states his experience as being that where one contractor is responsible for the several works of the complete building, he sub-lets the work to the various tradesmen, which "invariably leads to what Americans call 'graft.'" He claims that the system of separate contracts (each tradesman to his own work) which has been in existence so long in Glasgow has worked well, and he questions whether any other city has a cleaner business record. He adds—quite gratuitously, as we venture to think—"But if this system (practically new to Glasgow) of placing the whole contract for the various works of a building in the hands of one contractor is encouraged, then farewell to the straight, clean-handed placing of contracts." It does not seem to occur to this correspondent that the business integrity which depends on the facilities for keeping a close watch on it can be of no great intrinsic value. Another correspondent contends that the general contract system entails a vast amount of extra labour. It could surely be contended with equal plausibility that the contrary effect would be produced by the reduction of overlapping and the economy of general supervision. This correspondent agrees with those who make charges as to "the principal contractor setting one sub-contractor against the other, as in these days, in the building trade, it is impossible for him to make a profit otherwise, and yet be saddled with all the responsibility, including, as it does now, the employers' liability." Then he turns to a subject that, in its English aspects, has been dealt with somewhat exhaustively in these pages. "It is no uncommon practice," he states, "to hold up measurements for over twelve months [after the work is completed] without involving any extra percentage on the proprietor. Is this right? And cannot it be remedied?" He thinks it can.

Delay, he adds, justly enough, "ties up the contractor's capital to a serious extent for a lengthy period, and necessarily in most instances the sub-contractor's also—and this without any increment to them. There are numerous instances of bad debts incurred through this, and I believe that many a bankruptcy could be traced to it." That bad climax we have shown, by too numerous concrete instances, to be, as it were, beyond belief. The bankruptcy of several large English firms has been directly traced to locked-up capital.

Competition Deposits.

A CORRESPONDENT has favoured us with the particulars of a strange surprising adventure in a recent town-hall competition. No good purpose would, for the moment, be served by mentioning names, the general principle involved being the chief subject of interest. The essential data of the case may be briefly summarised. An architect, in reply to an advertisement, applied for the usual plans and conditions, and, in forwarding the cheque for one guinea required as a deposit, stated explicitly his assumption that, in accordance with "the usual procedure," this deposit would be returned in case the architect, deciding not to compete, sent back the documents within one week of receiving them. The town clerk, in acknowledging the receipt of the deposit, merely observed: "The deposit will be returned on receipt of a bona fide design." On examining the documents accompanying this acknowledgment, the architect decided not to compete. He returned the documents by the next post, complained that the point he had raised had not been definitely answered, and enquired, "Do you not think that it would have been better to have replied to my letter to the effect that your council did not intend to return any deposits sent unless a design was submitted, and have enquired whether I wished you to send the conditions or return the cheque? This," he urged, "would at least have given me the opportunity of deciding whether it was really worth my while to pay one guinea for the privilege of reading the said conditions." He added that, in the circumstances, and especially considering that the retention of deposits was obnoxious to the profession, he had felt justified in stopping the cheque. In reply to this the town clerk promised to take the instructions of the council; and having done this, he apprised the architect that "The council regret they cannot vary the conditions set out in the advertisement, viz., that the deposit is only returnable on receipt of a bona fide design. I must therefore ask you to send me another cheque for £1 1s., or cancel the order to your banker not to pay the cheque I now hold." The architect replied that as the advertisement did not state that the deposit of one guinea would *only* be returned on receipt of a bona fide design, he had "naturally concluded that your council were adopting the usual course of giving intending competitors the usual opportunity of consulting the conditions of competition before binding themselves to submit a design." In order that there should be no mistake about this point, however, he had, as we have seen, expressly stipulated, in forwarding his cheque, that he did so on the assumption "the usual procedure" would be adopted of returning the deposit if the architect decided not to compete, and sent back the documents within a week. This stipulation having been ignored, he felt justified in refusing to budge from the course he had taken with regard to the cheque. There, for the moment, the matter rests, and we would prefer not to comment upon it, "wondering," in Bunyan's phrase, "whereto these things may grow," and preferring not to risk prejudicing the issue. Upon the general question of deposits, however, it is permissible to say a word. It is difficult to see any other justification for them than their presumed effect in preventing the undue waste of documents. If it were not customary to exact a deposit, all kinds of undesirable applicants might occupy the field unprofitably. Some might be actuated by a morbid desire to satisfy merely idle curiosity; others might have no other object than that of self-education, eager young students having been known to collect such documents whenever they could obtain them gratis. The demand for a deposit has a decidedly steadying influence, and therefore to some extent protects the promoters against frivolous, vexatious, and sterile applications. The cheque is a sort of proof that the applicant is a man of some standing, and that probably he has serious intentions with regard to the competition. That object having been served, there should, we feel very strongly, be no question of retention, whether or not the architect, having examined the conditions, sees fit to become an actual competitor. To insist that an architect who, having examined the conditions, may see good reasons why he should not compete, should nevertheless send in a bona fide design or forfeit his deposit, is simply ridiculous. There have been, unfortunately, many complaints of the arbitrary manner in which local authorities have snatched at forfeiture of deposits; whereas it is difficult to conceive that they are in any circumstances or in any sense justified in the imposition of any such penalty.

Scotsmen and Brickwork.

SCOTSMEN do not, as a rule, love brickwork. They think that stonework looks far more noble; and hence their first impression of an English town where brickwork prevails is that it looks unspeakably mean; bricks being associated in the Scottish mind with factories, barracks, and workhouses, and therefore regarded as unfit for buildings of higher degree. Some stern Scottish "Covenanter's" opinion of the Roman Catholic cathedral at Westminster, which is the apotheosis of brickwork, would surely reach the zenith of objurgatory essays. It is all a matter of sentimental prejudice, and attempts to justify the preference on more solid ground have usually failed, good brickwork being well able to hold its own at all points of the comparison. The growing regard for colour, however, seems to have spread as far as Glasgow, where an important building is being faced with brickwork, to the delight of a correspondent of the "Glasgow Herald," who praises the architect for thus "adding a spot of colour in a very dull corner." He objects, however, to the laying of three courses of stretchers to one of headers, which he calls "lazy man's bond." There are, he very obligingly explains, "only two bonds in brickwork—English and Flemish—all the others are bastards." He signs his letter with a pseudonym from which nothing can be inferred as to nationality; but his observations do not support the flattering inference we should have liked to draw that he is a Scottish convert to admiration of the beauties of brickwork; for he remarks upon the danger of unattractive specimens prejudicing "the already prejudiced Scots people against all brickwork." And his profound knowledge of the recondite subject of bonds, lawful and illegitimate, surely bespeaks the Englishman. In any case, it is gratifying to find that brickwork is being not only tolerated but admired in Scottish cities, whose grey austerity—and here perhaps the Southron in his turn may be accused of prejudice—might be immensely relieved by the occasional introduction of the warmth and colour and charm that brickwork can bestow.

The Psychology of Compensation Claims.

A WORKMEN'S compensation case, of which the result will be noted with especial interest by building trade employers, shows a remarkable conflict of medical evidence, and suggests a somewhat neglected factor in the problem that thus arose. A firm of sanitary engineers applied to the Nottingham County Court for reduction or termination of an incapacitation award that had been made to a plumber. The doctors called on each side were equally emphatic in the expression of their opposing opinions—on the one hand that the plumber was, and on the other that he was not, still incapacitated by lead-poisoning. In these circumstances, Dr. Pye Smith, of Sheffield, was called in as medical referee. He found that the plumber had completely recovered from the disablement by lead-poisoning. Ultimately, the applicants agreed to pay the plumber five guineas, and also to pay the costs contingent on the settlement of the case. If there had been any question or suspicion of malingering, the termination of the case would no doubt have been less favourable to the plumber, whose representation of his condition was no doubt perfectly genuine; and it has often struck us that even strong suspicions of malingering are sometimes wholly unjust. It may be that they do not always take sufficiently into account the psychological elements of such cases. A man who has been injured by an accident, or who has contracted some disease incidental to his employment, may, we think, honestly continue in the habit of feeling unfit for work, when, as a matter of fact, the substantial cause for that feeling has disappeared. It is always very easy to fancy one's-self ill or out of condition, and it is sometimes very difficult to accept expert advice that contradicts the assumption. It would appear probable that the wholesale general charges of "shamming Abraham" that are brought against workmen are made in ignorance of such phenomena. A man is seldom so ill or so well as he thinks he is. Nevertheless, this very fact—if fact it can be called (and we fully admit the speculative character of the theory)—points to the necessity for the most stringent investigation of all compensation claims, and for the consideration of the whole question upon more scientific lines than hitherto. It is in some quarters held that cure by suggestion is possible; and if that is so, the converse (of illness or incapacity by suggestion) seems equally feasible, and may account for much regrettable misunderstanding on both sides, whereby unjust aspersions may be cast on the workman, or, on the other hand, unnecessary hardship may be inflicted on the employer. The point we have ventured to raise is therefore of practical and material interest, although at first sight it may appear to be a little bit fanciful; and of course it is advanced with all reserve, and in full recognition of the elusive and insubstantial character of the phenomena that appear to be involved. On the general subject of workmen's compensation, we are reminded by a "Times" message from New York that a new Workmen's Compensation Act, which is "probably the most advanced on the subject ever enacted in America," became effective in New York State on the first day of the present month. A summary of its provisions is given under our "Foreign Notes."

The St. Paul's Bridge Squabble.

AN extraordinary importation of spleen into the negotiations between the City of London Corporation and the London County Council with regard to the proposed St. Paul's Bridge is indicative of the way in which a controversy may degenerate into an unseemly squabble. The Corporation and the London Council are old antagonists, and lose no opportunity of quarrelling. The proposed bridge affords them an excellent bone of contention, about which they may annoy and thwart each other for months to come. The writer of a letter to the "City Press" exhibits, we fear, the typical spirit in which these quarrels are usually conducted. He says: "The letter from the London County Council gives the Corporation a splendid opportunity for building the bridge 'on its own,' since the former has all but said in as many words that it may not entertain the question of tramways in connection with the scheme." He then quotes the following extract from the Council's letter: "It is further proposed that the payment by the Council of the suggested contribution shall be spread over as long a term as possible. The committees concerned will be glad to learn what proposals the Corporation desire to make on this point. The whole arrangement indicated above is further subject to the Council being afforded such facilities as it may desire for constructing tramways on the new bridge and approaches, it being understood that the Council shall be under no obligation to construct such tramways, or, if constructed, to extend them to the north of Cheapside, so as to link up with the existing tramways in Aldersgate Street." The genial comment on this is: "The County Council having suggested that it may not feel under any obligation to provide tramways in connection with the proposed bridge, why, in the name of common sense, should not the Corporation take a similar line, and build a bridge without providing for the passage of tramways across it? I do not see why the City authorities should not build a bridge 80ft. wide instead of one 105ft. wide—I think that is the proposed width of St. Paul's Bridge—and thus not only reduce the cost of construction, but become the masters of the situation. An 80ft. bridge would give all the accommodation which ordinary vehicular traffic requires, and would render the vexed subject of tramways out of the question. We are not 'tramway mad' in the City, if some people are outside it. Consequently, it appears to me that the Corporation should take its courage in both hands, and apply for a Bill in Parliament to build St. Paul's Bridge at its own expense out of Bridge House Estates Funds. As to any successful opposition to the Bill, I do not anticipate it, as the London County Council has, by its own letter, given its case away in the fateful words: 'It being understood that the Council shall be under no obligation to construct such tramways, or, if constructed, to extend them to the north of Cheapside, so as to link up the existing tramways in Aldersgate Street.' I think it is a thousand pities that the two bodies cannot work together in this matter, but it takes two to make a bargain, and, if the letter from the Spring Gardens folk means anything at all, it certainly means that, so far as St. Paul's Bridge is concerned, the County Council is 'off.'" We have, of course, not the smallest desire to take sides with either the Corporation or the Council. We deprecate and deplore any attempt, such as that under notice, to widen the chasm and narrow the bridge. It pains us to notice that, as usual, the protagonists are wasting their energy over merely paltry and sordid trivialities, and apparently they know or care nothing about the infinitely larger issues that are at stake. Hardly any notice has been taken of the grave and dignified request, preferred at the beginning of the year by Mr. Ernest George as President of the R.I.B.A., that the bridge must be so designed as to be a credit not merely to London, but to the nation at large. Both the Corporation and the Council seem in need of the reminder that not merely local but imperial issues are involved, and that these will not be allowed to be smothered in a welter of pettifogging and contemptible persiflage.

Inefficient Labour.

THE annual report issued by the superintendent of the Westminster Municipal Labour Bureau includes some instructive if rather depressing observations. It is, for instance, stated that many situations cannot be filled for lack of suitable applicants. That is especially the case in respect of boys, who, although they have passed the requisite school standard, appear to lack the efficiency necessary for success in after-life. This is a somewhat serious reflection on our national system of education. Builders, however, in common with most other employers of labour, have only too much reason to know that it is no more than a mild statement of a truth that they have realised to their cost. That the vast sums lavished on so-called education should produce no better results than those which are the cause of such common complaint is a scandal which may stand a better chance of redress now that it has come so pointedly under official observation. In fairness, however, it must be allowed that in all probability the better class of boy does not come so prominently under the notice of the Labour Exchange officials as does the lad whose inability to find employment for himself may be a measure of his incapacity as a worker. But even with this discount allowance, it is plain that elementary education as at present organised is very far from being an efficient means of developing intelligence. We have often thought that important organisations of employers, like the National Federation of Master Builders, might effectively combine to set this matter on a sounder footing; and possibly the Labour Exchanges may render them valuable aid towards this desirable consummation.

NOTES AND NEWS.

Fountain, Colley Hill, Reigate.

The fountain illustrated on page 233 is built at the extreme north-west corner of the Long Beeches, Colley Hill, and has been presented by Lieut.-Col. Robert W. Inglis, V.D., to the town of Reigate. It is constructed of Portland stone. The interior of the saucer dome is covered with glass mosaics by Messrs. Powell and Sons, of Whitefriars, London, illustrating the exact positions of the planets comprising the solar system drawn up as from December 1st, 1909, thus indicating the date of the erection of the fountain. The architects were Messrs. Seth-Smith and Monro, with Messrs. Holloway Brothers as builders, and Messrs. Farmer and Brindley as sculptors and carvers, who modelled the arms of the town, the supporting figures, keystone figure, columns, basin-lips, and cups, in bronze, from the architects' full-sized drawings.

Architectural Copyright.

The discussion on this subject is continued in "Country Life" by Mr. Ernest Newton, Mr. P. Morley Horder, and Mr. Sydney D. Kitson. They all throw cold water on the proposal for copyright. Mr. Newton thinks that it would be embarrassing to the architect and fatal to the natural development of architecture. If an architect's work is sufficiently interesting to influence others, intelligent plagiarism is all to the good. Imitation of good work seems to him to be the only possible line of advance. Although the caricaturing of an architect's building is painful to the architect and bad for architecture, the proposed cure would be worse than the disease. The remedy lies in the hands of the public. If they become more discriminating, "the vendors of architectural hash will find their occupation gone." Mr. Morley Horder does not think that there is the least chance for copyright, nor does he see that it would be of the least assistance to architects. Copying can seldom, in the nature of the case, be successful. "The experience of most architects who are anxious about their work is, I think, that they are sorry for the man who is trying to repeat a design with which they are fairly disgusted long before it is finished. . . . After all, can anyone successfully copy an art which owes so much to the refining touches given by personal supervision, and the particular setting of a building?" Then, again, "The law is already sufficiently ill-informed in all matters of art, without adding a new possibility of misunderstanding." Mr. Kitson thinks that the legal protection of architecture can do but little good, and may actually do harm, to the orderly evolution of architectural designs. He would prefer legal registration, when "any flagrant act of 'lifting' a plan or feature" could be punished by causing the culprit to be struck off the rolls. On the Continent they exact an indemnity; for we note that M. Acker, the architect of the Brussels Exhibition, has just been awarded £80 in an action brought against an architect who had erected two houses of which the façades were closely imitated from a building designed by M. Acker. Also the judgment is to be published, at the expense of the defendant, in three newspapers to be chosen by the prosecutor.

A Fine House by Robert Adam.

Sir Watkin Wynn's house, No. 20, St. James's Square, is one of the most characteristic, as it is one of the most sumptuous, of the many town houses designed by Robert Adam. It is elaborately illustrated by engravings in that rather grand book, "The Works in Architecture of Robert and James Adam, Esquires," the first volume of which was published in 1777, but it has been left for "The Architectural Review" to give a complete set of photographs showing the chief features of the exterior and interior. These are published in the September issue. Robert Adam gave the most careful consideration to all his details, and this house in St. James's Square is perhaps as typical an example as it is possible to find. Ceilings, cornices, chimneypieces, doors and their furniture, and the delicate stucco decoration of the walls, are perfect in finish and precision of workmanship, and all bear the impress of the peculiar genius of their creator. Adam pretended to be an inventor, and so he was to some extent. But the versatility of his mind was stored, not with knowledge of great Classic work, but with provincial and curious manifestations of it. His interiors are less pleasant to live in than Georgian ones, yet they have a quality of their own—a cool and open feeling, a certain silver-grey harmony, not without charm and repose. In connection with the plans of the house it is observed that although on paper Adam's plans look admirable, being so clear and symmetrical, in reality they do not touch the imagination. Each room is a thing by itself, perfect in a lifeless way, but having no relation with its neighbour. His staircases, too, are poor. A staircase is one of the most difficult things to design, and yet it gives more character to the inside of a house than any other feature. In this respect Adam failed egregiously. He attempted to give Sir Watkin Wynn's staircase an effect of width by the introduction of the great alcove which appears on the ground floor and on the landing above. It is all most carefully planned, but these great niches, though fine in themselves, do not save the staircase, which, in spite of everything, looks like a funnel. The balustrade is of cast iron, and, though somewhat exquisite in design, does not give half the pleasure one experiences in regarding the simple wrought-iron scrolls it superseded.

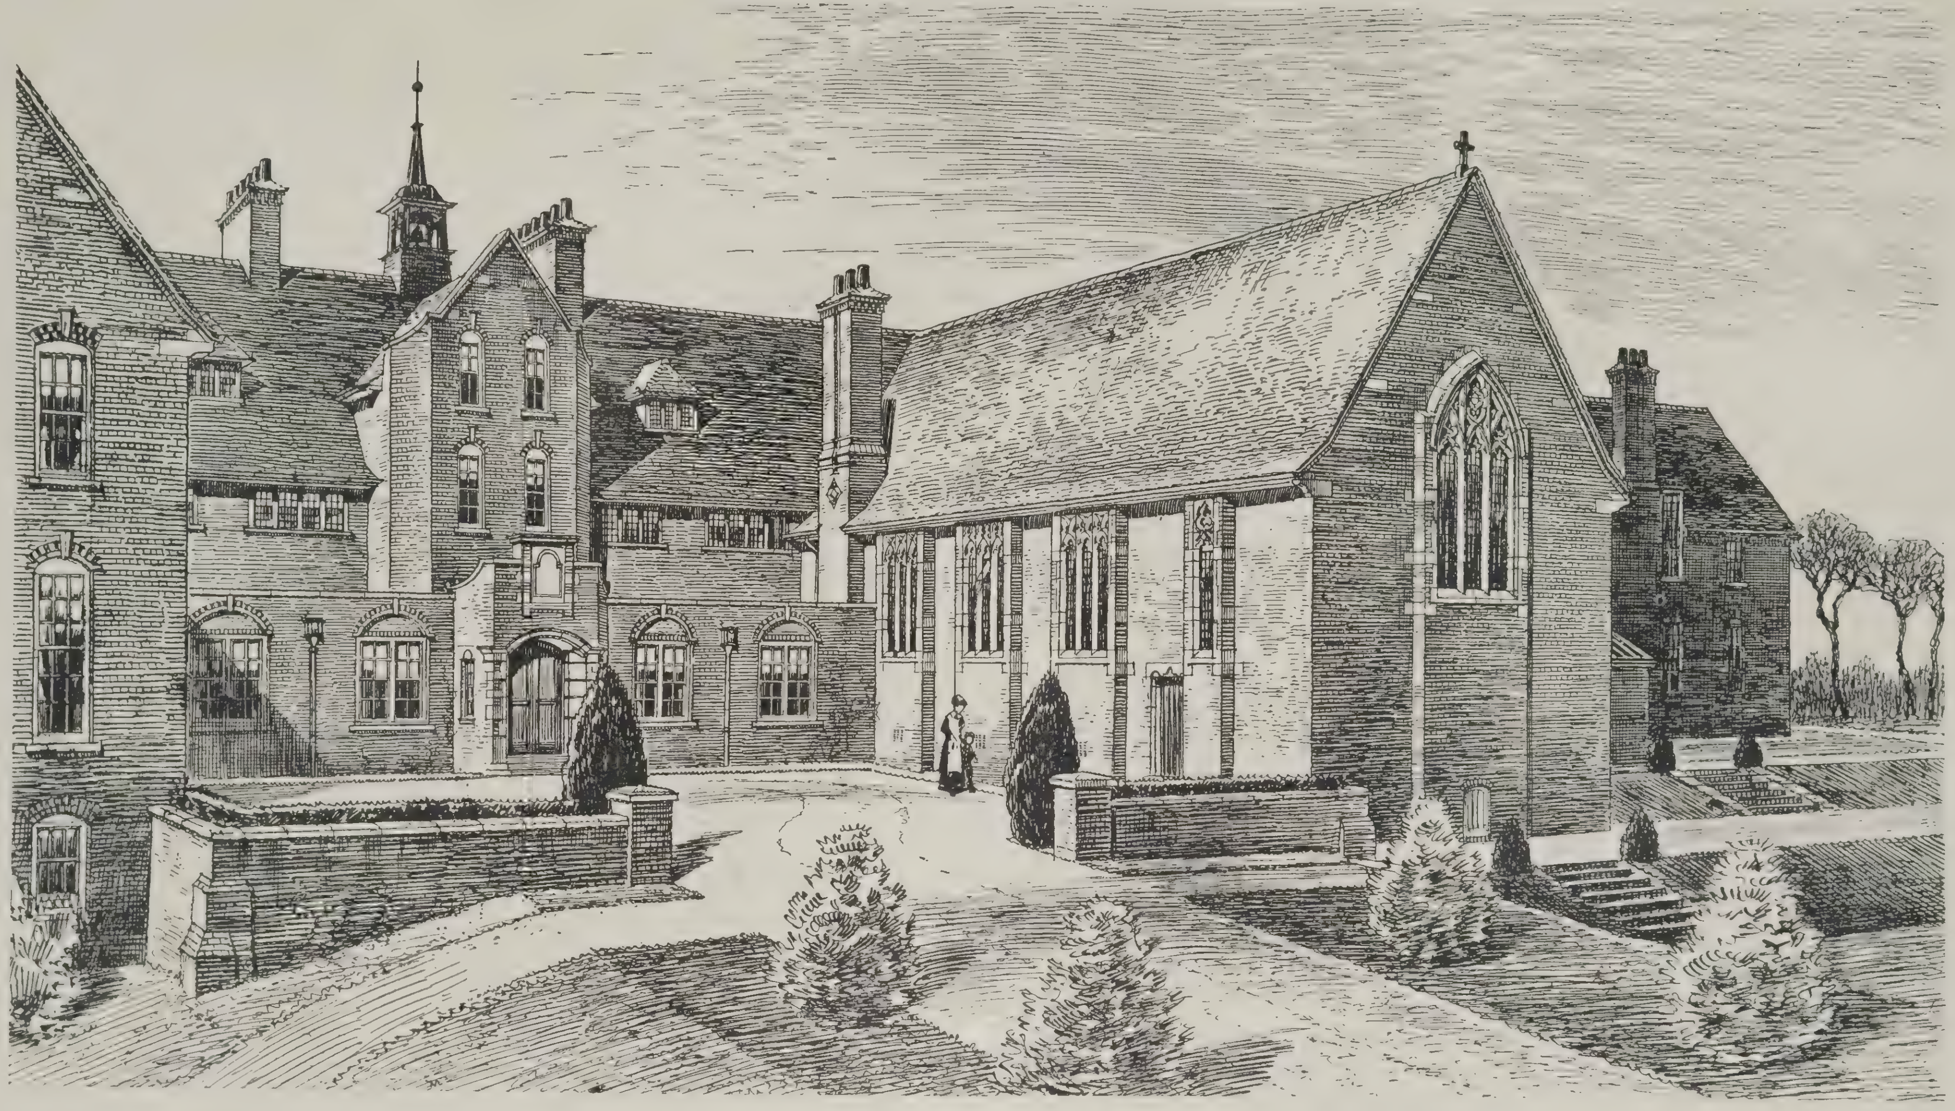
Another feature of the September issue is a series of measured drawings and photographs of the staircase at Cromwell House, Highgate, London. This has a most interesting carved and pierced balustrading, and is rendered especially quaint by little figures of "Roundhead" soldiers of the Commonwealth that stand on the newel-posts.

Of much interest, too, is a very fully illustrated article on Early Renaissance panelling, by Mr. Gotch.

Under "Current Architecture" are included photographs of the Church of SS. Anselm and Cecilia, Kingsway, London (by Mr. Fredk. A. Walters), and the Mission Church of St. Barnabas, Shacklewell, London, N.E. (by Professor Reilly); two striking details of modern work in Paris; and several views of the Liberal Club, Glasgow (by Mr. Alexander N. Paterson); while in the "Town Planning and Housing Supplement" are articles on a suburban development scheme for a portion of Manchester; the position of sculpture in relation to civic lay-out; and the cost and method of town-planning in America.

The London Parks.

While new open spaces continue to be added on the outer fringe of London, almost as much good work is being done for the health and recreation of its people by improvements in the older parks. In all schemes for improving the appearance of the parks it is essential to keep an eye on the characteristics of the site, and to build upon the fundamental aspects of Nature. As a consequence of the original diversity of the hillsides and river-flats on which London has grown up, there is a considerable difference in this respect. Battersea Park, which is in many ways a model of careful enterprise, had fewer original attractions on its tract of marsh than the gently sloping meadow-land of Hyde Park, or the well-timbered and broken ground of Kensington Gardens. It was therefore a fitter subject for landscape gardening of an elaborate and a slightly artificial type; and newer parks in the flat eastern suburbs provide ground of much the same character. The strikingly original beauty of Hampstead Heath makes its requirements very different; and here more than half the secret of successful management lies in preservation rather than construction. It is so, in the main, with the pleasant meadow-land of Hyde Park and Kensington Gardens, and to a less extent with Regent's Park. The most individual attraction of Hyde Park is the sense of space and freedom, often heightened by the grey London atmosphere, but also conspicuous, on fresh clear days, between the



This view shows the central entrance and chapel of the Home built for the Church of England Waifs and Strays Society to accommodate 100 cripples. The whole is built in red brick, and the chapel has Doulting stone dressings to the windows, etc. The general contractors were Messrs. Musselwhite & Sapp, of Basingstoke.

ST. NICHOLAS HOME FOR CRIPPLED CHILDREN, PYRFORD, NEAR WOKING: ENTRANCE FRONT AND CHAPEL. E. J. MAY, F.R.I.B.A., ARCHITECT.

Royal Academy Exhibition, 1910.

Achilles statue and the line of houses in the Bayswater Road; and any new work which encroached upon this vista would be diastrous. There is room in the older parks for many minor improvements of the kind which have been lately added; but with regard to the larger features of the landscape, the only satisfactory policy is to maintain, without further attempts at improvement, the legacy of earlier Nature.—"*Times.*"

Local Museums.

Aberdeen is proposing for itself a new municipal museum. In commenting favourably upon the project, a writer in a local newspaper lays stress on the number of ancient relics in the city that await suitable housing. This, we are rather disposed to think, is to take a stereotyped and antiquated view of the function of museums, which might conceivably serve a much more vital purpose than the cold storage of the *disjecta membra* of distant days. They should assume more of the character of those little art temples of which Mr. Colton is enamoured. A periodical change of modern objects worth studying should ensure incomparably more interest and profit than the customary jumble of stuffed birds, flint implements, and portraits of mayors and provosts.

Glasgow Cathedral Choir Roof.

The old oak roof of Glasgow Cathedral choir has now been revealed in the reparation works which are being carried out under the supervision of Mr. P. Macgregor Chalmers. The old oak roof, which has been a very fine one, consisting of massive timbers, well jointed and pinned together with oak dowels, has been very badly treated. When the plaster ceiling was introduced, the moulded couples which were over each wall shaft and midway between have been roughly hewn back so as to line with the others, and in some cases the couples have been actually severed and made up at the sides with rough pieces of pine. At various times patching has been done which can hardly have added much to the strength of the roof, although adding considerably to its weight. As originally constructed, with its tie beams at the level of the wallhead over every wall shaft and intermediate, this roof must have been a very strong one; but considering the treatment it has received since then it is really little short of marvellous that it is standing to-day. But the removal of the plaster vault has made the design of the original ceiling apparent, and now it is only a question of time till there is a roof on the choir, new in so far as it is necessary to renew it, but incorporating all the ancient sound oak in its construction, exerting no outward pressure on the walls, and built to the same design as the thirteenth century roof. There are evidences of intermediate moulded ribs, and also that the roof has been adorned with bosses carved and most probably richly coloured and gilded. It is to be hoped that the funds at the disposal of the authorities will enable these to be introduced again, so that the effect of the roof may be the same as when this magnificent choir left the hand of its designer under Bishop William de Bondington. Additional interest is given to this fine roof by the door from the tower at the level of the wallhead, which, it has been pointed out by the architect, led to a small platform just over the Rood from which the figures of our Lord with Mary and John at either side were suspended, and from which these figures were tended.

The British Association at Sheffield.

The British Association began at Sheffield the business of its annual meeting on Wednesday last, when Professor T. G. Bonney, Past-President of the Geological Society, and Emeritus Professor of Geology in University College, London, delivered his presidential address. He dealt chiefly with some aspects of the glacial history of early Europe. Earl Fitzwilliam, as Lord Mayor of Sheffield, proposed the vote of thanks for Professor Bonney's address, and stated that Sheffield, in the interval between the present year and 1879, when the British Association last held its meeting there, has increased in population from a quarter of a million to nearly half a million. Its area is between 23,000 and 24,000 acres. Its rateable value is nearly two millions, the municipal estates are worth over twelve millions, and the debt approaches nine millions. The waterworks are valued at three and a half millions. More than a million sterling has been spent on the tramways, £900,000 on electric lighting, and more than half a million for the markets, while, apart from the University, the educational buildings have cost more than a million.

St. Mary Magdalene's College, Cambridge.

(*See illustration, page* 234.)

The new range of keeping rooms, etc., built on the southern side of the college property and facing the river Cam has a frontage of 70ft. by a depth of 30ft., and is three floors in height. It comprises on the ground floor three sets of keeping rooms, each 18ft. by 14ft., and attached bedrooms 14ft. by 8ft., with the necessary Gyp rooms and accessories. In addition there is provided on this floor a lecture room 34ft. by 23ft. On the first floor there are three similar sets of rooms, and over the lecture room, a Dons' keeping room (23ft. by 18ft.), study (15ft. by 13ft.), and bedroom, 15ft. by 12ft.), with Gyp rooms, etc., as before. On the second floor there are three sets of rooms, with Gyp rooms, as before, and a fourth larger set with a keeping room (23ft. by 17ft.) and a bedroom (17ft. by 17ft.).

At the western end of this range of buildings, at right angles thereto, and joining the south-east angle of the hall block, new kitchens, scullery, stores, etc, have been added, and the present kitchen offices rearranged, while in the Magdalene Street block certain internal variations have improved the comfort and convenience of the occupants.

The new buildings stand upon a raft of Portland cement concrete covering their whole area, and 4ft. in thickness. They are constructed of local bricks with a facing of 2in. small-sized bricks of purplish brown hue to resemble that of the adjoining buildings.

Weldon stone is used for the dressings generally, and Ancaster stone for the copings, etc. The roofs are covered with a natural coloured tile, very much the colour of the old tiling near. Wainscot oak is used in staircases and other internal joinery. Carving is sparingly used; but on the north front the arms of the college, of the master, and of Lord Braybrooke, with the Royal Cypher, and that of the donor, the Rev. Mynors Bright, appear in the main cornice, and the fact that the buildings are in the main due to the munificence of the latter is recorded on a tablet in the centre oriel.

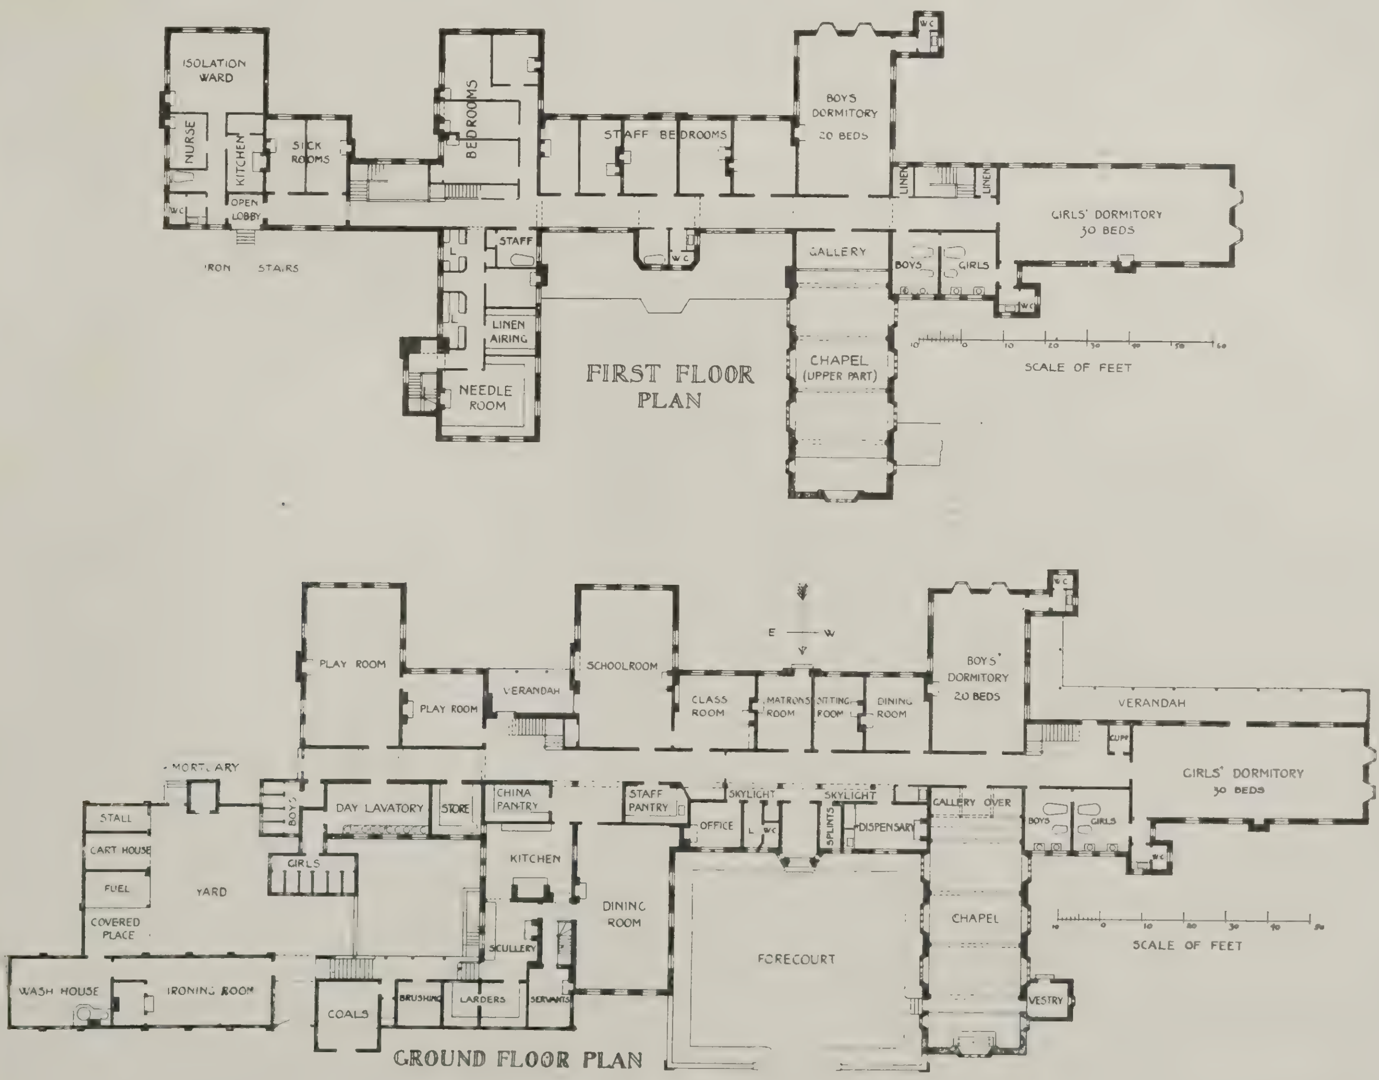
The style of the building might perhaps be called "Collegiate," inasmuch as it accords with the general style of the University buildings, a phase of late Tudor just touched with the Renaissance feeling. The buildings are purposely kept quiet and unpretending, and, although without any attempt at architectural display, it is thought suitable, as they are certainly sound and stable. Sir Aston Webb, R.A., F.R.I.B.A., and Mr. E. Ingress Bell, F.R.I.B.A., are the architects. The builder was Mr. W. Saint, of St. Barnabas Road, Cambridge.

The Preservation of Tintern Abbey.

In the report of the Commissioners of Woods, Forests, and Land Revenues, there is a reference to the work undertaken for the preservation of the structure of Tintern Abbey. During the past year a scaffold has been erected to the whole of the north front of the transept, including the gable, and the return of the angles on either side, east and west, the latter of which contains a circular stair. A close examination of the work fully confirmed the report of 1909. The condition of the stonework of both the window and the gable and staircase was such as to require immediate attention, and especially was this the case as regards the tracery of the window, parts of which would soon have fallen if preventive means had not been adopted. The stonework of the gable has been pointed and made secure, and what remained of the old coping has been reset. Those parts of the walls which were exposed, the coping having gone, have been so covered as to exclude wet. The dangerous openings and weak places in the side walls of the staircase were broken away, the stair being thus exposed to the transept, and also the missing and broken masonry at the top has been built up and made secure, and the north-east angle has also been repaired. Certain parts of the window divisions and tracery were found to be so much out of place and insecure that it was necessary to insert partial centres and strutting, and all has now been made safe with as little disturbance as possible. The stonework at the sides of the window and beneath, both inside and out, has been strengthened where necessary, and pointed.

Hampstead Garden Suburb.

Mr. H. Hamilton Fyfe devotes three articles in "The Daily Mail" last week to the praise of the Hampstead suburb. "Have you not sometimes dreamed," he asks, "as you noticed how pretty modern houses could be made, of a town or village all in harmony with the ideas of those architects who are recapturing to-day the spirit of the older English home-builders? If you have ever felt that spirit stir within you, as you drank in the quiet beauty of Tudor, the fanciful grace of Jacobean, the melodious rhythm of Georgian domestic architecture, you must have dreamed that dream. Well, here it is come true!" Tracing the scheme from its inception, he finds fault only with its name. "The only thing against it is its name. 'Suburb' is a horrid word, ill-sounding, ugly to look at; not only bad English because of its blatant Latinity, but even bad Latin as well. The street-names, you find, have all a true English ring about them. 'Hampstead Way,' 'Meadway,' 'Linnell Close,' 'Temple Fortune Lane." How clean and sweet they are after the grotesque names that Builder Jerry often chooses! But 'Garden Suburb' is bad. There is even a suggestion of priggishness in it. This matter of the name needs thought." Mr. Fyfe draws attention to the excellent manner in which the scheme was developed. The Trust "found the right people. Two companies entered with enthusiasm into the idea. A number of the best architects jumped at the chance of doing work into which they could put their whole hearts. It was agreed to add eighty acres to the heath, and to lay out the rest as a building estate in such a manner that the whole appearance of the place should be grateful to the eye, as different as possible from that of the ordinary suburb. What does a 'building estate' suggest? A plot of land upon which brick-boxes have been run up as close together as the law will permit. Depressing straight lines of ugly 'villa residences,' all alike in meanness of design and flimsiness of construction. Soulless mechanical uniformity. There is one suburb of London which shook itself free of this inane monotony. I mean Bedford Park, one of the fruits of the much-abused Æsthetic Craze, the creation mainly of the genius of Mr. Norman Shaw. But we have gone ahead rapidly since Bedford Park was built. It was time for another effort of the same nature to be made; time to show how the seeds sown in the seventies had germinated, and what blossom they had brought forth." The articles give many points of interest, not the least noteworthy being the statement that "as many as two thousand surprised and indignant British workmen were 'fired' either for slackness or incompetence before the necessary staff of 300-400 was formed" for the building operations.



ST. NICHOLAS HOME FOR CRIPPLED CHILDREN, PYRFORD, NEAR WOKING: PLANS. E. J. MAY, F.R.I.B.A., ARCHITECT.

The Treatment of London's Tower.

We are glad to note that in his new book, "The Tower of London," Mr. Richard Davey indicts the present treatment of the Tower, a matter to which we have frequently drawn attention in the past. The Tower is one of London's great architectural assets, and one of the most ancient. It is not only a great national possession with which the history of the English people is inseparably bound up; but it is probably the most complete of the ancient fortresses of Britain now extant. These facts would, we should have thought, entitle it to the veneration and most careful treatment of those responsible for its custody. The military authorities, however, regard it apparently as a storehouse and drill-ground to which they admit the public grudgingly, and under very irksome restrictions. Moreover, the policy adopted would seem, apparently, to point to the exclusion of the public altogether at a no very distant date. Each year there seems to be less of the Tower open to inspection; and more doors bearing the words, "Private—no admittance." Visitors are hustled from point to point; policemen and beefeaters are stationed in all directions to hustle them on or drive them off; and at the present day one can comfortably see all that one is allowed to see in the course of half-an-hour. The Tower now possesses no military value whatever, and the time has surely come when the military should evacuate it, and the buildings be scheduled as a national monument, to which the public has full and free access. Then the red brick barrack rooms and other anachronisms dumped down on Tower Green could be cleared away, and a clean sweep made of the wigwams and alterations in the various towers which a barrack occupation has made necessary. As Mr. Davey points out, visitors are now excluded from many of the most interesting parts of the Tower, "as, for instance, the vaults and cells under the White Tower, the famous, or infamous, 'Little Ease,' the torture chamber, the quaint house on Tower Green, in which Lady Jane Grey undoubtedly passed the last days of her life, and the Lieutenant's House, the threshold of which has been crossed by probably every illustrious prisoner that was ever incarcerated in the Tower. Also, hidden from profane eyes is that historic chamber where Guy Fawkes and his accomplices were examined. Moreover, it should be remembered that the towers on the walls, although nearly every one of them is connected with some historical personage—and not a few contain remains that are interesting—cannot be visited, with the exception of the Beauchamp Tower and the Wakefield Tower. The latter contains the Regalia, inappropriately exhibited in the chamber in which, it is said, Henry VI. was assassinated. The Bloody Tower, in which the young princes died, the Middle Tower, with its ancient machinery for lifting the portcullis, and many another place of interest, remain hermetically closed, even to the chosen few who have obtained official passes."

The Oratory of St. Piran.

The site of the ancient oratory of St. Piran, in the midst of the wide expanse of sand hills of Perranzabuloe, on the north coast of Cornwall, is being dug out of the sand, under which it has lain for centuries, and is to be enclosed in a concrete outer building, with a dome lighted by "tourist proof" glass. The foundation-stone of the outer building was laid by Mrs. Raffles Flint, and Mr. Thurston Peter sketched the history of the oratory. The church, he said, shared with Gwithian Oratory the distinction of being the earliest Christian edifices in England. St. Piran was in the sixth century of our era a missionary to Cornwall, and the building, if not of the time of St. Piran himself, yet at any rate perpetuated in pre-Norman masonry his original design. Augustine landed in 597 to convert England, and found Cornwall already a Christian land, and an independent kingdom. The first notice of the buried church he could trace was in the sixteenth century, and early in the nineteenth century an old man found the walls showing above the sand. More than one attempt had been made to excavate the church, but not until 1835 was the whole again in view. Several skeletons had been found deposited below the floors, one of gigantic dimensions, measuring about 7ft. 6in. Tradition said that St. Piran and his mother were buried at that place.

Causes of Unexplained Fires.

A correspondent of the "Times" points out what he considers is a potent cause, which might be removed, of many of the unexplained fires which occur from time to time. "In nearly every box of wooden 'lucifer matches' there are a few which have been 'cut the wrong way of the grain.' Unless these, when struck, are held much closer to the point than is usual, the ignitable tip breaks off and falls, it may be before or after it has ignited. In the former case it falls to the ground to be fired by the friction of a passing foot or broom; in the second case it may fall upon any inflammable substance that is near and set fire to it. This is especially liable to happen to children's or women's dresses. I do not doubt that if this matter is brought before the manufacturers of matches they will at once adopt measures for the prevention of so terrible a danger." We might add that the dangers of the top not ignited would be largely obviated by using those matches which will only light when struck on the box.

Garden Cities and Garden Suburbs.

Mrs. S. A. Barnett's speech to the members of the German Town Planning Association on the occasion of their visit to the Hampstead Suburb has drawn a reply from Mr. Ebenezer Howard in the "Morning Post." Mrs. Barnett appears to have extolled Hampstead as a suburb—the *natural* growth of an existing city—while Letchworth, though it was a noble attempt to create a city, was yet an *artificial* city. Mr. Howard rightly takes exception to this attempt to discriminate between two *artificial* things—as all creations of man must be—and he carries the matter further. Letchworth, he says, "is an attempt which is being very deliberately and successfully made to draw some thousands of people away from our overgrown cities, and thus to do just a little to check that overgrowth of London which nearly all statesmen have deplored, and it is an attempt, in doing this, to solve in some degree many other problems. Doubtless, so long as our city does stretch forth into new suburbs, thus inevitably somewhat stifling and spoiling the suburbs which lie within, it is much to be thankful for that forethought and care should attend such new growths. But it would be infinitely better—now that London has come to be so very large—if, in a quite con-

THE ST. NICHOLAS HOME FOR CRIPPLED CHILDREN, PYRFORD, NEAR WOKING: GARDEN FRONT. E. J. MAY, F.R.I.B.A., ARCHITECT.

scious way, the essence of town planning, as applied to London, should be recognised to involve, if it be possible, some arrest of its growth."

The New Hall of the Cordwainers' Company.

The new hall of the Worshipful Company of Cordwainers, in Cannon Street, takes the place of the somewhat dingy yet not altogether undignified old hall which had occupied the site for 130 years. The new hall, which has been designed by Mr. H. Chatfeild Clarke, is of English Renaissance style, and has a frontage of more than 60ft. on the northern side of Cannon Street. The court room and the reception room are on the first floor, and are separated by sliding doors, so that the two rooms may on occasion become one. The banqueting hall, which is on the second floor, is being panelled with British oak. Part of the ground floor and the basement will be let as offices. This is the sixth hall that has been built for the Company. One of them was destroyed in the Great Fire of 1666.

The Coldharbour Case.

The vandalism at Coldharbour, which manifested itself in the destruction of two fine sound trees in the village school grounds, consequently marring the landscape, appears to have been due to want of thought rather than want of heart. Since Professor Baldwin Brown drew attention to the matter in the "Times," correspondence has passed between him and the chairman of the Surrey Education Committee, who has, with other members, visited the spot. The question is to come up formally before the next committee meeting. And it is stated that possibilities of this kind will not be overlooked when future school alterations are under consideration. Builders are generally indicted (and in the case of speculative builders, with some ground) for their indifference to timber and the amenity it affords; but in this instance the new outbuildings are said to have been planned to come on the sites of the trees, and the responsibility would appear therefore not to rest with them.

"The Decline and Fall of Art."

"It is a pathetic spectacle that from year to year at this season the columns of the various leading daily papers should be devoted to the discussion of trivialities, when they might profitably be occupied by matters of importance to the whole world," and therefore the writer of a letter in the "Morning Post," from which this quotation is made, introduces the subject of "The Decline and Fall of Art." He aims at showing, by means of two comparative lists, how much richer we were during the Victorian era than we are to-day in the domains of music, painting, sculpture, the stage, literature, and vocalists. It saddens him to find, from a comparison of these two lists, that the artists of to-day are so few in comparison with the number included in the list that covers fifty years, and this he calls "The Decline and Fall of Art!" whereas it seems to be a case of proportional misrepresentation. After this, it is not at all surprising to note that the "five branches" into which he divides Art, as enumerated above, do not include the Mistress Art; for which omission, on the whole, we are in the circumstances rather disposed to be thankful. For the various classes are the homes of strange meetings, wherein is such mixed company as Offenbach and Wagner, Doré and Phil May, Boehm and Stevens, Wilson Barrett and Macready, Barham and Browning, Ainsworth and Meredith. From such a motley gathering, and from the discussion which this letter is presumably intended to provoke, the Mistress Art seems for the moment to have made a lucky escape, and it is to be hoped that no well-intentioned but misguided devotee will attempt to hale her into the horrent arena.

District Surveyors and Their Fees.

At Lambeth police-court, last week, before Mr. Hopkins, three firms of builders who had been employed by the London County Council to carry out works at certain of the Council's schools were summoned by Mr. Ellis Marsland, the District Surveyor for Camberwell, who sought to recover from them fees which he claimed to be due to him in respect of those works. Mr. Godfrey, who represented the London County Council, said that for the purposes of these summonses the Council were the defendants. When the Council became the Education Authority for London, they, rightly or wrongly, considered themselves exempt from the provisions of the London Building Act. Mr. Hopkins interjected: "From some of them." Mr. Godfrey replied: "In any event, from Parts 6 and 7." After great difficulty, it was arranged between the District Surveyors' Association and the Council that a friendly case should be taken to the High Court to ascertain whether the Council were exempt from the whole or part of the Building Act. That was the case of "Willis v. the London County Council." The Divisional Court held that the Council were bound to give notice to the District Surveyor, but, unfortunately, the decision did not go beyond that point. Then in the case of "Galbraith v. Dixon," the question whether, if notice were given, a fee was chargeable was raised; but the Divisional Court declined to listen to the question of exemption, and decided only upon the question of fees. The Council entered into correspondence with the District Surveyors' Association with a view to an amiable arrangement, and negotiations were pending. The Council felt that if they were exempt from Parts 6 and 7 of the Act there should be a reduction in the District Surveyors' fees. He asked that these summonses should be adjourned. Mr. Williams, who supported the summonses, opposed the application, and pointed out that the dispute had continued for five years. The exemption of school buildings from Parts 6 and 7 of the Act could not be adjusted between the Council and the District Surveyors' Association, but must be decided by the Court. Mr. Hopkins remarked that twice in six years the point of law which was raised had been sent to the High Court, and each time it had come down without decision. He adjourned the hearing of the summonses until October 26.

Corporation Powers as to Buildings.

Richmond Corporation has just brought to light what appears to be an anomaly of the law. It appears that the Local Government Board has informed the corporation that while it has power to build a public hall, it cannot, without obtaining a special Act of Parliament, acquire any existing building for conversion to that purpose. As apparently Richmond Corporation did not know this, or they would not have raised the question, it may not be superfluous to pass on the information for what it is worth. The disability is not altogether regrettable. The purchase of land by corporations is sometimes attended by abuses, and the power to purchase buildings would enlarge the scope for insidiousness or misadventure. Besides, it would encourage the adoption of makeshifts; and a "converted" building can never be so satisfactory as one that is specially designed.

Sheffield By-laws as to Timber Scantlings.

The report from the Sheffield Master Builders' Association, which will be found on p. 257 of the present issue, deals with a subject that is of considerable importance to architects as well as to corporations and builders. It concerns the new by-laws as to timber sizes which are now under consideration by the Corporation of Sheffield. Briefly, the City Council are disposed to increase the sizes of roof timbers to a degree that the master builders believe to be unnecessary, and accordingly their association has made representations to this effect, and the council have given ear to them, and seem, for the moment, to be in a strait betwixt the assertions of theory and the ascertainments of practice. They have accordingly suggested a further parley, at which the points at issue may be threshed out by two representatives from the Sheffield Society of Architects and Surveyors, two from the Master Builders' Association, besides the City Architect, the City Surveyor, the Chief Building Inspector, and a representative from the Town Clerk's Department. The issue of this conference should be interesting, and perhaps valuable.

SOME FINE WROUGHT-IRON GATES AND RAILINGS.

By HERBERT SKYRME.

The accompanying photographs show a fine old example of the craftsman's work in wrought-iron. I have never seen in any architectural, or other publication, either a description, drawing, or photograph of these beautiful gates, and think this may possibly be explained as follows:—

The gates are situated in a quiet country road facing a large mansion called Leeswood Hall, near Mold, North Wales, and unless one's attention had been previously drawn to their situation, few people, unless their business took them to one of the small villages which this road serves, would see them. Although, as previously mentioned, they face, and are within a quarter of a mile of the Mansion, there is no road between them and the Mansion, and they have always been closed. The actual entrance to the house is by means of a carriage drive on the main road leading from Chester to Mold.

Rumour asserts that the cost of these gates, which amounted to some thousands of pounds, was not forthcoming when they were erected, with the result that they were "thrown into Chancery" and still remain there. Whether that be the case or not, the absence of the carriage drive gives colour to the tale, and to the present day they remain an ornament of the Hall, and unused.

The gates are fixed between two fine carved stone piers, 5ft. square, about 25ft. high, each pier being surmounted by a sphinx. These figures were supposed to be of stone, but an examination during renovation revealed them to be cast lead. The ironwork is wrought into a design with central gates, with side wings, each panel divided by square wrought-iron piers. The length is about 103ft., and about 30ft. high at the loftiest pinnacle. The late occupier of the Mansion had the gates cleaned and painted a few years ago, and some idea of the size of them may be gathered when it is stated that the cost for painting only came to nearly £100.

NEWS IN BRIEF.

At the International Co-operative Congress, which opened at Hamburg on September 5, Mr. Henry Vivian, M.P., and Dr. J. Albrecht, will open a debate on the housing problem, with papers which will indicate what co-operative housing societies can contribute to the solution.

* * *

Mr. O'Brien Smyth, late chief inspector in the architectural department of the Local Government Board for Ireland, has retired, after twenty-seven years' service, and has been succeeded by Mr. Lewis E. H. Deane, son of Sir Thomas Deane, R.H.A.

* * *

Norfolk Park, an estate of about 60 acres, the use of which the Duke of Norfolk has permitted to the citizens of Sheffield for some years, was presented recently to the City. This gift increases to about 160 acres the extent of land which the Duke has given to Sheffield for parks. Mr. H. Coverdale presented the deed of gift on behalf of the Duke, who was unable to be present; and the Lord Mayor, Lord Fitzwilliam, in accepting the document on behalf of the inhabitants of the city, expressed hearty thanks to the donor for his munificence. Mr. Coverdale stated that the Duke thought that, in the event of the estate ever coming into the hands of trustees, they might be advised to cut up the beautiful park for building purposes, and it was in order to avert that risk, and to secure the park to the public for ever, that he decided to offer it to the Corporation.

* * *

Building operations have already commenced upon the new offices of the Board of Agriculture and Fisheries in Whitehall Place, and in the course of twelve months from the present time Earl Carrington, or whoever may then be President, will probably be able to enter into possession of his new home. The offices are situated close to the existing premises, and immediately facing the War Office.

* * *

The reading-rooms at the British Museum are closed for the half-yearly cleaning, and will remain closed until September 5 inclusive. The manuscript-room is also closed, but, as additional work is to be done this year, it will remain closed until September 8 inclusive.

* * *

Messrs. Patman and Fotheringham, Ltd., of 100, and 102, Theobald's Road, London, W.C., are the contractors for the new office building for Messrs. Willing and Co. Ltd., at 362, 364, Grays Inn Road, London, W.C. for which Messrs. Hart and Waterhouse are the architects. It was during the excavation work here that the old St. Chad's well at King's Cross was rediscovered, as reported in our issue for August 24.

These gates and railings are reminiscent of the celebrated ones that formerly stood at Carshalton. Like them there is no roadway, and they are never opened. The Sphinx figures on the stone piers are of cast lead.

WROUGHT-IRON GATES AND RAILINGS, LEESWOOD HALL, NEAR MOLD, NORTH WALES.

British and Foreign Admiralties, and of the Mercantile Marine throughout the world, also to the plant of the chief Industrial Concerns, Railways, and Municipal Corporations in the United Kingdom and abroad, have been awarded a diploma of the highest merit with gold medal. The same firm also received gold medals at Genoa, 1905, Milan, 1906, Savona, 1906, Bordeaux, 1907, Franco-British Exhibition, London, 1908, for superiority of the anti-corrosive qualities of their Patent "Bitumastic" Enamels, Coverings, and Solution.

* * *

A special committee of the Manchester City Council, appointed to consider the best means of utilising the site of the old Manchester Infirmary in the centre of the city, recently decided to recommend the erection on the site of an art gallery and free library, at a cost of £250,000. The existing art gallery and reference library, in the centre of the city, are in old buildings, and there has long been an agitation for their supersession. The recommendation will be considered at an early date by the City Council. Three hundred thousand pounds was paid for the infirmary site.

* * *

The eighty-eighth report of the Commissioners of Woods, Forests, and Land Revenues has been issued and states that, exclusive of land let for building purposes, foreshores, and mineral rights, the Crown property under the Commissioners' charge extends to about 322,767 acres, of which 67,020 acres are under timber. Parts of these woodlands are subject to common rights, and there are in addition 128,323 acres of unenclosed wastes subject to common rights. The total gross collection on account of income during the year amounted to £644,704 9s., and the expenditure was £156,234 13s. 3d., inclusive of repayments to capital in respect of advances for permanent improvements, and for the purchases of leaseholds. The corresponding figures for the preceding year were £646,268 2s. 7d., and £152,978 18s. 2d. respectively.

* * *

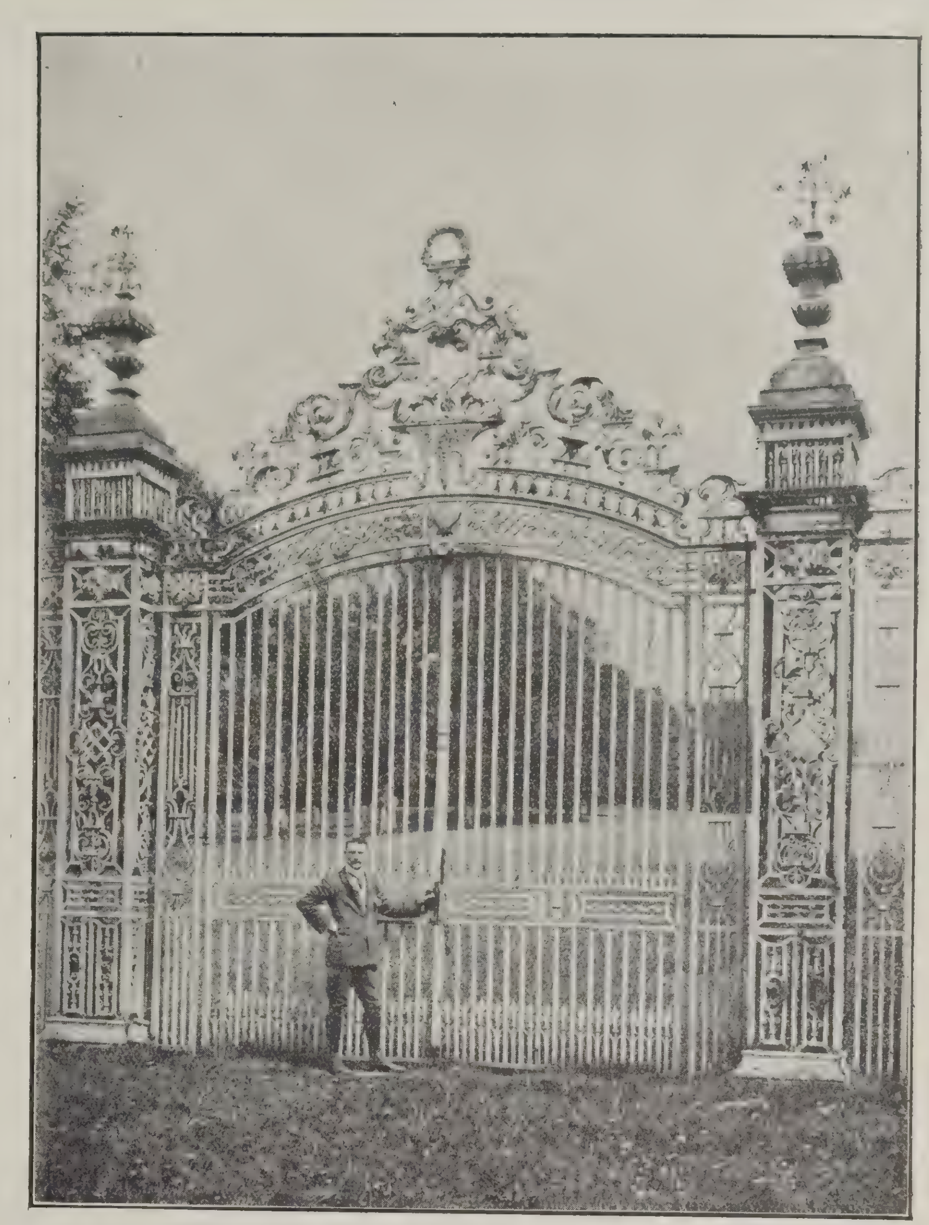
A correspondent of "The Evening News" makes the rather useful suggestion that if the route of the Coronation Procession for next year were to be settled at once, some alleviation of the usual winter distress in the London building trade might result. Redecoration and the building of stands might then be put in hand during the winter, at an early date, and carried out at reasonable prices; which will not be the case in the last few weeks preceding the great event.

* * *

The Sheffield Society of Artists hold their annual exhibition at the Montgomery Hall, Sheffield, from November 10 to December 12, 1910. Works will be received at the hall on Friday, November 4, from 10 a.m. to 6 p.m., and on Saturday, November 5, from 10 a.m. to 1 p.m. Communications from those desiring to send exhibits should be addressed to Mr. Alwyn H. Holland, Hon. Sec., Orchard Chambers, Church Street, Sheffield.

* * *

While varnishing the inside of some of the great water pipes constituting the Manchester Corporation's "third line" from Lake Thirlmere last week, three workmen were overcome by poisonous fumes, and one of them, James Thistlethwaite, twenty, of Caton, died. The others, named Bridges and Dennison, had narrow escapes, being brought round by artificial respiration. The mishap occurred in the Quernmore Valley, near Lancaster, and the men were found over a hundred yards from the mouth of the pipe tunnel.



WROUGHT-IRON GATES, LEESWOOD HALL, NEAR MOLD, NORTH WALES.

* * *

During an auction sale of grocery stock last week, at a room in King Street, Lancaster, the floor collapsed through dry rot in a beam, and fifty people were precipitated into the cellar ten feet below. Most of those who had fallen sustained injuries more or less severe.

* * *

Mr. Louis Stean, Hon. Sec. of the Tobacco Trade Travellers' Association, has written to Mr. Churchill with reference to the recent fire at the Kelvin Hotel, Belfast, when several lives were lost, suggesting that a short bill should be passed imposing upon hotel-keepers the necessity of providing approved means of escape, such as provision of a strong rope, firmly attached at the inside of each bedroom window; fire-bells to ring in and from each bedroom; outside iron staircases, with free access from every floor; adequate notices, prominently displayed in all corridors, indicating the direction of such access.

* * *

Five men were placed in a position of great peril in a sewage tunnel near Govan Cross, Glasgow, last week, through the bursting of a main pipe. The workmen were engaged behind an air-tight door when the accident occurred, and water rushing in quickly flooded the place. The fire brigade were summoned, and after four hours' pumping operations the water was sufficiently lowered to allow of the door being burst open, and the men were rescued from their perilous position.

* * *

A conference of representatives of the two Joiners and Carpenters' Societies—the Amalgamated and the Associated—concluded at Glasgow recently, when it was officially announced that the conference had agreed to recommend the amalgamation of both organisations. The question of a union will now be voted upon by the whole membership of the two societies.

* * *

Owing to the breaking of a water main, the whole of the district of Stoke Gardens, a populous part of the parish of Slough north of the Great Western Railway, was left without water, and the Gotha Iron Works, employing a large number of hands, had to close down last week in consequence. Over 500 houses were affected.

* * *

The recent sale of the fine old furniture and works of art of the late Mr. Vincent Robinson at Parnham, Dorset, realised about £14,000. The mansion, which has been sold separately by Messrs. Nicholas Denyer and Co., is one of the most notable Tudor houses in the West Country.

The Corporation of Sunderland are about to appoint a municipal architect, and from 66 applicants have selected Messrs. P. Dalton of Carlisle, Ling of Battersea, Pickup of Blackburn, H. Woodhead of Wakefield, Slater of Leek, and Matkin of Sunderland, for a final interview and selection.

* * *

The exhibition of the work of modern French artists in the Brighton Public Art Galleries will be closed at the end of the present month. It has proved a great success, the rooms having been crowded daily. The Brighton Corporation have purchased for the Permanent Art Gallery Gaston la Touche's "Les Ebats des Cygnes" (*Swans at Play*). The French Government have conferred upon the director of the galleries, Mr. Henry D. Roberts, the decoration of Officier de l'Instruction Publique. For three weeks from September 12 a portion of the works of the late Miss Sarah Dodson will be shown.

* * *

It has been decided to erect a monument to the late Hon. C. S. Rolls in the main street of the town of Monmouth; and the Mayor is making an appeal for subscriptions. Sir Aston Webb, R.A., has been consulted, and £1,000 is named as the necessary sum.

* * *

Mr. Walter Emden, past-president of the Society of Architects, who has been Mayor of Dover for the past three years, will, it is understood, accede to the wish of the council that he should continue in office during the Coronation year. Mr. Emden is an ex-Mayor of Westminster, and is still an alderman of that Corporation.

* * *

The Engineering Standards Committee have issued a revised edition of their standard specification for Portland cement, which will be dealt with in due course in this journal by a specialist contributor.

* * *

The Local Government Board has decided to hold, or has recently held, as indicated by the dates, inquiries into proposed expenditure by public bodies as follows:—Water Supply.—Walton-le-Dale Urban District Council, £6,500 (September 7); Marple Urban District Council, £800 (September 9). Electricity Undertakings.—West Bromwich, £11,386 (September 9); Colwyn and Colwyn Bay Urban District Council, £2,500 (September 8); Cleckheaton Urban District Council, £2,210 (September 6). Sewerage, Sewage Disposal Works, and Plant.—Scunthorpe and Crosby Joint Sewerage Board, £5,300 for Scunthorpe (September 8); Southwell Rural District Council, £850 for Halam (September 9); Bishops Stortford Urban District Council, £1,200 (September 10); Dover Borough Council, £11,000 (September 12). Street Improvements, etc.—Blaydon Urban District Council, £3,300 (September 7); Leigh Borough Council, £2,345 (September 7); Epsom Urban District Council, £915 (September 14); Withernsea Urban District Council, £2,000 for works of sea defence (August 31). Various.—Brighton Borough Council, £3,790 for workmen's dwellings (September 6); Epsom Urban District Council, £2,285 for fire station (September 14); Wallsend Borough Council, £8,000 for public baths, £2,000 for fire station, and £785 for chemical engine, motor fire tender, and escape (September 6); Leigh Borough Council, £2,142 for fire brigade purposes, £4,837 for Town Hall, and £647 for improvement of two bridges (September 7).

At an inquest held at Silverdale, Staffordshire, on a lady aged fifty-one, who resided alone and was found suffocated in bed the house being full of gas, a plumber stated that the gas pipe was broken at the junction of the bracket pipe and the main pipe, and the only explanation of the occurrence was that the breakage was caused by the building subsiding during the night. Other pipes in the neighbourhood had been broken owing to mining. There was no suggestion of suicide. A verdict of accidental death was returned.

* * *

During the leaping and trotting trials at Llangollen Agricultural Show, a wing of the grand stand, containing some hundreds of people, collapsed. Fortunately it was not a great height from the ground, and no one was seriously injured. The collapse was attributed to the occupants swaying forward to catch sight of the competitors in an interesting finish.

FOREIGN NOTES.

The Conseil Municipal of Amiens has just elected as Mayor, M. Antoine, architect.

* * *

A new society, "Les Amis de Bruges," has just been formed with the object of safeguarding the beauties of the chief town of Western Flanders, to preserve its historical character, not only in artistic and commercial aspects, but also in those of an educational and social character. The President, M. Canville Tulpinck, has congratulated the Municipality on its intelligent efforts for many years past in the conservation and reparation of the old public buildings. In future the society will actively support the Municipal Authorities in the work of preserving the old quarters and picturesque streets of the city, which in the exigencies of modern life are liable to be swept away. The society is about to acquire the curious old house at the end of the Place Van Eyck, regarded as one of the last specimens of fifteenth century architecture in wood. A tablet, commemorative of the fact, is to be affixed to the front of the house.

The Italian Minister of Public Works has approved of the extension of the Varese-Airolo section of the railway from Vintimillo to the Italian frontier, under the understanding with France. The construction of this extension will, it is expected, be completed in 1914.

* * *

The Technical and Art Sub-Committee for the monument to King Victor Emanuel II. has approved the proposition of Sig. Corrado Ricci in connection with the Palazzo Venezia. Sig. Ricci's idea is not to demolish, but to transform into a gallery the side of the court which forms an annex to the Palazzo. The sub-committee has requested Sig. Sacchi to call a meeting of the Royal Committee in order that a definite decision may be given on the matter.

A new Workmen's Compensation Act for New York State, which became effective on September 1, is probably, a "Times" New York correspondent states, the most advanced on the subject ever enacted in America. It makes the employer responsible for the acts of agents, employees, contractors, and sub-contractors, abolishes the principle of the voluntary assumption of risk by workmen, throws upon the employer the burden of proof of contributory negligence, fixes the scale of compensation for injuries in eight classes of specially dangerous occupations in which the plea of contributory negligence is not allowed. The law greatly increases the liability of the employer, and is also calculated to interfere with the business of unscrupulous attorneys, who prosecute claims for damages on contingent fees. One immediate result of the law is an increase of insurance rates by casualty companies by about 100 per cent.

Eighty-seven designs have been received for the monument commemorating the formation in 1865 of the International Telegraph Union, which is to be erected in the Place Helvetia at Berne. This monument follows that inaugurated last year to the International Postal Union. £8,000 has been set aside for the project by the Municipality. The International Jury of Assessors, presided over by M. Eugène Jost, architect, of Lausanne, includes M. Jean Injalbert, Professor at l'Ecole des Beaux-Arts, Paris; M. Emile Frey, Director of the International Telegraph Bureau, Berne; Professor Brener, of the Academy of Fine Arts, Berlin; Professor Helmer, sculptor, of the Imperial Academy of the Plastic Arts, Vienna; Sir George Frampton, R.A., sculptor, London; M. J. Honwai, of Budapest; Dr. Cuypers, architect, Amsterdam; Senor J. D. Ramalho Ortigoa, Director of the Ajuda Library, Portugal; M. Louis de Benoit, architect to the Imperial Court, St. Petersburg; and M. J. K. Liudberg, Professor at l'Ecole des Beaux-Arts, Stockholm. It is expected that the Jury will select the authors of half a dozen designs for a limited second-stage competition to decide the winner.

The old brown stone house at the corner of Fifth Avenue and Thirty-fourth Street, New York Ciy, will shortly be vacated by Messrs. M. Knoedler and Co., art dealers, who are erecting new premises on the site of the old Lotos Club, 556, 558, Fifth Avenue. This will enable Mr. Benjamin Altman, who owns the rest of the block, to pull down this old landmark and extend his building, which is some four stories higher, over the vacant site. Messrs. Knoedler and Co. are following the present movement of the New York art dealers, who are going north up Fifth Avenue.

The proposal to build a new bridge across the Hudson River to join Manhattan Island to New Jersey is about to take tangible form. Money was appropriated at the last session of the state Legislature for borings and the collection of general engineering data, and the borings are being made. It is not certain what site will be selected, but the probabilities are that it will be above 109th Street. The one which has been most favoured is the rocky point jutting out into the river from Fort Washington Park, at the foot of 179th Street, toward the Palisades on the far side. The river is narrowest there, a fact that was discovered by the American engineers in the Revolution, when they constructed a boom across it at this point, with the idea of preventing the British from passing up to Albany. It is thought that a bridge could be thrown across there for 10,000,000 dollars, a sum at least one-third less than it would cost elsewhere. The type of bridge has not been selected. Whether it will be the suspension or a cantilever, or even some other type, remains to be decided by the commissions after the data have been obtained.

COMPETITIONS.

Northwood and Ruislip Town Plan.

Conditions and maps in this competition are now available, and may be obtained from Garden Estates, Limited, 33, Henrietta Street, W.C. Designs must be sent in by November 15.

LIST OF COMPETITIONS OPEN.

SEPT. 10. SECONDARY SCHOOL, FOLKESTONE.—Competitive designs are invited from architects (being Fellows, Associates, or Licentiates of the Royal Institution of British Architects or members of the Society of Architects). Particulars, together with site plan can be obtained from A. F. Kidson, Town Clerk, Folkestone.

SEPT. 15. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 19. TOWN HALL, MAESTEG.—The Town Hall Committee invite competitive designs, etc., for the proposed alterations and additions (not exceeding in cost £3,000) to the Town Hall and Market Hall, Maesteg. Printed terms and conditions, etc., from the engineer, Samuel J. Harpur, Town Hall, Maesteg.

Oct. 1. ANTWERP. SCHEME FOR LAY-OUT OF SITE OF FORTIFICATIONS, ETC.—Premiums £1,000, £400, and £200. Conditions may be seen at Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C., or obtained from the "Commission d'études de l'aménagement de l'agglomération anversoise," Due du Jardin des Arbalétriers 57, Antwerp. Deposit 100 francs.

Oct. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., at a cost not to exceed £10,000. Particulars (deposit £1 1s.) of J. Parry Jones, Town Clerk, Denbigh.

OCTOBER 31, ETC. ROMFORD GARDEN SUBURB. Competitions in six classes for architects and in one class for builders for the best cottages, etc., erected in the Town Planning and Modern House and Cottage Exhibition, Gidea Park, to be held in June and July, 1911. Prizes amounting to £1,050. Particulars of the Secretary of the Exhibition, 33, Henrietta Street, London, W.C.

NOV. 15. TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan in the parishes named. Assessors: Sir Aston Webb, R.A., and Mr. Raymond Unwin. Premiums of £150, £100, and £50. Terms and conditions obtainable from the Company. Deposit, one guinea.

NO DATE. CHURCH, LLANDUDNO. Competitive designs are invited from architects who have practised for not less than five years in North Wales or in the City of Chester for the erection of a church for the West Shore District of Llandudno. A printed copy of the conditions of competition and necessary details, with a plan of site, will be sent to competitors on receipt of one guinea, which will be refunded on the receipt of bona-fide designs, or if the said plans and information are returned within fourteen days with a declaration that they will not be used for the purpose of the competition. Apply, the Rector, Llandudno.

Nov. 29. BANGOR (COUNTY DOWN). SEA-WATER BATHS.—The U.D. Council invite experienced architects to submit plans, specifications, and estimates for the erection of hot sea-water baths, at Pickie. Further particulars can be had on application to J. Milliken, Clerk to the Council, Town Hall, Bangor, Co. Down.

DEC. 1. DUBLIN. NEW PAVILION, ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK. Open only to architects practising in Dublin. Premiums £100 (to be merged), £30, and £20. Conditions on application to the Registrar.

DEC. 1. MANCHESTER. LAYING OUT OF THE BLACKLEY ESTATE. The Manchester Corporation invite architects and others to submit competitive plans, specifications, and estimates for the laying-out of their Blackley Estate. Plans of the estate, etc., from the City Surveyor's office, Town Hall, Manchester. Deposit three guineas.

SOCIETIES' REPORTS.

Northumberland and Durham Archaeological Society.

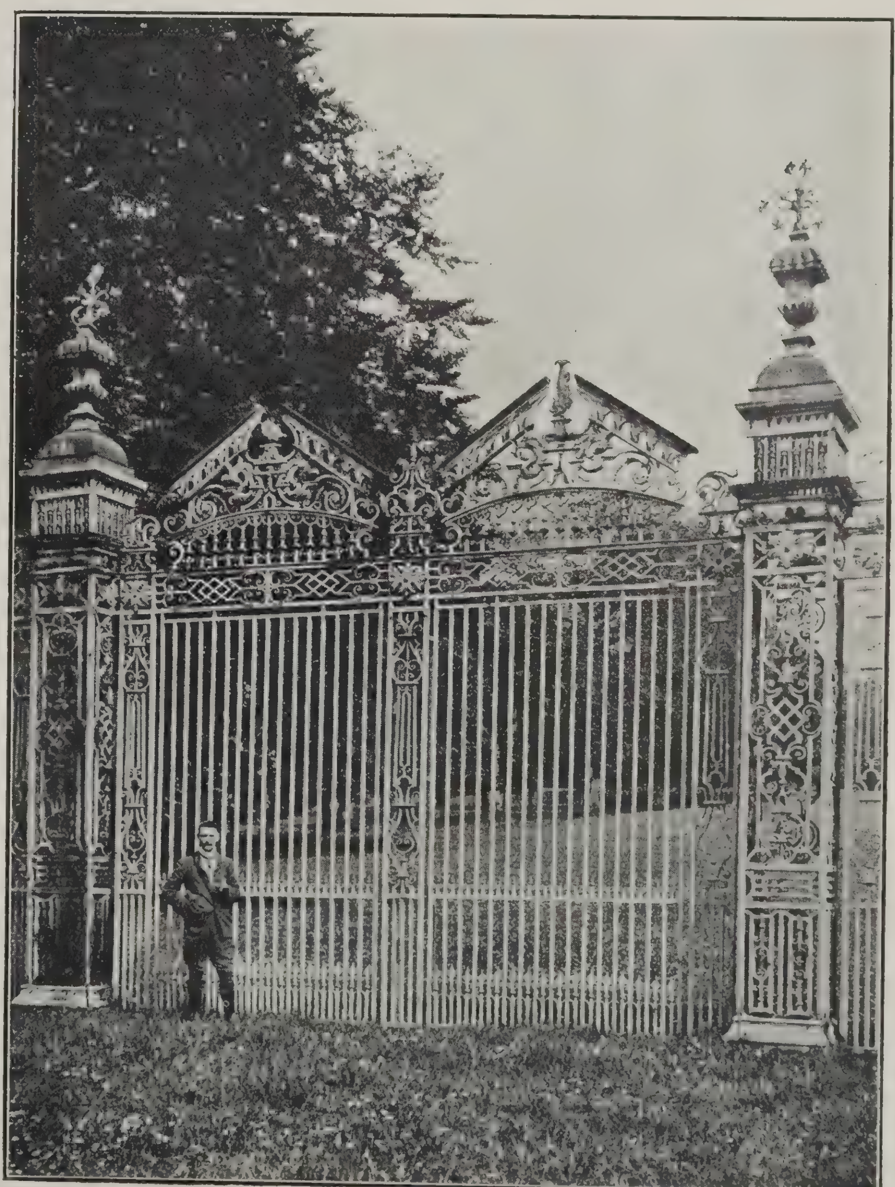
The Northumberland and Durham Archæological and Architectural Society had bad weather for their visit to Chester-le-Street and district. The party, numbering over 50, were conducted over the Church of St. Mary, Chester-le-Street, by Mr. W. H. Knowles, F.S.A., of Newcastle. Considerable interest was taken by the party in the effigies executed by Lord John Lumley. Mr. Knowles pointed out that these effigies were in reality fabrications, with the exception of two. These two, as a matter of fact, were not members of the Lumley family, but of the Fitz Marmadukes, which Lord John Lumley transferred from Durham in the reign of Queen Elizabeth. The party next journeyed to Lumley Castle, the seat of the Earl of Scarborough. Mr. C. H. Blair explained the armorial shields above the front gateway of the Castle, which was built by Sir Ralph Lumley in the reign of Richard II. These bearings include those of Richard II. and the Percy family. The spacious rooms were visited by the archæologists, and admiration was expressed at the ball room and the private apartments. Canon Greenwell gave the history of the Lumley family, and referred to the portraits on the walls. all of which were executed by Lord John Lumley, the maker of the effigies on the church at Chester-le-Street. The Canon pointed out, however, that these portraits were all fictitious. The fine collection of statesmen of Europe, and an original portrait of Shakespeare, obtained by this Lord John, were dispersed by a later holder of the title.

The Society of Architects.

The Society of Architects recently sent a congratulatory address to His Majesty King George V. on His Majesty's accession to the Throne, and the following reply has been received:—

Sir,—I am commanded by the King to convey to you hereby His Majesty's thanks for the loyal and dutiful address of the President, Council, and members of the Society of Architects expressing their congratulation on His Majesty's accession to the Throne. His Majesty has expressed pleasure at the beauty of the Society's address.

I am, sir, your obedient servant,
(Signed) Winston S. Churchill.
Home Office, Whitehall, 4th August, 1910.



A PANEL OF THE WROUGHT-IRON RAILINGS, LEESWOOD HALL, NEAR MOLD, NORTH WALES.

NEW BUILDINGS.

PROPOSED.

Banbury (Oxfordshire).—It is intended to commemorate the work of the late Dr. Parker, of the City Temple, as a preacher and author by erecting a Parker Memorial Institute on the site of the church that was the scene of his first labours.

Bingley.—The following plans have been approved :—Detached villa in Villa Road, and a pair of villas in Langley Avenue and Villa Road Bingley; alteration of and addition to workshop, etc., in Park Road, Bingley.

Birmingham.—A L. G. Board inquiry has been held with respect to an application by the City Council for permission to borrow £1,255 for the purchase of land for the purposes of Cannon Hill Park, and property in Brearley Street and Bacchus Road as sites for cottage baths. It is proposed to purchase a piece of land near Russell Road for the sum of £625. The site in Brearley Street contains 420 square yards, and the purchase money amounts to £255. The baths are estimated to cost £2,550, and accommodation will be provided for nine men and a similar number of women. The area of the site in Bacchus Road is 600 square yards, and the price asked is £375.

Blackburn.—Three sets of plans for a new council school in Ross Street have been prepared by the Borough Engineer, Mr. R. W. Smith-Saville.

Grimsby.—A L. G. Board inquiry has been held concerning the application of the Corporation to borrow £840 and to appropriate certain land in Victoria Street, for the purpose of extending the public library. Mr. J. G. R. Baxter, assistant borough engineer, has submitted plans and estimates of the scheme.

Kirkcudbright.—It has been decided to demolish the old church in the parish of Colvend, and to erect a larger building on an adjacent site. Built in 1771, Colvend Church presents that barn-like appearance which is common to many eighteenth century places of worship. Convenanting traditions still linger in the neighbourhood, and the congregation are one of the few in the south of Scotland which continue to maintain a precentor.

Manchester.—An inquiry at the Manchester Town Hall has been held on behalf of the L.G. Board, respecting the City Council's application for sanction to borrow £7,600 for works of private street improvement, £1,102 for works of sewerage in School Lane and Catterick Road, Didsbury, and £900 for the reconstruction and extension of the bridge over the Chorlton brook, in Brook Road, Chorlton-cum-Hardy.

Portobello (Scotland).—The Edinburgh Dean of Guild Court has granted warrant to the Church of Scotland Home Mission Committee to erect a church on a site in Rosefield Place, Portobello. The building will consist of nave with side aisles, north and south transepts, choir and choir aisles. At the west end will be a vestibule giving access to the central aisle and the aisle passages. Over the vestibule will be a gallery giving accommodation for 112 people. On the north-west angle will be a tower 23 ft. square, and 82 ft. to the parapet, terminating with a copper-covered spire. The church will contain 840 sittings. At the east end will be a hall, and between it and the church will be placed a session-room and vestries. The style of architecture will be fourteenth century Decorated. Outwardly it will have redstone dressings and natural faced rubble, and the external roofs will be covered with green-coloured slates. The architect is Mr. G. Mackie Watson. Warrant has also been granted to W. Birnie Rhind for the erection of a studio at Pitt Street; and another to David Waldie for a tenement at the corner of Roseburn Place and New Street.

Retford.—A criminal lunatic asylum is to be built near Retford at a cost of about £130,000, the contract for the buildings having been already placed by the Government. It is proposed to construct a light railway from the Great Central line to the asylum works.

Stockport.—The board of Guardians have appointed a committee to prepare a scheme for the separate accommodation of imbeciles. There are now some 160 imbeciles in the workhouse at Shaw Heath, and it is proposed to build a new ward at Stepping Hill for their exclusive accommodation.

Tardebigge (Worcestershire).—A new institute is about to be erected at the expense of the Earl of Plymouth. The building, which will be centrally situated on the main road from Bromsgrove to Redditch, will comprise a large hall capable of seating 250 persons and suitable for public meetings, entertainments, etc., and a billiard room, reading room, and library. There will also be provision made for technical instruction.

Warrington.—The Education Committee has approved the building of a new council school in Evelyn Street, to cost £11,676 and accommodate 1,206 scholars, the cost per head being £9 6s. 9d. This includes playgrounds, caretaker's house, cooking-rooms, and handicraft centre. A site for another council school in Winwick Road has been approved. The School of Art is also to be extended, and competition designs are shortly to be invited.

IN PROGRESS AND COMPLETED.

Ballymacarrett (Ireland).—New schools from the design of Mr. J. J. M'Donnell, J.P., have just been opened.

Chesterfield.—The Corporation Theatre, which has been altered and added to at a cost of £2,000, is now reopened. The improvements include new refreshment rooms, the provision of a well for the orchestra, and some minor alterations. The whole of the work has been carried out under the supervision of the Borough Surveyor, Mr. Vincent Smith. The principal contractors were as follows :—Mason's work, Mr. Geo. F. Kirk; painting, decorating, etc., Messrs. Eyre and Sons, Ltd.; upholstering, Messrs. White and Sons, all of Chesterfield. The whole of the building is illuminated with electric light.

Dawdon.—The erection of the new Anglican Church of St. Hilda and St. Helen, the future parish church of Dawdon, is now proceeding. The cost, it is estimated, will be about £5,500. The church will be in the Norman basilica style of architecture, with an apse. It will be built of Lincolnshire faced bricks from Burton-on-Humber. The nave will consist of an arcade of six semicircular arches on either side, and there will be two side aisles, chancel, etc. The length over all, including the chancel, will be 130ft., and the width 53ft. 4in. The nave will be 81ft. long by 35ft. wide, and the side aisles 6ft. 6in. wide. The church was designed by Mr. C. Hodgson Fowler, diocesan architect, and is being erected by Messrs. John Clark and Sons, of Ryhope.

Gourock.—A new aisle to St. Bartholomew's Episcopal Church has just been built to the design of Mr. H. D. Walton, architect, Glasgow. Additional accommodation has thereby been provided for about 150 persons. Advantage has also been taken of the alterations to enlarge the organ, the work having been carried out by Mr. Andrew Watt, Glasgow.

Keadby.—A L. G. Board enquiry has been made into the Great Central Railway's proposal to erect a new bridge across the Trent. The existing bridge has been in use for nearly fifty years, and the railway company have grave doubts as to its suitability for further service. Considerable diversity of opinion is manifested—some contending that the new bridge should also provide facilities for road traffic. To this view, however, the railway company takes exception, it having been indicated that the additional cost would have to be defrayed by them. Another argument against the erection of the proposed bridge is that it would form a hindrance to navigation. The enquiry has been concluded.

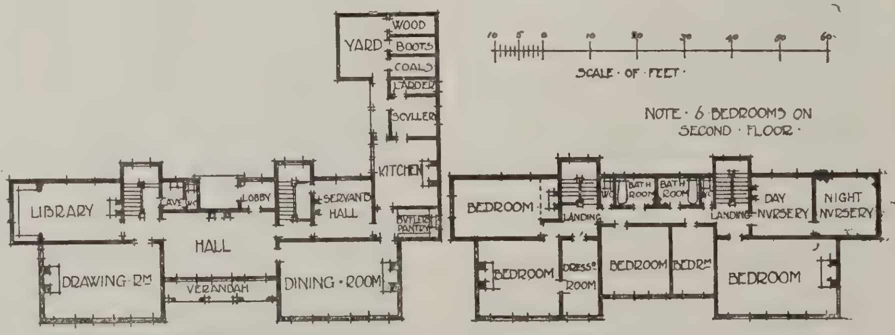
London.—The new block of workmen's dwellings now being erected in City Road by the bequest of the late Mr. W. R. Sutton, the carrier, will probably be opened about January next. The building is divided up as follows: Two four-room tenements, 9s. to 10s. a week; 94 three-room tenements, 7s. to 8s. a week; 123 two-room tenements, 5s. to 6s. a week; 65 one-room tenements, 2s. 6d. to 3s. 6d. a week. In each case the accommodation includes a scullery, in which a bath is fitted; and there are 10 shops, 32 barrow sheds, and 30 perambulator sheds.

London, N.—The new variety theatre for the Moss Empires, Ltd., which has just been completed at Islington, has, it is stated, involved a sum of about £45,000. The theatre occupies a site near Finsbury Park Station, and provides accommodation for 3,000 persons.

Leyton (Essex).—The Town Hall extension scheme has been completed, at a cost of about £12,000. The scheme included the rearrangement of the offices in the present Town Hall, and the erection of an addition, which comprises a Council Chamber, two committee-rooms, and various offices. Mr. William Jacques, A.R.I.B.A., London, was the architect, and Messrs. North Bros., Stratford, the contractors.

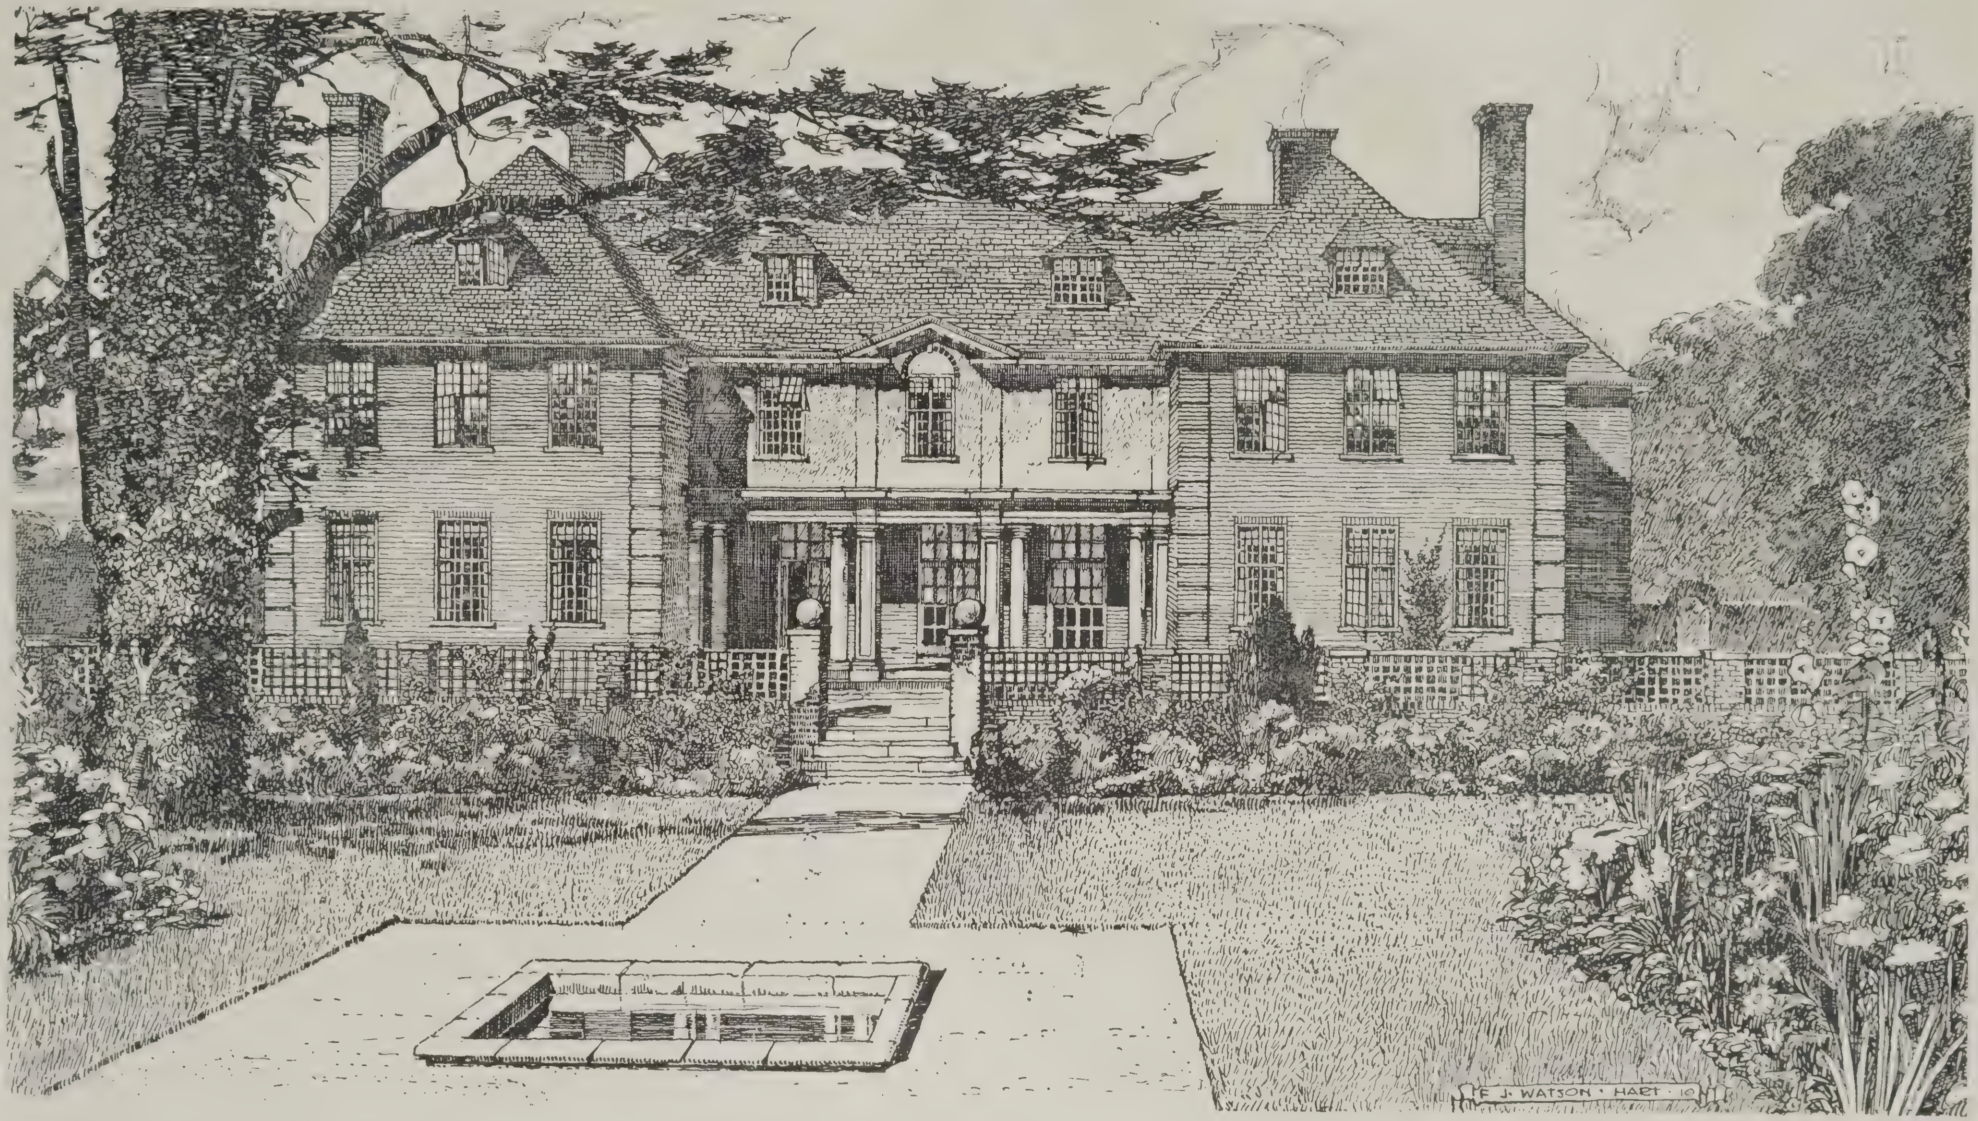
London.—When the Adelphi Theatre is reopened in October, it will have a new auditorium and entrances. The vestibule is being carried back three times the distance to which it used to extend, and will be rebuilt in marble and oak. The staircases at present leading from the centre of the hall to the dress circle and upper circle are being removed. A separate entrance for the upper circle will be provided from the Strand, and for the dress circle, foyer, and boxes a staircase leading from the further end of the vestibule will take the place of the old and narrow ascent. A semicircle of boxes will be built round the back of the dress circle, and the stalls will be provided with chairs upholstered in rose pink. The alterations are costing upwards of £15,000.

Mundesley (Norfolk).—At the church of All Saints, Mundesley, the Dean of Norwich has dedicated a new vestry, which has recently been erected on the northern side of the edifice on the original site of the long-fallen tower. Mr. S. A. Randall is the builder, and the work has been carried out from designs by the diocesan surveyor, Mr. A. J. Lacey, of Norwich. The greater part of the chancel is still in ruins.



· GROUND · FLOOR · PLAN · FIRST · FLOOR · PLAN ·

HOUSE NEAR WANTAGE. FAIR AND MYER, ARCHITECTS.



This house is situated about one and a half miles from the town in a plantation, and the garden has been formed by clearing and cutting an opening, so as to give a distant view of the hills from the reception room windows. The house is built of rough brindled stocks with brushed joints, red quoins, oak frames, and clear leaded windows. The Verandah and recessed portion are plastered and finished cream colour. The Roof is tiled with old tiles. Internally the hall is panelled in oak with enriched plaster ceiling: the drawing room is "Adam" in character, and the dining room has panelled walls painted green. The library has simple oak woodwork with beam ceiling. The terrace walls are in rough brickwork with oak trellis between piers.

Royal Academy Exhibition, 1910.

HOUSE NEAR WANTAGE: GARDEN FRONT. FAIR AND MYER, ARCHITECTS.

Newquay (Cornwall).—The new church of St. Michael, which is now in course of erection, is estimated to involve a sum of between £11,000 and £12,000. Mr. J. N. Comper, who is executing the Bunyan window for Westminster Abbey, is the architect.

North Rigton (Leeds).—The Countess of Harewood has laid the foundation-stone of the new church, which is in course of erection at a cost of about £2,000, but at present it is intended to erect only the nave and tower. Messrs. William Hill and Son, of Leeds are the architects, and their designs provide for a stone structure, with simple detail. The nave will be 43ft. in length and 23ft. wide, providing seating accommodation for 116 persons. A tower, 40ft. in height, will occupy the west end, having a small baptistery beneath. Both the site and the stone used for the building were given by the Earl of Harewood. The stone for the walls comes from the Crag quarries, and the ashlar from Harewood. The roof and the seating will be of oak. Mr. J. T. Wright, of Leeds, is the builder.

Oldham.—The Corporation has formally opened a new tramcar shed and works at Hollinwood, which have cost some £22,760, and occupy about 4,180 square yards. Increase in traffic has, in the main, rendered necessary the new building.

Old Trafford.—The new public elementary school for infants at Seymour Park, Old Trafford, which was recently opened, has been erected in Northumberland Road, Old Trafford, with the main elevation facing the Park. The accommodation provided for 400 infants is divided between eight class rooms, each holding 50 children, and grouped round three sides of a central hall.

Penmaenmawr.—The foundation-stone of a new parish hall has just been laid. The site is on the Vicarage ground, between Conway Road and St. Seiriol's Church. The building will consist of a large class-room, and smaller rooms on the ground floor. Over the smaller rooms will be a large room to seat between 320 and 350 persons.

Rosskeen.—A new church built by the dispossessed section of the Free Church congregation of Rosskeen has just been opened. The building is Gothic in style, erected from plans prepared by Messrs. Maitland, architects, Tain. The church is built to accommodate 400 persons, and its cost is about £1,300.

Slough.—The Urban District Council has approved the following plans:—House in Chalvey Road; four houses in Ledgers Road; two houses in Martin's Road; additions to shop front in High Street.

Stannington (Northumberland).—The chief stone for a new wing of the Philipson Sanatorium at Stannington for consumptive children has been laid by the Lady Mayoress of Newcastle. The Lord Mayor (Sir W. H. Stephenson) recently gave £4,000, which will enable the sanatorium to be completed in accordance with the original plan. The addition will comprise four wards, with accommodation for fifty children. Mr. D. M. Spence, of Shotleybridge, is the architect.

Starbeck (Harrogate).—The new church of S. Andrew, Starbeck, which was recently consecrated, is designed in the late Decorated style. It consists on plan of a nave of five bays, 79ft. long and 24 ft. wide, having north and south aisles 9ft. 8in. wide; chancel 36 ft. long, with chapel on north side 27 ft. long and 14ft. 6in. wide. The west window consists of five lights, with a fine tracery head. A bell turret, 60ft. high, is situated at the north-west angle of the nave. The nave arcade consists of octagonal piers resting on moulded bases, and having hollow splayed arches which spring direct from the piers. A tall clerestory of two-light, tracery-headed windows, is formed over the arcades. On both sides of the chancel is built a lofty arch, opening on the south side into the organ chamber transept, and on the north side into a portion of the chapel. The roofs are of open timber construction, and the interior is principally lined with stone. The total accommodation of the church, including chapel and choir, is 580. The work has been carried out from the design of Messrs. Austin and Paley, architects, Lancaster, by the following contractors: Mason, Mr. I. Dickinson, Harrogate; joiner, Mr. J. Tomlinson, Holbeck; slater, Mr. J. Shepherd, Harrogate; plasterer, Mr. R. Fortune, Harrogate; plumber and glazier, Mr. J. Woodhead, Wakefield; electric lighting, Mr. R. Falshaw, Harrogate; heating, Messrs. Saunders and Taylor, Manchester.

Sutton-in-Ashfield.—The new higher elementary school, the first one to be built in the county, has just been opened. It provides accommodation for 320 pupils, and the main building includes a laboratory. The total cost is between £9,000 and £10,000.

Trefriw (Wales).—The new Calvinistic Methodist Chapel, which has just been completed, including the site, together with five cottages, has cost altogether £7,500, the building and the organ costing £6,000. The chapel is 45ft. wide by 53ft. long, and provides, with the gallery, seating accommodation for about 550 persons. At the rear of the chapel are placed the various vestries, classrooms, etc., and above these, on a level with the gallery and opening direct from the high ground at the rear of the site, is a schoolroom with accommodation for about 225 persons. The building is fourteenth-century Gothic in design. The external walling is built with selected stone from the Trefriw quarry, relieved with "Grinshili" freestone dressings. The work was carried out by Mr. Joseph Hayes, contractor, Shrewsbury, from the design, and under the superintendence of Messrs. Dickens-Lewis and Haynes, architects, Shrewsbury.

Troon.—The foundation-stone of the new Roman Catholic church in course of erection in St. Meddans Street, has been laid. The estimated cost of the completed buildings is £10,000.

Wellington.—The new swimming and private baths in Walker Street have just been opened. The building has cost £2,500, and comprises a large swimming bath, 25 yards by 7½ yards, nine slipper baths, shower bath, caretaker's house, etc.

Whalley.—The Asylum Visiting Committee, in a report to the Lancashire Asylums Board, state that they have received 15 tenders for the erection of the main buildings in accordance with the plans and specifications approved by the Home Secretary. The tender sent in by Messrs. R. Neill and Sons for £356,000 has been accepted. On examination, certain miscalculations were discovered amounting to £154. Messrs. Neill and Sons agreed to reduce their original tender by that amount, and a contract is being entered into with them for due performance of the work at the sum of £355,846. Seven engineering firms were invited to send in schemes for the engineering works, comprising boilers, heating, and ventilating apparatus, hot and cold water supply, and fire service. The scheme of Messrs. Ashwell and Nesbit, involving a cost of £30,408, has been accepted. The cost of this work is included in the tender of Messrs. Neill and Sons.

Wolverhampton.—The new council school, which has been erected at the rear of Graisley Hill, has just been opened. The building stands in two acres of ground, of which two-thirds is set apart for recreation purposes, and has cost, with the land, £16,000. The new building, which is of red brick with tiled roofing, is divided into two blocks, and will accommodate 1,100 children.

Worksop.—A new Phthisis Hospital in connection with the Worksop Workhouse Infirmary, at Kilton Hill, has been opened by the Right Hon. F. J. S. Foliambe. The new building, which is of brick, has been built at the rear of the Infirmary on high ground to the north of the town, and is connected with the Infirmary by a covered corridor, the cost being about £1,088. Mr. Frederick Hopkinson, Worksop, was the architect.

Wrexham.—The new church of St. John Baptist, Wrexham, was consecrated recently by the Bishop of St. Asaph. It forms the third instalment of the church extension scheme set on foot three years ago. A new church house and institute was opened last autumn, a school church at the beginning of this year, and this new church marks the completion of three out of the four church buildings which the committee reported to be required. The cost of the buildings exceeds £15,000. The new church is a stone building in Perpendicular style, having seating accommodation for about 500, and has a tower and broach spire 120ft. high. There is no chancel arch, but the choir and sanctuary are separated from the nave by a carved tracery screen of oak. At the east end there is a very fine window of seven lights and tracery. The subject is the Te Deum. The figures are all designed by the late Sir Edward Burne-Jones, and the window has been carried out by Morris and Co., of Merton Abbey. The church was designed by Messrs. Prothero, Philpott and Barnard, architects, of Cheltenham, and the builders were Messrs. Collins and Godfrey, of Tewkesbury.

Yarmouth.—As a memorial to the late King, Lord Claud Hamilton, M.P., opened recently the new King Edward children's ward, which has been added as a wing to the hospital. This addition to the institution, including the new nurses' quarters and other alterations, etc., has cost about £3,300.

York.—The second section of the York Central Mission, comprising school premises and lecture-hall, has been opened. The school, which faces Swinegate, with three class-rooms and a kitchen, is on the ground floor and the lecture hall on the first floor, each providing accommodation for 220. They are heated by low-pressure hot-water pipes and radiators, and lighted by electricity. With the opening of these rooms the whole of the scheme—costing about £4.500—has been completed. Mr. C. H. Channon, F.R.I.B.A., of Malton, was the architect, and Mr. C. Martin, of York, the contractor.

CONCRETE FARM BUILDINGS FROM A SANITARY STANDPOINT.[*]

BY S. CUNNINGHAM, JUN.

Requirements for the sanitary construction of farm buildings make concrete and cement the most useful materials for floors and walls and even for roofs and ceilings when expense does not prohibit their use. Most Boards of Health which undertake to regulate the production of milk sold under their jurisdiction require or advise the use of cement for floors in cow stables and specify also that the walls and ceilings must be tight, clean, and free from dust-catching surfaces. This evidently suggests the use of cement or hard plaster finishes. At present stables are usually built of wood, but concrete in block or cast in forms is being used more each year and there is already a large number of barns scattered throughout the country which show in a highly developed way the best uses of concrete. The fireproof and permanent qualities of this material are powerful inducements of themselves towards its use. The ease with which it may be kept clean, the good health of the animals stabled in concrete buildings and the possibility of securing clean milk with a minimum of labour all increase the weight of argument in its behalf.

In floors, concrete shows practically no wear from use; it is watertight, non-absorbent and sanitary and if sufficient bedding is used it makes a satisfactory material for animals to stand and lie upon. When the floor is upon earth fill, it is advisable to put a layer of sand 6in. or more thick under it especially in damp locations, and to place under the stalls themselves a waterproofing layer. The latter is easily made by putting down two or three layers of tar paper on a base of cement, brushing it well with coal-tar pitch. This prevents dampness from drawing up through the concrete and makes a warmer floor. The waterproofing should be covered with a thickness of concrete and cement surfacing of at least 3in. for cow stalls and 4in. for horse stalls. It is possible to use less than this for cow stalls (but not advisable in horse stalls) by putting down metal lath over the waterproofing, nailing through to the concrete beneath to hold the lath firm, then plastering the lath with a heavy coat of cement mortar mixed 1 to 2, 1in. thick, or more. All stall surfaces and passages to be used by animals should be left rough, finished with a wooden float, or a float covered with carpet.

---

[*] Paper read before the National Association of Cement Users.

Many farmers are prejudiced against a concrete floor; they think that it is cold, causing stiffness and rheumatism in stock and udder troubles in cows. If sufficient bedding is used, this objection is removed. The good points of a concrete floor outweigh all supposed disadvantages. If a wooden surface is preferred for the stalls, a platform may be made of 2in. oak, chestnut, or spruce, creosoted to prevent absorption of urine. The platform should be built in sections, one or two for each stall, set in a pan formed of concrete so as to be readily removable for cleaning or renewal. An excellent floor may be made of the creosoted wood paving blocks, such as are used for street paving. They are about 3in. thick and set with the grain vertical on a concrete base, and hot asphalt poured on to fill all cracks. Asphalt softens less from animal heat than coal-tar pitch, and does not work out of the joints to stick to the hide of the animals. There are some special floors that are good. Asphalt, mixed with granulated cork in a layer about ¾in. thick, makes a floor that is warm and gives a good foothold. Many of the patent floors are either cold or those made with a mixture of sawdust absorb the urine, and swell and come up from the concrete base; even those that stand well an occasional wetting will not stand the continued action of the urine.

Feed mangers in front of the cow stalls should be low and of just sufficient depth to allow also of watering the cows. Six inches is deep enough. Watering in this way at regular periods has been proved the best for cows. They drink more, and at more suitable intervals than when they have water always before them in individual drinking pots, which are, besides, very difficult to keep clean. It is often impossible to turn a large herd out to water from a trough in the yard, and the continuous manger into which water may be admitted from a large hydrant forms an easy and cleanly method of watering. The water being shallow and the mangers the temperature of the stable, the chill is taken off the water even in severe weather, while the water in a yard trough, unless special means are taken to warm it, is often too cold for the cows to drink deeply. The low mangers offer the advantage of feeding practically on the floor. The passage in front should be as high as the front of the manger, so that any feed thrown out by the cows may be easily swept back within their reach.

The stalls are made short enough (the length depending on the kind of stock) to have the droppings from the cows fall in the gutter, which should be about 16in. wide and 8in. or 10in. deep, enough so that when the cows lie down they will not get foul. The stalls should pitch not more than 1in. to 1½in. to the gutter. Too much pitch brings the weight of the calf and udder too much on the hind legs.

All feed passages, mangers and gutters should have a smooth, hard trowelled finish, easier to keep clean than a float finish.

Details in Concrete.

Concrete partitions have been used between stalls both for cows and horses, but iron pipe cow stalls are better, with metal stanchions to confine the animals. For horse stalls, partitions built with iron posts and ramps and 2in. by 8in. yellow pine slats, separated about 1in., are very stiff and give good ventilation, making them cool in summer. Horse stall floors should be treated as for cow stalls. They should pitch about 2in. towards the gutter. The gutter in this case should be very shallow, not over 1½in. deep, 16in. wide, and uncovered. There will be more wear on horse stall floors, so they should be laid more carefully, with this fact in view.

Where the floors join the walls, and in fact all interior angles in the stable should be coved or rounded on a 3in. radius to prevent corners for the collection of dirt. This seems a small detail, but it is one that makes a great difference in the cleanliness of a stable.

Concrete in many forms has been used for walls. The object to be attained is a hard smooth wall surface, insulated as well as possible from changes of external temperature. It is, of course, not difficult to prevent moisture coming through the outside, but condensation of moisture inside is more difficult to avoid. Concrete block with air-spaces, cored reinforced walls, and solid walls, furred with wood or metal and finished with plaster on metal lath, or lined with plastered partition tile or concrete block with a space between the two walls, are means used for insulation. Dampness in a stable is very often a sign of poor ventilation. A cow gives off from the lungs and skin from 8lbs. to 10lbs. of water per 24 hours, which must be removed to prevent the air from becoming saturated. In such an event, if the wall surfaces are but slightly colder than the dewpoint or condension temperature, water will form on them and under bad conditions there will be dripping. Fortunately, the amount of air required for healthful condition of breathing is in excess of that necessary to remove the moisture except in certain conditions. When warm, moist weather succeeds much colder temperatures the walls do not respond immediately and condensation occurs. If the air space in the walls is filled with chopped straw, sawdust, or planer chips, the insulation is improved. In wooden frame structures with inner walls of hard plaster on lath, condensation takes place unless the walls between the studs are filled as above noted, and even smooth wooden sheathing, painted or varnished, becomes moist, though it is not so apparent. The objection, then, is not one that holds against concrete alone.

Ventilation Must be Thorough.

This subject of ventilation is very important, and definite means should be provided to insure a proper circulation of air. The old farm buildings which were scarcely more than rough sheds were full of cracks through which air could pass. Modern concrete barns leave no such chances for haphazard ventilation, and with forty cows in a barn of 20,000 cubic feet capacity, each cow requiring five or six times the amount of air necessary for a man, the ventilation must be positive and adequate to make conditions healthful. It has been the usual experience, where condensation was taking place, that the circulation of air was insufficient for the health of the animals, due to the ventilators being kept closed. There are several good systems of natural ventilation, and no barn should be constructed without one of these, or other proper means to supply fresh air. In northern climates the barns should be made small; about 500 or 600 cubic feet capacity per animal is about right. Such a building is easier to keep warm and yet is large enough to allow proper ventilation without causing severe draughts. The ventilating flues may be built of concrete, tall enough to act on the principle of a chimney and to cause circulation by difference in weight of the column of warm air within and the cold air outside.

Concrete in Small Buildings.

For piggeries the use of cement in construction is as advisable as for stables. They are much more likely to be neglected and allowed to become foul, and a concrete finish is so easily washed down that there is no excuse for any such condition. Pigs are liable to contagious diseases, and a building that can be hosed out and disinfected, and that has no absorbent materials or cracks to harbour bacteria can be used again with no danger of the infection spreading. This applies as well to cow stables.

Almost all large milk farms depend in a great degree on ensilage for food. A concrete silo is equal to the best that can be built for storing ensilage. The proper preservation of ensilage depends on keeping it packed tight to exclude the air, with smooth walls, so that as the ensilage settles it does not loosen at the walls to admit air there. Structually, concrete silos are practically everlasting. The acids existing in the fermented juice of the corn attack the surface to a very slight degree only, and concrete walls, either solid or cored, prevent the freezing of ensilage better than a wooden stave silo, the form most commonly used. The freezing not only spoils that part of the ensilage lying within a few inches of the wall, but by causing the frozen ensilage to cling to the wall, the even settlement is interfered with and part of the rest spoiled by the admission of air.

For poultry houses, concrete makes a warm, tight building that will exclude rats and other animals preying on chickens, and that can be kept clean, to the prevention of lice. The floors in laying house pens should be made 6in. below the levels of the door sills and filled with cut straw or gravel for scratching. This can be renewed as often as necessary to keep the floors clean.

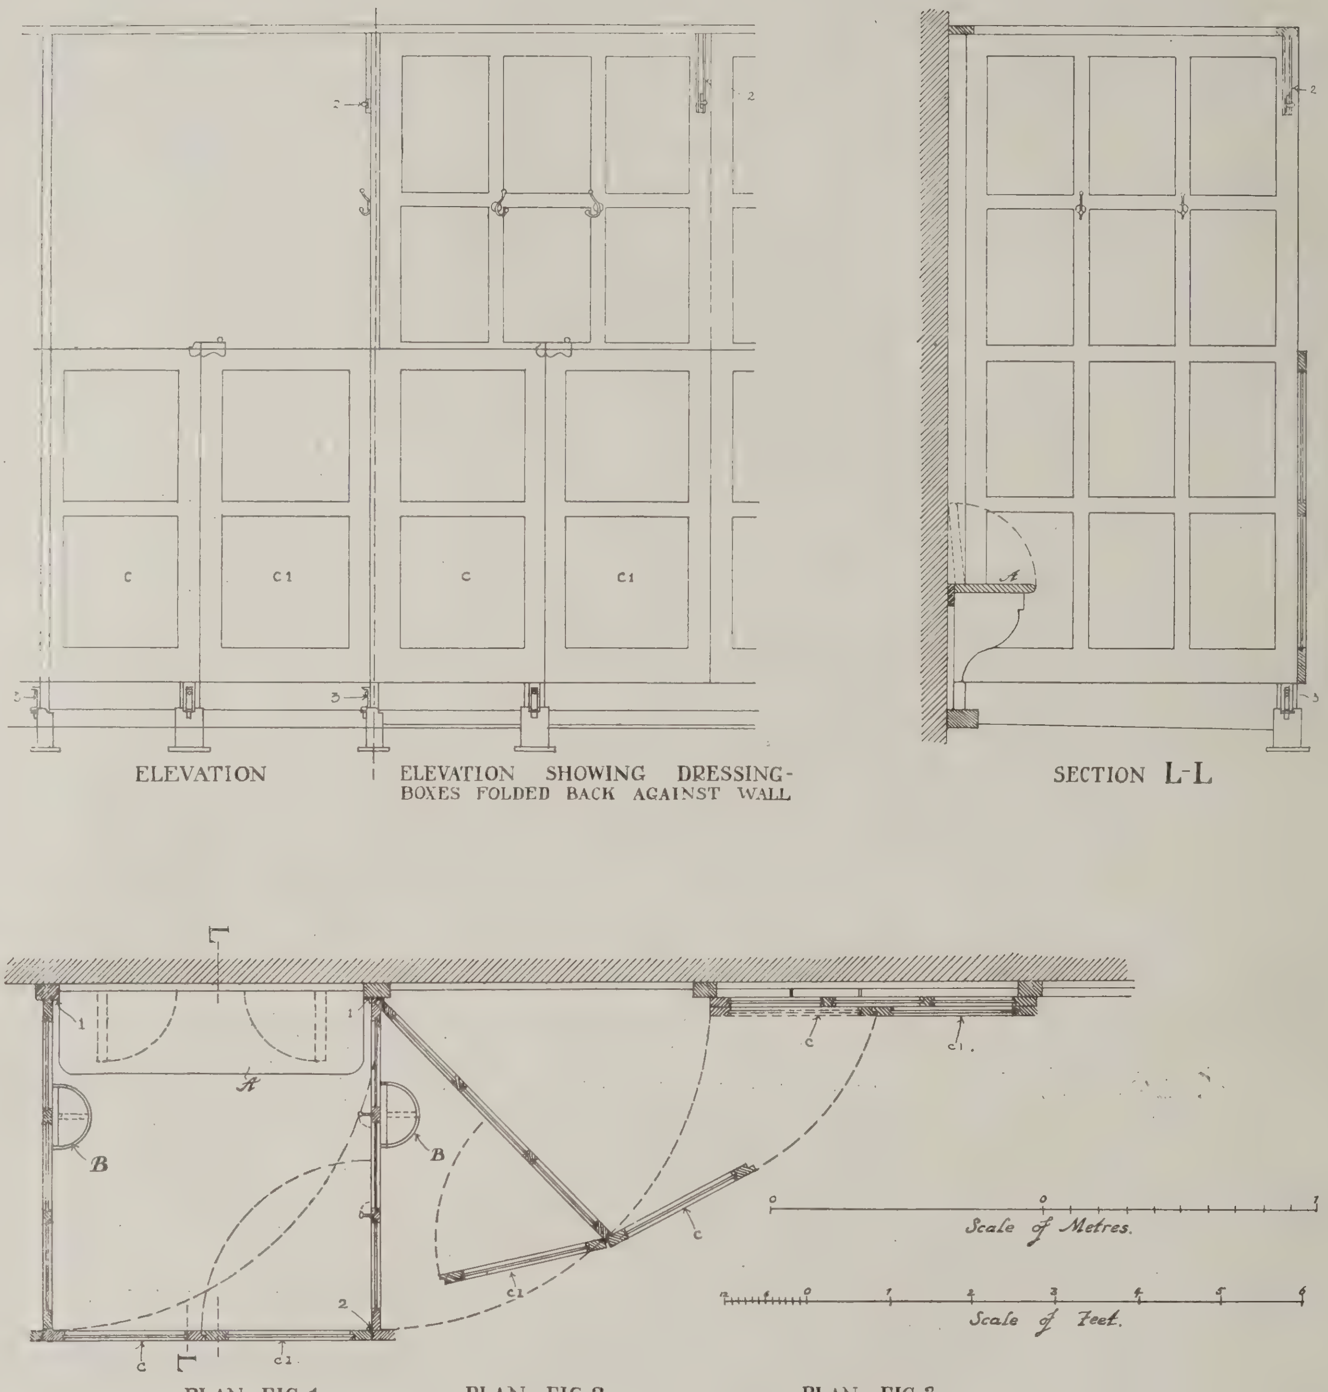
When manure is stored and not spread on the fields as soon as produced, a tight pit, covered or uncovered, is necessary to prevent the leaching away by the weather of the soluble parts of the manure, which are the most valuable as fertilizer. Concrete offers an excellent material of which to construct such pits. The floors may be pitched to a sump pit in one corner and the liquid pumped out and applied to the fields, using a sprinkling cart for this purpose.

Concrete Best for Dairy Buildings.

The production of clean milk requires the best sanitary conditions in the buildings in which the milk is handled as well as in the cow stable where it is produced. The extensive use of concrete floors and smooth plastered walls with coves in all angles will make such a dairy easy to keep clean but offers no particular requirements in the way of sanitary design. In this connection, however, it has been found that wooden soled shoes offer a much better way of keeping the feet of the workers dry and warm than do rubber shoes, which are heavy and unhealthful and wear out quickly on the concrete floors. The use of live steam and hot water from hose-bibbs offers an increased advantage in keeping such buildings clean and sterile.

For greenhouses, hotbeds, and wherever wood in contact with earth has been found to rot out, concrete has been substituted with the expected advantages. Tables in greenhouses can be easily designed and built of it, making them permanent and avoiding a large item of expense in renewals. No objection has been discovered to its use in this way from any unfavourable action on plant life. In fact, it forms a better protection than wood from possible variations of temperature.

The fact that concrete can be kept clean more easily than any other material in common use is its greatest recommendation for its use in farm buildings. The realisation that health depends to a very great degree on cleanliness is as true for farm stock as it is for mankind. Good labouring help is difficult to obtain on most farms, and anything that, like concrete, contributes to the reduction of labour necessary to keep the surroundings clean is bound to grow rapidly in favour on that score alone, especially since no valid objections can be substantiated to its use in connection with stock or farm products.



ELEVATION

ELEVATION SHOWING DRESSING-BOXES FOLDED BACK AGAINST WALL

SECTION L-L

PLAN. FIG. 1

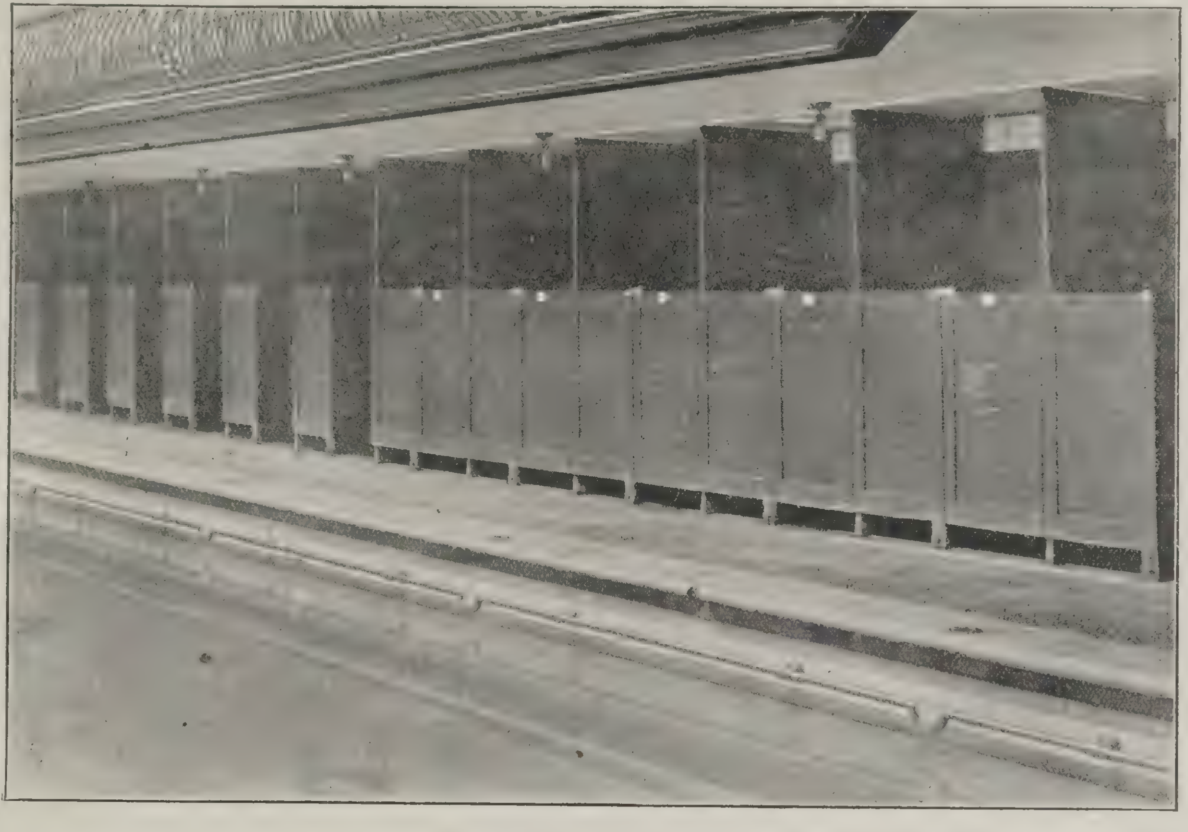
PLAN. FIG. 2

PLAN. FIG. 3

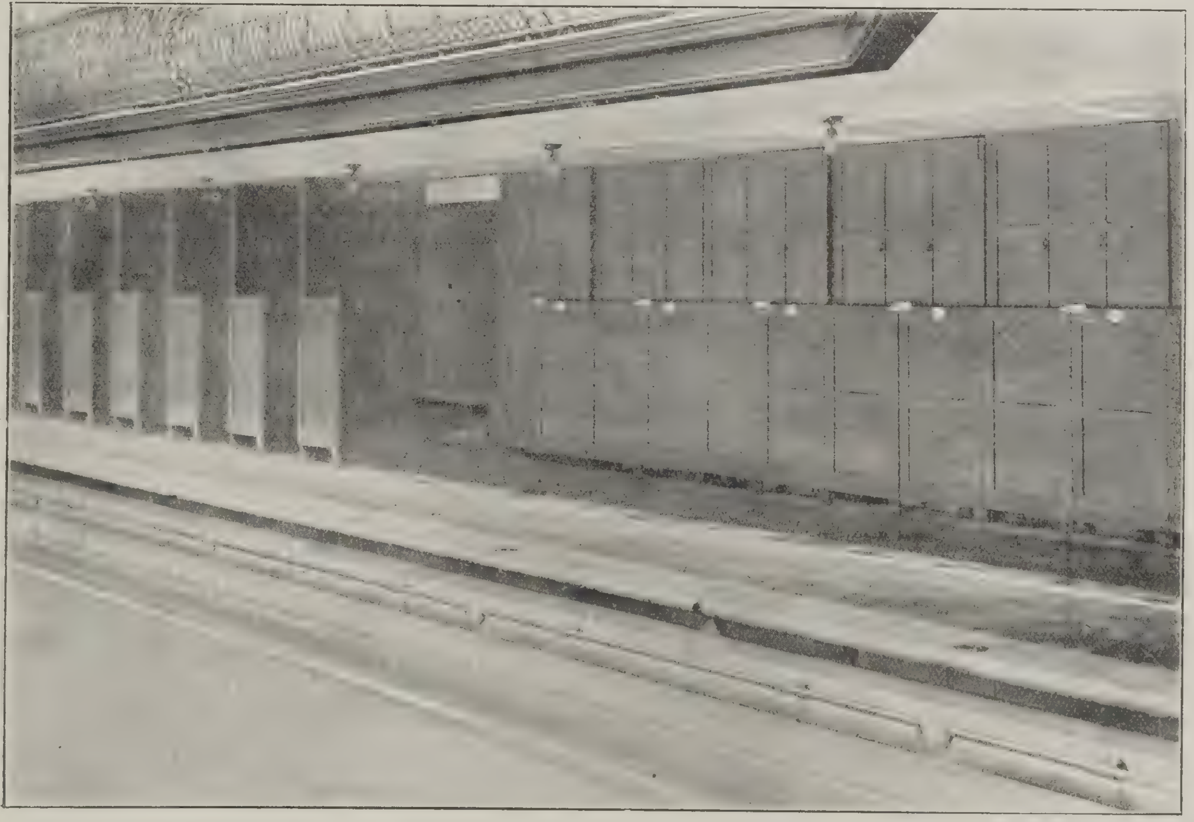
Fig. 1 shows the dressing-box in its normal position, the partition (which is hinged at 1) being held at the front by a bolt (2) at the top, and another bolt (3) at the bottom fitting into a gunmetal shoe let into the floor. The shoes are removable. When it is desired to alter the boxes the bolts are withdrawn and the partition pushed inwards: this is the position shown in Fig. 2. Fig. 3 shows the final position. Each partition carries the front half C of one box (which is bolted at the bottom) and the door C1 of the adjoining box, and both are hinged on the same side, C covering the thickness of the partition and C1 butting against C. At Hoxton the boxes are made of teak, and it is desirable that they should be so made where it is proposed to obtain a licence from the London County Council for using the bath hall as a place of entertainment.

COLLAPSIBLE DRESSING-BOXES, HOXTON PUBLIC BATHS, PITFIELD STREET, LONDON. N.

A. W. S. CROSS, M.A., F.R.I.B.A., ARCHITECT.



View showing boxes in position.



View showing boxes folded back against the wall.

Swimming-baths are frequently covered over with a temporary floor during the winter months, so that the hall may be used for entertainments. The value of these collapsible dressing-boxes will, therefore, be at once apparent. The idea was suggested by Mr. E. J. Wakeling, Chairman of the Baths Committee of the Shoreditch Borough Council. It will be seen from the drawing reproduced on the opposite page that the boxes are held normally in position by bolts at top and bottom, and that they can be folded back against the wall when required, forming excellent panelling and affording extra floor space. At Hoxton the gallery comes down on to the boxes, which makes it difficult to obtain a satisfactory photograph; but the above views, seen in conjunction with the drawing, will show how the folding back is effected.

BUILDERS' NOTES.

Scottish System of Contracting. With reference to the note on the English and Scottish systems of contracting which appears on another page, it is to be recorded that Mr. John Wylie, secretary of the Glasgow and West of Scotland Building Trades Employers' Council, states that this organisation is protesting strongly against the inclusion of the various trades in one contract.

A Paint-makers' Federation. A meeting of the committee of the Paint and Oil Section of the Newcastle Chamber of Commerce was held recently, at which a letter was read from the Hull Association, asking the opinion of the committee in regard to the formation of a National Association of Paint and Oil Manufacturers. It was unanimously agreed, says the "Magazine of Commerce," to support this proposal, and to send representatives to any meeting that might be held. The Chairman called attention to the new duty on ordinary paint in Greece, amounting to 5d. a pound, which would practically shut out all paint from Greece. It was agreed to make representations, jointly with other associations, to the Board of Trade, and also to the Grecian Chamber when it meets in the autumn. The question of railway rates, especially the difference between the charges for the carriage of lead and oil was also discussed.

A Gift to Bath Master Builders. Mr. Mowbray Green has presented Mr. George Hayward, president of the Master Builders' Association, with fifty copies of the photograph of the party taken by him on the occasion of the Bath Master Builders' Association outing to Corfe Castle. The photograph is distinctly good. The negative is quite a small plate, and Mr. Green has most successfully developed it, and has had the picture enlarged, and it now makes a most artistic souvenir of a very happy day. Mr. Hayward is sending the photograph out with the inscription upon the back: "A souvenir of the Bath Master Builders' Outing, June 22nd, 1910, with compliments from Mowbray A. Green, Esq., F.R.I.B.A."

The Yorkshire Federation. The monthly meeting of the Yorkshire Federation of the Building Trade Employers was held in the Albemarle Hotel, Scarborough, on August 19, Councillor W. G. England, J.P. (Barnsley) presiding. Others present included Alderman W. Judge (Wakefield), Councillor W. Kitching (Malton), Mr. A. J. Forsdike (Sheffield), Mr. W. T. Ledgard (Leeds), Mr. J. Dawson (Huddersfield), Mr. W. R. Thompson (Dewsbury), Mr. J. W. Mallinson (Huddersfield), Mr. W. E. Biscombe and Mr. C. Dent (York), Mr. A. W. Sinclair, Mr. R. H. Carr, Mr. R. Watkinson, and Mr. C. Peckett (Scarborough), Mr. B. Rushforth, and Mr. R. G. Kitching (Great Grimsby), Mr. W. Hodgson, Mr. R. Finch, and Mr. T. Townsley (Hull), Mr. W. Hoggard, and Mr. T. Kneeshaw (Bridlington), Mr. F. Mountain, Mr. G. W. Nettleton, and Mr. P. Rhodes (Leeds), Mr. H. Fallas (Horbury), Mr. J. L. Skyes (Huddersfield), Mr. R. Raper and Mr. C. Booth (Bradford), Mr. H. Naylor (Halifax), Mr. A. Marshall (Dewsbury), and Mr. J. Davidson, secretary (Leeds). The business was of a routine character. The members and delegates were entertained to tea by the members of the Scarborough Association. At the conclusion of the tea a hearty vote of thanks was proposed by Mr. Paul Rhodes (Leeds), and seconded by Mr. W. Mallinson (Huddersfield), to the Scarborough Master Builders' Association for their hospitality. The President announced that an invitation had been received from the Bridlington Master Builders' Association to hold their next meeting there. The invitation was accepted.

THE "HOUSE DREAM," NEAR RINGWOOD, HANTS.

This house, called the "House Dream," by its owner, was built, or rather grew in the neighbourhood of the quaint old Hampshire town of Ringwood. It nestles, as shown in the sketches, among the pine trees for which Hampshire is so famous. Old hand-made sand-faced tiles were used on the roofs, rough rubble masonry for the chimneys, with stone slates to the slopes; strawberry-red, brick-on-edge cappings and edgings, giving an inexpensive and simple finish. The whole of the upper storey was weatherboarded in oak with the bottom edges uncut, showing the natural contour of the tree. The bricks were obtained from a tumble-down barn, and these, handled carefully by sympathetic workmen, still retain in their new position the colours that age alone can give; there is an indescribable mellow tone over the whole. Although the "House Dream" has been given an appearance of age, it has all modern conveniences. The sanitation is on the latest methods; there is an electric bell service, and a system of telephones from room to room. Electric light is made on the estate with a small oil engine plant. Internally, one of the chief features is the large dining hall. No wall papers have been used, and in some cases Hall's washable distemper was placed straight upon the brickwork. The "House Dream" is designed to very special requirements, as the plan will show. The architect was Mr. H. Bryant-Newbold, of Fisherman's Walk, Bournemouth.

THE "HOUSE DREAM": PLANS.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

- **(1) *Enquiries about buildings to measure in particular towns and districts.***
- **(2) *Enquiries embodying questions which have been set in examination papers.***
- **(3) *Enquiries which ask for or require the preparation of special designs as part of the answer.***

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

St. Fagan's Church, Glamorganshire.

K. F. (EGREMONT, CHESHIRE), writes: "Please give particulars of any interesting architectural features at St. Fagan's Church, Glamorganshire. Any interesting historical facts would be appreciated."

—This church consists of a nave of three bays, with north aisle, south porch, and western tower, and a chancel with sedilia. It consists principally of Norman and Decorated work, and was restored in 1860. There is a brass tablet to John Rosse, dated 1710.

G.

Partnership Formalities.

N. H. (HUDDERSFIELD) writes: "A is an architect who has been in practice for 15 years. B is 28 years of age, has served his Articles under A, and has been in his employ since. B intends going into equal partnership with A. (a) How many years' purchase, calculated on the nett profits, ought B to pay for such partnership? (b) Does nett profit mean the profits of the business after deducting a reasonable salary for A, also deducting interest for capital invested in the business by A? (c) Is it customary for partnerships to be for a stated period? (d) What security has B for money paid as premium at the expiration of that period?"

—As to (a), there is no definite rule so far as we are aware with regard to the number of years' purchase which a person entering into partnership with an architect must be prepared to pay. Much depends on the nature of the business. If it is of a purely personal character, that is to say, a practice in which the *clientele* relies to a large extent on the personal skill and taste of the architect, it is apprehended that it would not be regarded as worth a very high premium. As to (b), in estimating net profits, it appears to us to be clear that the salary of every paid assistant must be taken into account. It is an outgoing; a form of expenditure which is necessary in order to earn the income. It would also be deducted by the architect himself when making his return for income tax. The point as to whether interest on capital invested by A in the business is to be taken into account is not so easy to decide. It appears to be a matter for negotiation between vendor and purchaser. As to (c), there is no custom for partnership to be for any particular period. As to (d), the only security which B will have for his premium is that which he would derive from the partnership assets when the partnership was in voluntary or compulsory liquidation. When the accounts were taken, it would then be considered how much each partner had put into the business, and B's share would be charged on the assets of the business. Of course, this would not be the correct principle if there was a special clause in the partnership deed providing that the premium was to become the sole property of A.

X.

How to Become a Reinforced Concrete Expert.

Apropos our answer to a correspondent published under the above heading in our issue of August 24th, our attention has been drawn to the value of instruction by correspondence, which forms a convenient method of acquiring knowledge when it is difficult, personally, to attend one or other of the usual centres. In such circumstances, it is advisable to take up a course of tuition by post, such as provided by the Embankment Engineering Institute, 64, Victoria Street, Westminster, who give particular attention to the practical designing of reinforced concrete structures. The courses of instruction are very carefully prepared, and specially adapted to the circumstances indicated.

Wright's Concrete Fixing Bricks.

A correspondent writes asking for the name and address of the makers of Wright's patent concrete fixing bricks. Should any reader have cognizance of the bricks referred to, the Editor would be glad of the information.

Foundation in Unstable Soil.

"NOVICE" writes: "I am about to build a small residence on a riverside site, the subsoil of which is very unsatisfactory. The houses on either side of the site are cracking badly, the one being built upon piles, and the other having a concrete foundation 6 feet deep. Water is reached at a depth of less than 9 feet. I should be much obliged if you would suggest a way of making a firm foundation. Would reinforced concrete answer? The height of the highest ridge to proposed house will be under 30 feet. I intend using rough-cast externally. Kindly give composition of a good white rough-cast, to be finished with a smooth surface."

—Our correspondent does not provide any detailed information regarding the depth of the bad ground, and the exact nature of the strata on the site in question. It seems to us a case for piling, which would be best in reinforced concrete, though when ground is permanently waterlogged, it might be of timber, upon the heads of which piles reinforced concrete beams sustaining a reinforced concrete platform should be constructed. Upon this the walls could be raised without fear of settlement. The work would need to be designed specially for the site and the building. As regards the white rendering which our correspondent contradictorily calls smooth rough-cast, we suggest the use of silver sand and the white Portland cement made by Messrs. G. and T. Earle, Ltd., of Hull, proportions three sand to one cement.

D.

Apportionment of Expenses.

J. C. (FARNWORTH) writes: "Under Section 150 of the Public Health Act, 1875, under which certain work has been done, can an Urban District Council add 'Surveyor's Charges' to the contract? Can an amount paid to the authority several years ago, to which was added 10 per cent. for such charges, be deducted from an account now due to the authority (to which contract 5 per cent. has been added for 'Establishment Charges')?"

—The scheme of the Public Health Act and of the Private Street Works Act in relation to the apportionment of paving expenses is that all reasonable expenses incurred by the local authority in relation to the making up of a road shall be apportioned among the frontagers. It is obvious that the local authority must employ a surveyor to give advice in relation to the matter, or they may incur unnecessary expense. In these circumstances, the fees of the surveyor may clearly be added to the total cost which is to be apportioned. Assuming, however, the charge is improper, there is a definite procedure by which any householder who is affected may make a protest; but it must be made within a certain time. He certainly could not seek to recover an overpayment after the lapse of seven years, for his claim, even if it were otherwise good, would be barred by the Statute of Limitations, which provides that actions for the recovery of money must be brought within six years. "Farnworth" does not make it very clear whether the "establishment charges" are sought to be levied in respect of a new apportionment. If so, it seems to us that establishment charges are not properly made, and we would advise him to appeal against it. He should consult a solicitor about this.

X.

Book of Public Health Acts.

S. H. (ASHBY) writes: "I should be pleased to know what book you would advise containing all Public Health Acts from 1875 up to date, etc."

—Public Health Act, 1875, and other Statutes and parts of Statutes relating to public health. With a complete index to same by F. Stratton. New edition revised to 1908. 8vo. 8s. 6d. net, postage 5d. extra. B. T. Batsford, 94, High Holborn, W.C.

Safe Loads of Fireproof Floors.

"SAFETY" writes: 'I have received an estimate for fireproof floors, which have to carry a safe load of 1 cwt. per foot super. The estimate provides in the first floor for 5in. × 3in. steel joists, 2ft. 6in. apart, for a bearing of 17ft. with cement concrete 6in. thick, and in the second floor for the same bearing and the same thickness of concrete with 4¾in. × 1¾in. steel joists. What is the greatest deflection that should be permitted as safe in testing the floors?"

—With ordinary joist sections of steel in a concrete floor, spaced comparatively widely apart, such as in the present example, it is not safe to treat the work as reinforced concrete. Consequently, we can only regard the concrete as serving to strengthen the joists latterly against side bending, whereby we can safely employ sections for spans of thirty times the depth; whereas ordinarily we can only safely employ them for spans twenty times the depth of the section. We cannot rely upon the deflections being reduced by the presence of the concrete, though it often is so, and perhaps the resistance might be augmented.

As regards the resistance, we must not exceed the safe stress on the material. In the example furnished by the correspondent nothing is said about the load on the upper floor being different from that on the first floor, so that there is obviously no reason to reduce the steel as has been done. Therefore, taking the concrete and steel as weighing 150lbs. per foot cube, we have 187lbs. per sq. foot as the inclusive load on a stirrup 2ft. 6in. wide and 17ft. span. This gives us a bending moment on each joist of 90.5 inch tons. The modulus of section of the 5in. by 3in. joist is 5.45. Dividing the 90.5 by this figure, we obtain 16.6 tons per sq. foot as the stress in the steel, which is too much. Likewise, with the 4¾in. by 1¾in. section, which has a section modulus of 2.84, we get 31.7 tons per square foot as the stress, and the ultimate strength would only be from 28 to 32 tons. We therefore see that the floor is incorrectly designed. Of course, if continunity were spread over several spans, and the joists were loaded alternately, the bending moment would be less, and similarly the stress; but on the information given, it would appear that this is a case where reinforced concrete could be used with economy.

D.

FEDERATION NEWS.

Sheffield Master Builders' Association.

The monthly meeting of the Sheffield Master Builders' Association was held on August 11th, at the Builders' Exchange, the president (Mr. Wm. Longden) in the chair.

Finance.—The treasurer's statement showed the finances of the association to be at the highest point they have ever been in the history of the Association. The President was unanimously elected trustee in succession to the late Mr. Mastin.

New By-Laws.—Timber Sizes.—It was reported that this question was still under consideration by the sub-committee of the City Council, which had in the meantime met two deputations from the Master Builders' Association. Up to the present, however, the sub-committee did not appear to be inclined to make any deviation from the revised sizes issued by them, which they held were the net result of expert opinion culled from text books and from the local architects' society. The secretary, referring to a paragraph and article in the "Architects' and Builders' Journal," pointed out that a similar matter was under discussion at Gateshead, and he was instructed to obtain further particulars of the sizes which were there suggested. The sizes recommended by the association appear in the first column below, the larger sizes appearing in the second column, being those recommended in the new draft by-laws of the City Council.

6.0 to 7.6 (2) we suggest 11 x 4 not 11 x 5½

7.6 to 9.0 (3) we suggest 11 x 3 not 12 x 5

The sizes recommended by the association are well in excess of those which are in general use, and they have only been suggested by way of meeting as far as possible the extraordinary demand for increase on which the City Council at present insist, and for which increase the sub-committee of the Council are unable to give any reason whatever beyond the fact that they are the result of expert (i.e., theoretical) opinion. At the last meeting of the deputation with the sub-committee of the Council it was mentioned that the association should have an opportunity of placing their views before the full Committee, and, accordingly, the deputation, which consisted of Messrs. J. D. Cook, T. Eshelby, J. Sivil, W. Lockwood, and the secretary, met the Committee on Tuesday, August 30th.

In presenting the case on behalf of the association to the sub-committee, the secretary read a statement in which he pointed out that in the first instance the new draft by-laws contained sizes of roof timbers which the association considered were far beyond what were necessary. They ascertained that they were the result of theoretical calculations which had been placed before the Council, and complained that when the Council had considered it prudent to seek outside suggestions, they had overlooked the Master Builders' Association, who were more vitally interested in this question than any other body. The result was that they were recommended to meet a representative of the Architects' Society, who had taken much interest in this matter, and when they met him on June 14th they were told that the figures had been worked out in all instances on maximums where there was a jump from a shorter to a greater length of purlin. In face of the calculated experience to which he was referred, he could not say that the sizes suggested by the association were inadequate, and would not be prepared to oppose their adoption by the City Council. This, at the request of the sub-committee of the City Council, had been duly communicated to them.

The association asked the Council why the sizes which originally appeared in the draft by-laws had been still further increased by a memorandum, and they had asked, and repeatedly asked, for a reason, but had got the reply that roofs had sagged. They are still asking for instances. They naturally argued that if floor timbers were left at the old sizes, while roof timbers were enormously increased, it was self-evident that there was some cogent reason for the divergence, and that the Council or its officials had some specific cases in mind of which the association had no knowledge. On its own side, the association gave the names of the six members of the deputation:—Messrs. Longden, Forsdike, Cook, Eshelby, Savil, and Biggin — all of whom were large and well-known builders and contractors, and said that any or all of them would be pleased at any time to show the Council's officials, or anyone, thousands of houses constructed over 20 years ago, with timbers of the usual sizes—which were less than those now suggested — and where the roofs were as straight and perfect as when they were constructed. The offer had not been taken up, and was still open. They could not think that it was possible to offer any more convincing or conclusive proof.

The association pointed out that a heavy beam did not necessarily imply additional safety; everything depended upon the distribution of weight, and once the factor of safety had been reached and a reasonable margin allowed, it was almost as unwarrantable to increase the size by an inch as by a yard.

The sub-committee would probably expect them to refer to a case in which the roofs of some cottages had tumbled in since they last met the Committee. In this case the Corporation's officials had invited the deputation to inspect the property with them, and the town clerk had subsequently favoured them with photographs showing the damage. This case did not advance the argument beyond proving that the contentions of the association were correct. The subsidence had no connection whatever with the size of the timbers used, though the timbers were of less sizes than those recommended by the association and by the sub-committee of the Council. The fault was entirely due to the method of construction, which would not now, and ought never to have been permitted. A pair of cottages were divided by a 3ft. passage, the walls of which, instead of being carried to the ridge, were carried only to the level of the eaves, and a prop of 5 x 3 charred timber simply placed on end on the top of one of these walls was the only support for 28ft. of 6 x 2½ purlins. One of the purlins was 16ft., and was nailed to a notch in the prop, while the other was nailed on top of it without other support. The only wonder was that it had held up so long as it had done. It was fortunate that the sizes now recommended had not been used in this case, as with such a method of construction there might conceivably have been fatal consequences if the additional weight of timber had gone through the ceiling and fallen into the bedroom beneath. At this point, the chairman of the Committee, Mr. Councillor Neal, intimated that the Council did not intend to support their contentions on this case, and the secretary, in reply, said there was therefore no need for them (the deputation) to show the Council the prop, which the deputation had brought with them.

Mr. Sivil followed, and reminded the Committee that the association were anxious to give their support and moral sanction to the whole of the by-laws. It would be a most unhappy state of things to have by-laws which were repudiated by the very people (the builders) who were best able to judge of their efficiency and necessity. Fortunately they were able to support the bulk of them, but in regard to sizes of roof timbers they were hopelessly at variance with the sub-committee. In purlins they (the association) had supplied a list of sizes which they considered to be ample for the purpose (the sizes being much larger than those which were now ordinarily in use), but in some cases these sizes were not of more than half the strength which had been put down in the new schedule. The sizes the association had suggested had a weight-bearing capacity of quite double what they would be called upon to bear with the thickest Welsh or Westmorland slates. The advisers of the sub-committee seemed to have some theory about wind strain, which they said made necessary a further addition of 100 per cent. to the strength, while they (the association) considered that the allowance made—double the strength—was sufficient for any wind strain to which a roof would be subjected in this part of the world. If the wind strain had to be calculated, it must be clear that was very much greater between a one storey and, say, a 4, 6, or 8 storey building, where the force of the wind was enormously increased, but no distinction was made in the schedule. Moreover, the wind strain on a roof with dormer lights, turret gabelets, or other obstructions, was much greater than in a plain roof, but no account whatever was taken of this difference. Further, there were no sizes whatever put down for anything except plain roofs, no sizes for principals, no method of construction, etc., etc., no sizes for hip rafters or valley rafters. As a matter of fact, a builder might comply with the new by-laws by hanging a 6 x 14 purlin to a 2 x 9 rafter, the absurdity of which must be apparent to everyone. Their case as an association rested upon practical requirements. They had the most practical proof which could be had that their sizes were abundantly adequate for the purpose, and could point to at least 80,000 out of the 105,000 houses built in Sheffield which were roofed with purlins in no case larger than those suggested. Why so greatly increase timbers which had been so abundantly proved to be sufficient? Further, they challenged any person to produce a house where the purlins had given way where they were of the sizes suggested by the association. The difference in cost between putting in the necessary timbers and the quite unnecessary sizes required by the schedule would be from £3 to £4 in the smaller houses, up to a much larger amount in the larger ones. This, in conjunction with other requirements, would mean an addition to the rents, which were already complained of in Sheffield as being too high. Indeed, as a city they were trying to encourage builders to build houses which were within the reach of persons of small income, but in this case it was proposed to add expense, and so increase the rent with unnecessary and burdensome timbers.

Mr. Cook followed, and quoted an instance under the County Council where plans had been objected to, and ultimately the sizes of timbers had been reduced. He referred to a building now being constructed with an 80ft. span, with no larger size of timber than 1½ x 11, 2ft. long, and when he added that this roof was selected in competition with a steel structure, they would see that it conclusively proved that it was not a question of weight, but of method of construction. Large sizes of timber also meant that they would require to be cut only from large trees, and this would still further increase the cost. He also wished to remind the Council that in recommending smaller sizes than those in the schedule, the builders' association could not be accused of supporting any selfish interest, as it was much to the advantage of most of them that the maximum sizes suggested should become operative, seeing that it would increase the value of the property already erected. Mr. Cook also pointed out that some of the sizes suggested would incur unnecessary waste and expense.

The chairman and Colonel Hughes, in reply, referred to the position in which the Council found themselves. The Committee, they pointed out, had adopted several of the suggestions of the Master Builders' Association, for which they thanked them, but in this matter of timber sizes they were not as a committee prepared to make such a great reduction in the sizes given them by experts and their own officials as the builders required. All they (the deputation) could do would be to have the matter raised in the Council, or at a subsequent stage to communicate their observation to the Local Government Board, which, the Chairman understood, had already intimated that they might be prepared to make some allowance in some of the sizes.

Heating Engineers and Plumbers.—The strike of operative plumbers at the Royal Hospital still continues. The vexed question of the line of demarcation to be drawn between the work of plumbers and heating engineers is still open, though the matter has been taken up since the June conference at Sheffield, by the local master plumbers, who have referred the question to their national association. That something may yet come out of the conference is shown by the meeting of the Executive Committee of the plumbers at Norwich on 12th inst., when it was decided that the matter be left in the hands of a special committee consisting of the President, and Messrs. Armitage, Beal, Hill, and Lightfoot. At that meeting Mr. Cawthorne, of Sheffield, was received, and the secretary was instructed to approach the general secretary of the U.O.P.A. suggesting a conference to consist of two representatives each of the Institute, the U.O.P.A., the Sheffield Masters' Association, and the Sheffield Operatives' Association, to discuss the matter in the hope of arriving at a friendly settlement.

Municipal Trading.—It was reported that the Committee of the association had sent a letter protesting against the proposal of the Electric Light Committee, contributing a sum of £25 towards the cost of an appeal by the Leicester Corporation restraining them from running an electric wiring and fittings department in connection with their electricity undertaking. On behalf of the association it was pointed out that the members of the Committee as ratepayers could not agree that the money of the ratepayers of Sheffield should be used for the purpose of assisting the Leicester Corporation to defend themselves against their own ratepayers in a system of trading which the courts had up to the present declared to be illegal. As a result, a letter had been received from the Corporation stating that the proposed contribution had been dropped.

Time Limit Penalties.—The case of three members of the association engaged on a Corporation job who had had penalties imposed on them for delay in completion was considered. The penalties were originally £47, but had been reduced by allowances to £25. The contractors held that they were not at fault, and could have completed within the stipulated time. Subsequently a deputation of the contractors met the Hospitals Committee of the City Council, and pointed out that it was unfair that they should be mulcted in penalties for delays over which they had no control. It was also their opinion, and the opinion of the association, that penalty clauses were only enforced when there was culpable negligence on the part of the contractor, of which no instance could be given in this case. After a lengthy discussion, however, the penalties had been confirmed by the Council.

Breaches of Working Rules.—An alleged breach of working rules was referred to the association by the operative masons, but the matter had been amicably adjusted, the secretary taking the opportunity of remarking that the relations existing between the association and all the operative societies were most amicable.

Building Trades Exhibition.—It was reported that the arrangements for the Building Trades Exhibition to be held at Sheffield in October were proceeding apace, and spaces were being rapidly booked. Members were asked to give all possible publicity to the exhibition, and free invitations would be extended to every builder, architect, plumber, and decorator within 50 miles of Sheffield.

Annual Excursion.—It was decided to hold the annual excursion in conjunction with the members of the Building Trades Exchange and Club, on Thursday, September 1st, the place chosen being the Dukeries, the party going by train to Worksop, and afterwards by coaches through Sherwood Forest, visiting all the places of interest.

Thos. Smith, Sec.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 9-24. **HOO ST. WERBURGH (Kent).**—Erection of a new Council school, to accommodate 200 children, at Chattenden, in the parish of Hoo St. Werburgh, for the Kent Education Committee. Plans and specification, prepared by the Committee's Architect, W. H. Robinson, M.S.A., and form of contract may be inspected at the offices of the Committee. Names and addresses, accompanied by a deposit of £1, to be sent to the Secretary by Sept. 9. Tenders to be sent to Fras. W. Crook, Secretary, Caxton House, Westminster, S.W.

Sept. 10. **EPPING.**—Execution of (1) laying out cemetery, including surface drainage, the construction of roads and footpaths; (2) erection of gates and fences; (3) building of chapel and tool shed. Quantities will not be supplied, but each contractor will be given a copy of the plans and specifications on deposit of 5s. Applications should be sent by above date to G. J. Creed, Clerk of the Council, Epping.

Sept. 12. **EAST PRESTON.**—Building a wall at "The Clappers," Ferring; also laying a storm water drain at Durrington Lane, Durrington, for the R.D.C. Tenders to be sent to the Chairman of the Rural District Council, Board Room, East Preston.

Sept. 12. **HINDLEY (Lancs.).**—Erection of cart sheds in the stable yard, Cross Street, Hindley, for the U.D.C. Plans may be seen and quantities obtained on application to the Surveyor, Oswald P. Abbott, on deposit of £1 1s. Tenders to be delivered to Thomas Robey, Clerk, Council Offices, Hindley.

Sept. 12. **ABERTILLERY.**—Erection of 31 houses and construction of roads at Cwmtillery, in accordance with plans and specifications which may be seen on application to Lionel D. Lewis, Council's Engineer, King Street, Abertillery. Copies of specifications may be obtained on deposit of £1 1s. (by cheque, made payable to the Council). Tenders to be sent to William Gait, Clerk to the Council, Council Offices, Abertillery.

Sept. 12. **ST. HELENS.**—Erection of a new secondary school for boys in Cowley Hill Lane, St. Helens, for the Borough Education Committee. Plans and specifications may be inspected, and bills of quantities and conditions obtained, at the office of the architect, Frank S. Biram, George Street, St. Helens, on or before Aug. 22, on deposit of £1 1s. Tenders, addressed to the Chairman of the Finance and General Purposes Committee, must be delivered to Percival Sharp, Secretary for Education, Education Office, St. Helens.

Sept. 12. **PORTSMOUTH.**—Constructing, supplying, and maintaining in thorough repair for six months from the completion of the whole of the following works:—(1) Waiting room for visitors and bicycle store at the north-east entrance of the Town Hall, and (2) alterations and additions to the Borough Engineer's offices at the Town Hall, for the Corporation. Specifications, general conditions, and plans may be seen, and a form of tender obtained at the Borough Engineer's Office, Town Hall. Tenders to be sent to G. Hammond Etherton, Town Clerk, Town Hall, Portsmouth. Fair wages clause.

Sept. 13. **ABERPORTH (Wales).**—Erection of a residence at Aberporth, according to plans and specification which can be seen at the Step, Aberporth. Tenders are to be sent in to Capt. J. Davies, Step, Aberporth, R.S.O., Cardinganshire.

Sept. 13. **UPPERBY (Cumberland).**—Erection of new mixed school and for alteration and additions to infants' school, Upperby, for the Education Committee. Drawings and specifications at the office of the Architect, J. Forster, M.S.A., 13, Earl Street, Carlisle. Tenders to be delivered to C. Courtenay Hodgson, Secretary, The Courts, Carlisle.

Sept. 13. **TONYREFAIL.**—Alterations and repairs to Bethel Welsh Congregational Church, Tonyrefail, for the Trustees. Plans and specifications to be seen with R. S. Griffiths, M.S.A., Architect and Surveyor, Tonypandy, or with Stephen Evans, Bon Marche, Tonyrefail, to whom tenders should be delivered.

Sept. 13. **HELENSBURGH.**—Alterations and additions to Helensburgh post office, for the Commissioners of H.M. Works and Public Buildings. Tenders are required for the whole work and not for separate trades. Drawings, specification, and a copy of the conditions and form of contract may be seen on application at the Post Office, Helensburgh. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Sept. 13. **ST. HELENS (Lancs.).**—Erection of a small power house near to Windle Smithies, for the Rainford Gas Co., for the Gas Committee. Plans and specifications may be copied upon application at the Gas Works Office, Warrington Old Road. Tenders to be in official envelope to be obtained upon application at the Gas Works Office. Fair wages clause.

Sept. 14. **EXETER.**—General reparation, painting, etc., to the Workhouse, Exeter, for the Guardians. Specifications may be seen and full particulars obtained at the office of the Architect, R. M. Challice, 14, Bedford Circus, Exeter. Tenders must be sent to Arthur Snell, Clerk to the Guardians, New Buildings, Castle Street.

Sept. 14. **CAMBRIDGE.**—Erection of a cottage in Albion Row, according to certain plans, specification, and drawings prepared by the Borough Surveyor, for the Corporation. Copy of plans and specification may be seen at the Office of the Surveyor, Guildhall, where further particulars, together with form of tender, may be obtained. Tenders should be sent to J. E. L. Whitehead, Town Clerk, Guildhall.

Sept. 14. **RATHDOWN.**—Erection of one single and five pairs of labourers' cottages, for the Rathdown No. 2 Rural District Council. Contractors may tender for all or part of above work, which must be completed within six months after they have been laid out by the Architect. Plans, specifications, and tender forms can be obtained from the Clerk to the R.D.C., Patrick Cunniam, Loughlinstown, on payment of 5s.

Sept. 14. **MARKET HARBOROUGH.**—Erection of new police court, superintendent's house, stables, and alterations to existing buildings, at Market Harborough, for the Leicestershire C.C. Bills of quantities and form of tender may be obtained on Aug. 31, from the County Architect and Engineer, S. Perkins Pick, F.R.I.B.A., 6, Millstone Lane, Leicester, on deposit of £3 3s. Tenders to be sent to W. J. Freer, Clerk to the Leicestershire County Council, 10, New Street, Leicester.

Sept. 14. **WAKEFIELD.**—Erection of new house and alterations to existing house and farm buildings at Bond Hill Ash Farm, Copmanthorpe, near York, for the West Riding Small Holdings and Allotments Committee. Plans may be seen and specifications with quantities obtained on application to the West Riding Architect, County Hall, Wakefield. A deposit of £1 must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to the Clerk of the County Council.

Sept. 15. **HURST (Berks.).**—Erection of small holding farm buildings at Church Farm, Hurst, for the Berkshire C.C. Small Holdings and Allotments Committee. Specifications, etc., may be obtained from the County Land Steward's Office, Assize Courts, Reading.

Sept. 15. **CHARNEY BASSETT.**—Erection of small holding farm buildings, and alterations and adaptation of existing farm buildings, for the Berkshire C.C. Small Holding and Allotments Committee. Specifications, etc., may be obtained from the County Land Steward's Office, Assize Courts, Reading, on deposit of £1 1s.

Sept. 15. **LONG SUTTON (Lincs.).**—Execution of improvement works and repairs upon the Long Sutton Market House. Specifications and plan can be seen at the office of W. H. H. Davis, Architect, 2, York Row, Wisbech, or with Mossop and Mossop, Clerks to the Market House Company, Long Sutton, Lincs., to whom tenders are to be sent.

Sept. 15. **LONDON, S.W. (Wandsworth).**—Erection of a new greenhouse and potting shed at Wandsworth cemetery, Magdalen Road, Wandsworth, for the Corporation. Form of contract, specification, and plan may be seen, and forms of tender obtained, at the Borough Engineer's office, 215, Balham High Road, S.W. Tenders must be delivered at the Council House, East Hill, Wandsworth. Fair wages clause.

Sept. 15. **LEYTONSTONE.**—Erection of Leytonstone Sorting Office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. Rutherford, H.M. Office of Works, Carlisle Place, S.W. Bills of quantities and form of tender may be obtained at the undermentioned address on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Sept. 16. **TEWKESBURY.**—Alterations at the old buildings of the Tewkesbury Grammar School. Drawings and specifications can be inspected, and further particulars obtained from H. A. Badham, Secretary, Tewkesbury, to whom tenders are to be sent.

Sept. 16. **MINSKIP (Yorks.).**—Erection of proposed farmstead at Minskip, near Boroughbridge, for the West Riding Small Holdings and Allotments Committee. Plans may be seen and specifications with quantities obtained on application to the West Riding Architect, County Hall, Wakefield. £1 deposit must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

Sept. 17. **ANDOVER.**—Erection of a new post office at Tidworth Camp, Andover, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to E. Cropper, at 22, Carlisle Place, S.W., or to the Postmaster, Tidworth Camp Post Office. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s., to which address tenders must be sent addressed to the Secretary.

Sept. 17. **PENGE.**—Additions and alterations to the offices at the Town Hall, Anerley Road, S.E., for the U.D.C. Drawings, specification, bills of quantities, and form of contract may be inspected at the office of the Surveyor to the Council, Town Hall, Anerley, S.E. Builders desirous of tendering must send at once their names and addresses to the Architect, H. W. Longdin, Town Hall, Anerley, together with deposit of £2 2s. Tenders to be delivered to C. W. Dommett, Clerk to the Council, Town Hall, Anerley Road, S.E.

Sept. 17. **EDENDERRY (Ireland).**—(a) Repairing thirty-six labourers' cottages; (b) repairing and putting in thorough working order pumps at Johnstown Bridge and Kilshanroe; (c) sinking wells and erecting pumps at Freagh, Clonkeen and Drehid, for the Edenderry U.D.C. When the wells shall have been sunk to a sufficient depth for the purpose, samples of water shall be taken therefrom and submitted for analysis, and pending instructions from Mr. H. R. Waters, C.E., after receipt of reports thereon, the works shall not be proceeded with. Specifications of the various works can be seen on application to H. R. Waters, C.E. Each tender must contain the names of two solvent securities willing to join in a bond with contractor (at his own expense) for the due performance of the contract. Forms of tender can be had on application to T. Humphrey F. Bor, Clerk of the Council, Boardroom, Edenderry, to whom tenders must be sent.

Sept. 19. **ROSCOMMON (Ireland).**—Erection of a new Crown post office at Roscommon. Plans and specification can be seen at the Post Office, Roscommon, and with H. Williams, Secretary, Office of Public Works, Dublin. Forms of tender and bills of quantities will be supplied on deposit of £1.

Sept. 19. **WHITEHAVEN.**—Erection of new bank premises in Lowther Street, Whitehaven, for the directors of the Bank of Whitehaven, Ltd. Contractors must send in their names to the architect not later than Sept. 1, accompanied by a deposit of £2 2s. Plans, specifications, and conditions of contract may be seen at the office of A. Huddart, Architect, 9, Lowther Street, Whitehaven, to whom tenders are to be sent.

Sept. 19. **WINCHESTER.**—Execution of alterations and heating apparatus to cells at the police station, for the C.C. Conditions of contract, and specification and other information at the offices of W. J. Taylor, County Surveyor, The Castle, Winchester, on deposit of £1 1s. Deposits must be made by cheque, payable to the Hants County Council. Tenders to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

Sept. 19. **SITTINGBOURNE (Kent).**—Erection of a temporary building at the County School for girls, Sittingbourne. for the Kent Education Committee. Plans and specifications, prepared by the Committee's architect, Wilfred H. Robinson, M.S.A., may be inspected at the office of the Committee, Caxton House, Westminster, S.W., or at the office of the Local Secretary, E. C. Pearcy, 45, High St., Sittingbourne. Tenders must be addressed to E. C. Pearcy, as above.

(Contracts continued on page xi.)

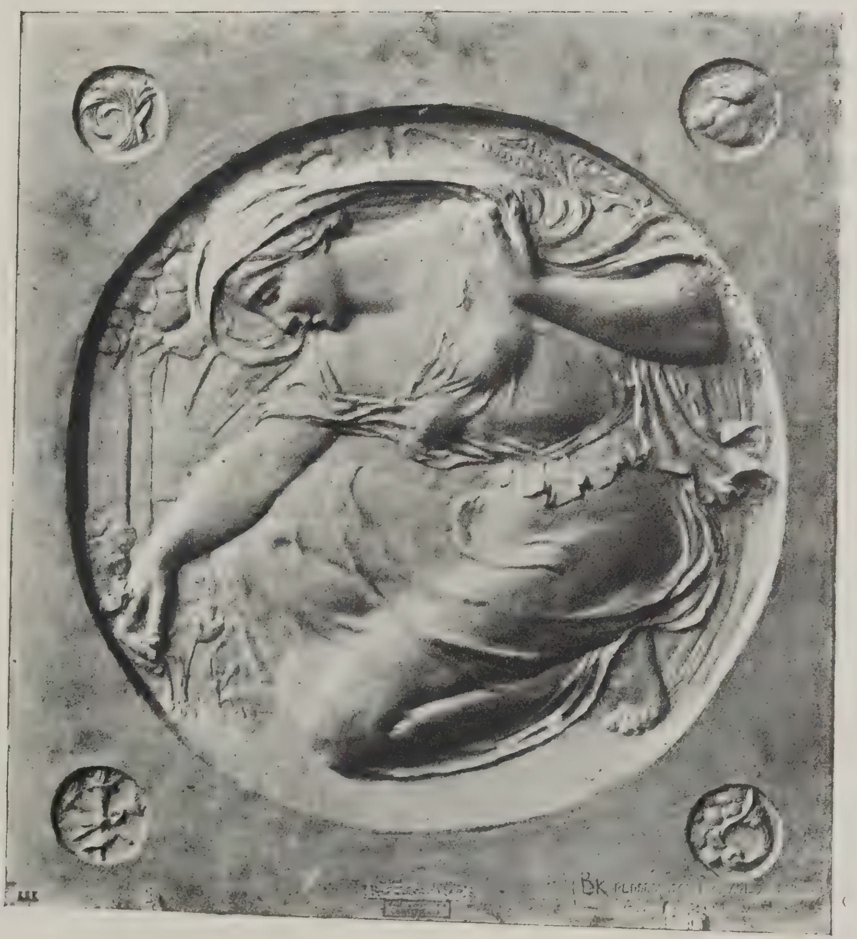
THE ARCHITECTS' &
BUILDERS' JOURNAL

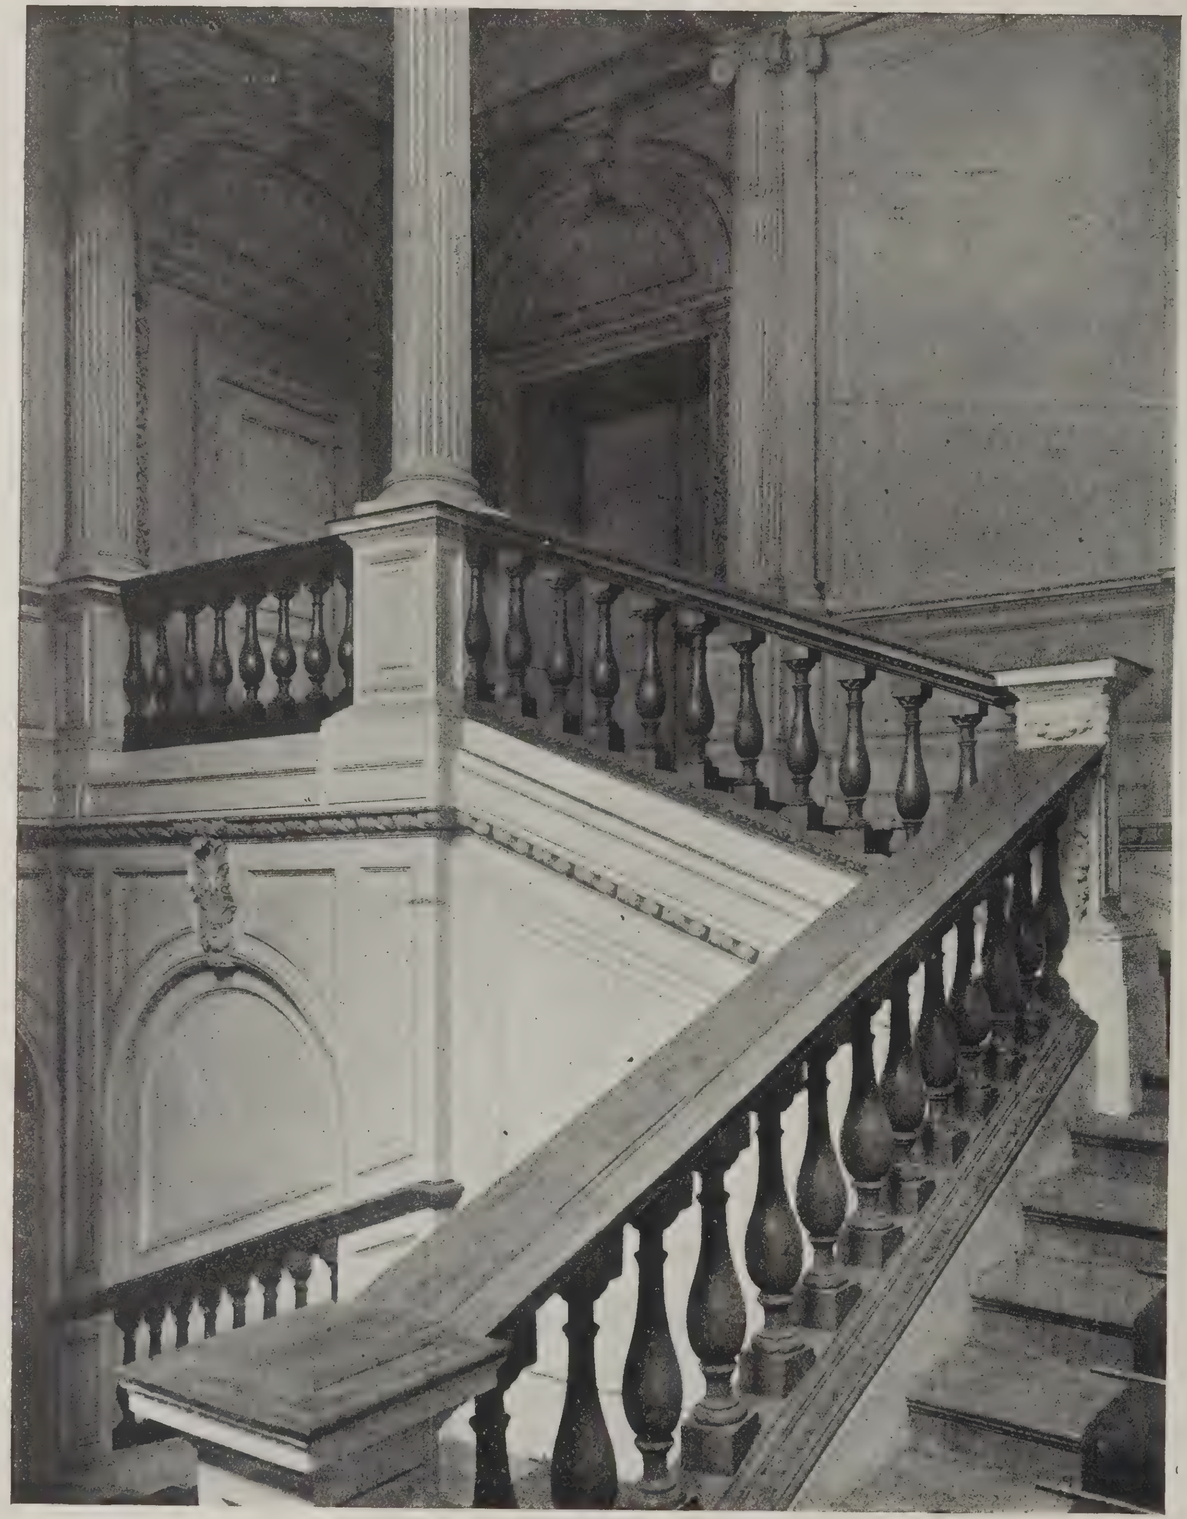
WEDNESDAY,
SEPTEMBER 14th, 1910.

Volume XXXII. No. 815.



A criticism of the works by students of various art and technical schools submitted in the National Competition this year (some of which are illustrated in this issue) was given in our number for August 10th.

NATIONAL COMPETITION EXHIBITION, 1910. MODELLED STUDY IN RELIEF OF A DRAPED FIGURE FROM LIFE SET IN A ROUNDEL. BY JOYCE A. REDDROP. AWARDED A NATIONAL BOOK PRIZE.



This staircase is one of the most beautiful in the United Kingdom. It is difficult to imagine anything giving an effect of greater spaciousness than Jones's genius contrived in this example. It is admirably adapted for the pageant of a richly dressed procession. Ashburnham House now forms part of Westminster School.

GENERAL VIEW OF STAIRCASE, ASHBURNHAM HOUSE, WESTMINSTER. INIGO JONES, ARCHITECT.

THE ARCHITECTS' & BUILDERS' JOURNAL.

Note: The List of Contents will be found on Page V of the front advertisements in this and subsequent issues.

Competition Trouble in the American Institute.

IN our issue of June 15th, we commented at some length upon the new code of competition regulations which the American Institute of Architects put into operation on March 30th last. We took occasion then to point out one or two important points in the American code which ought to be seriously considered by our own R.I.B.A. Council; in particular, "the decisive manner in which compliance with the ruling of the Institute as to Black-listed competitions is demanded from its members under pain of their conduct being banned as 'unprofessional'; and the view that the programme of a competition should be so drawn up as to constitute a contract between the promoters and the competitors." The American view (as expressed in the code) that open competitions are to be discouraged we entirely disagreed with; but in general we regarded the American code as a distinct and notable advance, and likely to produce better results for both architects and clients, if properly supported and adhered to by the Institute members. We were almost prepared to say that this was one of the things that they do better in the United States. Unfortunately the sense of loyalty to the leading professional Institute does not seem more pronounced in America than in the United Kingdom. It is a Fellow of the American Institute who attacks the whole code and points out the weak points of the regulations—weaknesses which are probably inherent to any scheme which aims at a higher code of ethics among men of a particular calling.

Incidentally his criticism reveals the fact that the chief competition evils existing over here seem equally prevalent on the other side of the Atlantic. Having obtained from our contemporary "The American Architect" an estimate of the total number of architects in the United States, he shows in a letter to that journal that only 18 per cent. of the practising architects in the United States are members of the A.I.A., leaving 82 per cent. as non-members. The ratio of R.I.B.A. members, as regards British architects generally, would probably be greater; but on general lines the situation is not very different, and the argument that this F.A.I.A. bases upon it is probably equally applicable here.

> "The 18 per cent.," he says, "may, of course, safely be called the most prominent architects, while for that very reason they, without doubt, engage least in competitions; probably more than half of them have business enough without desiring to enter into the very unattractive field of competitive effort where the history of expense and return has been an outlay for the architectural profession, as a whole, of more than double what the winning architect must earn after he has won. Here lies the greatest evil of the competitive system, which has come to be adopted for nearly all public buildings, churches, hospitals, hotels, banks, in an increasingly widening circle, until it has come to this that almost the only exception is the field of private residences and mercantile buildings. Would the remedy offered by the Standing Committee, viz., that a programme of competition must be approved by a committee from 18 per cent. of the architects else that 18 per cent. of the architects is debarred from taking part, could that ever cure the disease (if it is a disease) that afflicts the other 82 per cent. of practising architects? Would not the gambling spirit in the 82 per cent. be rather glad of improved chances by the proposed elimination from competition of 18 per cent. small though that percentage is?"

He then proceeds to criticise the principal remedy of the American Institute—the appointment of the Professional assessor. It will be remembered that this is the one point upon which the R.I.B.A. maintains absolute firmness; but the American critic would apparently dispense with assessors altogether. After instancing two or three cases that he considers unfavourable to professional referees, he proceeds:—

> The professional referee, like every architect, is educated on lines that become fixed, of what he likes and dislikes, and woe to the competitor who does not discover and work along those lines. This of itself should answer nine-tenths of the question: Shall there be a professional referee? But, after all, these are unimportant details. The main question is not how to call the righteous to repentance, nor yet, how this Standing Committee shall properly segregate the righteous (the 18 per cent. A.I.A. members are, in the main, such) and eliminate from their numbers any who differ from the committee's views by transgressing. No, the question for them is, how shall they become a power, for helpfulness, for the struggling 82 per cent. who unconsciously wrong one another and who are shamefully wronged by the public, in the monstrous methods of competition as they at present exist, putting upon architects a burden of losses that no other profession carries and that constantly saps our strength for really legitimate work.

He advises first that the committee dismiss their appeals to A.I.A. brethren. "The 18 per cent., or rather one-half of that, 9 per cent., is unimportant; what they do or abstain from doing, as to competition, matters little."

Secondly, he advises the committee to drop the professional referee, and to educate non-members and the general public in order that work on competitive studies may be reduced to a minimum. It would be a help to every architect in the land if the A.I.A. Standing Committee would start a campaign of education in issuing advice, by publications in every city, and by circulars, to limit competitive drawings to a scale of 1-16in. to the foot for preliminaries, and place the number of drawings at less than half of what is usually asked for. The rest of the letter is mainly occupied in disputing that it is unprofessional for members of the A.I.A. to enter what the writer terms "ordinary competitions," and concludes: "But the Standing Committee should consider carefully before they ask of A.I.A. members that they cut themselves off from business opportunities which those of highest standing have entered into in the past. And they certainly should not put any unfair penalty upon us who sustain an association that ought to be national in its membership and influence—but certainly is not so while its membership is only 18 per cent. of the architects."

This is bitter criticism for the A.I.A., though the writer places himself rather in a false position by attributing to a committee what was really the action, as the President, Mr. Pond, points out in a subsequent letter, of the whole Institute assembled in Convention. What the critic fails to appreciate, however, is that the American Institute have adopted a course—probably a self-sacrificing one—for the benefit of all architects in the United States, and for furthering the dignity of their art. As Mr. Pond points out:—

> Rates have no bearing in matters involving character and principles, so it is of small moment that the Institute members in the profession are to the non-Institute members in the ratio of 18 to

82. The existence of one righteous man, we are told, would have saved the great cities of Sodom and Gomorrah. If, however, ratios are for a moment to be considered, the value of the Institute may be likened to the cement in a mass of concrete; there is one part of cement to eight parts of other material in the standard aggregate, and it is that one part which gaves the great mass its strength and stability. It is for the loyal Institute member to maintain the integrity of this one small part.

Mr. Frank Miles Day, the Chairman of the Standing Committee on Competitions of the American Institute, also replies, pointing out that the code has been issued by the Institute itself, and adds:—

> Your correspondent seems to rest under the impression that nothing has been done to inform the public and architects in general as to the Institute's attitude. It may, therefore, be well to state that the Institute has issued 15,000 copies of the circular, sending them not only to its members and to architects who are not members, but to the public as represented by owners, editors, judges, educators, etc. The board feels justified in giving wide circulation to the document, but it does not assume to dictate ethics of practice to architects who are not members of the Institute. It has, however, in mind the advancement of the Institute ideals and the education of the profession and the public, not alone through the circular of advice, but through the medium of periodicals and technical journals, and it will welcome any serious suggestions tending to make its work effective either along these lines or otherwise.

Another correspondent points out that the critic in his 82 per cent. of non-members ignores the kindred bodies, the Architectural League of America, Chicago Architects' Business Association, Architectural League of New York, Beaux Arts Society, Society of Columbia University Architects, various architectural clubs, sketch clubs, etc. In many cases the principal officers of these societies are very active in the Institute's local Chapters, and as the societies are closely allied with the Chapters, they are very often the source from which the Chapter membership is drawn.

Into what seems to be a family quarrel of the American Institute we should hesitate to intrude, but for the fact that the circumstances disclosed, and the difficulties to be surmounted, are so entirely similar to those confronting us in this country. The task of convincing the general body of architects, either in the United States or here, that it is to their ultimate advantage to disregard the "business opportunities" presented by irregular competitions is a heavy task which both the British and American Institutes have undertaken. None the less, it is the only possible way in which to raise competition work out of the slough into which the cupidity of the general public and architects have thrust it. The education of the general public to a better appreciation of the art of architecture must none the less be accompanied by the work of educating architects to a higher sense of their own calling. The objections put forward by a F.A.I.A. have also been raised in this country. There is the same distrust of the leading members of the profession, who —because they participate but little in competition work— are suspected of want of sympathy with the difficulties and struggles of their less wealthy brethren; the same suspicion as to the single-mindedness and ability of assessors, manifested in this country by a growing demand for the jury system, in preference to the single assessor; the same feeling that certain assessors are influenced by designs which more or less play upon their own work; and the same erroneous notion that the leaders of the profession are sacrificing the rank and file to some quixotic standard of ethics.

It is difficult, in these days, when individual opinion attains undue recognition over collective wisdom, to establish the fact that the higher code of competition ethics put forward by the British and American Institutes is in reality but evidence of ordinary common sense and material foresight. F.A.I.A., in saying that "professional conditions are not made by the say-so of one committee—but rather by the growth of years in what has been standard professional practice as developed by the demands of the public and the concessions of a profession to those demands," gives away his case. It is because both here and in America the public during the "growth of years" has made more and more outrageous demands upon the architects, and the architects, by a policy of *laissez-faire*, have been "conceding" them, that competitions have come into such bad odour; and it is both right and natural that both Institutes should take a bold stand to check the evil. F.A.I.A.'s suggestion that competition studies or drawings should be reduced to a minimum is well worth consideration and support; but as the general public could hardly understand the rough sketches and plans that would be perfectly intelligible to the trained eye, it seems to us that the only valuable part of his criticism completely stultifies his demand for the abolition of the professional assessor.

The Outlook for Copyright.

MR. JOHN W. SIMPSON, in answer to adverse critics of the Copyright Bill provisions for the protection of architects, has presented a brief restatement of the case for copyright. Mr. Voysey's somewhat transcendental views he regards as "an apology for the thief in art," and "the music pirate, the forger of bronzes and engravings, and other like miscreants, would gladly avail themselves of such a plea." This is all very well as a debating point, but is, we think, hardly a legitimate extension of Mr. Voysey's thesis. Pirates, forgers, and other miscreants did not, so far as we can see, come into Mr. Voysey's purview. Mr. Simpson, however, is more clearly justified in saying that "In truth, the cause of healthy art is not served by high-flown talk about the artist being degraded by the thought of reward. The whole range of artistic biography shows the spur of need and the hope of reward—either in gold pieces or in admiration, or in both—to be necessary for the artistic temperament to produce its finest work." This matter, indeed, is so far past argument that we are disposed to take Mr. Voysey's pronouncement upon it as the elephant took the horse-drench—hyperbolically. Of course the artist must live; and to affect to despise the means of livelihood is one way of disregarding the artistic accomplishment of seeing life simply, steadily, and sanely, and completely. Had not Shakespeare a delicately sensitive artistic temperament? Yet he was an excellent man of business. Mr. Simpson repeats an argument that he has previously put forward—that for the purposes of protection "the practice of the art of sculpture will be found almost exactly analogous to that of architecture," and, he adds, "We ask that the latter should enjoy equal and similar privileges and be placed on the same footing as its two sister arts." But, except in matters of the most primitive simplicity, analogies are seldom so perfect as to render their introduction useful to the contention which they are intended to support, and it would not surprise us to find someone pointing out vital points of disparity between architecture and sculpture. For one thing, the sculptor has more freedom of scope for invention and composition. A strong feature of Mr. Simpson's case is the reference to Continental example. Copyright in architecture seems, on this showing, to work very well in France, Belgium, and Denmark. Mr. Buxton's Bill, however, Mr. Simpson acknowledges to be "evidently far from satisfactory as it stands," and to "require very careful consideration by the Royal Institute." Architecture, indeed, occupies but a small place in it, and no doubt its case has been greatly prejudiced by the minority report of the commission, as well as by the copious douches of cold water that have been thrown upon it by most of the architects who have taken part in the discussion in the public press. All these, being men of original talent and of high standing in the profession, are among those who might be expected to feel most acutely the need of protection from piracy; and yet most of them appear to laugh the idea to scorn. The outlook for the Bill, therefore—or, rather, for such of it as concerns architecture, is distinctly discouraging. Even supposing a greater number of equally eminent men were now to come forward on the other side, we should then have to face the serious and probably fatal objection that architects are not making anything like a united demand for a measure of protection towards which, we must confess, we had thought the great majority to be favourably inclined.

NOTES AND NEWS.

Some Curious Facts About Paris.

Mr. John N. Raphael gives some curious facts about Paris to the "Daily Express." The longest street in the town is the Rue de Vaugirard, which runs from the Odéon Theatre to the Porte de Versailles. This street is over three miles in length. The shortest street is the Rue des Degrés, which runs from the Rue de Cléry to the Rue Beauregard (near the Boulevard Poissonière). It is exactly seven yards long and four yards wide. It has another peculiarity. Although it is right in the centre of Paris, it has neither doors nor windows. The Rue des Degrés has houses in it. The Rue Baltard has none; and it is forty yards in breadth. This street runs across the Central Markets (Halles) from the Rue Berger to the Rue Rambuteau. The highest house in Paris is one of nine storeys, in the Passage Radziwill. The house with the most people in it is No. 129, Faubourg du Temple. Although it has only one number in one street, this house consists of twelve separate buildings with communicating doors, has four courtyards, and thirteen staircases.

Inspection of Dwellings.

In the Housing and Town Planning Act of 1909 provision was made for inspection, by local authorities, for the purpose of ascertaining whether any dwelling-houses in the district were in a state "so dangerous or injurious to health as to be unfit for human habitation." The Local Government Board issued last week an order making regulations with respect to the manner in which the inspection is to be carried out. The order directs that authorities are to prepare a list of dwelling-houses in the case of which the Medical Officer of Health considers that "early inspection" is "desirable," and a "thorough inspection" is to be made of these in regard to specified points. These include the arrangements for preventing contamination of the water supply, sanitary appliances, drainage, the condition of the house in regard to light, air, dampness, and cleanliness, arrangements for the deposit of refuse, etc., the "existence of any room unfit for human habitation," and any other defects which might render the dwelling-house injurious to the health of an inhabitant. It is directed that the inspection shall be carried out by the Medical Officer of Health, or under his supervision and direction, and that records shall be kept showing the results of each inspection and any action which may be taken in consequence. Further, the Medical Officer is to include an account of the work done in this connection in his annual report. The authority are to take the records into consideration at each meeting, but may delegate this duty to a committee.

The Difficulties of Preserving Buildings.

The difficulties which beset the path of the antiquarian and art-lover are exemplified by an instance at Limpsfield. The business of the post office there has outgrown its present quarters, and the Postmaster-General has called upon the Sub-postmaster for the district to find the necessary increased accommodation. The postmaster, who carries on also the business of a baker, proposes to pull down an old timbered building (of which he is the freeholder), which is one of the ornaments of the village, and to build new premises on the site. Mr. A. Leveson-Gower, who happens to be staying in the village, has invoked the aid of the Surrey Archæological Society. The Postmaster-General, to whom representations have been made, replies that he has no right to interfere, the responsibility resting solely with the village postmaster. All postmasters of this class receive an inclusive salary, and must themselves provide the premises in which the postal business is carried on. Mr. Berry, the Limpsfield postmaster, maintains that there is no alternative to his proposal. The new office must be in a central position, and in the High Street. He has heard, vaguely, that another site could be obtained by pulling down another building higher up the street, but Mr. Berry contends that this would involve turning out the tenant, and probably banishing him from the district. Small houses in Limpsfield are so scarce that the tenant might not be able to obtain another. "To me," Mr. Berry explains, "it seems better to pull down an old stable—however picturesque it may be—than to turn folk out of house and home. At the same time I shall be only too glad to consider another site if it can be found, for I quite realise the objections to my present scheme. If the post office can be built elsewhere I will undertake to turn the old stable into a pretty cottage, such as it was, I believe, many years ago." Although the building in question is of no great historical interest, says the "Daily News," its demolition would do injury to the quaint village street in which it stands. Probably dating from the early part of the seventeenth century, it forms an integral part of a picturesque group of old buildings near the famous mediæval house known to hundreds of antiquaries as "Detillens." It is of two storeys, constructed of oak timbers, filled with red brickwork, and is surmounted by a roof of weather-worn red tiles, forming a high-pitched gable towards the street. Its neighbour on the right, with a projecting gabled upper storey and massive oak cornerpost, is of an even greater age, having been erected at the end of the fifteenth or beginning of the sixteenth century.

The Union Parliament Buildings, South Africa.

By the end of the present month, the home of the Union Parliament of South Africa is to be ready for occupation, after alterations and additions which have cost between £95,000 and £100,000. The old Cape Assembly Chamber was 66ft. by 36ft.; the new is 70ft. by 44ft., which is very little inferior to the 72ft. by 45ft. of the British House of Commons. Seats with desks will be provided for 131 members, while the total number of seats is 190. The new wing is, of course, directly connected with the old building, a continuous corridor running from the new hall to the vestibule of the old building, and serving as a lounge. What was formerly the Speaker's room and library now becomes a smoking-room, while the old Assembly Chamber is made into a banqueting hall, the old Press Gallery being adapted as a sort of minstrels' gallery. All the other galleries have been abolished, but there is a new Press Gallery over the Speaker's chair. A roof garden may be expected to fulfil some of the purposes for which the terrace of the Westminster House is renowned.

The Scottish System of Contract: Building Owner's Bitter Cry.

Correspondence on the question of introducing into Scotland the single-contractor system that is common in England has become very voluminous, and continues to be very one-sided, nearly every writer protesting vigorously against the introduction of the English system. The only writer on the other side remarks, indeed, that "all the other letters have evidently been written by people who are interested in keeping matters as they are." This particular correspondent, on the other hand, seems disposed to welcome a change. As a house-owner in Glasgow, he has had, under the present system, two experiences which he has no desire to repeat. In one case, his building cost twenty-five per cent. more than the architect's estimate on a very large operation. In the second adventure, an extensive alteration exceeded the estimate by seventy-five per cent. From this bitter, and we should hope exceptional, experience, he infers, we trust quite unfairly, that "the reason why a house-owner cannot make an overhead contract for a building complete is not far to seek. The present system suits everyone admirably except the proprietor who has to pay the piper. The architect who controls all the work, and the measurer who when it is completed measures it up for him, are both as a rule paid by a percentage on costs; and, without imputing bad motives, it is perfectly evident that this arrangement cannot lead to economy in cost." He thinks, therefore, that "if house-owners consisted of practical men, and were able to compare notes with each other, the present system would soon be knocked over." He further complains that under the present system he has "found from bitter experience that it is impossible to fix the blame for excessive cost, delay, in completing work, faulty design, or any other matter, on anyone under the present system in Glasgow," and he hopes that other sufferers will come forward and give their experience. So far as can be judged from internal evidence—the signatures to the letters revealing nothing to the contrary—architects have taken no part in the controversy, feeling, no doubt, that they have but little concern in it; but now that, "without imputing bad motives," this correspondent has cast mud at the profession, perhaps some of them will be provoked to retort. Yet it is difficult to see that their intervention could serve any good purpose. The "motives" which this gentleman would rather insinuate than impute are, in every aspect, beneath contempt. Their imputation, or at least their insinuation, seems to be the solace of the owner whose building bill turns out to be bigger than he anticipated; and there is a well-marked type of building owner whose frugal mind is disposed to cheapen everything—even probity. This, however, is but a side issue. The main question is, Which of the two systems is likely to commend itself as preferable to the building owner? If the innovation commends itself to him, there seems to be no possibility of resisting it. For this is a matter in which, after all (to adopt the correspondent's well-worn metaphor), the man who pays the piper can really call the tune.

The Late Mr. Holman Hunt.

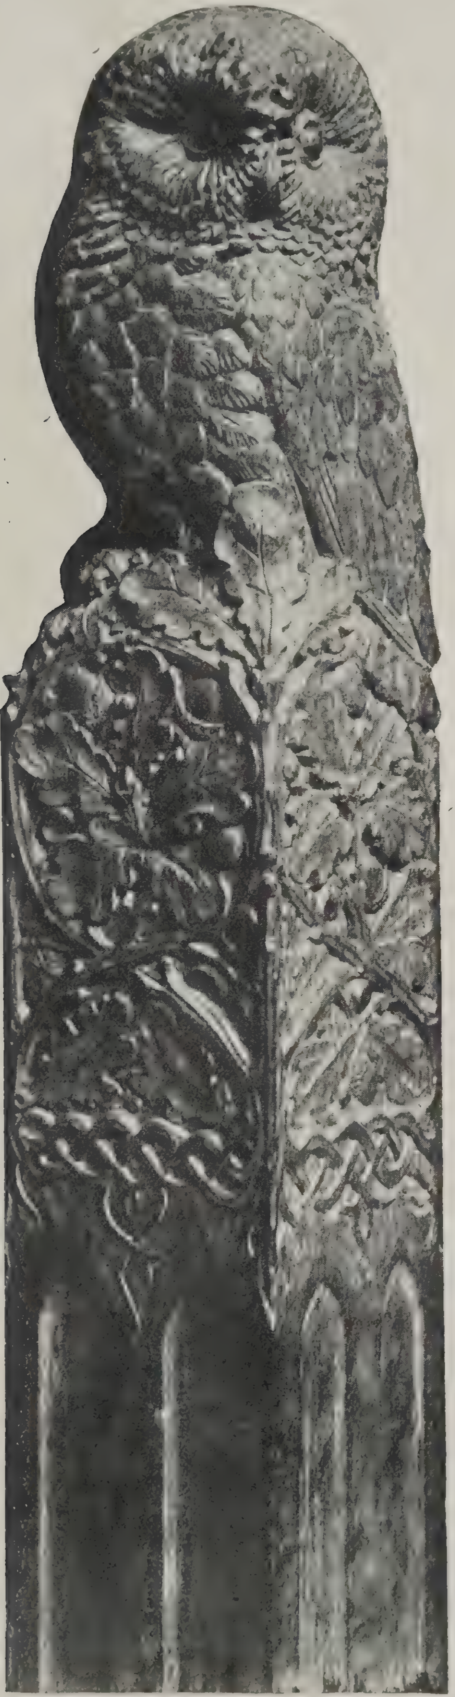
The death of Mr. Holman Hunt, at the age of 83, removes from among us a painter in regard to whose work it is difficult to express an opinion without opening up questions which concern the whole theory of the objects of the art of painting itself. In regard to the methods of painting, we are faced with the question, Is it the object of the art to give a vivid impression of a scene, subordinating minor details to the total effect, or is it the object to give absolute and laboured realistic imitation of fact? As to the philosophy of painting, is its object to give pleasure, to add to the intellectual enjoyments of life, or to convey a moral lesson? In regard to the second question, the general object of Holman Hunt's paintings was undoubtedly a moral one. In the words of an eminent French critic, M. de la Sizeranne, he was "la conscience fait peintre"; the expression exactly describes him. One exquisite little picture, "The Strayed Sheep," which will probably last to be the gem of collections for many generations, is an exception; an example of sheer beauty of scene and execution, painted for itself alone. Otherwise, all his pictures have a religious or a moral motive. And he was the embodiment of conscience in regard to execution also. No detail was to be slighted, passed over, or even subordinated; no amount of labour was too great for arriving at perfection of representation. Of pictures conceived and executed in this spirit one thing at any rate is certain—that they will not be commonplace. Hunt's pictures are few, but every one of them seems the embodiment of a problem to which the artist's whole mind has gone. Among the small band who, under the title (almost accidentally imposed and adopted) of the "Pre-Raphaelite Brotherhood," made a determined stand against careless and sloppy execution in painting, Hunt alone stuck to his colours to the last day of his artistic life. In his way he was a hero in art, thinking no study and no application too great, if he could attain the perfection he strove after. Such an artist is not to be lightly judged. We may think that he was in part a failure, but it is a kind of failure better than many facile successes, for it holds a high example before us. The truth seems to be that he was a great painter injured more or less by adherence to a mistaken ideal. In attempting to paint every detail of a scene he neglected the principle which Millet so decisively stated as the gospel of his art—that whatever detail or accompaniment does not assist the main object of a picture is a positive injury to it; and he forgot, too, that Nature, with far more infinite detail than any painter can reproduce, has her own secret of harmonising all into a consistent whole. Thus, in "The Hireling Shepherd," the wonderful painting of the vegetation in the dry ditch under the trees may be worth the labour bestowed on it, but the defiant realism in every detail of the countenances and costume of the two figures only results in giving the effect of a coarse blowsiness which destroys the sentiment of the scene; just as, again, in "The Awakened Conscience," a picture with a powerful moral, we are almost shocked by the hard and minute painting of the man's head. His greatest work is the "Finding in the Temple," where the central group is one of the most masterly things in art; and those who have seen the study for it, with the skeletons of the three figures drawn first, then the nude outline added, and finally the lines of the habiliments, can alone realise what conscientious pains went to make it so. In his "Valentine and Sylvia," the expression and attitude of Julia, embarrassed in her boy's dress, and expecting immediate discovery, renders the figure one of the greatest successes in modern painting. On the other hand, when he painted a realistic study of a young Syrian for the figure of Christ in "The Shadow of the Cross," he did not seem to realise that this brought us no nearer to an adequate conception of the sacred personality; imagination was wanted for that, and Hunt had only realism to bring, and an exaggerated emphasis of anatomy which is almost unpleasant to the eye; the kneeling figure of the Virgin is the only beautiful thing in the picture. The "Light of the World" is a remarkable work in a pictorial sense, especially in colour, in which it is almost an inspiration; but the allegorical element in it is really rather childish. Next to the "Finding in the Temple," the "Isabella" and the "Lady of Shalott" are perhaps his greatest and most successful works. Whatever may be thought of the mistakes of some of his paintings, and of his manner of regarding art, he will always be remembered as a painter far above the common level, and it is likely that his best works will increase in value and repute as time goes on. They are among the few modern paintings of which it can be said that each has left its mark behind it, and which show something of the concentration and intensity of purpose of the great masters of the early ages of painting.

Manchester Infirmary Site Proposals.

The proposal, now practically settled, to erect a new art gallery and free library on the site of the old infirmary at Manchester is still meeting with considerable opposition. The alternative suggestion was to build a new Royal Exchange. A correspondent of the "Manchester Courier" sets forth two calculations by which the latter scheme is shown to benefit the ratepayers to the extent of £70,000 a year. According to these figures the Corporation would obtain per annum from present members of the Exchange £40,000, from Raw Cotton Exchange members £10,000, from the Corporation for underground tramway offices £2,000, and increase in income of the Manchester Ship Canal £35,000. (We are not clear how the last figure is arrived at; it seems problematical.) This makes a total income of £87,000, and deducting £17,000 for interest and sinking fund charges on land and building, a net income of £70,000 is obtained. His figures for the art gallery and library scheme show a capital expenditure of £2,383,000, made up as follows:—New building (land given in) £333,000, furnishing the library, £50,000, and furnishing the art gallery "would cost anything up to £2,000,000." We wonder the last item was not made £5,000,000 or £10,000,000, and with equal reason. But with a capital expenditure worked up to £2,383,000 this correspondent triumphantly concludes that the ratepayers would be saddled with a burden of £100,000 a year. From this we conclude that Manchester has no art treasures, no public-spirited collectors, and that loan-collections are unknown. But, after all, it is now the silly season.

Light on the New Land Duties.

Mr. J. Davidson, secretary of the Yorkshire Federation of Building Trades Employers, has prepared, for the benefit of members, some exceedingly useful observations on the Finance (1909-10) Act, 1910. "Owing to the ambiguity of some of the language expressed on Form 4, and also in the Act itself," Mr. Davidson premises, "varying opinions have been expressed as to the meaning and intentions of some of the provisions." Accordingly, "in order that no owner may be unduly prejudiced." Mr. Davidson has summarised the new duties leviable under the Act, and has put forward a series of admirable hints for the guidance and protection of those whose interests they affect. He points out the several exemptions which should receive careful consideration, such as those relating to small properties in the occupation of the owners; and he emphasises the desirability of studying closely the clauses as to provisional valuations, and of appealing against unsatisfactory assessments; and in particular he points out that "Builders who paid a deposit for the purchase of certain land to be conveyed or possession to be taken in plots as required should safeguard their interests under this section, especially as increment duty is probably only payable (Section 1 (a)) in pursuance of any contract made *after* the commencement of this Act." Other valuable tips refer to official errors or default, to the date of service or notice and return of Form 4, to the undesirability of seeking the assistance of valuation officers of other Government officials, and to certain important points that should be taken into consideration with respect both to high and low valuations. Mr. Davidson is a trained expert in such matters, and the members of the Federation of which he is secretary are to be congratulated on the guidance he places at their disposal in the leaflet under notice—a copy of which, we understand, has been forwarded to the secretaries of affiliated associations.



NATIONAL COMPETITION EXHIBITION, 1910:
CARVED WOOD FINIAL FOR A BEDPOST. BY W. B. BINNS.
AWARDED A SILVER MEDAL.

Conciliation and Arbitration Boards.

In a Parliamentary Buff-book that has just been issued by the Board of Trade—the "Second Report on Rules of Voluntary Conciliation and Arbitration Boards and Joint Committees"—Mr. G. R. Askwith explains that although less than three years has elapsed since the publication of the first report on this subject, a second edition has been rendered advisable by the extensive developments which have taken place in the machinery for conciliation in several trades, including the building trades, and by the important alterations which have been made in the rules of a number of boards already in existence at the date of the previous report. The number of permanent boards and joint committees known by the department to be in existence in the various trades at the present time is 262, and it is estimated that nearly two million workpeople are covered by all these agencies for conciliation. There are also fourteen district boards, which afford mediation of a general character, and are not confined to any particular trade, and two boards whose work is restricted to questions affecting employees of co-operative societies. In most of the principal trades of the kingdom, joint meetings of representatives of employers and workpeople are now the generally recognised method of settling disputes or adjusting differences in regard to questions which might otherwise lead to a cessation of work. It is noted that, as readers of this Journal are particularly well aware, national schemes of conciliation are in existence for all the principal branches of industry. The rules of most of the boards provide that no suspension of work shall be brought about by either party until the matter in dispute has been discussed; and some boards, in the event of a stoppage of work having occurred, refuse to consider the disputed question until work has been resumed, while others impose penalties for a stoppage of work, as also for the breach of any award given by the board or its umpire.

As many as 153 boards and committees provide "full automatic machinery" for the avoidance of deadlock, where the parties are equally divided, the difficulty being met by reference, in the final instance, either to (1) an arbitrator appointed by the Board of Trade, or (2) a permanent neutral chairman, arbitrator, or umpire, or (3) an arbitrator or umpire appointed *ad hoc*, or (4) three arbitrators, with decision by majority. In 81 cases, most of which occur under the National Building Trades Conciliation Scheme, full machinery for the settlement of disputes is provided, but can only be put into operation by the mutual consent of the parties. That there is room for improvement in this machinery, builders are well aware; and such collections of miscellaneous data as those given in the Buff-book under notice may perhaps be profitably studied with a view to further improvement or evolution.

NEWS IN BRIEF.

At a meeting of the Council of the Dublin Industrial Development Association on September 5, the prospects of reopening the granite quarries in the Burtonport district of Donegal were discussed. The quarries, which comprise deposits of grey and red granite covering 70 square miles, have been closed over ten years through want of working capital. There are ample facilities for easy transit, and labour in the district is cheap.

* * *

The Local Government Board has decided to hold inquiries into proposed expenditure by public bodies as follows:—Sewerage and sewage disposal works and plant.—Merthyr Tydfil Borough Council, £1,050 (September 14). Street improvements, etc.—Weymouth and Melcombe Regis Borough Council, £4,920 (September 13); Carlton Urban District Council, £1,250 (September 16). Various.—Wilmslow Urban District Council, £2,500 for fire station, etc. (September 15); Bridport Borough Council, £3,600 for workmen's dwellings (September 14); Portsmouth Borough Council, £24,000 for electric lighting (September 17).

* * *

A Runic cross in light Cornish granite is being erected in Quinton Road, Coventry, within a quarter of a mile of the railway station, to the memory of the Coventry martyrs of the sixteenth century. The cost, about £200, has been defrayed by public subscription.

* * *

The War Department has agreed to give a site on high land east of Dover Castle, for the erection of a memorial to the late Hon. C. S. Rolls, whose historic flight to France and back started at this spot. The Dover Corporation will erect a Rolls memorial in Guilford Lawn, facing the sea, to correspond with that erected to Captain Webb on Clarence Lawn.

* * *

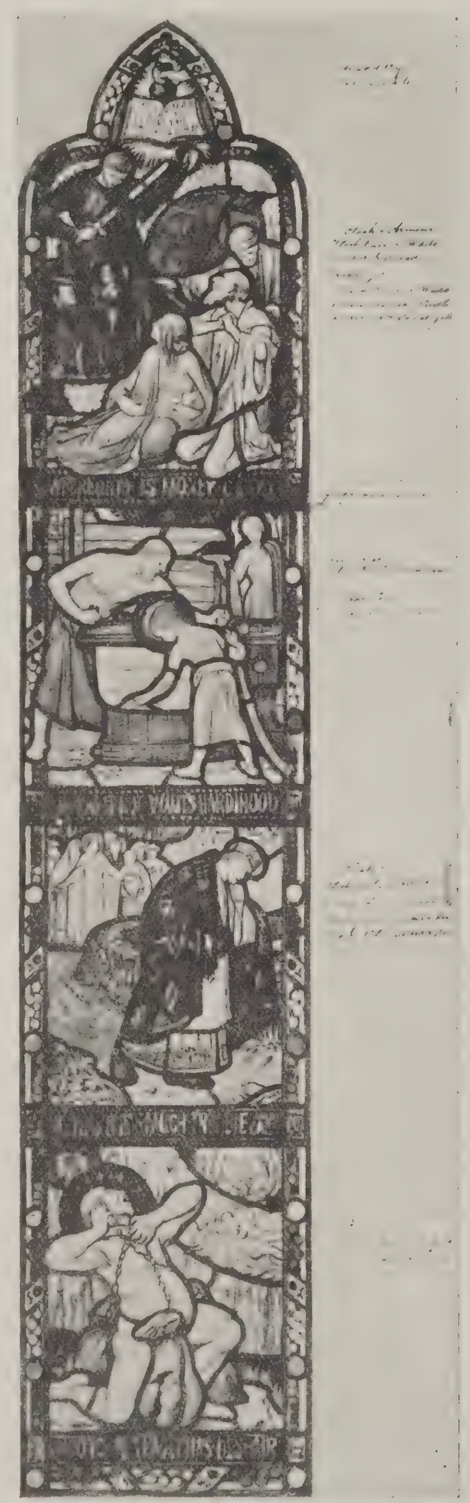
Mr. Francis Healey, architect, of Bradford, died there on September 5, at the age of 69. Mr. Healey had a large practice in ecclesiastical work, one of his earliest works, in conjunction with his father, being All Saints' Church, Bradford. Similarly, Mr. Healey had a share in the restoration of the Bradford Parish Church, over ten years ago, and more recently in the erection of the churches of St. Columba and St. Oswald. Among other church buildings in which, with his brother, he was concerned were St. John's, Great Horton; St. Luke's, Manningham; St. Michael's, City Road; St. Barnabas's, Heaton; St. Bartholomew's, Bowling, and St. Augustine's, Otley Road. The Synagogue in Rowland Street was built from their plans, and they designed the Eccleshill Congregational Chapel, the new St. Peter's Church, Shipley; Thornton Church, St. Luke's, Harrogate; Tockwith Church, near York; Worsborough Church, near Barnsley; Otley Congregational Chapel, Matlock Bank Church, Haworth Church (restoration), Steeton Church, Milton Chapel, Huddersfield; St. Andrew's, Yeadon; Harden Church, and the Leeds Exchange. He was also the architect for the Victoria Hall, Queensbury; Littlemoor, the residence of Colonel H. A. Foster; Egton Lodge, near Whitby; and the residence of Mr. R. J. Foster at Stockeld Park, near Wetherby.

* * *

Mr. Hall Caine has unveiled, at Blackpool, a Lancashire county memorial to the late Samuel Laycock, the Lancashire dialect writer. The memorial consisted of a life-size oil painting by Mr. S. Lawson Booth, and a tablet referring to Laycock's connection with the county as a self-educated son of the people, and to the fact that he was born at Marsden, near Huddersfield, in 1826.

* * *

The Salle des Fêtes at the Brussels Exhibition has been allotted to the British exhibitors who were burnt out a few weeks ago. The work of conversion was entered upon with extraordinary vigour. Orders for new show-cases were placed with several firms, who, working at high pressure, undertook to complete their contracts between the 7th and 10th of the present month, and an army of carpenters and painters was sent over from England. The interior of the Salle, which was formerly used for conferences, concerts, and similar functions, has had to be considerably modified to meet the new conditions. For example, the flooring was formerly arranged in three rising stages, and has now been reduced to a general level; and several additional doorways have been formed. A writer in the "Daily Telegraph" claims that "the whole reconstructed section is a monument to British courage, energy, and resource, in time of crisis."



NATIONAL COMPETITION EXHIBITION, 1910: DESIGN FOR STAINED GLASS.

BY EDWARD RIDLEY.

AWARDED A GOLD MEDAL.

The Lord Mayor of London has added the following names to the Mansion House Committee of the Fund for providing a memorial in London of the late King:—Alderman Sir Walter Vaughan Morgan, Sir Henry Burdett, Sir Frederick Low, K.C., M.P., the Hon. Joseph Martin, M.P., the Prime Warden of the Goldsmiths' Company, and Dr. R. J. Collie, Consulting Medical Officer to the London County Council and the Metropolitan Water Board.

* * *

The new sewage purification works constructed for Prescot (Lancs.) by Messrs. Taylor, Wallin, and Taylor, of Newcastle, which were formally opened by the Hon. Arthur Stanley, M.P., on August 31, were begun two years ago and completed in the early part of this year. The filter beds, which are 7ft. 6in. in depth and have a total area of 2,143 square yards, are designed to take 28 gallons per square yard. The sludge is buried in trenches, the area of land for this purpose being sufficient to last for three years before it will be necessary to go over the same ground again. The effluent from the first filters is nearly equal to the standard required by the Mersey and Irwell River Board, and the final effluent contains but one-quarter of the impurities allowed by that standard.

Tenders for the supply and erection of the steel superstructure of the new bridge to be erected over the St. Lawrence at Quebec are to be submitted to the Canadian Department of Railways and Canals by October 1. It is understood that two or three of the principal German engineering companies will unite in submitting a joint tender, and that three of the leading American and two of the Canadian bridge-building firms also intend to compete. In Great Britain a tender is to be submitted by the Cleveland Bridge and Engineering Company, of Darlington, in association with the Metropolitan Amalgamated Railway Carriage and Wagon Company, of Birmingham. These companies propose to establish a large bridge and engineering works in Canada, and they have recently formed a new syndicate, which has been registered at Montreal under the title of the British Empire Bridge Company, with a capital of £1,000,000.

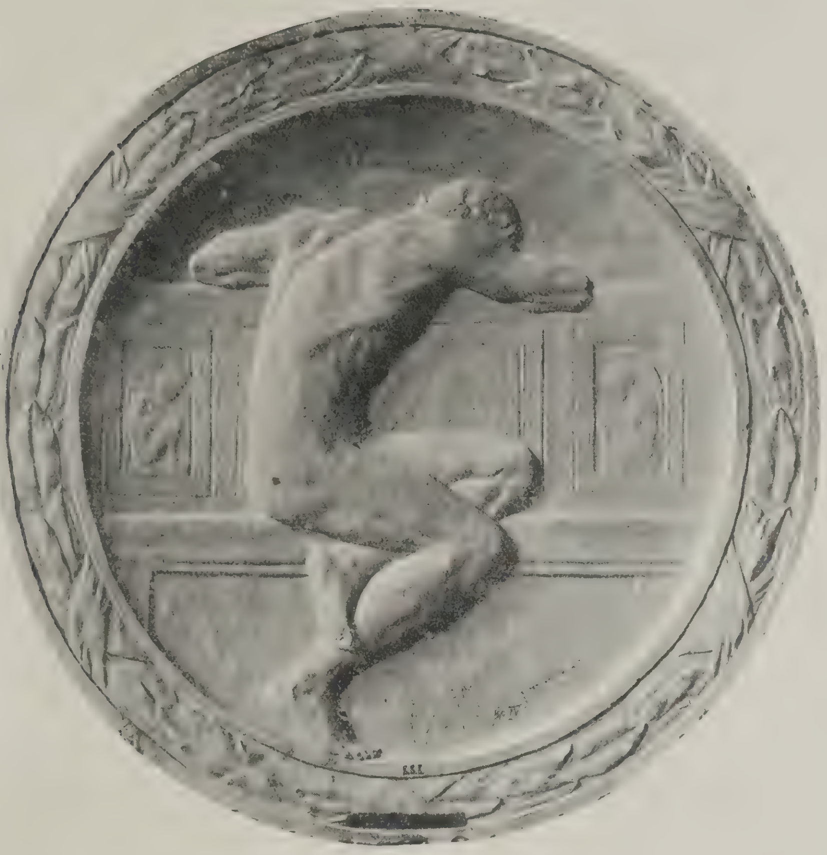
The late Sir Francis Seymour-Haden's antique furniture is to be sold by auction early next month at Alresford, Hants, by Messrs. Knight, Frank, and Rutley.

* * *

During the work of restoration at Morton House, Hatfield, which is now being carried out under the supervision of Mr. Winter Rose, architect, for Mr. F. W. Speaight, there has just come to light an ancient oak roof that for several centuries has been covered with lath and plaster; several coins of James the First's period have also been found.



NATIONAL COMPETITION EXHIBITION, 1910: MODELLED PANEL.

BY ROSIE BAUERKELLER. AWARDED A BRONZE MEDAL.

For designs for the new university buildings at Moscow, for Chanievsky University, the sum of 1,040 francs is offered for each of five selected designs. The elevations, etc., are to be delivered by October 1, 1910, and the detail drawings by January 20, 1911.

* * *

In a competition for a new police barracks (caserne de gendarmerie) at Gannat, in the department of l'Allier, the following awards have been made: 1 (execution of the work), M. Gilbert Bonnet, Vichy; 2 (premium of 600 francs), M. Eugène Giraud, Moulins; 3 (premium of 400 francs), M. Griffet-Lacarin, Vichy.

* * *

The calendar of the Glasgow and West of Scotland Technical College, which was noticed in last week's issue, contains particulars of a newly instituted diploma course in building for day students. In this course, Professor Gourlay informs us, the standard set is a high one, as students before entering the diploma course require to pass an entrance examination in general education equivalent to that to the Scottish Universities. The object is to set before the young men who aspire to be master tradesmen or clerks of works, a course including a sound scientific and technical training which will thoroughly qualify them for co-operation with architects in the erection of buildings. For evening students there are junior and senior certificate courses of three and five years' duration respectively. The College classes are all advanced ones, because elementary work is taught in continuation schools, which are attended by students before they enter the College.

Interesting details concerning the revenue and expenditure of the Bridge House Estates of the City Corporation, out of which the four City bridges are maintained, and were originally built, are given in the Chamberlain of London's annual accounts of the City for 1909. The total income for the year was £152,974, of which rents and quit rents were responsible for £149,018. The cost of maintenance of the bridges was as follows:—Tower Bridge, £15,585; Blackfriars Bridge, £1,207; London Bridge, £1,494; Southwark Bridge, £989. The City police were paid £2,000 for watching the bridges, and a sum of £1,450 was paid for the hire of a steam tug to assist vessels in navigating the Tower Bridge. Strangely enough, although the Tower Bridge is much narrower than its older neighbours, the cost of cleaning it is much heavier, being £1,400, against £750 each for London and Blackfriars Bridges. In the matter of lighting, the City's newest bridge also led the way, this item costing £1,134 for the Tower Bridge, as against £228 for London Bridge, £249 for Blackfriars Bridge, and £157 for Southwark Bridge.

The Garden Cities and Town Planning Association, 31 and 32, Birkbeck Bank Chambers, Holborn, is prepared to arrange for lectures, with or without lantern slides, in any part of the country, illustrating the progress of the Town Planning movement at home and abroad and the great development in the adoption of Garden City principles. A number of well-known authorities on Town Planning generally and upon the Town Planning Act of last year have consented to lecture for the Association, and arrangements are now being made for the winter months.

CORRESPONDENCE.

Duties of a Clerk of Works.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—The following was sent in answer to a Building Committee who wished me to define the duties of a Clerk of Works:—

To assist in setting out all the work, and to check all the dimensions.

To keep a diary in which he makes notes of the weather, the number of men employed, and materials delivered, and to send a copy of the diary to the architects every Monday.

To check and sign time-sheets for all work not included in the contract.

To see that only the materials specified are used, and in their proper quantities, and that the workmen are thoroughly competent.

To see that the builder orders all materials in ample time to ensure punctual delivery.

To keep the architects informed of every difficulty that is encountered, and to draw their attention to any discrepancy that there may be between the quantities, the small scale drawings, and the ¼in. scale drawings, and the full sizes, and to see that the sub-contractors and other firms employed have proper facilities for carrying on their work.

A Clerk of Works should visit the builder's yard about once a fortnight, and see the joinery before it is framed up and primed.

Perhaps some of your readers would care to add to or criticise the list. The question is one that is constantly made to architects. G.

Sound-proofing Partitions and Floors.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—I shall be obliged if you will publish the following exposition of a difficulty I have met with—in order, if possible, to elicit from your readers an explanation or a cure that any of them can recommend from their own experience. I recently erected a hollow partition between two bedrooms, consisting of steel angle-iron uprights, one to each face of partition, connected together with steel cross pieces, upon which was metallic lathing. This was covered on both sides with a quick-setting plaster. The result is excellent as construction, but the partition is far more pervious to sound than any ordinary wood stud and lath and plaster partition, and even more so than a solid 2in. single thickness partition of a similar metallic structure.

I also constructed two floors—a ground floor above a basement storey, and a first floor. These were of wooden joists resting on iron girders and the walls, and with metallic lathing suspended well below the wooden joists by steel hangers and grounds. In this case, again, the ceilings were coated with a quick-setting plaster. The result is a floor extremely pervious to sound in both cases. Now, I believed that in both the partition and the floors I was following the method of comparative disconnection of the two surfaces which has been over and over again recommended as being the best method of sound-proofing, and far better than any form of pugging. I therefore omitted pugging. Even now, after filling the partition with sawdust, it is not much better. I shall be grateful for any comments on this trouble.

W. B. HOPKINS, A.R.I.B.A.

97, High Street,
Berkhamsted.

TOWN PLANNING NOTES.

A New Road, West Hartlepool. The Borough Engineer of West Hartlepool has drawn up a scheme for a new direct road between that town and Middlesbrough. Though the two towns are only 7¾ miles apart in a straight line, the nearest distance by rail is 17 miles; by road 12½ miles with some bad gradients, awkward corners, etc. He proposes, therefore, to construct a new road of a length of about 5½ miles, commencing at the southern end of Seaton Carew, skirting the west side of the golf links, crossing Greatham Creek, and effecting a junction with an existing partially constructed roadway formed by the Tees Conservancy Commissioners, which is at present practically unused and grown over with grass. Thence the traffic would be taken along the existing thoroughfare to the transporter bridge. The scheme would involve entirely new road construction over 3½ miles, and the widening and improving of the existing roadway over two miles. The plan provides for a centre footpath 9ft. in width; on the east side of the footpath a road for motor and light fast traffic 24ft. in width; and on the west side of the footpath a road for heavy slow traffic 22ft. in width. This gives a width for highway purposes of 55ft. The plan further shows on the westernmost side of the footpath a width of 14ft. reserved for light railway purposes, making a total width of land to be acquired of 69ft. Mr. Dennis states that there are no engineering difficulties to be encountered, and for purposes of traction the conditions are ideal, the gradient of the roadway being practically level for its whole length. The estimated cost of the work is approximately £47,000 or £50,000.

The Housing Act at Washington. The Chester-le-Street R.D. Council has been requested by the Washington Parish Council to adopt Part III. of the Housing of the Working Classes Act. The Chester-le-Street Authority, having already appointed a special committee to deal with this subject, referred the matter to it.

Co-partnership Housing. The Co-Partnership Housing Council report that since 1903, when the only co-partnership housing scheme in existence was at Ealing, and the cash value of the land and buildings in the possession of the Ealing tenants was £10,237, 13 other schemes have been started, there being three at Hampstead and one each at Garden City (Letchworth), Sevenoaks, Leicester, Manchester, Harborne, Fallings Park, Stoke-on-Trent, Derwentwater, and Sealand, the total area of land in the possession of these societies being 652 acres, on which it is intended to build 6,595 houses at a total cost of £2,105,990, of which about one-fourth had been expended at the end of the last financial year.

Proposed Garden Suburb, Haslemere. The rector, Rev. G. H. Aitken, foreshadows in the Parish Magazine a housing scheme at Haslemere. He says: "What exact form the scheme will take and on what system the cottages will be built are not yet decided. What has seemed to be needed for a long time is something in the nature of a little garden suburb, not too large, to fit in with the general proportions of the town, and with cottages pleasantly built, surrounded by small gardens, and standing at a rent which is not beyond the wages which prevail in this district."

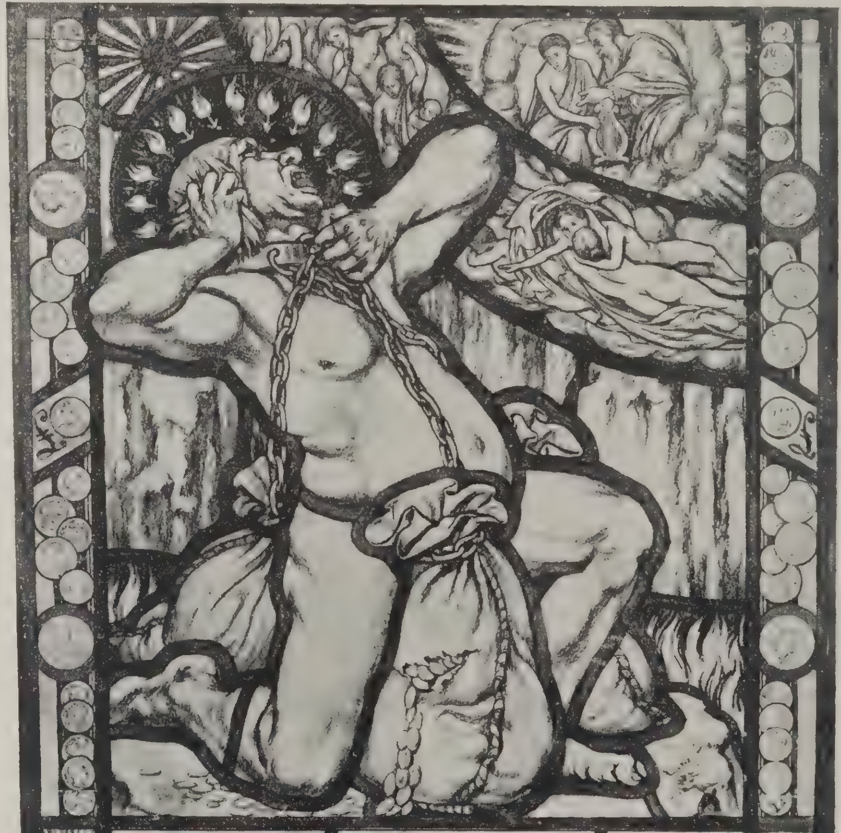
Brent Garden Village. The main feature of the new garden village at Finchley is the system of co-operative housekeeping to be inaugurated there. Brent Lodge, which stands on the estate, is to be preserved, and used as a central dining hall and clubhouse. The catering department will be managed by an experienced chef, and tenants who wish to avoid the trouble of cooking their own meals may have them provided at the central hall or sent to their own homes. Mrs. Melvin, the secretary, announced to a meeting of subscribers and friends that applications had already been made for 40 or 50 flats, and capital had been coming in at the rate of £1,000 a month. The arrangements were all complete, and it only remained now for the necessary capital to be subscribed. The estate to be purchased provides 24 acres of land, upon which houses and flats at rentals varying from £35 to £60 a year are to be erected.

The Preservation of Borrowdale. Mr. H. D. Rawnsley and Mr. Nigel Bond announce that the purchase money for Borrowdale Estate has been raised. The number of donors is 450, of which one gave £147, three £100, three £50, five £25, 25 more than one acre, 101 one acre, and the rest sums varying from £5 to 1s. Amongst the donors of acres were friends to the movement in America, who remembered the beauty of Borrowdale; the public schools and staffs of Harrow, Winchester, Rugby, and Sedbergh also gave acres. The Princess Louise set an example in the purchase of 13 acres of Grange Fell as a memorial to the late King. Many reasons have conspired to make it a peculiarly difficult time to raise money for such a purpose, and the greater, therefore, is the honour to those who have determined to help to preserve for the nation in the heart of this northern home for health, recreation, and thought, one of the most beautiful bits of our Lakeland scenery.

SOCIETIES' REPORTS.

L.C.C. School of Building.

The prospectus of the London County Council School of Building, Ferndale Road, Brixton, S.W., is a stout pamphlet of forty-four pages, in which are set forth in detail the growing activities of this seemingly prosperous institution. The studies are arranged in three sections:—(1) Trades classes; (2) building construction and allied subjects; and (3) architecture and drawing. In the first section, all the usual trade subjects are taught; in the second, the "allied subjects" include book-keeping, estimating, office routine, the law of easements, chemistry, and physics of building materials, land surveying, mathematics, and, as stated in our "Concrete and Steel Section," the new subject of reinforced concrete, in which lectures will be given by Mr. H. Kempton Dyson on Tuesday and Friday evenings. The Director of Architecture is Professor Beresford Pite, F.R.I.B.A., and the Principal of the school is Mr. H. W. Richards.



Who once has had it has despair

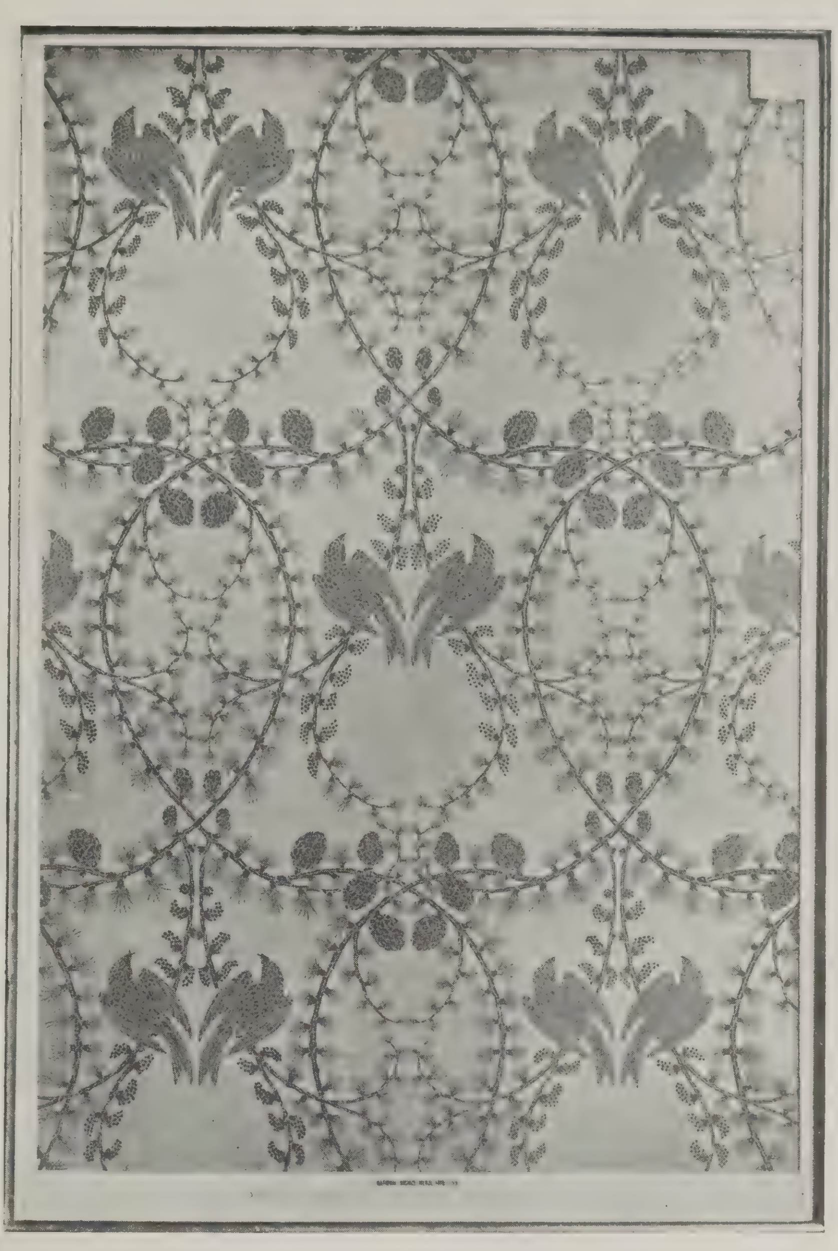
NATIONAL COMPETITION EXHIBITION, 1910: DETAIL OF DESIGN FOR STAINED GLASS. BY EDWARD RIDLEY. AWARDED A GOLD MEDAL.

MAGAZINES & REVIEWS.

The only article in the "Art Journal" which bears on design as distinct from pictures is that by Mr. Holmer on "Hedgerows in Late Summer," one of the "Nature Study" series, with illustrations by Miss Augusta Cullis. These are foreground studies of leaves and sprigs, and are full of suggestion for decorative design.

The "Burlington" contains a reproduction of an interesting sketch by Rembrandt, in the print-room at Berlin, which is supposed to be a view of London with old St. Paul's in the centre. There seems to be no record of Rembrandt having visited London, but a comparison of the outline of the building with Hollar's well-known view of old St. Paul's seems to render it probable that it is the same building. The spire had been destroyed or taken down at this time; the tower only is shown, with a square finish. Another drawing of old St. Paul's, of the school of Rembrandt, is reproduced from a Vienna collection; in this case there can be no doubt of the subject, though the artist, whoever he was, has got into trouble with his perspective in putting in the transept gable. The reproduction of the two sketches is at all events an interesting addition to our illustrations of mediæval St. Paul's.

The "Architectural Record" (New York) gives a long and fully illustrated article to the New York Public Library, of which Messrs. Carrère and Hastings are the architects. This is a Classic building of very sumptuous design in all its interior details, planned on symmetrical lines, with an immense general reading-room on the third floor at the back of the building, divided across the middle by two parallel columned screens of woodwork, of fine design, which form a kind of central vestibule and distribution room. The architects, we are told, purposely kept this main reading-room at the back and out of sight, because they recognised that a monumental architectural effect could not be consistent with the provision of large window space, and perhaps its position on the third floor was also influenced by a desire for a better light than could be obtained below; but as far as we can understand the plans, which are not very well reproduced, the main reading-room would seem to be rather difficult of access from the street. Otherwise, the plan seems a very good one. The main staircase is very dignified and spacious; the principal front, towards Fifth Avenue, is treated with a Corinthian engaged order the whole height of the building, with a sumptuous cornice; the details of this part seem very good in their conventional style, though the grouping of the front as a whole is not impressive, the pedimented end pavilions being rather weakly treated. The article describes this as "the most important building erected since the American architectural revival began." We do not exactly understand where that "revival" counts from, unless it is from the time when everything in American architecture became French. In that case the New York Library no doubt is typical. It seems rather a pity that nothing more original could be done for the front than the conventional engaged Classic order. Mr. Montgomery Schuyler's article on "The Architecture of American Colleges" is continued. The dates put to the illustrations render them rather amusing landmarks of the changes of architectural taste, which till recent years seem to have followed those of England pretty closely. Girard College (1833) is an octastyle temple façade; Logan Hall (1874) is Gothic in the manner of the late Mr. Waterhouse; in the buildings of the last decade of the century we come to a quieter collegiate Gothic with mullioned windows; and so on.

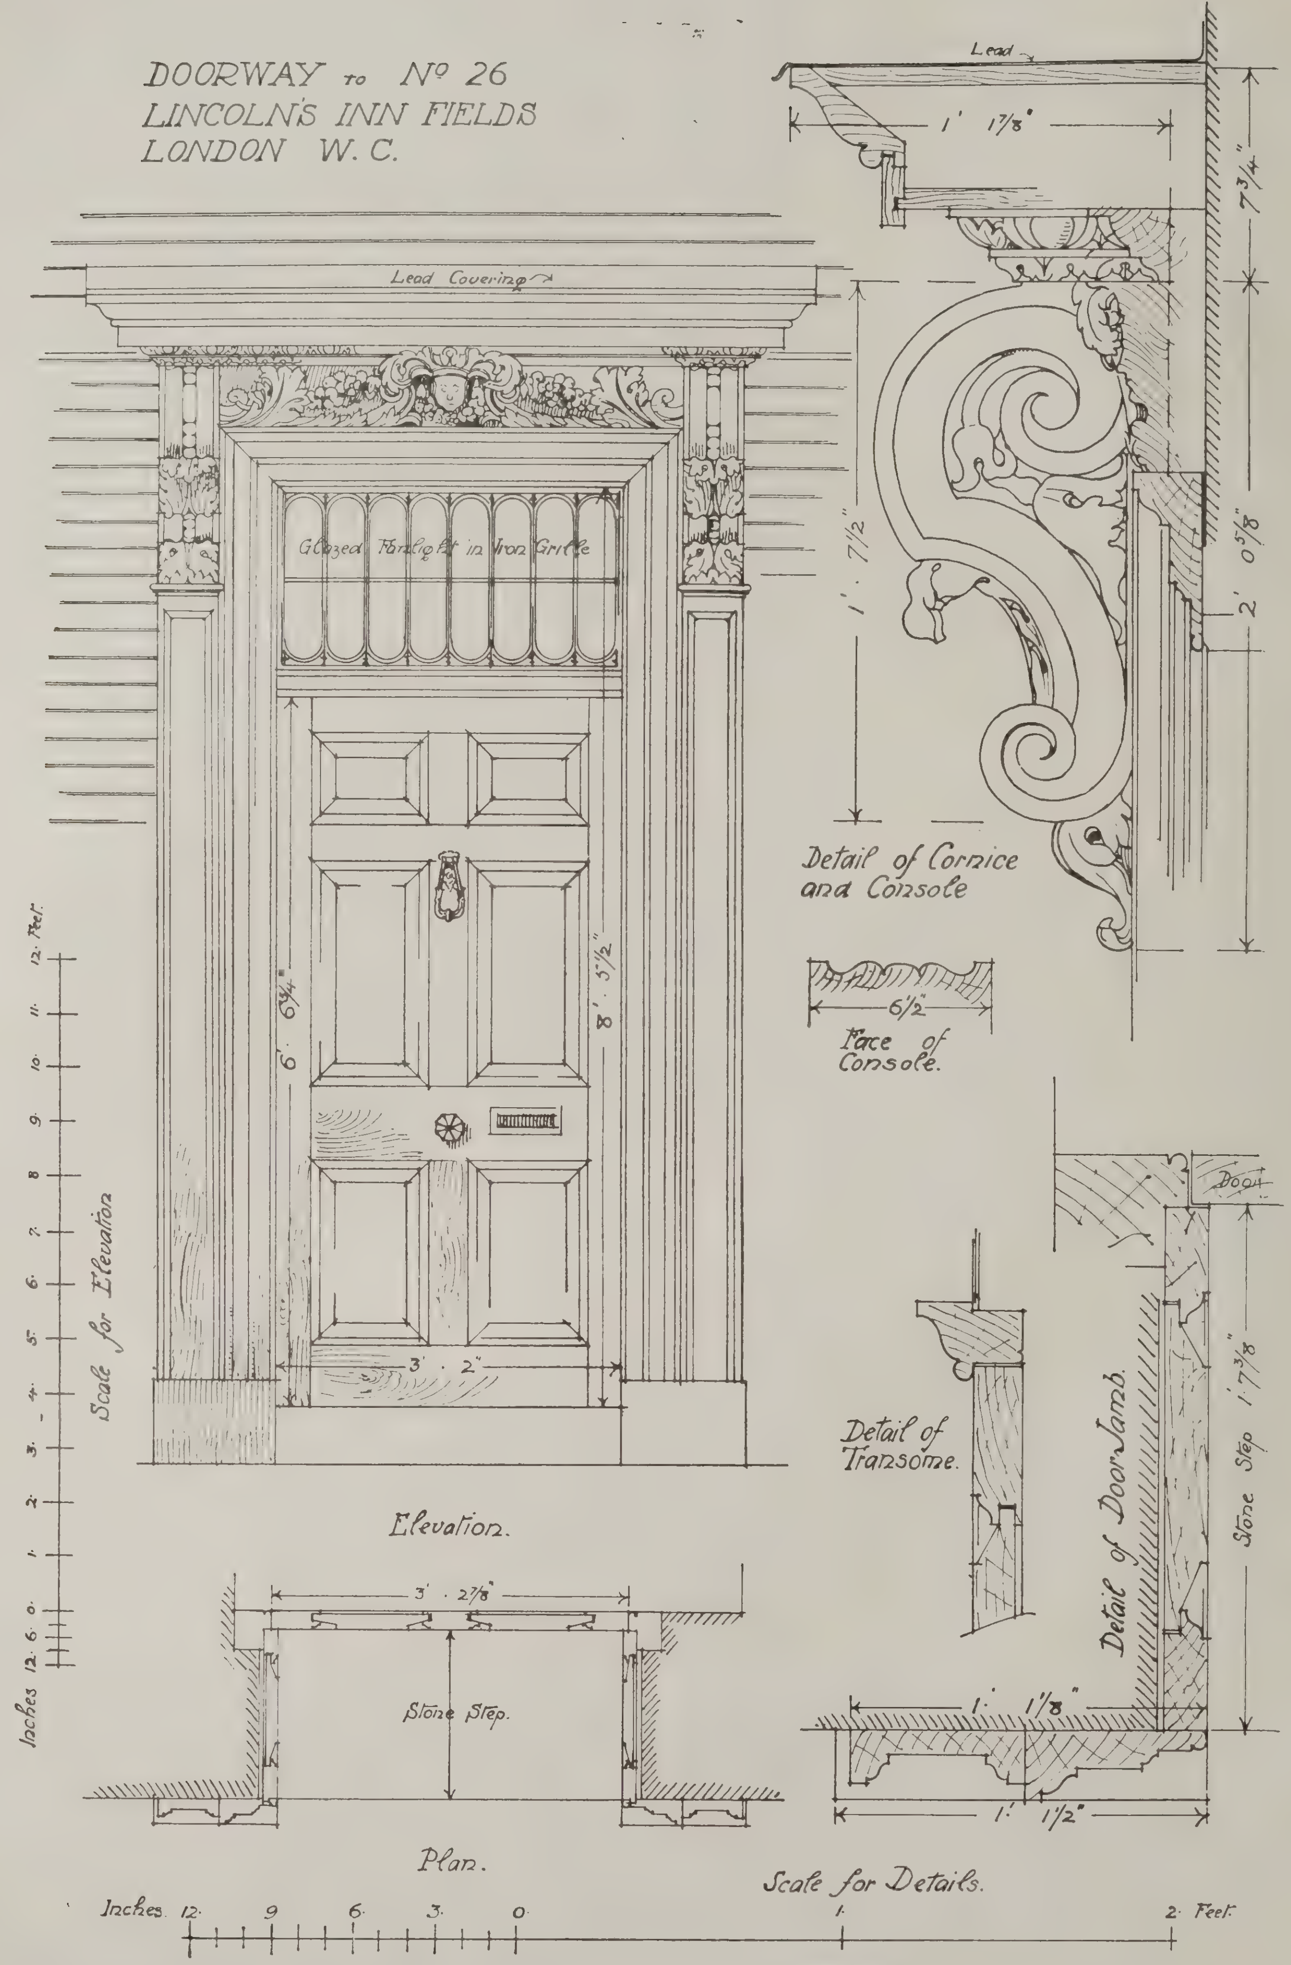


NATIONAL COMPETITION EXHIBITION, 1910. DESIGN FOR PRINTED COTTON-HANGING. BY LUCY MACARTHUR. AWARDED A BRONZE MEDAL.

"Scribner" contains, under the title "The Canal Builders," an account of a visit to the works of the Panama Canal. It is so crammed with American operatives' slang (being mostly in the form of reported conversations with the men), that a good deal of the detail is not very intelligible to the ordinary reader; but one may gather from it that work in the way of excavating by steam-shovels, blasting with dynamite, and laying immense masses of concrete, is really going forward on a great scale, and that those concerned in directing the undertaking mean to carry it through, though no one can yet say when the end of it will be in sight. It may be gathered also that the work is carried on a good deal in that careless and happy-go-lucky fashion which has led to so many accidents on American railways, and that several disastrous premature dynamite explosions have accounted for a good many lives. One can hardly imagine such avoidable accidents happening under the rule of an English contractor. Under "The Field of Art" are some observations on "Contemporary Architectural Sculpture in Colour," which appears to be attracting a good deal of attention among American architects, chiefly in consequence of the extensive employment of terracotta as a covering for steel structure, and the opportunities thus afforded for reviving the art of Della Robbia. Three buildings are mentioned as having been recently decorated in this manner; a church, an opera house, and an hotel:—

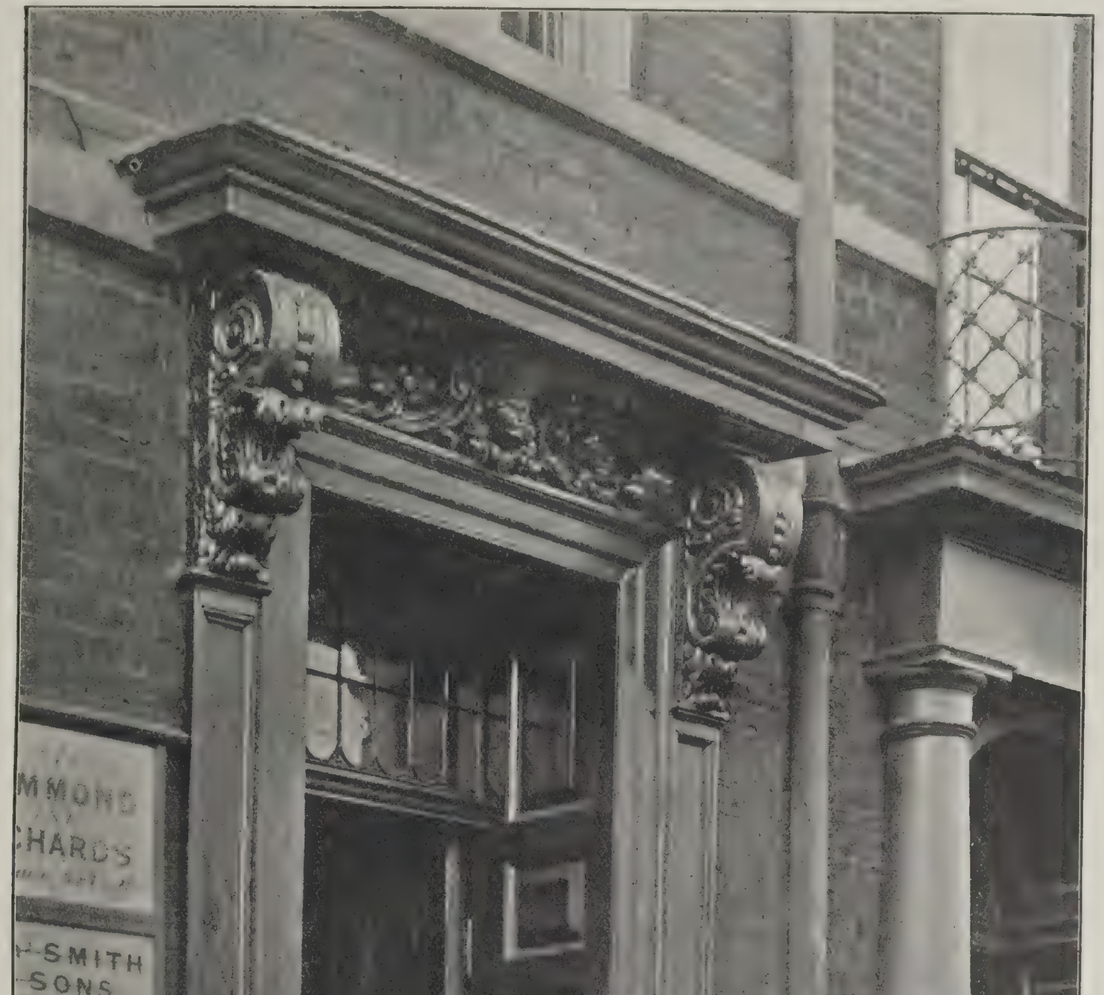
> "In the simpler colour schemes adopted, the arrangement of white figures on a blue ground is frequently maintained to-day, as in the pediment of Dr. Parkhurst's Church, Madison Square in this city. In the panels of the Boston Opera House, representing Music, Drama, and Dancing, this blue takes on a greenish tinge. In the large medallions and reliefs on the façade of the new Vanderbilt hotel, in this city, now in process of construction, the colour is more delicate, the figures being white and the background a delicate cream colour. But for all this work, sculptural and purely architectural, the number of colours, it is claimed, can be indefinitely increased.

An illustration of the church pediment is given. Apparently the church is a stone building; what would be the effect of the highly coloured pediment sculpture in such a case seems rather doubtful. But the subject is of considerable interest to modern architects.



DOORWAY TO Nº 26
LINCOLN'S INN FIELDS
LONDON W. C.

MEASURED AND DRAWN BY J. Lᴸ BERRY



The West Central district of London abounds in examples of eighteenth century doorways. The above is a good specimen, though marred by the glossy varnish on the woodwork. The consoles in particular are very bold in design and execution.

DOORWAY TO NO. 26, LINCOLN'S INN FIELDS, LONDON.

ROYAL SANITARY INSTITUTE CONGRESS.

The Health Exhibition.

The Royal Sanitary Institute Health Exhibition at Brighton, which was opened on September 5th, and remains open until September 14th, comprises about 70 stalls. Among the most noteworthy from our particular point of view are the following:—John Gilkes and Sons, Ltd., decorators' merchants, North Street, Brighton, whose elegant stand, with correctly proportioned Ionic pilasters, was designed by Mr. W. C. F. Gillam, M.S.A., of Westminster and Brighton. They showed wall-papers and decorative materials, and were awarded a bronze medal for "Tekko," a non-fading and washable wall-covering of brilliant colouring, and another for the Birge leather papers. The Horsfall Destructor Co., Pershore (silver medal); Goddard, Massey, and Warner, Ltd., Nottingham (silver medal for an improved steam disinfector); Thomas Parsons and Sons, varnish and enamel manufacturers, Long Acre and Mitcham, who showed their Endelline enamel and other decorative and sanitary preparations; Ronuk, Ltd., London, Manchester, and Portslade, floor staining and polishing preparations; Sussex Portland Cement Co., Ltd. (silver medal for educational value of exhibit); Cakebread, Robey and Co., Ltd. (bronze medal for magnet lockfast joint, and another for Stevens's barrel locks, of which a description has been already given in this journal). Carter and Co., Ltd., Poole, Dorset, and London, show tiles, mosaics, terra-cotta, etc., and receive a bronze medal for their leadless glaze ware. The British Sanitary Co., Glasgow, are awarded a silver medal for their self-acting earth-closet, and the Eagle range (Eagle Range Co., London and Birmingham) receives a similar award.

The Cable System of Heating.

An exhibit of exceptional interest is that by Messrs. J. F. Phillips and Son, of 21, Old Queen Street, Westminster, also of Brighton and Liverpool, of Barker's Cable system vacuum hot-water heating. This system has been already described in the journal, but its principal features may be again usefully summarised. The cardinal principle of the system is that circulation is obtained not by driving or propulsion, but by suction, which draws or aspirates the water round the system at a very high velocity. The chief agency in obtaining this effect is called the thermo-syphonizer. An automatically controlled valve sprays water into a heating chamber, where it is heated by the admission of low-pressure steam or vapour at or below atmospheric pressure, when the condensation of the steam causes a powerful suction on the return pipe. After being heated, the water is forced by silent steam pressure up to a tank at a higher level than the apparatus, and is thence conducted (through the flow-pipe) to the radiators, through which a powerful circulation of hot water is maintained. The temperature remains constant to the degree to which it is set by the simple adjustment of a regulating lever, by means of which it is placed under complete control. No pumps are used, and as regards the laying of the pipes the system is absolutely independent of levels or gradients. The pipes can be fixed at any level and bent in any direction, as demonstrated at the exhibition, where a length of flexible pipe is contorted into elliptical loops, and tied into slip-knots, without the least detriment to the circulation. We thus get the very important advantage that the system can be applied without structural alterations. At the Brighton pavilion, about 1,000ft. of piping has been laid without the slightest interference with the structure. Smaller pipes are required than those necessary in ordinary systems; and any number of detached buildings can be heated and supplied with hot water from one apparatus, without excavations for boilers or pipes. The Cable system has been successfully installed in many parts of the country; and among the more important buildings for which it has been adopted are the Royal Aquarium at Brighton; Royal Portsmouth Hospital (two installations fitted, and a third under consideration); British Motor Cab Co.'s Garage, Pimlico; Messrs. Pratt Bros.' extensive shops, showrooms, workshops, and offices, High Road, Streatham, S.W.; scarlet fever pavilion at the Borough Hospital, Brighton; and at many other hospitals, churches, schools, factories, and private residences. The installation at the Royal Sanitary Institute Exhibition has received the Institute's highest award, the silver medal. Messrs. Phillips also exhibit (for the first time) the "Perfecta" or "Warm Wall" system of warming and ventilating, in which there is direct radiation from the surface of a wall, in which the apparatus (including a humidifier) is concealed. To this invention we hope to be able to refer more fully on a future occasion.

The Congress.

The 25th annual Congress of the Royal Sanitary Institute was opened at Brighton on Monday, September 5, when delegates attended from the following bodies:—Colonial and Foreign Governments, 3; Government Departments, 4; County Councils, 18; Borough Councils, 45; Metropolitan Boroughs, 4; Boroughs, Urban District Councils, or Sanitary Authorities, 80; Rural District Councils, 9; Port Sanitary Authorities and others, 6; Education Authorities, 9; Societies, Universities, Colleges, etc., 51. The Royal Institute of British Architects, the Society of Architects, the Surveyors' Institution, the Institution of Heating and Ventilating Engineers, and the Incorporated Society of Municipal and County Engineers were amongst the bodies represented. The Hon. Sir John A. Cockburn, K.C.M.G., was President of the Congress, and delivered the inaugural address on Monday evening.

Town Planning.

On Tuesday a joint Conference of engineers and surveyors to county and other sanitary authorities and medical officers of health was held under the chairmanship of Mr. P. H. Palmer, M.Inst.C.E. (Borough Engineer, Hastings). In his inaugural address Mr. Palmer said that during the last ten years the scope of subjects with which the municipal engineer had to deal had been greatly extended and widened, the operations of various Acts of Parliament, the introductions of reinforced concrete, extension of the Public Health Act, Housing and Town Planning, and various other matters had made it necessary that his knowledge should be special, and that he should be a highly trained man. One of the subjects of most recent creation, and one which would ultimately have far reaching consequences for good, was the passing of the Housing and Town Planning Act. Of all subjects connected with the health of the community nothing could be of greater importance than the control which local authorities were empowered to exercise in the future over the provision of living accommodation for the working classes. The effect of this great public health measure upon the future welfare of the population engaged in large industrial centres could not be overestimated. The regulations which had now come into force appeared to have been made so as to meet all the points in the Act, but no doubt these would require alteration as the operations of the Act were more fully understood. On reading the regulations one could observe that they had been drawn up on lines which indicated most careful consideration and the application of practical minds. The regulations showed that a considerable amount of work would be thrown upon the officers of the local authority in regard to the scheme, and it appeared perfectly obvious that the drafting and carrying out of all town planning schemes would be a matter of considerable magnitude, and would have to be prepared and dealt with by the greatest care and consideration on all hands so that all interests involved might be taken into account, and local prejudices smoothed over.

Reinforced Concrete.

Reinforced concrete, although only used extensively within recent years, was old in principle, and had been used in works of considerable magnitude for years past. The Romans to some extent strengthened and reinforced concrete with tiles so as to give a bond in walls, and no doubt to some extent understood the principles in a rude or rule-of-thumb manner. It was only within the last few years that the subject had been studied scientifically as regarded the calculation of stresses, in the combination of two materials so very different in their characteristics. The calculations in connection with reinforced concrete structures were decidedly intricate, although not difficult; they required great care and a good knowledge of applied mechanics and of the properties of concrete. The execution of reinforced concrete structures had to some extent been confined to certain firms who had made the subject a special study, and had gained much experience, and, in his opinion, the use of reinforced concrete to a large extent in either engineering or architectural structures should only be entrusted to those who had studied the subject and had very considerable experience in the use of steel and concrete in all its various forms. It was now put to many uses in engineering as well as architectural work. Many very fine specimens of such work were to be seen in various parts of the country, but it must not be forgotten that there had been a considerable number of failures, which one did not so readily hear of.

Town Planning Procedure Regulations.

Mr. F. E. Fremantle (County Medical Officer, Herts) gave a paper on "The Town Planning Procedure Regulations (England and Wales), 1910." He pointed out that town planning under the Act was confined to land which is in the course of development or appears likely to be used for building purposes." It did not apply to land at present occupied by buildings, and it therefore had little to do with the central area of existing towns. Nor was it likely in the near future, despite the successful example of Letchworth, to be largely used for the planning of new towns from the outset. Its main application will be to the extending fringe of suburbs of existing towns and villages, and in his judgment every town and village throughout the length and breadth of the land in or around which any land "appears likely to be used for building purposes" should within the next few years frame a town planning scheme for the guidance of possible building developments in accordance with the public interests and the saving of future costly improvements. The fundamental objection to the regulations was that the procedure prescribed was unnecessarily and inordinately troublesome, costly, and elaborate, and would certainly hinder very greatly the spread of town planning. The regulations went far outside the Act, and they were indeed a direct breach of Mr. Burns's undertaking to the committee that considered the Bill in Parliament to the effect that the preliminary procedure for sanction to prepare or adopt a scheme should be the simplest possible. The regulations should be divided into two chapters, one for schemes proposed by owners, and the other for schemes proposed by the local authority. As they stood, the procedure in the two cases was elaborated on similar lines, article by article, and each stage of procedure was swollen out to include every conceivable contingency. The author concluded by moving the following resolution:—"That this meeting is of opinion that the procedure imposed on a local authority by 'The Town Planning Procedure Regulations (England and Wales), 1910,' prior to obtaining authority to prepare or adopt a town planning scheme will entail considerable expense, opposition and difficulty; that it will greatly deter authorities from making use of the Act; that details at this stage are unnecessary and that to insist on the details prescribed at an early stage will to a large extent defeat the intention of the Act; and that the Council of the Royal Sanitary Institute be asked to make such representations to the Local Government Board as may appear to the Council to be necessary in the matter."

Dr. Weaver, in seconding the resolution, expressed the belief that in the small districts the Act would not be put into force because surveyors would not be able to persuade their Councils to embark on the elaborate processes required by the regulations.—Mr. R. Brown M.I.C.E. (Southall, Norwood) considered there would be a danger in making the regulations too easy, but he thought the Government might well assist the smaller communities in the matter of keeping their ordnance sheets accurately up to date.

Mr. Lanbie (Lanarkshire) and Mr. Munce (Belfast) both opposed the resolution, and said they were only just commencing with the Act, and it would be time to go to the Government when it was found they could not deal with schemes under the regulations.

Mr. P. Boulnois (Local Government Board) said the author had dealt with what was a mere bogy. A layman reading the requirements might be frightened, but to the men who had to do the work they were absolutely simple. He assured them that the regulations were simplicity itself.

The resolution was defeated by a considerable majority.

THE ROMFORD GARDEN SUBURB COMPETITIONS.

We are informed by the Hon. Secretary of the Town Planning and Modern House and Cottage Exhibition that, although the 31st of October has been fixed as the date for receiving designs in Classes I. and II., it will greatly assist the judges if a fair proportion of the designs are sent in for consideration before that date. The entries at present received fully justify the hope that Mr. Raphael's generosity will result in a most interesting and valuable exposition of modern cottage architecture, which should exercise a far-reaching influence on suburb building near London. It has been arranged to publish a fully illustrated quarto volume, describing the houses and cottages erected with plans and drawings, and competitors are asked to furnish perspective drawings and short descriptions of their work, with the names and addresses of the architects and builders, as soon after the 31st October as possible, in order to facilitate the preparation of this work The conditions of competitions which, together with a plan of the estate, have been furnished to us are as follows:—

Competitions Open to Architects.

Class I.—A detached house, to cost £500; First prize, gold medal and £250; second prize, £100.

Class II.—A detached cottage, to cost £375: First prize, gold medal and £200; second prize, £100.

Class III.—For the best internally fitted house in Classes I. or II.: First prize, £50.

Class IV.—A town plan of Gidea Park: First prize, £100; second prize, £50.

Class V.—A garden design for house or cottage in Classes I. or II.: First prize, £25; second prize, £10.

Class VI.—A perspective drawing, suitable for reproduction, of a house or cottage entered for competition in Classes I. or II.: First prize, £10; second prize, £5.

Competition Open to Builders.

Class VII.—For excellence of workmanship and construction in the erection of a house or cottage in Classes I. or II.: First prize, gold medal and £100; second prize, £50.

Conditions and Instructions to Competitors.

1. The competitions for Classes I. to VI. inclusive are open to all architects resident in the United Kingdom, and the competition for Class VII. is open to all builders resident in the United Kingdom, provided that no promoter of the competition, and no assessor or judge engaged upon it, or any employee of either shall be eligible to compete, nor shall they assist any competitor. Any competitor ineligible on these grounds shall be disqualified.

2. Mr. E. Guy Dawber, vice-president R.I.B.A., Mr. H. V. Lanchester, F.R.I.B.A., and Mr. Mervyn Macartney, F.R.I.B.A. (who are at liberty to obtain the assistance of lay advisers in such manner as they think fit) will judge the entries and award the prizes in all classes of the competition, and their decision, or the decision of a majority of them, with regard to any matter arising in connection with the Exhibition, shall be binding on all parties and without appeal.

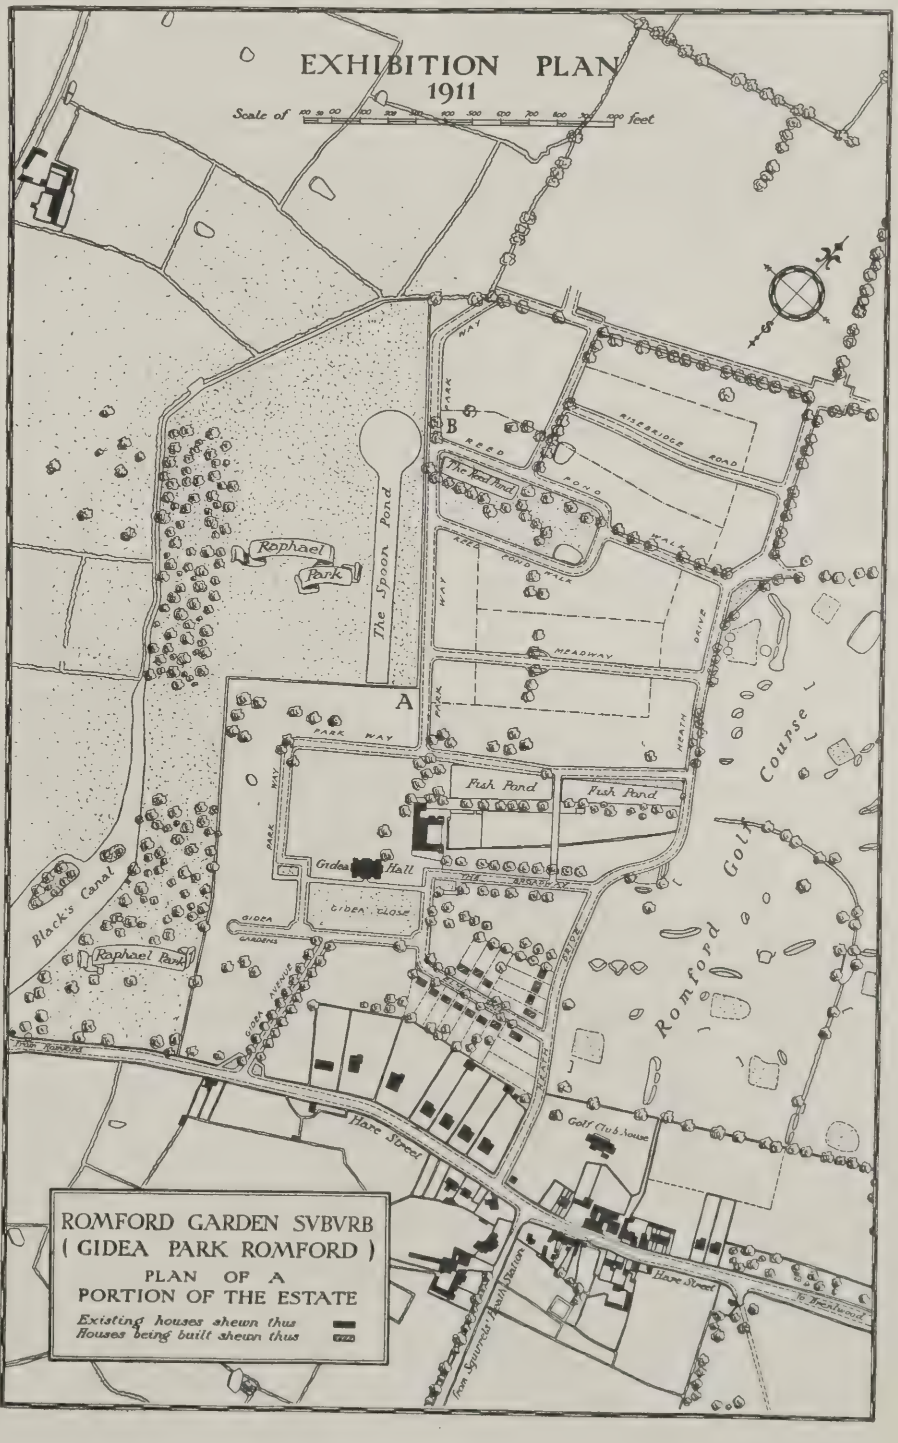
3. Any designs or entries will be excluded from the competition (a) if sent in after the dates named (unavoidable delay in transit alone being excepted); (b) if in violation of the instructions; and (c) if any competitor attempts directly or indirectly to influence the decision of the assessors.

4. Competitors entering for the Exhibition shall be held to accept and be bound by these conditions and instructions.

5. The directors of the Romford Garden Suburb have allotted for the purpose of this competition a site bounded by Raphael Park in the town of Romford on the South-west side, and by the Romford golf links on the north-east, and on the south-east by the ornamental grounds of Gidea Hall. A plan drawn to a scale of 1/2500, and showing the plots allocated to the purposes of the Exhibition, can be obtained on application to the Secretary, Town Planning and Modern House and Cottage Exhibition, 33, Henrietta Street, Strand, W.C.

6. The plot plan above referred to will be clearly marked with the freehold price of each plot, and the ground rent for a 99 years' lease of each plot, and it will be optional on the part of the competitors to purchase the plots upon which they build in fee simple or to lease same. The lease will contain an option to purchase the freehold within three years.

Note.—The judges will have full power to extend the period within which entries are to be received or buildings are to be erected, if, in their judgment, it becomes advisable to do so, of which due notice will be given to all competitors.



Classes I. and II.

The prizes in these classes will be awarded by the judges to houses and cottages to be actually erected by competitors in Gidea Park

7. The cost price must include the entire building cost including builder's profit and architect's fees (5 per cent.) but not the cost of the land or of any work done in laying cut or planting gardens except as provided in clause 10, section VI.

8. The directors of the Romford Garden Suburb will be prepared to purchase for cash at the Exhibition price the first six houses or cottages in each of Classes I. and II. in the order in which they are placed by the judges.

9. Arrangements have been made whereby at least three-fourths of the cost of erection will be advanced on each house or cottage erected for Exhibition purposes. Terms can be had on application at any time after September 8th to the Secretary of the Exhibition. Competitors desiring to avail themselves of these facilities are requested to submit their designs for approval at as early a date as possible.

10. Classes I. and II.—Competitors desiring to erect houses or cottages for exhibition under Classes I. and II. must submit on or before October 31st, 1910, sketch designs of the houses or cottages proposed to be erected, drawn on plain paper of imperial size and to a scale of ⅛in. to a ft., together with a portion of the principal elevations drawn to a scale of ½in. to a ft., with a block plan to a scale of 1/500, with soil and R.W. drains clearly shown thereon, and in a form in which they can be deposited with the Romford Urban District Council (see extracts from by-laws on pp. 45 and 46) without alteration. A short description of the principal materials proposed to be used in the external construction of the building must be clearly indicated upon the drawings themselves. The length of sewer from disconnecting chamber to centre of road to be taken at 30ft.

(1) The drawings will be submitted to the judges for approval, who may approve the same unconditionally or conditionally upon these regulations being complied with, and such designs as in their opinion are not in accordance with the regulations herein set out will be excluded from the Exhibition, and competitors submitting these designs will be at once notified of such exclusion, and their drawings will be returned to them.

(II.) In order to obtain a reasonable uniformity of treatment the following regulations as to building shall be adhered to by all competitors in Classes I. and II., and neglect to comply with these regulations may disqualify a competitor.

(III.) Materials and Construction.

(a) External walls may be faced with well-burnt red, grey, or brindled bricks jointed in mortar. They may be built in common bricks or other hard and incombustible material coated with cement roughcast and distempered with cream distemper, or they may be built of 11in. hollow walls of common bricks twice limewhited.

(b) It is suggested that the chimney stacks in all houses should be faced with red, grey, or brindled bricks jointed as above.

(c) Roofs must be covered with tiles, and must have a pitch of not less than 45 deg. to the horizontal.

(d) The window panes should be of a standard proportion of width to height of 6 to 7½, or as near this proportion as the competitor finds practicable.

(e) All buildings are to be in accordance with the by-laws of the Romford Urban District Council, and competitors must submit drawings, etc., to the Council and obtain the necessary approval.

(IV.) Accommodation.

(a) Houses in Class I. must contain the following accommodation, and may contain more at the option of the competitor: On the ground floor, two reception, kitchen, scullery, larder, servants' w.c., coals; on the first floor, four bedrooms, bathroom, separate w.c. (one bedroom may be placed in attic if desired).

(b) Cottages in Class II. must be designed in two storeys and must contain the following accommodation, and may contain more at the option of the competitor: One reception, living, kitchen, scullery, larder, coals; three bedrooms, bathroom, separate w.c.

(c) No living room or bedroom in any house to contain less than 500 cubic feet.

(V.) Houses must be completely finished in every respect ready for occupation, and fitted throughout, the drains connected to sewers, and the water and gas laid on, and the site and garden absolutely clear not later than May 1st, 1911, and non-compliance with this regulation will disqualify competitors.

(VI.) Every plot must be enclosed on one side and at back with open trellis fencing, and along the front boundary with post and chain fencing. In order to obtain uniformity this fencing will be carried out by the Exhibition Committee, and a sum of £15 in Class I. and £10 in Class II. must be provided within the cost limit to defray the expenses of fencing, exclusive of any entrance gates.

(VII.) Competitors are advised to have the gardens laid out, and, if desired, planted, as this tends to improve the appearance of the house, but this work is not to be included in the cost limit. The attention of competitors in Classes I. and II. is specially directed to Classes V. and VI.

The plan issued to competitors will show the aspects of the various plots, and competitors will be required to state upon the entry forms for which aspect they intend to erect their houses. The plots will be allotted by the judges, and buildings frontages marked thereon when the designs are approved, with a view to grouping houses of different material and design in such a manner as to secure, so far as practicable, uniformity of architectural effect.

No plot may be of a less width than 35ft. in Class I. or 30ft. in Class II., but the width of plots will be increased by the judges where necessary to accommodate the frontages of houses and cottages as designed by competitors, and competitors must allow for a minimum space of 5ft. to be left unbuilt upon on each side of a house entered for erection in Class I., and for a minimum space of 4ft. to be left unbuilt upon on each side of a cottage intended to be erected in Class II., and in arranging windows the proximity of the houses on either side should be borne in mind.

Competitors must on or before the 1st May, 1911, send a written statement to the Secretary of the cost of erection as defined in Clause 7, which price will be the exhibition price and must not exceed the cost prices allowed, and successful competitors in Classes I. and II. must be prepared to satisfy the judges that the houses have been erected, and can be repeated, within the building price allowed, after allowing a reasonable margin of profit to the builder employed, and for this purpose must be prepared to produce to the judges vouchers and accounts on completion, or such other information as they may require.

Class III.

No special form of entry is necessary for this class. The prizes will be awarded to the house or cottage in Classes I. or II. which, in the opinion of the judges, is best fitted and contrived to minimise domestic labour and service. The principal point which will be considered will be the convenience of the house and its internal fittings, as apart from movable furniture, from the housewife's point of view.

Class IV.

Detailed conditions in Class IV. will be sent, post free, to all applicants on and after September 30th, 1910.

All plans submitted to the judges will remain the property of the competitors. The directors of the Romford Garden Suburb reserve the right to utilize the same for repeats subsequently to the Exhibition, on payment of the usual professional charges.

Class V.

No special form of entry is necessary for this class. The prizes will be awarded by the judges to the gardens of houses or cottages erected in Classes I. or II., which have been actually laid out and planted by competitors on or before the 8th May, 1911.

Class VI.

Perspective drawings should be drawn to a size of 12in. by 8in. and suitable for reduction to one-third of that size, and must be line drawings, and must be sent to the Secretary on or before the 30th November, 1910.

Class VII.

No special form of entry is necessary for this class. The prizes will be awarded to builders who have actually erected houses or cottages in Classes I. or II., irrespective of whether such houses or cottages have or have not obtained prizes in Classes I. or II.

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

SEPT. 15. The QUEENS UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

SEPT. 19. TOWN HALL, MAESTEG.—Printed terms and conditions, etc., from the engineer, Samuel J. Harpur, Town Hall, Maesteg.

Oct. 1. ANTWERP. SCHEME FOR LAY-OUT OF SITE OF FORTIFICATIONS, ETC.—Premiums £1,000, £400, and £200. Conditions may be seen at Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C., or obtained from the "Commission d'études de l'aménagement de l'agglomération anversoise," Due du Jardin des Arbalétriers 57, Antwerp. Deposit 100 francs.

Oct. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., at a cost not to exceed £10,000. Particulars (deposit £1 1s.) of J. Parry Jones, Town Clerk, Denbigh.

OCTOBER 31, ETC. ROMFORD GARDEN SUBURB. Competitions in six classes for architects and in one class for builders for the best cottages, etc., erected in the Town Planning and Modern House and Cottage Exhibition, Gidea Park, to be held in June and July, 1911. Prizes amounting to £1,050. Particulars of the Secretary of the Exhibition, 33, Henrietta Street, London, W.C.

NOV. 15. TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan in the parishes named. Terms and conditions obtainable from the company. Deposit, one guinea.

NO DATE. CHURCH, LLANDUDNO. Competitive designs are invited from architects who have practised for not less than five years in North Wales or in the City of Chester for the erection of a church for the West Shore District of Llandudno. Deposit, one guinea. Apply, the Rector, Llandudno.

Nov. 29. BANGOR (COUNTY DOWN). SEA-WATER BATHS.—The U.D. Council invite experienced architects to submit plans, specifications, and estimates for the erection of hot sea-water baths, at Pickie. Further particulars can be had on application to J. Milliken, Clerk to the Council, Town Hall, Bangor, Co. Down.

DEC. 1. DUBLIN. NEW PAVILION. ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK. Open only to architects practising in Dublin. Premiums £100 (to be merged), £30, and £20. Conditions on application to the Registrar.

DEC. 1. MANCHESTER. LAYING OUT OF THE BLACKLEY ESTATE. The Manchester Corporation invite architects and others to submit competitive plans, specifications, and estimates for the laying-out of their Blackley Estate. Plans of the estate, etc., from the City Surveyor's office, Town Hall, Manchester. Deposit three guineas.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Novelty in Reinforced Concrete. One of the novelties in reinforced concrete of heavy proportions has been tested by the large guns of the U.S. Navy in the walls of the Panama Canal. Sections of the wall have been built up as targets, and are to be tested fully. In an accidental shot from one of the United States twelve-inch guns the solid shot at six-inch muzzle distance tore through the eight-foot wall seemingly with undiminished speed. Apparently this would show that the shot would have penetrated many more feet of the concrete body. Examination proved, however, that the shot had risen upward steadily and had gone out at the top of the wall. According to this chance shot, it is believed by army engineers that a few more feet of concrete would have let the shot out of the wall, leaving no debris, and especially leaving no crack in the wall.

Calcium Aluminate and Natural Cement. At the recent meeting of the American Society for Testing Materials, Mr. Henry S. Spackman, of Philadelphia, presented a paper on the use of calcium aluminate with lime and cement mortars. An extended investigation covering the past two years shows, among other things, that the strength of natural cement is greatly increased when the aluminate is added. The process (under investigation) consists in adding to lime and natural cement mortar various proportions of calcium aluminate as a dry mix, and then testing the neat and mortar briquettes so formed in the regular tension tests. In the tables submitted by Mr. Spackman it was shown that in various mixtures of aluminates with lime, trass, clay, ashes, slag (all finely divided silicious material), the tension tests, both neat and in mortar, show much higher than in ordinary lime mortars. When mixed with ordinary natural cement, various percentages of calcium aluminate raise the tensile value of briquettes 200 to 600 per cent, in many cases above the standard requirements for Portland cement. The exact reason for this increase in strength and the best proportion of mixture have not been determined, but in the light of these experiments, the author considers that for many purposes it will be possible to substitute a lime-alumina or a treated natural cement mortar for one of Portland cement at a great saving in cost. Based on this remarkable showing, of natural cement it is stated that several manufacturers have undertaken on a commercial scale the manufacture of these so-called "Alca" cements. This will open up a very interesting field for development.

Sand for Concrete. In discussing this question before the Boston Society of Civil Engineers, Mr. J. P. Snow states that a good criterion of cleanliness of sand is the freedom of its grains from sticking together. The sand may be coarse or fine, but if each grain admits of being wholly covered with a film of cement, the mortar will have the strength of the cement. If, however, several grains adhere together strongly enough so that they are not separated by the process of mixing the mortar or concrete, it is evident that the spot in the mass where this lump is will be no stronger than the lump itself. The material causing the sand to stick together may be clay, a film or silt; organic matter, oil or chemicals, but if effective enough to hold the grains together till the concrete is placed, it will cause a weak nucleus in the material. A magnifying glass will greatly assist in determining the qualities of sand.

Instruction in Reinforced Concrete Design and Practice. The would-be student of reinforced concrete construction is often in a quandary as to how and where to commence a course of study in the subject, and in his need, which is the more pressing because of the novelty and importance of what is still in rapid growth and still far from completely determined, or in reference to which the whole field is not explored, he finds little or no assistance from our building and engineering teaching centres. There is a tendency, perhaps, to treat the subject as an appendage to instruction in applied mechanics, theory of structures, or building construction generally; but it cannot be adequately so dealt with. Our readers will have noticed, even from our enquiry columns, that we are often asked to advise as to how the subject can be studied, and we have been compelled to suggest the very poor expedient of reading books, for the books are by no means an adequate substitute for personal teaching, and there is very much of importance in practice that is not to be found in books, or else is not to be seen in its proper relation therein. While a few expensive books do contain some valuable information on the theory for the advanced student of mechanics, we know of none that give the instruction that is so badly needed on the practical side as required by the craftsman, foreman, and clerk of works, as well as by the designer. Instruction, though, is not less needed by the engineer, architect, and draughtsman, in respect to theory as applied practically to the design of reinforced concrete construction.

At the L.C.C. School of Building. Hitherto we have not been able to refer our readers to any course of personal instruction; but we are glad now to be able to announce that the want will no longer remain unfilled, as we announced last month, for a very complete course of lectures has been arranged for the session commencing September 27, at the London County Council School of Building (which seems destined to become the English "Charlottenburg"), the lecturer being Mr. H. Kempton Dyson, the Secretary of the Concrete Institute. We are informed that Mr. Dyson intends giving his students a thorough grounding in both the practice and theory of the subject. It is proposed to arrange the course under three heads—namely, theory, practice, and workshop experience. Those who are wishful of designing reinforced concrete will take the full course, but those who desire only to study the practical side of the subject, such as foremen, clerks of works, surveyors, and craftsmen, will be required to attend only the lectures on practice and the workshop experience. The lectures will touch on all phases of the subject. Those on "Construction of Reinforced Concrete and Quantities for same" will deal with the history and development of reinforced concrete, materials, tools, and appliances, making of concrete and manufacture of reinforcing steel, centering, the actual work of construction, architectural treatment and finishings, quantity taking and estimating for reinforced concrete work, etc. The lectures on "Theory and Design of Reinforced Concrete" will deal with the elastic theory of materials, experimental data, bending moments, shear stresses, beams, slabs, walls, columns, arches and domes, chimneys, reservoirs, tanks, bins, caissons, retaining walls, dams, pipes, sleepers, fence posts, poles, temperature stresses, rules and regulations, and practice in design.

Workshop and Laboratory Practice. The "Workshop and Laboratory Practice" is intended to supplement the lectures on practice and theory, and will deal with cement: its properties and testing; properties of stones and other aggregates, sand, water, and steel; concrete proportioning and making; steel manipulation; making of centering and moulds; tests on concrete and steel; porosity; tests of structural members of reinforced concrete, the making of which affords practice in construction; bending moments; shear; adhesion, etc. The course will be amplified by experiments, diagrams, lantern slides, specimens, models, and the use of testing plant. An endeavour will be made to visit works in course of construction so as to acquaint students with actual working conditions. The time of the lectures will be from 7.30 to 9.30 p.m.

The Development of Reinforced Concrete. The first lecture will be a special one, introductory to the course, and will be entitled "The History and Development of Reinforced Concrete." Admission to this lecture can be obtained free on application by those who contemplate joining the classes. It will be illustrated by the lantern, and will be complete in itself, though introductory to the course. It will be delivered in the school lecture hall at 7.30 p.m. on Tuesday, September 27, 1910. There will be, we are assured, an earnest endeavour to make the course of real value to those even who have had considerable experience in design and practice in reinforced concrete construction. The fees are very moderate, being: for those earning over 30s. per week 10s. the session, and for those earning 30s. per week or less 4s. 6d. the session, which fees include the whole or any of the classes in every subject held at the school. Moreover, apprentices, learners, and improvers under 21 years of age are admitted free to the school. We have in this country for too long lagged behind America and the Continent in regard to proper theoretical treatment and experimental study of the subject of reinforced concrete, and it is the lecturer's hope to secure at Brixton sufficient support to remove this reproach as regards London.

CHURCH OF ST. BARNABAS, SHACKLEWELL, LONDON.

Though quite a small church hidden away in the north-east of London behind factories and amid surroundings of uninviting character, this is a very interesting piece of work, both constructionally and from the standpoint of architectural design. Economy being a ruling factor, and exterior effect being impossible owing to the situation of the church, the architect concentrated his attention on the interior. From the accompanying plan it will be seen that the church is entered from Shacklewell Row by a covered passage (not yet built). This leads into the nave, which is about 30ft. wide with a narrow ambulatory on either side, carried right round the church. The width of the nave is continued into the chancel. The eastern end, behind the altar, has an apsidal termination, the ambulatory connecting the choir vestry on the north side with the small morning chapel on the south.

Dividing the chancel from the nave is a finely proportioned screen, comprising four columns carrying a rood-beam as entablature and crowned by a cross, all in wood on a stone base. Of much interest, too, are the doors leading out of the chancel to the morning chapel and to the covered way and garth which it is proposed to form on the north side, adjoining the suggested vicarage. The total seating accommodation is 408. The fabric is of stock bricks, and the roof and vault, which are in one, are of concrete reinforced with expanded metal.

The main roof is 105ft. 0ins. long internally, and is comprised of a barrel roof, 30ft. 0ins. span, over the nave; a dome, 18ft. 5ins. radius, over the chancel; an arched roof, 20ft. 6ins. span, and a semi-dome roof, 8ft. 6ins. radius, over the apse. The height to the springing of the roof is 30ft. 3ins. from the finished floor of the nave. The barrel roof over the nave is carried by external ribs. The soffits of these ribs and the soffits and sides of the four arches carrying the main dome are faced with stock bricks in cement tied by bonding irons to the concrete; this brickwork facing, which forms bands or rings, is merely a shell put in for appearance, and was not calculated to assist the reinforced concrete in any way. In addition to the above, expanded steel-concrete flat roofs were formed over the morning chapel and heating chamber. The whole of the roofing is covered with $\frac{3}{4}$-in. of "Seyssel" asphalte put on in two layers for waterproofing purposes.

This form of construction has resulted in an economical yet substantial building, the total cost of the church having been £4,400. The general contractors were Messrs. L. H. and R. Roberts, of Islington. The reinforced concrete work was executed by the Expanded Metal Co., Ltd., of Westminster. The windows and electric light fittings were executed by Messrs. Wenham and Waters, of Croydon. The architect was Professor C. H. Reilly, M.A., A.R.I.B.A., of Liverpool.

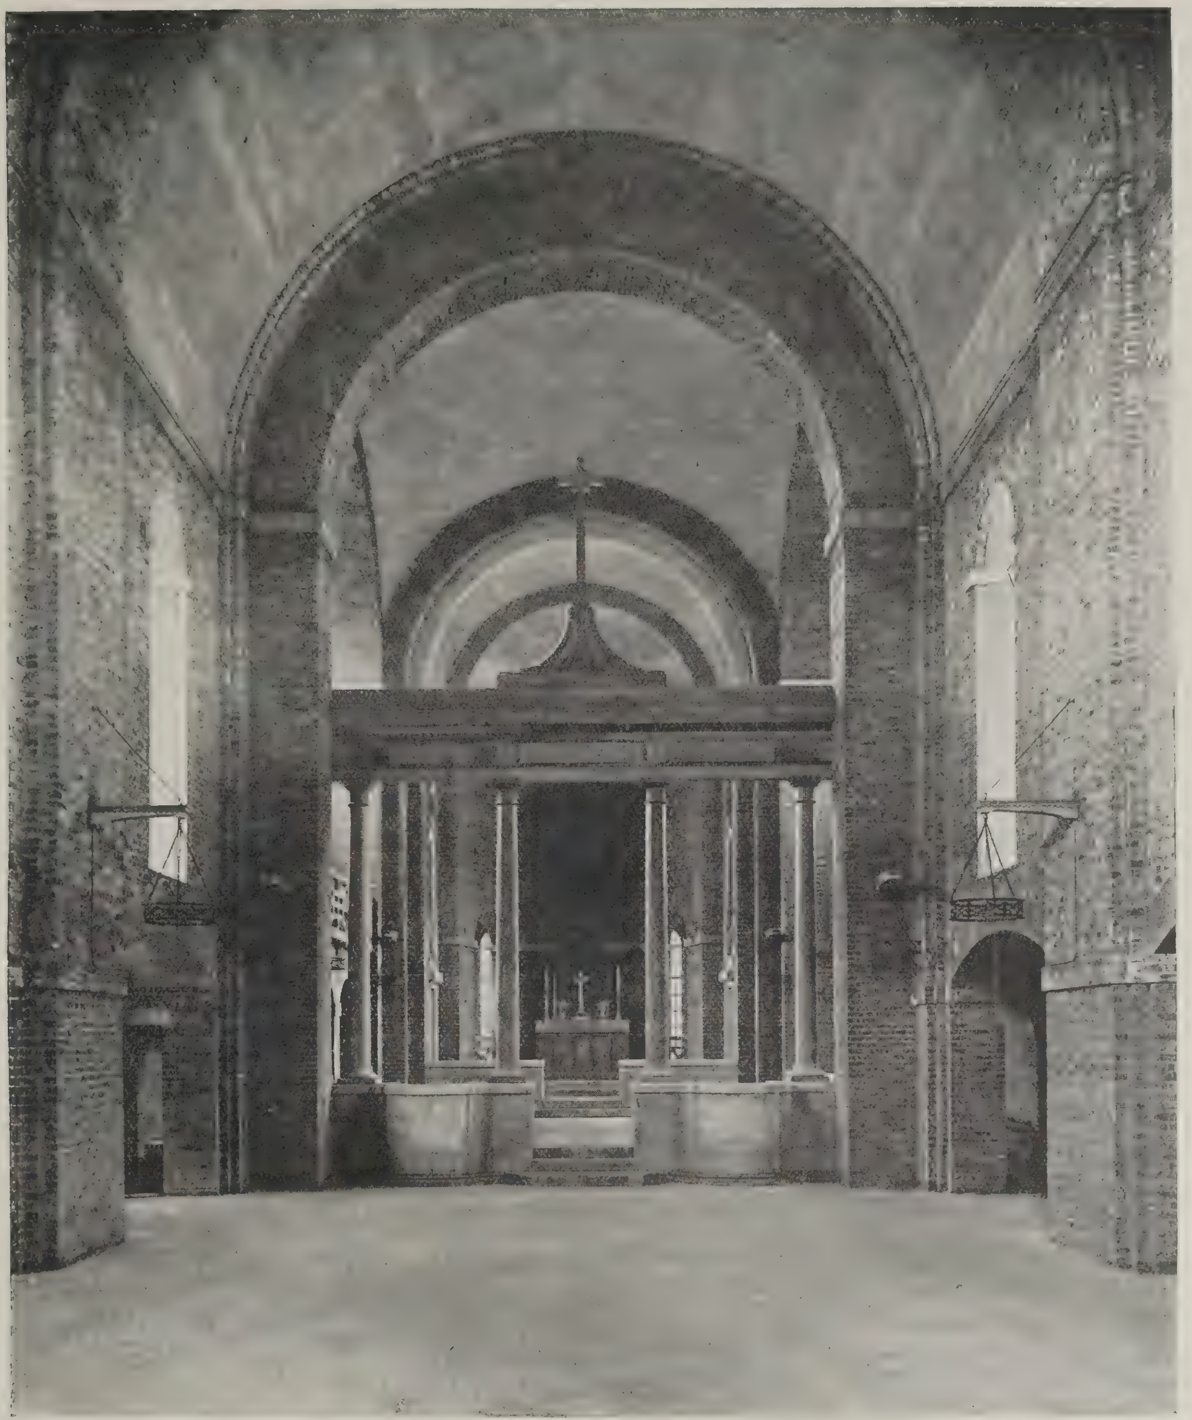
CONCRETE NOTES.

Civil Engineers and Reinforced Concrete. The preliminary and interim report on the conditions of the employment of reinforced concrete in engineering structures has been issued by the Institution of Civil Engineers. The members of the committee who are conducting the inquiry hope to formulate recommendations on the subject at a later date. In the meantime the present report deals with the facts which have been elicited up to the present time, and gives particulars of the principal systems of reinforced concrete now in use, the general advantages claimed for them, a comparative analysis of specifications adopted for work in these materials, the nature of the requirements and the calculations which should be regarded as of primary importance, reports on works executed, and a synopsis of the evidence given before the committee.

Fire Test on a Reinforced Concrete Building. As the most important point that concrete exponents bring forth after proving the economy of construction is the fire-resistance of reinforced concrete, the results of a test applied by the building department of Denver are rather interesting: The slab selected was a $7\frac{1}{2}$-inch slab, in the Railway Exchange building. The panel size is 14 by 20 feet, reinforced with $\frac{1}{2}$-inch round rods, running four ways, 8 inches on centre, the Turner mushroom system of reinforcing being used. The slab was poured on February 18, and the test took place April 28, giving the concrete an age of of 69 days. The panel was loaded with 60,800 pounds of cement, or approximately 225 pounds per square foot. The deflection under this load was exactly $\frac{1}{8}$-inch. A fire was then started by igniting two cords of very dry pine wood and five gallons of kerosene. This was allowed to burn about 18 minutes, when the deflection was increased by one inch. The fire was then extinguished, and cold water sprayed on the under side of the slab, causing about nine square feet of spall to a maximum depth of one inch. The test load was removed, and four hours



THE CHURCH OF ST. BARNABAS, SHACKLEWELL, LONDON: INTERIOR, LOOKING EAST.
PROFESSOR C. H. REILLY, M.A., A.R.I.B.A., ARCHITECT.

after the test a recovery of one-half-inch was recorded. By nine a.m., May 6, only ⅜-inch deflection remained. The conclusions to be drawn from this test are that while the test was absurdly severe the concrete was practically unharmed, as the slight spalling was merely on the surface, and was due to the great extremes of temperature on material which had not had time to properly harden. The rocks forming part of the aggregate were clearly broken, showing that the adhesion of the cement was perfect.

Waterproofing a Reinforced Concrete Water Tank. The City of New Ulm, Minn., has just completed a reinforced concrete reservoir of 1,000,000 gallons capacity, a cylindrical structure 75ft. in diameter with the walls 30ft. high, and covered with a conical concrete roof. Since it was of the utmost importance that the walls and floor should be water tight, special care was taken during the construction to grade the aggregate for the concrete. It has been found by experiments that the densest concrete can be made when rounded pebbles varying in size from about ¼-inch to about 2½ inches are used instead of broken stone on account of the ease with which such pebbles will move about in a quaking mixture while it is being worked in place, and adjust their positions so as to form the least amount of voids. For this reason pebbles were screened from a gravel bank and used instead of crushed stone for the walls and upper part of the floor, and the sand used was a mixture of very coarse and ordinary fine sand. To reduce the permeability of the concrete to a minimum, 20 pounds of hydrated lime was used in every barrel of cement, and after the forms were removed the walls were brushed and cleaned with steel brushes, and two coats of cement plastering were applied on the inside. The mortar for the plastering consisted of one part cement, two parts of sand, hydrated lime to the extent of 10 per cent., and Medusa waterproofing compound to the extent of 3 per cent. of the cement used. The proportion used for the concrete in the walls and the upper 4 inches of the floor was 1 : 2 : 4, and this proportion of concrete, together with the plastering, has apparently made the walls water tight, as no leakage has been noticed up to this tice except a small leak in the bottom shortly after the reservoir was filled, which was due to an imperfect bond at one point between the old and new concrete. This, however, did not cause serious trouble.

BOOKS.

The American Engineers' Pocket Book.

The publication of this 19th edition of Trautwine's "Civil Engineers' Pocket Book," which brings it up to the remarkable circulation of the 100th thousand of copies, affords the opportunity of some remarks upon the subject of engineers' "pocket books" generally, though some belonging to the category would require a very large pocket, and may more often be found on the desk. There are several standard works in the several chief countries for engineering practice.

These various books each have distinguishing characteristics, and no one can be said to be superior in every direction to the others. Considering the very great influence they have on engineering and building practice, and the importance they possess to the student and practitioner such publications are of national importance, and would, perhaps, be best undertaken by public bodies, though this has a detriment, as private enterprise is more readily moved by public opinion, and responds more quickly to new ideas and movements. The German engineers' pocket book is the only one conducted by a public society, and it must be confessed that it is a remarkably able and valuable production; it is very scientific and theoretical. The French book is also very comprehensive and shows national temperament in its architectural sections which might well form the model for the aid-books of other countries. The American pocket books are distinguished by their commercial and practical outlook, while the English books are a curious medley of the theoretical and practical. It would be a very praiseworthy work to form therefrom a compilation of the whole, and supply a translation for every important language.

Coming, however, to review this latest edition of Trautwine, we find it a very valuable production, and most wide in its application. It is a great favourite because it does not require any extensive knowledge of mathematics. Indeed, the original author, in his first edition, expresses the opinion that it was fortunate that few engineers were good mathematicians, for nature rarely combined high mathematical talent with that practical tact and observation of outward things so essential to a successful engineer. That point of view was coloured by the original author's own ability as a mathematician, though to a great extent he was to be commended for taking so useful a line with such courage, but since then we have progressed in engineering education, and many engineers can quite well follow and apply higher mathematics, which the modern teaching has made much simpler of acquisition. Therefore, though it is excellent to have results stated for application by those who have little mathematical knowledge, we think it would have been well to also include in the work higher mathematics and application to engineering design. One feature of Trautwine is most commendable, and that is the way in which elementary and advanced principles are explained in a short way so that the book is both a text book and a memoranda book; most of the other works tend to omit the elementary and intermediate steps, and give the final formulæ, which is a mistake, for one consulting such work should be able to see the argument to be able to apply the formulæ quickly and accurately. It is important that the user should know what he is about.

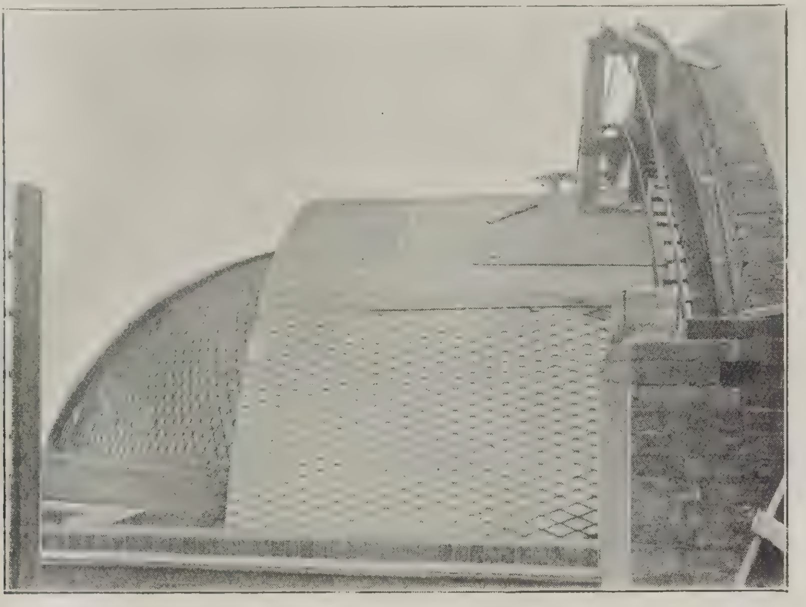
The 18th edition of 1902 was a tremendous advance on the others, and contained much new matter; and this nineteenth edition is a further improvement and extension. The most important additions are in connection with concrete and reinforced concrete, which subject has advanced rapidly in the past 8 years. The section of the work devoted to this is a very large one, consisting of about 200 pages, which in the small type used and abbreviated form are equal to about 400 pages of an ordinary text book. Two of the most valuable features of the section are the "Selected results of experiments and practice" and the "Digest of specifications" for concrete work. This chapter led to revision of the general information on strength of materials. The mathematical introductory chapters have been rewritten, and additional information included on steel and iron columns. The book should be in the possession of all engineers, architects, and builders with a knowledge of the English language. It is very good value for money.

"The Civil Engineers' Pocket-Book." By John C. Trautwine, revised by John C. Trautwine, Jr., and John C. Trautwine 3rd. 19th edition. New York: John Wiley and Sons. London: Chapman and Hall, Ltd. Price 5 dollars, or 21s. nett.

Testing Materials.

Professor Unwin's book on testing materials has, after an interval of 12 years since the second edition, now arrived at a third edition. In that time a considerable amount of investigation has taken place, while the Engineering Standards Committee has come into being, and the International Testing Association has done much to improve and standardise methods of mechanical testing. Professor Unwin has therefore found a good deal to note in his new edition, and he has carefully revised the whole, and made the book of considerably greater value. A knowledge of the methods of testing for strength should be possessed by every engineer and architect, for upon such tests is our structural designing now based. Personal study and experimentation will give, as no perusal of books can, an appreciation of the strength and value of materials, and will lead the engineer or architect to realise the practical nature of his work. Very many of the errors and blunders one constantly sees in designs spring from ignorance of the properties of materials, it being clear that the designers have not realised with what they were dealing. Everyone who has to deal with structural design should be able to realise in some degree the resistance of materials—to many persons the bald statement that a concrete cube has shown a crushing resistance of 300 tons per square foot conveys nothing, unless perhaps they may know that that is considered very good, but when a good many tests have been personally made and seen performed on concrete cubes with all the conditions of making a much more vivid idea is obtained, and one begins to get the power to realise instinctively the resistance of structural members, and can then begin to appreciate the loads and what is required to sustain them in full sized work. To this latter end, however, full-sized tests on structural members should be seen conducted. The testing of materials is now recognised as an essential part of engineering education, but it should also be required of architects and building construction students. To that study Professor Unwin's book is an excellent guide, as, indeed, it is to the expert and advanced experimental engineer. His treatise consists of three parts. In the first, the mechanical properties of materials are explained, that is, the phenomena and elasticity and plasticity, and the relations of stress and strain, so far as they have been scientifically ascertained. In the second, the apparatus used in the engineering laboratory is described. The third part contains a collection of the most complete and trustworthy results of testing of all the ordinary materials of construction. This latter is a valuable record, though it has its deficiencies. We are particularly surprised to find so little attention paid to concrete and reinforced concrete, upon which there has been so much investigation of recent years, and which is now considered of such great importance. We notice only slight reference to the fact that cubes of brittle material such as stone, brick, and concrete, give higher results than the true crushing resistance, because they shear on planes at a less inclination with the vertical than 45 degrees, and we do not notice any reference to the reason for this, which is friction on the shearing plane, nor to the correct shape of test piece, to secure a normal failure, being a prism of height 1½ times the side. In some respects, too, the title of the book is not quite correct—it is too all-embracing; for the testing of materials includes chemical and physical tests that are by no means adequately dealt with in the book. The value, however, lies in its being a record of Prof. Unwin's view on matters within his knowledge, and it is a source of original information in many directions. It is, of course, a book for every library.



View shewing expanded steel reinforcement for apse roof, in position.
CHURCH OF ST. BARNABAS, SHACKLEWELL, PROFESSOR C. H. REILLY, M.A., A.R.I.B.A., ARCHITECT.

THE MONEY ORDER DEPARTMENT, HOLLOWAY.

(*See illustrations, pages* 282, 283).

The plan given of one of the floors of this building shows the general arrangement of the beams and pillars. The particular method of reinforcement used for the beams is that known under the name of "Coignet System for Beams of Uniform Strength." This method of reinforcement presents the advantages of the most economical sections of steel and concrete in any section of the beam, the section of the steel in tension being greater in the middle portion of the beam and gradually growing less towards the points of support, in proportion to the bending moments. The ends of the bars are made use of to resist the shearing stresses by being bent upwards and hooked over a top bar. The shear members are also spaced gradually closer together at each point of support. They are all bent at an angle of 45 degrees. The reinforcement of the pillars consists of a certain number of longtitudinal principal bars, bound by a spiral bar of small diameter. The slabs are composed of a meshwork of principal bars and distributing rods. This is the third post office building which has been erected on the Coignet system of reinforced concrete for the Office of Works.

Sir Henry Tanner, I.S.O., is superintending architect for the Office of Works, and the contractors are Messrs. William King and Co.

STANDARD REINFORCEMENT.

As any industry advances, the development toward uniform methods and standard practice is necessary. For some time the need of standardised reinforcement has been apparent, and yet structural concrete is in itself, so adaptable and flexible in application, "built on the work," as it were, that standardisation has seemed almost impossible. On the other hand, there are certain fundamental needs in concrete reinforcement that must be met. Consensus of the best opinion, based on study, tests, and observations, show that rigid attachment of the web reinforcement develops a maximum efficiency; also that web reinforcement should be securely fixed in the top fibre of the beam; and last, but not least, the reinforcing steel must be held in place throughout the operation of pouring and tamping concrete, so that the steel is in its exact position within the finished structure, to meet the stresses for which it is designed. Any reinforcement, "standard" or not, should at least approximate the above conditions.

In structural concrete, there is now and always will be a large element of the "personal equation," says "Concrete Engineering." It cannot be otherwise, for as it is now, the man bending and placing the steel rods is determining the neutral axis of the beam; the manner in which the carpenter frames a beam determines the amount of concrete in compression; the man behind the mixer holds in his hand the unit compressive value of the finished concrete, and the man on the floor placing the concrete, is determining the flange depth and T-beam efficiency.

In working toward the ideal, the last few years have advanced the industry greatly.

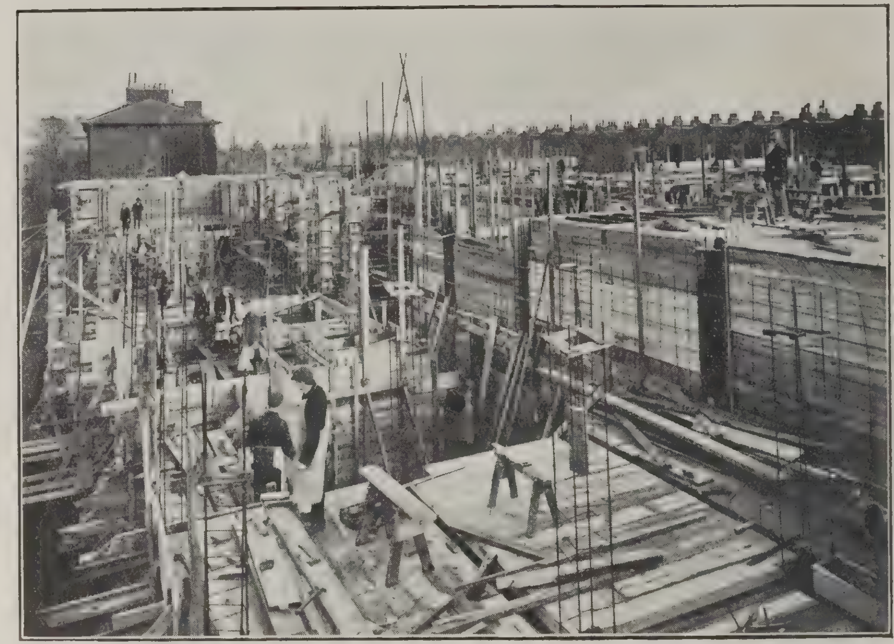
View shewing completed building.
CHURCH OF ST. BARNABAS, SHACKLEWELL. PROFESSOR C. H. REILLY, M.A., A.R.I.B.A., ARCHITECT.

Mechanical concrete mixers are in universal use. Mechanical proportioning devices are being developed. In the field of reinforcement, much has been accomplished, and the different unit systems and frames have marked a steady advance and cumulative progress toward better methods.

The latest of these, and the development that prompts this comment, is a standard reinforcement developed by one of the larger steel companies. They have carefully investigated the needs of the field, and with the aid of engineers, special tests, and investigation, have brought out an efficient reinforcement. The careful effort spent in developing this product merits more than passing attention, for an apparently standard product has opened the way for an endeavour toward extensive standardisation of design.

It is not so much the question whether or not this special reinforcement is the most efficient available or the final word in this development, for structural concrete, so long free and broad in its application, will wander long before submitting to the bridle of standardisation, to travel sedately the road of uniformity. But the fact remains that the industry has attained the dignity of a real well-founded endeavour at standard design.

As we progress toward better methods, all of these endeavours of earnest men help the industry toward the ideal. The problems of concrete reinforcement must be met by the men on the "firing line" in field and office, who must secure efficiency, economy, and effect, who must meet their associates in construction, owner, architect, engineer, or builder, as the case may be (and in the case of the builder, he must meet his material bills and pay-roll). These men are bringing structural concrete to success and renown, and every effort toward better methods is a "lift on the road." As such we see this latest development toward a standard reinforcement.



THE MONEY ORDER DEPARTMENT BUILDING. MANOR GARDENS, HOLLOWAY VIEW SHOWING WORKS IN PROGRESS.

(See previous page.)

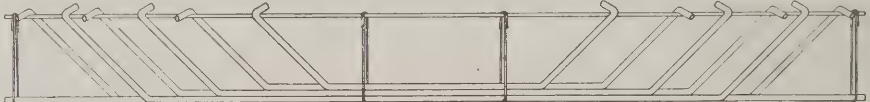
COLOURING CEMENT.

The difficulty of obtaining an even-grained surface of uniform colour on concrete work is one of the hardest which builders of concrete structures have to overcome. Concrete work is subject to many sorts of surface imperfections, of which the two most common are roughness or irregular surface texture, and discolouration or variability of colour. Either of these disfigurations will spoil the appearance of an otherwise beautiful structure, and the task of avoiding them is one that is occupying the attention of all who are building in reinforced concrete.

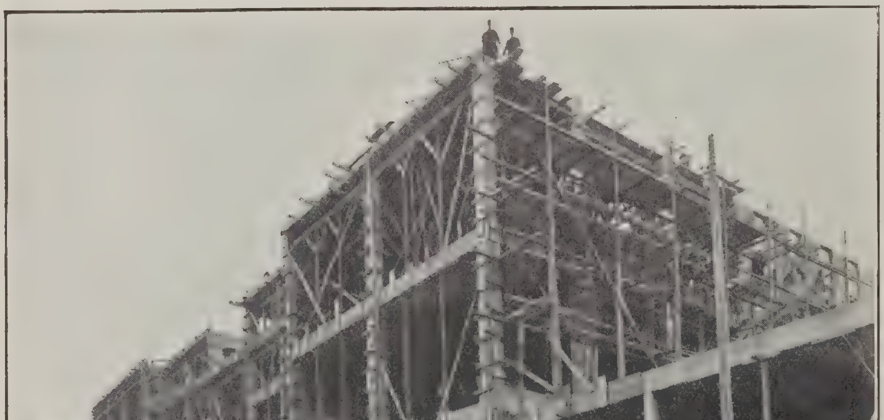
Unfortunately, the business of building in concrete is still in its infancy, so no regular set of rules have as yet been drawn up that can be followed to prevent with absolute sureness these two highly objectionable features. But experience has taught that certain causes produce certain results, and the causes of discolouration can be eliminated by the careful workman.

Causes of Discolouration.

Some of the causes of discolouration are obvious, and others are difficult to determine with any degree of exactness. Roughness or uneven surface texture is a common cause of variation in colour, since the alternate rough and smooth parts weather differently and collect and hold dirt and soot in different degrees. Another cause of discolouration is the use of different cements or different mixtures of cement in adjacent parts of the surface. No two cements are of exactly the same shade, nor are any two different mixtures alike in colour, and the concrete made of the various cements partakes of the variation. In the same manner, sand of different shades of colour or of different degrees of cleanliness will cause a streaky appearance in concrete surface. Dirt adhering to the moulds will also frequently stain the exposed parts.



THE MONEY ORDER DEPARTMENT, MANOR GARDENS, HOLLOWAY: REINFORCEMENT OF BEAMS.



THE MONEY ORDER DEPARTMENT BUILDING, MANOR GARDENS, HOLLOWAY: FRONT VIEW OF THE REINFORCED CONCRETE STRUCTURE.

Even when the smoothness of the surface is satisfactory and there is no criticism possible as to the kind of cement or sand used and their disposition and the cleanliness with which the work is done, concrete surfaces frequently vary in colour and have cloudy light and dark appearance. In many cases there seems to be good reason for attributing this to the bleaching out of lime compounds and their disposition as a form of deposit on the concrete surface. The extent of this efflorescence varies.

At times this deposit is so thin that it merely gives a lighter shade to the surface where it appears, and at others it will often form an encrustation of considerable body and thickness, which may be scraped off in the form of a thick white or yellowish powder.

A Chemist's Opinion.

An authority on the chemistry of cement has said in relation to this form of discolouration:

"It is primarily due to the variations in the amount of water used in the mortar of which the cement is composed. It will be readily understood that when any excess of water is used, segregation of the coarse and fine particles will take place, with a resulting difference in colour. When a large amount of water is used, the concrete is more porous, and the considerable percentage of lime liberated from the Portland cement in the course of setting is more readily brought to the surface at such a point. The amount of water in a cement, the surface of which is to be exposed, should neither be too small nor too large, but such a surface should be allowed to harden dry or the surface will be honeycombed.

Where the greatest care is used as to the amount of water added to the mortar, and to prevent its loss, and where separation of the mortar from the broken stone or gravel is carefully avoided in depositing the cement and ramming it in, the exposed surface after the removal of the moulds, is fairly uniform in colour. A more uniform colour will always be obtained when some puzzolanic material is ground in with the cement such as slag or dross. This hydrated silicious material combines with the free lime which has been liberated, and prevents its being washed out on to the surface. Exactness in the amount of water used in the concrete, when the elimination of the stain caused by the free lime is considered desirable, and the addition of some substance containing silica in an active form, are the two steps to be taken to produce a concrete surface which should present a uniform colour and pleasing appearance."

To Prevent Discolouration.

The measures whose adoption are recommended in the quotation just made are designed to prevent the occurrence of efflorescence by adopting certain precautions in the materials and workmanship of the original structure. Their adoption, however, if it gives the degree of success anticipated, is obviously the way to get at the root of the trouble.

THE NEW MONEY ORDER DEPARTMENT BUILDING, HOLLOWAY: GENERAL VIEW, SHOWING ONE OF THE FLOORS APPROACHING COMPLETION.

THE EFFECT OF SODIUM SILICATE MIXED WITH OR APPLIED TO CONCRETE.*

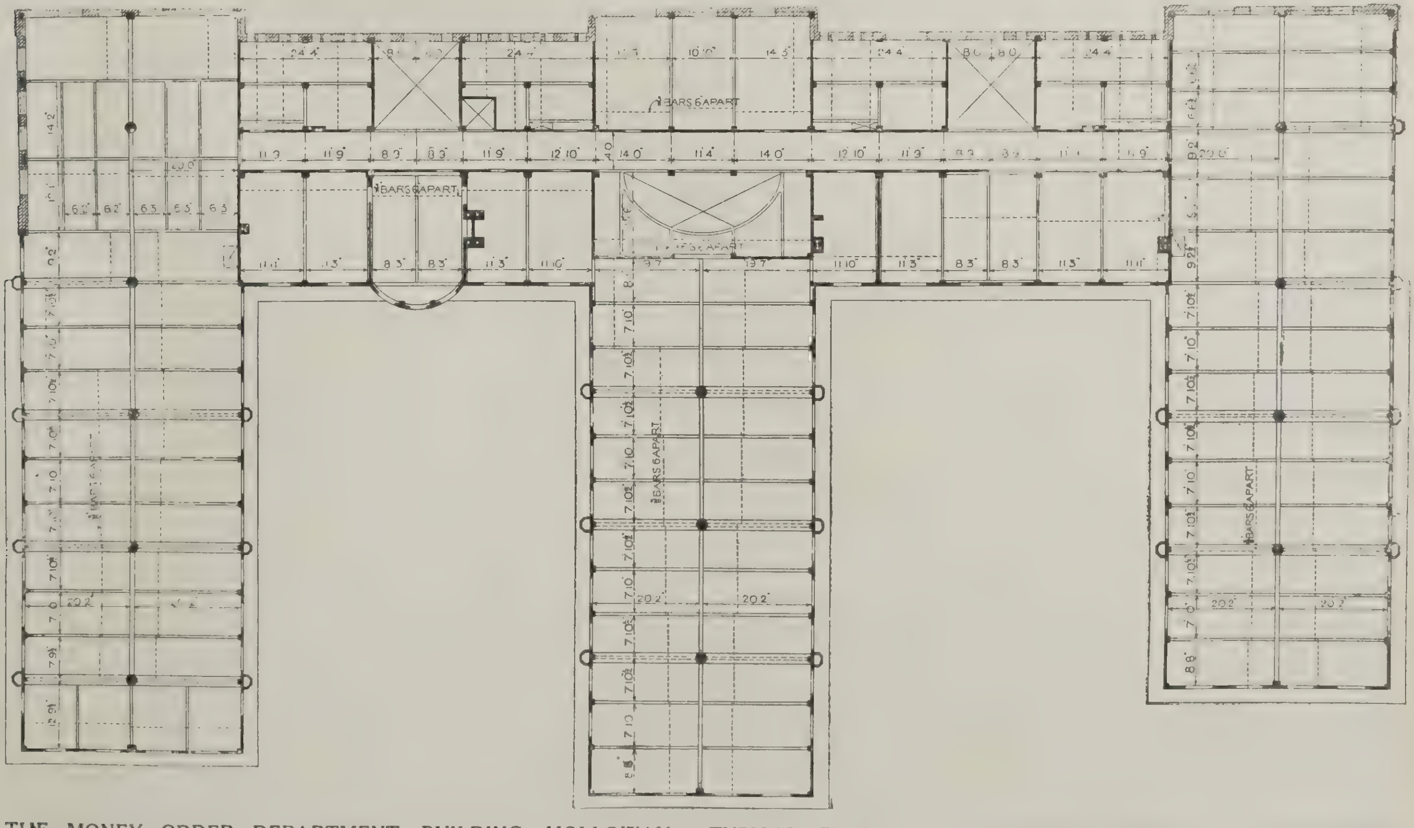
By ALBERT MOYER, ASSOC. AM. SOC. C.E.

The easy abrasion, or what is commonly called "dusting" of cement concrete floors in office buildings, has called my attention to the need of a material which could be readily and economically applied, resulting in the hardening of the concrete itself and not producing a veneer which would soon wear off under foot or other traffic.

I, therefore, started some experiments with sodium silicate, both in powdered form and in the form of water-glass. I found that the powdered sodium silicate, which can be obtained commercially, contained impurities which did not render it readily soluble in water. The sodium silicate in the form of water-glass of about 40 degs. Baumé was readily mixed with water, the object being to thin the sodium silicate down to a point where it would penetrate as deeply as possible into the pores of the concrete, making several applications until the pores were all filled and the sodium silicate flushed to the surface. That which flushed to the surface, being soluble, was readily washed off with water, and that which remained in the pores having come in contact with the lime and other alkalies, hardened into what we may term "mineral glue." From experiments extending over several months, I found that we had obtained the results we had been striving for.

---

*Read before the American Society for Testing Materials, Atlantic City, N.J.



THE MONEY ORDER DEPARTMENT BUILDING, HOLLOWAY: TYPICAL FLOOR PLAN, SHOWING GENERAL ARRANGEMENT OF THE BEAMS AND PILLARS.

This suggested various other uses, all of which had the object in view of hardening and waterproofing the surface of concrete; such as the protection of arrises, cast stone, waterproofing hollow concrete block, hardening, waterproofing, and protecting interior surfaces of cisterns, and protecting buttermilk vats against the action of lactic acid. There would also be included the protection of porous concrete surfaces against the action of oils, preventing efflorescence, seeping out of soluble salts from Portland cement mortar, concrete, or stone, and the possible prevention of hair cracks and crazing.

It is also entirely within the range of possibility that such treatment of interior and exterior surfaces of concrete may be of valuable assistance in solving the drain tile, alkali, and sea water problems. After the tile has been made and set hard for two or three weeks, and has then dried out so as to permit the introduction of sodium silicate in thin solution into the pores, the drain tile may be immersed into a bath of sodium silicate, composed of 1 part water-glass, 40 degs. Baumé, and 3 parts water, a total of four parts. Immersion must be of sufficient duration to allow the tile to absorb the maximum quantity. It is then removed from the bath and allowed to dry. Thus the sodium silicate coming in contact with the lime and other alkalies present in the concrete forms into a mineral glue which is insoluble and very hard.

I believe I have suggested a sufficient number of uses to illustrate the possibilities of sodium silicate applied to concrete.

The action of sodium silicate applied to dry concrete is vastly different from what it is when it is mixed with the cement while the concrete is being gauged. Through the courtesy of S. Warren Hartwell, and W. R. Dunn, and some opinions, advice, and suggestions from Dr. Allerton S. Cushman, we carried on some experiments with cement and sand briquettes which were mixed with a thin solution of sodium silicate and water, compared with normal briquettes treated in the usual way, and also compared with normal briquettes afterward immersed in water containing 10 per cent. of sodium silicate.

I also made up some briquettes of 1 part hydrated lime, 3 parts standard sand and water; also briquettes of 1 part hydrated lime, 2 parts building sand mixed with a solution of 1 part water-glass, 2 parts water; the initial set was half an hour, final set 1 hour. As soon as dry, they were immersed in a solution of sodium silicate, 1 part water-glass, 40 degs. Baumé, 3 parts water. After the briquettes had absorbed the maximum amount of this solution, they were allowed to dry out. They had become hard but showed very little strength in tension. They were then immersed in water for several days, no disintegration taking place. The object of this test was to ascertain the solubility of lime briquettes so treated.

A series of briquettes was made of 1 part Portland cement, 3 parts Ottawa sand, mixed with the usual quantity of water containing 10 per cent. of sodium silicate. The result showed a falling off in strength compared with the same sample of cement mixed with the usual quantity of water, no sodium silicate added, and the briquettes immersed in water in the usual way. This falling off was noticed both in the 7 and the 28-day periods.

Briquettes of 1 part cement, 3 parts Ottawa sand, mixed with the usual percentage of water containing no sodium silicate; after 24 hours these were immersed in water containing 10 per cent. of sodium silicate, with the result that the strength was increased, as compared with the sample of cement treated in the usual way, no sodium silicate having been added in mixing the cement with the water.

Effects of Strength.

No neat cement tests were made for the reason that the comparisons we wished to obtain were those which would tend to show that the introduction of sodium silicate into concrete after final set would strengthen such concrete. Reducing the results to figures, I give below the average results of a full set of experiments:

One part Portland cement, 3 parts Ottawa sand. Briquettes mixed with the usual amount of water and immersed in water:

7 days—285lbs. per sq. in. cross-section.
28 days—347lbs. per sq. in. cross-section.

Mixed with water containing 10 per cent. sodium silicate and immersed in water:

7 days—117lbs.
28 days—203lbs.

You will note a considerable falling off in strength.

Mixed with the usual amount of water containing no sodium silicate and after 24 hours immersed in water containing 10 per cent. of sodium silicate:

7 days—360lbs.
28 days—497lbs.

Quite a considerable increase in strength.

We assume that the sodium silicate coming in contact with the lime or other alkalies and alkaline earth salts gives a reaction which causes a deposit of silicic acid which forms into an insoluble gelatinous silica and hardens into and acts as a mineral glue.

Sodium silicate mixed with the cement while the mortar is being gauged quickens the setting time, an arbitrary period determined by the stiffening of the mortar to a degree which will bear a wire or needle under certain pressure. The final hardening, however, never attains as great strength as normal, slow-setting concrete.

I mixed up some water-glass in proportion of 1 part water-glass, 3 parts lime water—that is, water containing all the lime which it would take up in solution, then decantered off. On standing for a few minutes it became a jelly. I then mixed up a solution of sodium silicate and ordinary water, mixed with it neat cement to a wet consistency, probably 30 per cent. water. Within a few minutes, this mass had become a stiff jelly; this jelly is very quickly formed, thus quickening the time of setting, which in reality is merely a stage of definite stiffness, and has little or no relation to the time of maximum hardening. This jelly, having been formed before the cement had time to harden, interfered with the process and weakness resulted, which is shown by the tests.

I would suggest that those interested in this subject experiment by using a retarder, such as a 10 per cent. solution of sodium hydrate caustic or a similar solution of magnesium sulphate. If the formation of the gelatinous silica is retarded until the cement has had an opportunity to set, it is possible that the strength of laboratory specimens will be increased. We might thus obtain some information as to the effect of sodium silicate on concrete if experiments are made extending over long time periods. A set of specimens in the form of briquettes and cubes for tensile and crushing strength may be made and stored in water, breaking these specimens in regular periods of time up to two years. As far as I know, this has not been done, and might possibly lead to some interesting data on this subject.

Surface Application Gives Strength.

Concrete is strengthened and hardened when sodium silicate in solution is applied to the surface. The concrete has hardened normally, and that which is porous will allow the introduction of sodium silicate to some little depth in the pores, the depth depending upon the porosity of the concrete. The action of forming into a jelly thus takes place without interfering with the process of hardening, and this gelatinous substance forms into an insoluble mineral glue.

Without experimental proof and based upon the theory of maximum density, it is my opinion that this method or treatment by the application of sodium silicate to concrete surfaces, will set as waterproofing and prevent the action of salt, alkaline, or sulphurous water on the surface.

This is a field which requires some laboratory experiments which should be followed up by field experiments. Sodium silicate in the form of water-glass is very cheap, less than ½d. per lb., and a pound thinned down with water to the proper consistency that will enter the pores of the concrete will cover quite an area. I treated the floors of the office in which I am located, covering some 1,400 sq. ft., at a cost of ¼d. (three mills) per sq. ft., which includes all labour and material.

Should exhaustive experiments and field tests demonstrate by long-time results that there is no further action of water on surfaces so treated, and that the sodium silicate remains in the form of an insoluble mineral glue, many very serious problems have been solved, such as the action of alkalies or sulphurous soil on drain tile and other concrete products, the action of sea water on concrete, waterproofing tanks, the protection of tanks against certain acids and oils, and the dusting of concrete floors.

TRADE AND CRAFT

Interphones and Private Line Telephones.

The Western Electric Company, Ltd., Norfolk House, Victoria Embankment, W.C., have issued "Bulletin No. 4003," entitled "Western Interphones and Private Line Telephones," in which are described and illustrated various types of instruments designed to meet the growing demand for intercommunication telephones in private houses, hotels, and business premises. In the automatic replacement type, key-buttons automatically return to their normal position as soon as the microtelephone is replaced on the switch-cradle. These telephones are readily adapted for table or wall use, but both wall and table patterns are supplied. Wall sets of the new metal type are made in two sets, namely, a non-flush set for mounting on a wall, and a flush set for recessing in it. All the interior apparatus is readily accessible. Several patterns of domestic telephones are listed for use with existing bell circuits; but the use of separate metallic circuit instruments with either local or central battery is strongly advised where the number of stations exceeds five or six, as by this system conversation is transmitted very clearly through a cable made up of twisted pairs. Some useful accessories are also listed in the booklet, which is of pocket size, and is primarily intended for the use of contractors and practical electricians, who, by arrangement, can have their own names and addresses printed on the cover.

FEDERATION NEWS.

Midland Centre Conciliation Board.

A special meeting of the Midland Centre Conciliation Board was held at the Derwent Hotel, Derby, on Tuesday, 30th August last. In the unavoidable absence of the chairman (Mr. J. B. Whitehouse), Mr. R. Tompson (General Union of Carpenters and Joiners) presided.

The meeting was held to consider a dispute which the Mansfield Local Conciliation Board had been unable to settle. It arose through notice given by the Mansfield carpenters and joiners for alterations of rules in regard to rate of wages, winter hours of work, overtime, piece-work, etc., and notices for alterations of rules. Messrs. H. T. Shepherd and T. Vickers presented the case for the operatives, whilst Messrs. J. Beckett, R. Moore, and C. G. Percival represented the employers. The following decisions were arrived at by the Board:—An increase of ½d. per hour (8d. to 8½d.) in the minimum rate of wages as from 1st September, 1910; the hours of work to be as suggested, with the exception that Rule 2c be altered as follows:—"remaining 12 weeks—Monday to Friday, 8 a.m. till 4.30 p.m., with half-an-hour for dinner, on outside jobs, and 8 a.m. to 5 p.m. in shops; Saturdays, 8 a.m. till 12 noon;" overtime not to commence until a full working day has been completed, except in cases over which the workman has no control, or time lost owing to inclement weather. Rule 6 (piece-work, etc.) to be altered as suggested by the operatives. Six months' notice to be given for alteration of rules, such notice to expire on 1st May in any year.

The Board suggested the following addition to Rule 11 (alteration of rules):—"Counter notices shall be given on or before 1st December. Failing a settlement on or before 1st March, the matter in dispute shall be referred to the local Conciliation Board."—FRED. W. AMPHLET, Employers' Secretary.

Notes on Town Planning Schemes.

ARCHITECTURAL study in England seems suddenly, in these last three or four years, to have taken a leap from the particular to the general; in place of the study of the design of separate buildings, our principal attention and effort seems to be now claimed for the study of the arrangement and collocation of buildings in reference to general effect and general convenience. It has dawned upon us, somewhat late in the day, that a city is or may be an architectural entity in itself, with a general design to which individual buildings should be subservient.

Somewhat late in the day, for our large cities are all built, and have mostly developed in a somewhat haphazard manner from small beginnings, and the chance of "founding" a city and laying it out from the first on a fully considered plan is one that is hardly likely to occur in these democratic times. Such great works were done by kings and conquerors of old, who could do as they pleased without consideration of economic conditions, or of the legal claims of neighbouring owners. Any occasional modern example has been due to personal power and initiation. Nancy is built as a city that is at unity with itself, because it was practically the private property of a great personage, who had it designed for him; but that is an example on a small scale only. There is something like this, however, in the development of the modern plan of Paris, which was commenced by one autocrat and carried further by another; but the example thus set has had a permanent effect, so that the present democratic authorities of Paris seem as anxious for street improvement and the formation of vistas as the third Napoleon himself.

Bath is perhaps the only example in modern England of a city of which the most important portion, architecturally, was built at one time and with a special regard to effect; a condition which the present authorities of the city seem disposed to spoil if they can. In London we are only just beginning to arrive at such a perception of the importance of system and symmetry in planning as was in existence in Paris a century ago; and it is only a few weeks since that we saw a small new monument deliberately placed out of axis with its most important architectural neighbour. Quite recently, too, we had the spectacle of the absurd *fiasco* of the so-called Marble Arch improvement, where the original suggestion, which had some merit, was entirely spoiled and rendered nugatory by the action of the Office of Works, under the pretext of producing a more commodious line of route for vehicular traffic. Commodious lines of route are of practical importance; but if a city is to have architectural dignity something more than that must be sought for. And so far it may be said that it is always the official authorities who stand in the way of architectural laying out of sites. There was another instance a good many years ago, when the Constitution Hill Arch was moved (again under the pretext of providing for traffic accommodation), and placed facing a shapeless *place* with shapeless islands in it, in the kind of manner which one might have expected from the normal estate agent. This, again, was the Office of Works; it is the official authorities who spoil everything; it is from outside, from members of the architectural profession, that any suggestion for a higher standard in city improvements emanates. That is why the forthcoming Town Planning Congress, organised by the Institute of Architects, is an institution of considerable importance, and should receive every support from those interested in the improvement of London, and of other large English cities. It may be the means of educating both the public and the official mind to a higher perception as to the architectural treatment of cities.

The great difficulty in carrying out improvements in an existing city lies of course in the fact that both the width and the line of streets have been settled already by accidental circumstances, and without any regard to future development or to any general scheme. The one great London improvement of modern times, the Thames Embankment, was fortunately not hampered in this manner; we had to cover and build up a river foreshore, and there was a clear field for the work, and the lines were laid down for it by Nature herself. The Victoria Memorial road was also comparatively easy of accomplishment, as the greater part of it lies through park land unencumbered by buildings, though the scheme has been sadly shorn of its effect as originally contemplated. When we have to deal with existing streets, the problem is very different. Except where the existing property is so old and so inferior in value that its removal is an obvious advantage, projected improvements have to take into account the lines of existing streets and make the best of them, so far as they will lend themselves to the general scheme; or their widening, as in the case of East Piccadilly, can only be achieved by a long and gradual process of alteration bit by bit.

The first necessity, therefore, in taking in hand the improvement of an existing city, is to form a comprehensive scheme of which every detailed improvement should form a part, so that it should not be wasted, but should form one step towards the realisation of a general scheme. For London we have at present no such scheme. A great public improvement has been made in the formation of Kingsway and Aldwych; one of the class of improvements which are effected by the destruction of streets and buildings which were out of date, and which are so little missed that most of us have already nearly forgotten what was there. Even in this, however, there has been some want of comprehensiveness and foresight. The plan of the island of building land between Kingsway and the Strand was laid out without sufficiently considering how it would affect the junction of the Strand and Fleet Street, and hence gave rise to much criticism in regard to the road line at that point. What the critics forgot was that the western portion of the block was already built, and that no alteration could then be made without destroying the symmetry of the plan and the possibility of laying out the whole block to the best advantage. It is true that a fine rectangular *place* might have been formed there by setting back the northern side of the Strand to a line with the northern side of Fleet Street; but that should have been thought of from the first, and the whole plan made accordingly, before any buildings had been erected. After their erection had been commenced, it was too late to alter the whole disposition of the ground. It was a lesson on the importance of thinking out the effect of a plan fully before actual building.

In the second issue of the new "Town Planning Review" which has been started under the auspices of the University of Liverpool, there is an important article, accompanied by a plan, on a proposed general scheme for the improvement of Liverpool, representing exactly what we ought to be getting out in regard to London. It is almost melancholy to look at the plan, with its wavering lines of irregular streets running at haphazard, and think what Liverpool might have been could it have been built at one time on a comprehensive plan. For the situation has magnificent possibilities of effect. The land, in its general trend, slopes upwards from the shore of the broad estuary of the Mersey, and one could fancy the town built in a series of terrace formations rising up from the river. There are still points to be made, however, and some of the suggestions in the article, read along with the plan, are of considerable interest. We can only refer to one or two which are capable of being easily described. Some of the existing features belong to the time, not so very far distant, when Liverpool was a much smaller place than it is now. The city runs north and south along the river bank (the south end being what residentially is the "west end"), and the line of the wide Castle Street and South Castle Street runs parallel with the river, and its vista is closed at the south end by the Custom House and at the north end by the Town Hall, with the quadrangle of the Exchange Flags behind it. This is one of the difficulties complained of in the article; the street is architecturally shut in at each end. But for old Liverpool that was suitable enough; this was the main part of the town, and the two large buildings stood in a dignified position. Now they would like (or the author of the article would) to connect Castle Street more directly with a northern street just in its line, Old Hall Street (a name which preserves the memory of an old mansion), without going round the Exchange buildings; and we gather that the proposal is to open out the centre of the north side of the quadrangle to Old Hall Street, and make it a public square through which traffic could pass on each side of the Town Hall. It seems rather a doubtful scheme. A quadrangle is—a quadrangle; a good bit of architectural effect; its whole effect of seclusion is spoilt by making a breach in the centre of one of its sides. We gather that since the new Cotton Exchange was built the use of "The Flags" as the place "where merchants most do congregate" is at an end; they can congregate under cover in the new Exchange. Why not, then, transform the old Flags into a garden with fountains, and add an ornament to the city? It would be a better use for it than to drive cabs through it for the sake of a shorter cut. Wyatt's buildings round the quadrangle are worth keeping intact, too; the author is quite right, however, in his conjecture that the old quadrangle was architecturally much superior to Wyatt's; it was a fine range of buildings, exactly in keeping with Wood's Town Hall, and was condemned solely because the offices were small and insufficiently lighted; and Wyatt made a great mistake in not keeping to the same style, instead of introducing a much more busy style of architecture, out of keeping with the Town Hall.

The Cathedral is another point touched upon. We consider the position of the Cathedral one of Liverpool's mistakes. It is true that on the east side, towering above the lower level of the St. James's Cemetery Gardens, it is a site for fine effect; but it is an out-of-the-way site, as far as streets are concerned, with no central or axial approach. It should be explained that owing to the exigencies of site the Cathedral lies nearly north and south, the ritual "east end" being the south end. You get to it by a street running not up to it, but *past* it. The proposal in the improvements plan is to continue Renshaw Street, which runs straight up towards the north-west angle of the Cathedral, but stops short of it, up to the Cathedral, so as to get a certain vista to it; but even then the vista and the approach is only up to an angle of the Cathedral, not axial with it. To be sure, if this street alteration had been contemplated in advance, the Cathedral might have had an angle tower designed for the situation. But the right place for the Cathedral would have been what, at the time of the site controversy, was called "the London Road site," where it would have had a central and axial approach up to its western façade. As it is, it is a cathedral in a corner, and it would take a very extensive street alteration—almost a re-planning of that part of the city—to make it otherwise.

We see that there is an important new thoroughfare proposed, running down to the docks in a more modern quarter of the city, as a new entrance to the city from the east, with a crescent near the river, and wide spur streets running up to north-east and south-east; the latter is intended to connect St. George's Hall more directly with the river front; it is said to be axial with St. George's Hall, but it is not quite so according to the map. One effect of this would apparently be to shift the principal access to the city from the river to a point farther north than it is at present. How far that would be an advantage we can form no idea. But it must be admitted that St. George's Hall, by far the finest building Liverpool possesses, though well placed as to its immediate surroundings, is only connected by rather indirect routes with the river front; from most directions you come on it, as it were, by surprise, round a corner; and a proposal to form a direct road with a vista to it is worth consideration.

We recommend the article and the map to our readers' attention, as an interesting suggestion for a definite improvement scheme for a large city.

Sound-proof Partitions.

REFERRING to the letter addressed to us last week by Mr. W. B. Hopkins in regard to his disappointment with the behaviour of some partitions with spaces between them, which failed to exclude sound, we should say that there is rather a mistaken idea as to the efficacy of spaces. If you take a very thin and light form of partition, which in itself would certainly not be expected to exclude sound, and place a similar partition two or three inches from it, and then expect them to exclude sound, it is expecting more from mere space than can be reasonably expected from it. If a fairly thick and solid partition has been erected which would be nearly sound-excluding in itself, no doubt the erection of another such with a space between them would render it more efficient; but we doubt if air space will do much to help partitions which, if set up alone, would be easily permeated by sound. And there is another point to be considered in connection with the subject. It is a question whether it is all desirable to have in a building a considerable quantity of empty space, either in walls or partitions, which no one can get at or examine. They may be supposed to be entirely vermin-proof, and dust-proof, and so on; and may be so when new. But one never knows what goes on, or what decaying and unwholesome matter may collect, in such unexplored spaces.

A Memorial to Florence Nightingale.

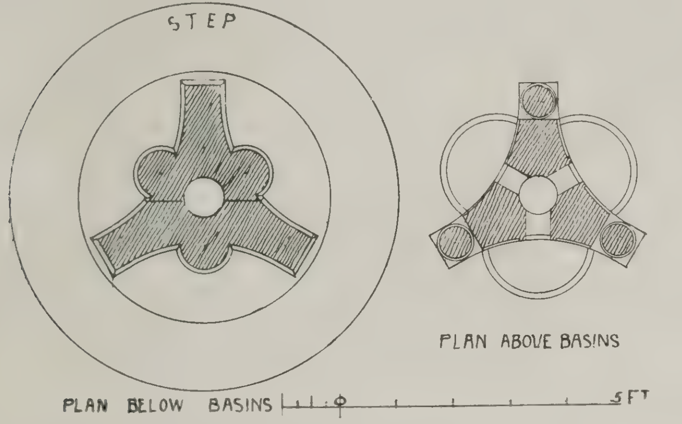
THE London City Corporation contemplate raising a memorial to the late Florence Nightingale, who, it will be remembered, was presented, somewhat belatedly, with the Freedom of the City in 1908. One proposition is that the memorial should take the form of a bust. We trust that it will; for Miss Nightingale would make a particularly good subject, and a bust, if not a statue, of her would be a gracious augmentation of the very scanty number of public memorials to women.

NOTES AND NEWS.

Memorial Drinking-Fountain, Wandle Park.

This memorial fountain has recently been erected in what is called the "Mill-pond Garden" in connection with Wandle Park, near Wimbledon; a piece of ground surrounding a small lake, which was purchased and laid out by Mrs. Richardson Evans, of Wimbledon, as a gift to the public and an addition to Wandle Park. The fountain is a memorial to a relative, one (according to the inscription on the fountain) "who loved Nature and his fellow-men," and from whom the funds partly expended in this good work were inherited.

As the fountain was to have the function of a monument and to bear some inscriptions, it was necessary that it should assume an architectural character somewhat beyond that of the mere practical requirement of a drinking-fountain pedestal, and the triangular plan was adopted as affording a little variation from ordinary erections of the kind. The accompanying diagrams give the plan below and above the basins.



On one side is the memorial inscription already referred to; on another the statement that the fountain and grounds are vested in the National Trust; on the third side is engraved the following verse from Matthew Arnold:—

> "Calm soul of all things, make it mine
> To feel amid the city's jar,
> That there abides a peace of thine
> Man did not make, and cannot mar."

The inscriptions are in incised letters, from the architect's drawing. Mr. H. H. Statham, F.R.I.B.A., is the architect. The stonework was executed by Messrs. Farmer and Brindley, in selected white Portland stone. The plumbing work was done by Messrs. Parsons and Townsend, of Wimbledon. The taps project through removable moulded gun-metal covers, behind which are openings wide enough to allow of inspection and handling if required. The small wreaths on the urn finial at the top are gilt.

Ireland's New Form of Contract.

It will be seen from a contribution which appears in another part of the present issue, that the Royal Institute of Architects of Ireland, and the Dublin Master Builders' Association, have between them evolved a new form of contract which, while based on the English form, is in some respects an improvement on it as regards the builder's point of view. The Irish form has specific provisions against those delays in settlement which are always vexatious, and are too frequently ruinous to the contractor. The surveyor is required to furnish a copy of his valuation of the variations, not only to the contractor, but also to the employer, who is thus placed in a position to object at once to items which he may possibly feel inclined to submit to arbitration. The architect is required to issue his penultimate certificate within an agreed and definite number of days after the delivery of the surveyor's statement of extras and omissions to employer and contractor. The whole intention is to promote prompt consideration and settlement of the accounts by providing definite dates at which they may be presented and considered; the architect being thus relieved of considerable responsibility, which he can transfer to the employer by adhering to the specific terms of the contract, while the employer will at all events have everything placed before him in a businesslike way, and will thus in a manner be prompted to be prompt, whether in declaring his objections or in settling his accounts. Whether he and the architect will take kindly to this mild compulsion of documents and dates is yet to be seen; but there seems to be no sound reason why both should not willingly acquiesce in an arrangement to which the Royal Institute of Architects of Ireland has consented, and which seems to bring building contracts more into line with modern business methods. Whether, if the Irish form of contract is found to work satisfactorily, the English form is likely to be modified accordingly, is a question about which it would be premature to speculate.

Carillons for London's County Hall!

The suggestion has been made that the builders of London's County Hall should seriously consider the possibility of installing "a worthy carillon with a keyboard." It is urged that "recitals could then be given in the summer months, and a delightful addition would then be made to the free concerts which are now provided in the parks and open spaces of London." This is the language of the "Times" correspondent at Mechlin, where "the bells live in a vast upper chamber open to all the winds of heaven. . . . It is a great pity," he thinks, "that bell music should not be heard on that coast as far as the rays from the lighthouse can be seen. It is so here and there along the coasts of Holland, and sometimes the fisher-folk can hear the starry music from an inland tower when fog has blotted out all the warning lights." This is all very pretty and poetical; but a large and influential section of the prosaic population of London will probably become frenzied at the bare idea of a County Council Hall carillon recital with river-tug fog-horn obbligato. For one thing, it would cost money; and for the moment the party of economy is in office, and is strenuously supported by the indignant ratepayer.

The "Gran Via," Madrid.

The City Council of Madrid has begun work upon the new boulevard, to be called the "Gran Via," which has been in project for about 25 years. A syndicate composed of French and English capitalists secured the contract for its construction. The Government is erecting a palace for its Department of Posts and Telegraphs, and a company is erecting a large modern hotel, which is to contain 185 rooms and 75 baths. A clubhouse, costing £160,000, is nearing completion. There are, according to "Commercial Intelligence," about 50 apartment houses now in course of construction in the capital. These buildings will be equipped with electric elevators of the type common in Europe, which carry passengers up but not down, and modern heating and plumbing systems. Each apartment is furnished with a kitchen range of the "built-in" type; that is, each range has all the essential parts of an ordinary range, but the fire box, ovens, and water heater, supported upon a bed of concrete faced with tiles and the extensions at each end of the iron top, are covered with marble and serve as kitchen table. The outer doors of the apartments are all supplied with very heavy locks, but light mortice locks, with a peculiar kind of brass knob, are placed upon the doors to the rooms. The windows are of French style.

St. Dunstan's Tower.

Owing to the removal of old property in Eastcheap, wayfarers can now obtain an admirable view of a much discussed tower. It belongs to the church of St. Dunstan-in-the-East, was, the legend runs, designed by a daughter of Sir Christopher Wren, and closely resembles the lantern of St. Nicholas's Cathedral at Newcastle. Like so many other Metropolitan edifices, the original St. Dunstan was very seriously damaged during the great fire of 1666, and was rebuilt 30 years later—with a spire rising from four arched ribs that spring from the angles of the supporting tower. A Newcastle writer insists on its inferiority to the tower of St. Nicholas. He quotes an unnamed old topographer as saying:—"St. Nicholas's tower is so lofty and of such a girth that to compare great things with small our London piece of vanity is but a molehill to the Newcastle 'mountain'—the pride and glory of the northern hemisphere." Having become badly dilapidated, St. Dunstan's was restored in 1817, and is particularly well seen from London Bridge. With respect to Wren's daughter's share in the design, the obviously apocryphal story—or one version of it—is that the peculiar form of the tower was suggested to Wren by observing his daughter toying with her scissors-case; which is not much more absurd than the average architectural folk-myth.

First Garden Village in Wales.

Last Thursday the Mayor of Swansea formally opened the Swansea Garden Village, for which the National Housing and Town Planning Council is responsible, and for the next two months the estate will be on exhibition. It is the first garden village in Wales. The site is on Town Hill, and as yet is but partly built over and difficult of access. It is proposed, however, to lay a tramway to it. There is a fine prospect overlooking the town and Swansea Bay, and the type of house adopted is designed to give both light and air. Operations began two years ago, when the Town Planning Council secured 54½ acres of Corporation land on Town Hill.

Builders' Federations, International and Imperial.

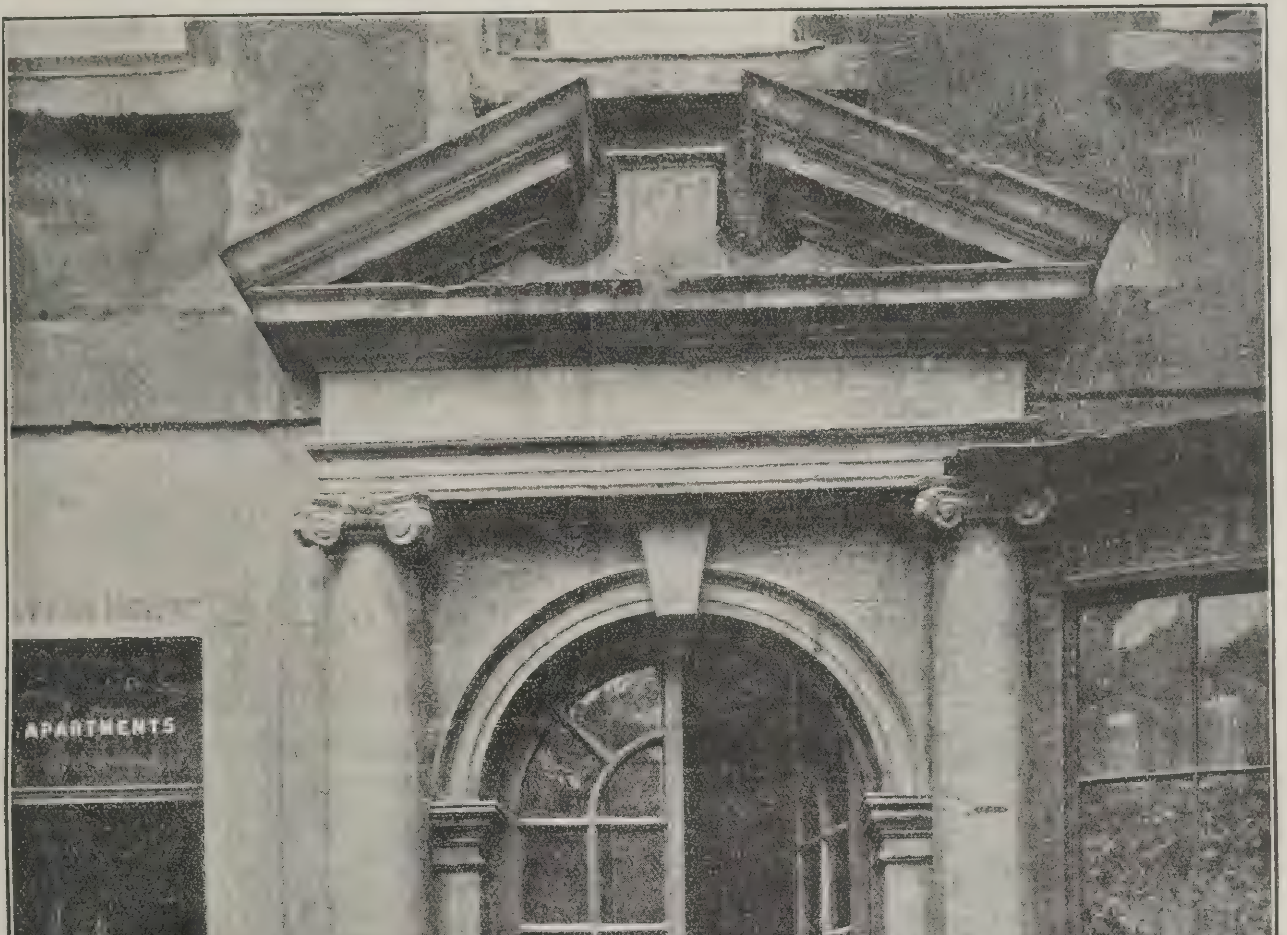
A dream that perchance is not all a dream is recounted in a very thoughtful communication which appears in another part of the present issue. The author of this communication suggests that, since the workmen's unions are more or less rapidly tending towards international federation, the employers in our great industries are themselves being impelled in self-defence to place their own organisations on a similar basis. It is recalled, indeed, in the communication under notice, that a movement for international federation of the building trades was begun a year or two ago, and it is expected by our correspondent (whose optimism is surely of the "robustious" order) that this movement will result in the establishment of an international federation covering some fourteen European countries, and of colossal membership. We note, also, that at the annual meeting of the Scottish Building Trades Federation last Wednesday, it was stated that arrangements had been made "for a monthly exchange on matters of interest between the Scottish Building Trades Federation and similar organisations in Germany, Belgium, Holland, and South Africa." Our correspondent's idealism, however, does not blind him to the serious character of the usual stumbling block. What he calls "finance" may possibly wreck the best laid scheme of federation that can be devised by the wit of man. Our correspondent does not disguise the difficulty that always arises when the great idea is translated into terms of hard cash. He complains of the feebleness and inadequacy of the "financial backing" even in the local and national institutions; and this being so, the larger conception of federation seems unlikely to develop into great issues. Another difficulty which our correspondent points out is the disparity that arises from this country being so far ahead of others with regard to conditions of labour. The other countries would take a long time to level up; and in the meanwhile, British employers could hardly be expected to sympathise very actively with foreign endeavours to resist concessions to labour such as were granted in this country from thirty to fifty years ago. It will, therefore, we apprehend, be somewhat hard to convince the organised master builders in this country that international federation would be of sufficient all-round benefit to warrant the necessary outlay. With regard to the building industry, perhaps the money would be better spent in strengthening the home defences—that is, in perfecting the organisation and intensifying the activities of the local associations and of improving the position and increasing the scope, power, and influence of the National Federation, which has yet much strenuous work to do, and to do it effectually must be assured of an adequate financial backing. International federation, nevertheless, need not always remain an unsubstantial dream; but it would seem to us that the realisation might very appropriately be preceded by a kind of Imperial federation, such as that which seems to be foreshadowed by the very friendly relations which exist between the home organisation and the master builders' organisations of Australia and South Africa, as evidenced, for example, by the hearty reception accorded to Mr. J. T. Brown, Secretary of the South African Federation, and Mr. Dey, Secretary of the Pretoria Master Builders' Association, when they visited the half-yearly meeting of the National Federation at Chester last July.

Vandalism in Cyprus.

In view of the "deplorable indifference long displayed by the British Administrators of Cyprus to its monuments of antiquity," Messrs. D. G. Hogarth, M. R. James, J. A. R. Munro, John L. Myres, and R. Elsey Smith, who have all been at various times engaged in research in the island, take the opportunity of urging upon those in high places that it is the bounden duty of British administrators, to whom care of a piece of classic ground has fallen, to display something of that solicitude for, and interest in, its priceless and irreplaceable memorials of antiquity which can be credited to the officials of other European nationalities. Now comes another report of unchecked destruction by peasants proceeding on the site of the ancient Soli. It is said that a large building, probably a temple, is being systematically quarried for building stone by the natives of Karavastasi and its neighbourhood. The site is well known, and 20 years ago was marked by an inscription of Sergius Paulus, the "deputy of the country," who listened to Barnabas and Saul (Acts xiii. 7). This stone was then serving as the threshold of a village cafe, and is now, doubtless, worn smooth or destroyed. There have never been wanting in Cyprus enlightened officials who deplored the Governmental attitude of indifference, but they have not been enough to leaven the lump and secure that general protection of monuments which the excellent Island Police could so easily afford.

The Colour of Roads.

The volumes that have been written on the "colour" of various cities appear to be spreading the gospel in that kind. At a recent meeting of Harrogate Council, Alderman Chippendale (*nomen clarum et venerabile*) moved that Mountsorrel granite be substituted for whinstone on other than the main roads. He argued that the effect of whinstone on the Harrogate roads was to make them drab and cheerless; whereas, in a health resort, to which many invalids came, it was desirable that the roads should be light-looking and pleasant to the eye, and he held that granite fulfilled that condition. Another gentleman, laying stress upon a more purely practical side of the question, said that the surfaces of the whinstone roads of the town were so hard and flinty that they pulled motor tyres to pieces—which some might regard as a virtue in whinstone, as ensuing a kind of poetic justice, or *lex talionis.* The motion in favour of granite was adopted, in spite of the increased expense implied; thereby providing an occasion of rejoicing to those who discern in the decision a minor triumph for æsthetical over merely sordid considerations. The colour of roads, indeed, is a point that, for the excellent reason adduced by Alderman Chippendale, and for some other considerations, is not too small for serious regard. It would no doubt, be highly ridiculous to advocate delicate art tints for roads and pathways, in conformity with the general tone of the buildings, but there is no doubt that one's general impression of a town is strongly affected by the colour of its roads; and "the old brown road" and "the grey and winding way" have even found a place in song and story. Bournemouth, Eastbourne, and the delectable towns of the Isle of Wight, for instance, owe much to the rich and cheerful tints of their roads; and Harrogate does well to recognise the importance of the feature.



DOORWAY OF No. 2, TERRACE WALK, BATH, 1740-48. J. WOOD, SENR., ARCHITECT.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE DESIGN AND CONSTRUCTION OF OPEN-AIR SCHOOLS.

BY REGINALD G. KIRKBY, A.R.I.B.A., F.S.I.

The system of open-air education for debilitated children may be supposed to have passed through its experimental stage, and to have now become firmly established. The beneficial results attending the experiment, and the rapid growth of the movement, have no parallel in educational work of recent years. So great are the benefits to be derived from daily attendance at open-air day schools for a short period of three to six months that any expansion of the system should be on the lines of duplicating such schools, rather than in providing schools of a residential type. The children usually remain at school for the whole day, which necessitates some provision for the supply of meals, and this should be taken into account in the planning of an open-air school.

These schools are usually closed for the winter months, thereby simplifying their planning and construction. So good, however, were the results which attended the keeping open of the Bradford open-air school at Thackley during the winter of 1909-10, that the desirability of extending their usefulness to the whole of the year is clearly shown.

The medical aspect of the work should be of first importance, and the building should be designed somewhat in the nature of a hospital. At the same time, the desirability of carrying on such work of a special educational character as is possible in an open-air school should not be lost sight of. Therefore, a building to meet all the requirements of an open-air school should in reality be both a hospital and a school combined.

Whilst the local conditions of a particular district may call for some slight modifications in the construction of a building, yet the principles of planning should be generally maintained, and the following requirements should be met:—(a) daily rest and sleep; (b) provision for teaching in class rooms in wet weather, as well as teaching in the open air; (c) physical exercise; (d) bathing; (e) meals; (f) accommodation for medical inspection; and (g) the usual offices, which should be specially constructed to meet the requirements of an open-air school.

Site.

The school children are usually collected in batches at some central spot in the town, and thence conveyed (under the supervision of the teacher) to the site. This makes it desirable that the school be placed within easy reach of the town, and near a railway, or a tramway. Otherwise the mode of transit would have to be by means of some special conveyance, which might add to the cost of working the school. If the town be a manufacturing one, the site should be as far removed from the smoke belt as possible; and in all cases the school should be on the windward side of the prevailing winds, so that it does not receive the used up polluted air which has passed over the town. A southern open aspect is essential, in order to obtain as much sunshine as possible.

The schools should be provided with protection on the northern half of the compass, and also be protected from the prevailing winds. This protection might be obtained by placing the building in proximity to a clump of trees, or a wood, to which the children could have access for nature study, etc. Suitable land should be available for the laying out of gardens, and for purposes of outdoor drill and play.

Water supply, drainage, and lighting should also have careful consideration, and where found possible connection might be made to the existing town's supply.

Buildings.

The prescribed daily rest in the open air will necessitate the provision of deck chairs, specially constructed so as to allow of the children lying in a much more recumbent position than is possible in ordinary deck chairs. During the warm, dry days, the children could wrap themselves in rugs and lie on the ground, but this would not, of course, be possible in wet weather.

For rainy days some necessary protection overhead during resting time will be required; and for this purpose large open resting sheds should be provided. These might consist of a roof open to the apex, supported on tiers, to allow the free circulation of air. It would be an advantage to have the back and one side closed in, to give some protection against rain and strong cross winds.

The open-air school erected at Thackley for the Bradford Education Committee has the resting shed enclosed on the northern side, and provided on the western side with revolving shutters, which can be lowered to shelter the shed from the prevailing rains from this quarter.

Physical exercise in dry weather would naturally be conducted in the open air, but on rainy days, and particularly in winter time, the resting sheds would adequately meet this requirement.

Class Rooms.

The planning of the class rooms for formal academic instruction calls for special consideration, as it is essential from the nature of the school that this should be given practically in the open air, although in class rooms. At the same time, it is necessary to provide sufficient class room accommodation to house all the children at one time.

At Thackley the class rooms are arranged in two blocks, each consisting of three class rooms, for boys and girls respectively. The floor area is on a basis of 20ft. per child, instead of the usual 10ft. required for elementary schools. Adjoining, and opening out of each class room, is a teaching verandah, to which the teacher may take the children out for instruction even on rainy days, providing, of course, the weather is not too cold. The veran-

REGINALD G. KIRKBY, A.R.I.B.A., F.S.I., LATE CITY ARCHITECT, BRADFORD

dahs are protected from the north and westerly prevailing winds and rains. Another method of obtaining this result is shown in the accompanying plans of a new cripple and deaf school about to be erected at Bradford, in which the principles of the open-air school are to be adopted. Each class room opens on to a verandah on the south side, the verandah being sufficiently wide to prevent the rain from reaching the scholars while at lessons in the class room. Casement doors opening outwards are provided for the full length of the room. The verandah is fitted with a glass roof so as not to obstruct the light in the class rooms, and opening windows are placed above the verandah roof.

The class rooms should be provided with ample ventilation hoppers and tipplers, to allow the room to be frequently scoured with fresh air. To ensure this, the means of access from one class to another at the rear of the class room might also be in the form of a verandah, with a low roof. Ventilating hoppers could then be made to open directly on to the verandah, with tippler ventilators placed above, opening directly into the open air above the verandah roof. In an exposed site, the verandah, even if closed as a fresh-air corridor, would still leave the direct cross ventilation into the open air above the corridor roof.

Baths.

It is necessary to provide sufficient bathing accommodation to allow of each child being bathed at least once a week. A bathroom to accommodate up to 20 at one time would appear to be sufficient for a school of from 100 to 150 children. Shower baths appear to be the best, as they allow the water to run away from each child, and so reduce the risk of contagion from any disease. Troughs might be provided in which small children could paddle, as the effect of the shower might cause the very little ones to dislike the bath. The showers should be just above the children's heads, with a separate ring spray for each child. Each section of three or four showers should be under separate control, and all fitted with a regulating thermometer valve, so that water can be supplied at any desired temperature. The walls should be lined with white tiles, or brick; the room will be well lighted and ventilated, and everywhere the idea of cleanliness should prevail.

A system of drill could be adopted in the bath, whereby all the children would soak the head at one time, and then the arms, etc., the showers coming into play between the soaping drills. This might be arranged in rows of 4 to 6 over a trough, with the floor raised between the trough, to enable the teacher to inspect the children without standing in the water.

A slipper bath will be found necessary, in which to wash some of the children who on arrival at the school are found to be too dirty to go under the showers with the other children.

Separate dressing compartments should be provided, so that the children do not dress all in one room, a practice which is particularly objectionable to older girls who require more privacy. The divisions should not be higher than the shoulders of the average child, to enable the teacher to look into its compartment, and so easily supervise the dressing and undressing. A curtain at the front will provide all that is necessary in the way of a screen.

Meals.

The accommodation necessary to provide for the daily meals should be centrally placed in the buildings, so as easily to serve all departments, and should include dining room, large kitchen, store rooms, larder, etc. The kitchen should provide sufficient accommodation to enable the three daily meals to be prepared and cooked, and should be provided with a large scullery, as in addition to the ordinary work of preparing the meals, the children will assist in turn in the preparation and cooking of the food, and also in washing up the dishes, etc.

The dining room should be capable of seating all the children at one time, with ample space for passing between the tables, so as to enable the children to be taught to lay the tables, and provide for those who take part in serving at the table.

The dining room and its adjuncts should comprise a separate block, as it is not desirable that the smell of cooking should reach the class rooms, etc.

It is necessary that the cloak rooms and lavatories should be well lighted and ventilated, as if these precautions are not taken the atmosphere of these rooms is likely to become very foul.

Each child should be provided with a separate towel, hung in a separate recess, thereby preventing the towels from touching each other. This is more necessary in an open-air school, as a towel common to a number of children is likely to be a means of spreading disease.

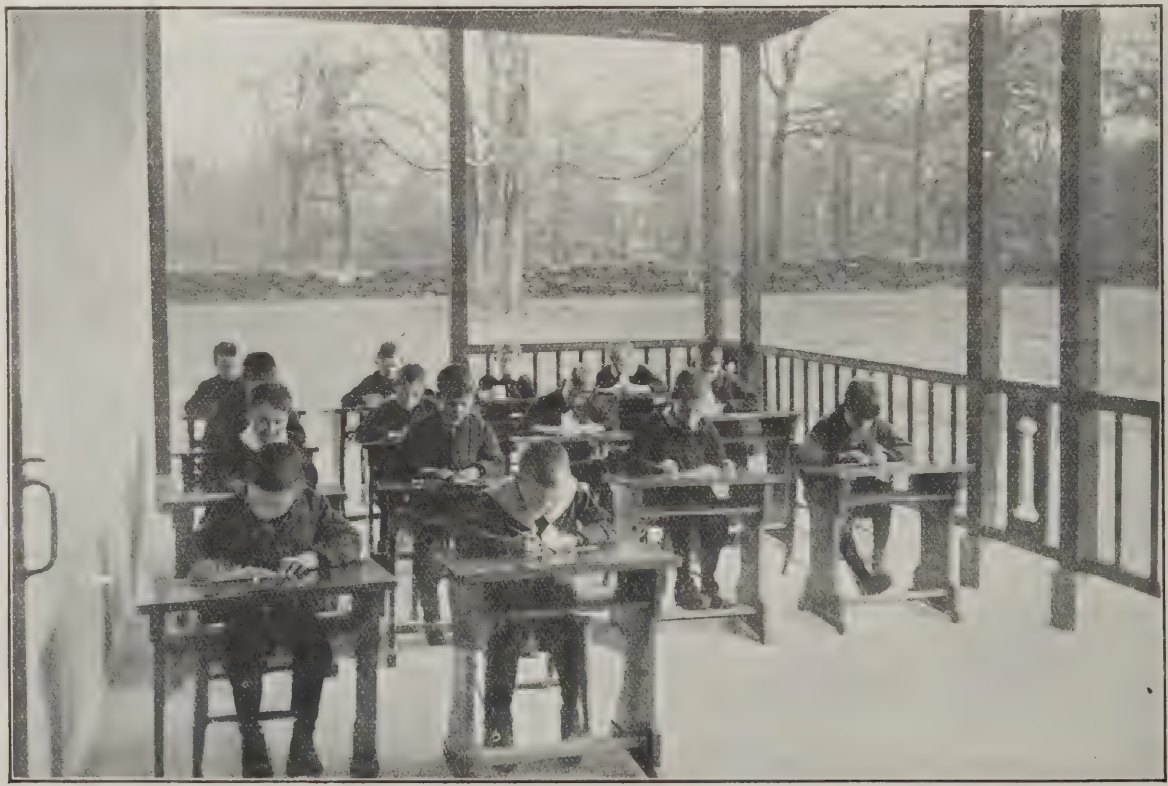
While gardening should provide some lessons of manual instruction, it may be deemed necessary to include a room fitted with benches, etc., for the teaching of woodwork and the like.

A room, or rooms, might also be included for the teaching of housewifery and needlework. These, with the rooms for manual instruction, might form a separate block.

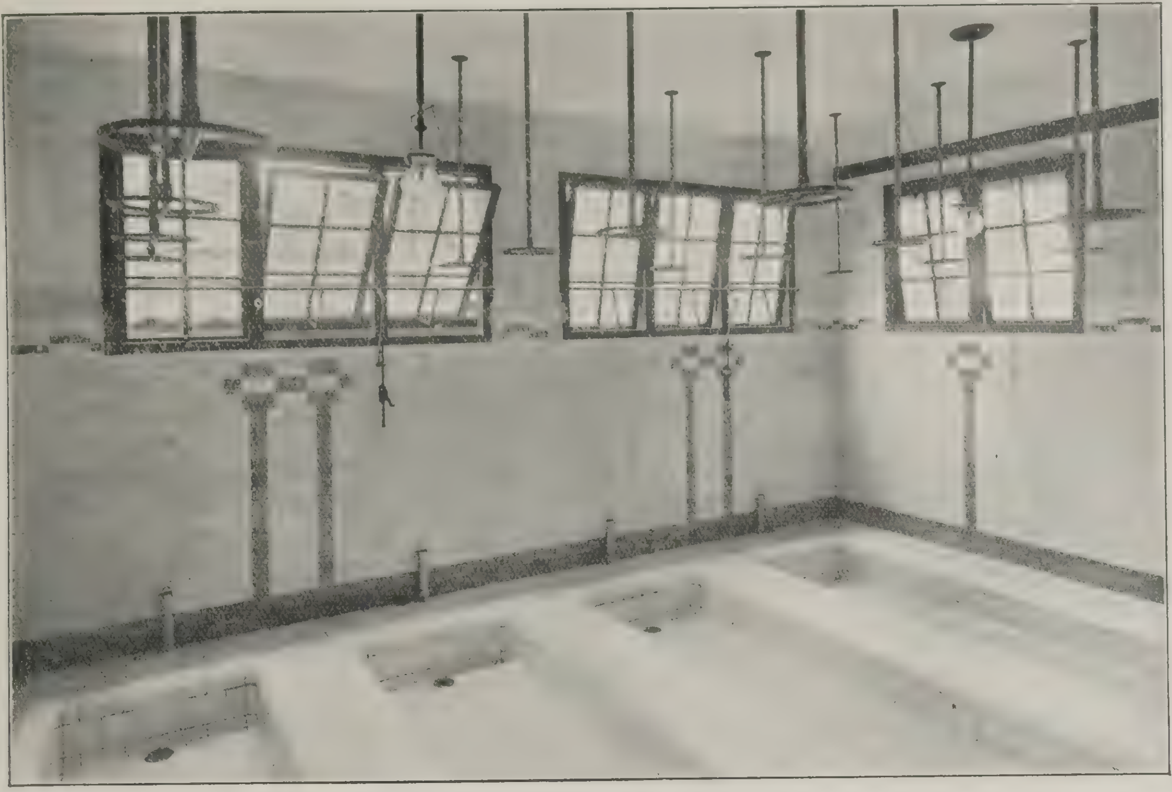
In addition to the necessary teacher's room, a room for the nurse and medical inspection is desirable if the school be some distance from the town. This room to be fitted with a sink and lavatory, and also with ample cupboard accommodation. Such a room would facilitate medical inspection, which necessarily forms an important part of the work of such a school.

Construction.

The buildings which have been specially erected for the use of the open air schools have hitherto been more or less of a temporary character, consisting chiefly of wood framing, covered with boarding or sheet-iron. Now that the principles of



OPEN-AIR SCHOOL, THACKLEY, BRADFORD: A CLASS ON THE VERANDAH. REGINALD E. KIRKBY, A.R.I.B.A., F.S.I., LATE CITY ARCHITECT, BRADFORD.



OPEN-AIR SCHOOL, THACKLEY, BRADFORD: THE BATH-ROOM. REGINALD G. KIRKBY, A.R.I.B.A., F.S.I., LATE CITY ARCHITECT, BRADFORD.

open-air schools have been firmly established, a more permanent type of construction is necessary, as it has been found that it is not really economical to erect a temporary class of building for this purpose. From the nature of the work of an open-air school, it is not essential, however, to adopt an expensive type of construction, and some form of construction is desirable which is lasting, and yet not costly to build.

At Thackley, Bradford, the walls are only three inches thick, and yet are waterproof, fire resisting, and permanent. The outside is rough coated, and the roof covered with red tiles.

The importance of isolating the various blocks of buildings in a school of this description so that a free current of air can circulate round them cannot be too greatly emphasised. It is equally important that these blocks of buildings should be connected by a paved, covered way, enabling the children to be under shelter whilst passing from one block to another.

In nearly every school specially built for the purpose of an open-air school, the various buildings are entirely isolated, with the result that children, many of whom are poorly shod and clothed, have to sit in the class rooms or resting sheds with damp feet and clothes, after, perhaps, having received their meals in a warm room.

The whole of the buildings at Thackley are connected by means of a verandah which runs in a straight line from end to end of the buildings, as this arrangement appeared to suit the site best. The buildings, however, might be grouped round a quarter circle, as is indicated on the plan of the cripple school. The site, however, will govern to some extent the disposition of the various buildings.

General Observations.

The remarkable physical improvement which is noticeable in children attending open-air schools suggests the consideration that some of the principles governing the planning of open-air schools might with advantage be extended to other school buildings, and it would appear as if these principles are destined to have a very important influence on the design of future school buildings.

In a new elementary school at Thornbury, which is being erected for the Bradford Education Committee, the principles of an open-air school are adopted.

All the class rooms open on to a verandah facing south, the lower portion of the walls being so constructed that by means of folding doors practically the whole of one side of the class rooms may be thrown open. The folding doors are fitted with special folding hoppers, to close up when the doors are open, and to regulate the flow of air into the class room when the doors are closed during inclement weather.

These principles are being adopted in a new cripple and deaf school to be erected for the Bradford Education Committee.

In view of the overwhelming evidence that exists to-day in favour of a more rational type of school planning, it is surprising that the authorities are still permitting school buildings to be erected on the old central hall plan.

The main points of this article were given in the form of a paper read at the Royal Sanitary Institute Congress at Brighton, in conjunction with two other papers on school subjects, respectively by Mr. W. H. Webb and Mr. Edward Willis, reported on pages 303 *and* 304 *of this issue, together with the discussion on all three papers.*

SCHOOL AND COLLEGE BUILDING.

It was the Education Act of 1870 which inaugurated the new era in school building in this country. Before then, as "A School Architect" writes in the "Times," the requirements had been simple, and had been met by haphazard arrangements. From that time, however, all the conditions of school life were scientifically studied, and the new requirements imposed new conditions of design, which it was not always easy to turn to satisfactory architectural account. But the problems involved were at least stimulating; and, in many cases, especially in the buildings designed for the School Board for London, they led to an adaptation of a fairly elastic phase of foreign Renaissance architecture which proved not wholly unsatisfactory.

As the first impulse towards the modern development of educational architecture was due to the requirements of elementary schools, the "Times" writer observes, these requirements may be held to have influenced those of higher-grade secondary schools, colleges for women, training colleges, modern universities, and the new buildings erected to meet modern demands at Oxford and Cambridge. The principal line of cleavage between elementary schools and places of higher education is fixed by the consideration whether or not the building is residential; and residential accommodation may be in a variety of forms. In secondary schools the usual arrangement is the provision of large dormitories with day-rooms, and a few studies. In what are generally termed public schools, these dormitories may be subdivided into cubicles, as at Charterhouse, to afford comparative privacy for the individual; or, again, as at Eton and Harrow, each boy may be allotted a room which is bed-room and sitting-room in one; while, as at Rugby, the number of private studies may be increased so as to provide accommodation for all. Obviously the combination in one scheme of residential with purely educational accommodation involves complexity in arrangement and design: the former naturally assumes a more domestic, the latter a more academic character; and, if a chapel is needed, the ecclesiastical note cannot be excluded.

The writer suggests that the rules fixed by the Board of Education are somewhat Procrustean. It is an anomaly that such rules should admit of no exceptions—that the same proportion of window-space should be demanded whether the outlook is in a narrow street or on to unbroken space, whether the aspect is north or south. The result in many cases is externally the undue diminution of wall-space valuable for architectural effect, and internally an excess of light which is almost intolerable.

The writer, noting the developments of modern collegiate architecture, points out that building by successive instalments seldom allows of comprehensive treatment and composition. In conclusion, he contends that educational buildings, if they are to conform to modern requirements, call for a new departure in character and style. That style which is least bound by rigid precedent is most elastic and adaptable, and is most capable of the harmonious expression of varied requirements, should eventually prevail. To this we should like to add our own opinion, repeatedly expressed before, that the monotonous repetition of a few pronounced types of school in London is æsthetically undesirable, and that therefore the perpetuation of the system by which they have been produced is very regrettable. Variety and individuality in the elevations might be more satisfactorily attained if the designing were thrown open to competition.

BRITISH BUILDERS AND INTERNATIONAL FEDERATIONS.

(*Communicated.*)

In an article on the Labour Socialists' Congress at Copenhagen, in the "Daily Chronicle," Mr. Ramsay Macdonald, M.P., offers some observations which demand the serious attention of all employers of labour, as they seem to foreshadow important industrial developments. After indicating that the leaders of every Socialist and Labour Parliamentary group in the world were present at the congress, and marking the great advance of Parliamentary methods as compared with revolutionary methods, the latter being found useless when it comes to actual work, Mr. Macdonald says:—"In factory inspection, child labour, hours of work, and in political grasp of the meaning and development of systems of State insurance, State inspection, and trade-union action, the British Labour party is half a generation ahead of the Continental Socialist movement." And again: "Thus, congress after congress since the formation of our Labour Party has shown the steady advance of our party in the esteem of other nations. It is being studied more and more as the model for Continental organisation in working-class Parliamentary policy."

As usual, however, the international weakness is due to lack of readiness on the part of British unions to contribute financial help to their Continental brethren—which is not to be altogether wondered at, seeing that the latter have in many cases neglected to provide any substantial financial backing for themselves. It is now being realised, however, that finance lies at the basis of successful international action; and no doubt in due time effect will be given to that conviction. Once the international financial relations of the trades unions are put on a workable basis, they will constitute a very remarkable force of organised labour, seeing that in Europe alone they represent over 10,000,000 electors.

Considering these things, and bearing in mind the great struggles which the labour unions in the building trades in Germany, Italy, and France have been waging recently for higher wages and improved conditions, it is small wonder that building trades employers, shipping employers, and other great industrials, are tending towards international federation in self-defence.

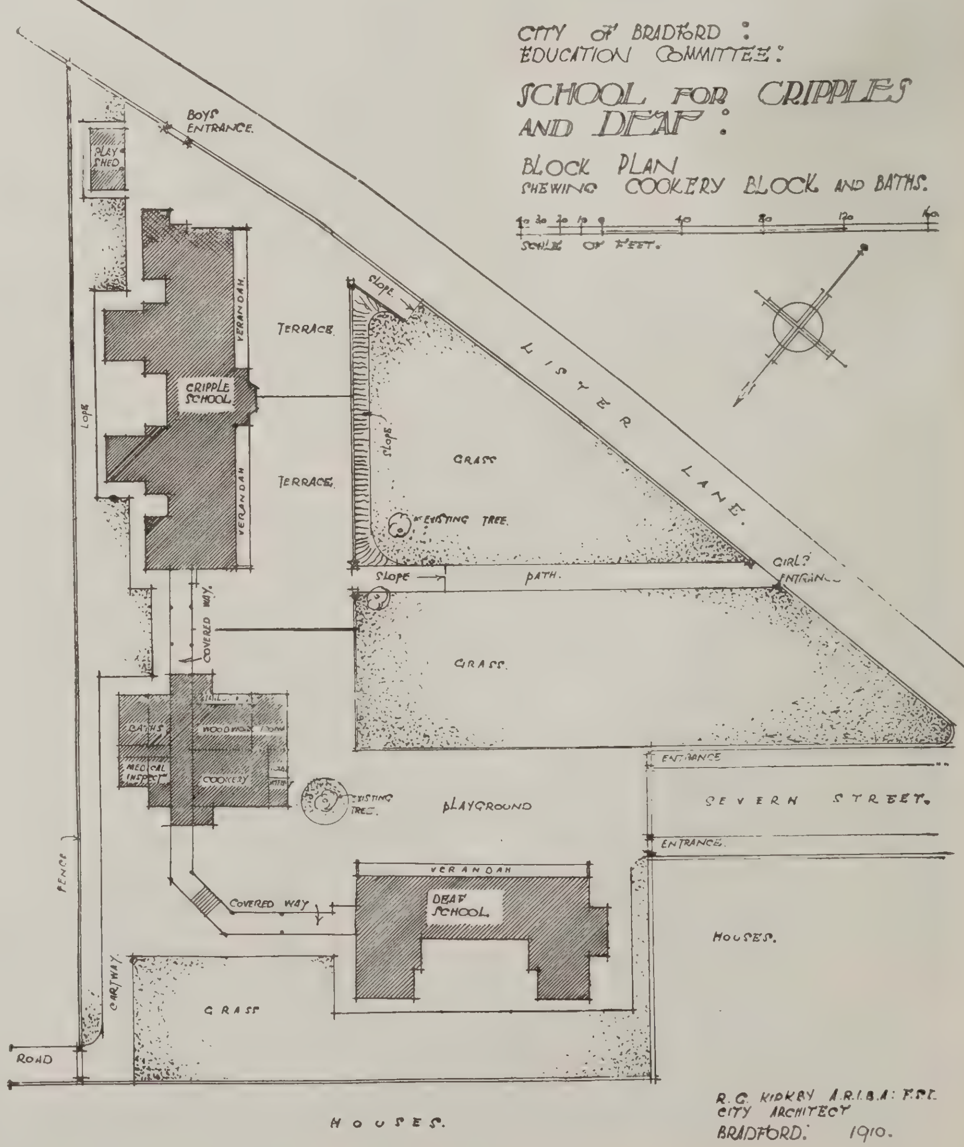
A movement for international federation of the building trades was begun a year or two ago, and it is expected that it will result in establishing an international federation covering some fourteen European nations, and representing fifty thousand to a hundred thousand contractors engaged in building and public works.

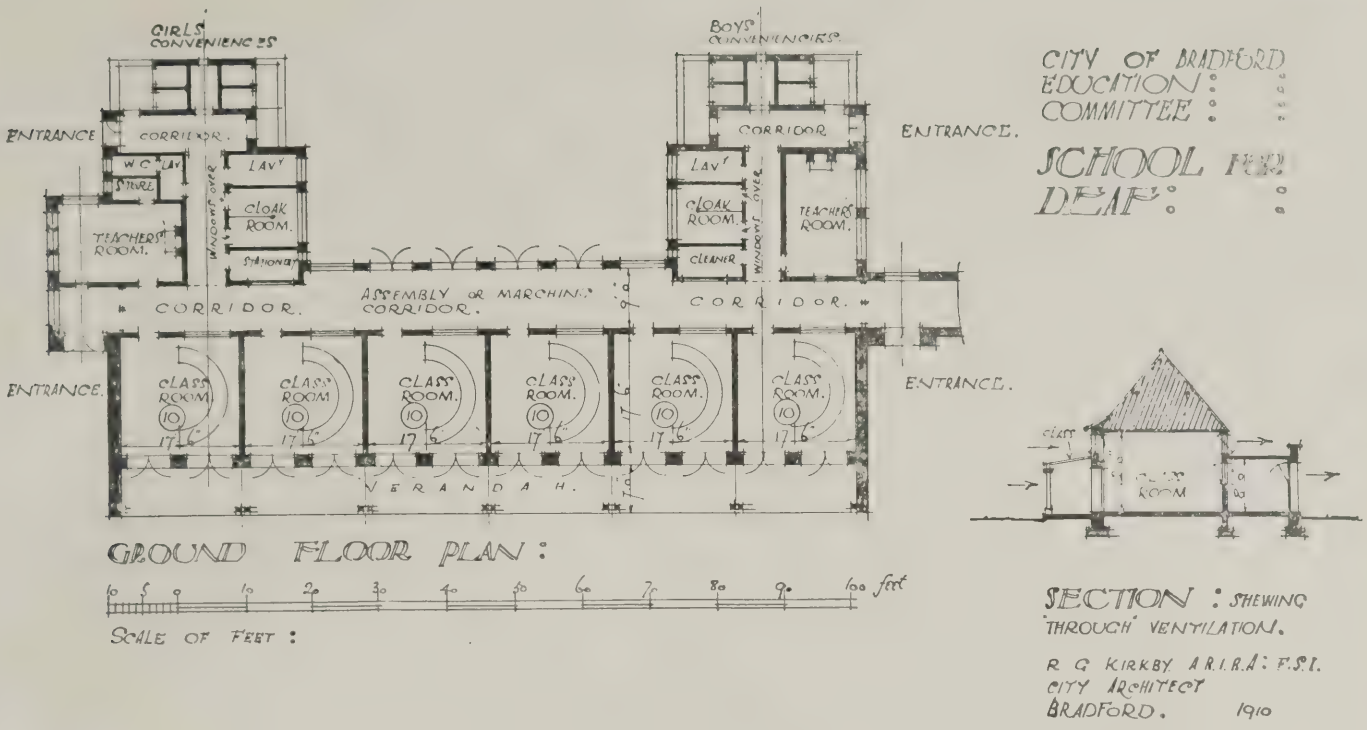
There is also some danger here that finance will prove a stumbling-block. The various employers' federations in the respective countries are organised on a democratic and representative basis, with local autonomy, and control the expenditure of the various federations. There is much difficulty already in obtaining adequate revenue for both local and national purposes, let alone for international purposes. The national and international bodies are too remote from the individual contractor to inspire him with enthusiasm or to enlist his financial support. Many local contractors rarely attend meetings of the local organisation to which they belong, and do not take any interest in regional or national and international federations, and, in fact, only a representative few can take an active part in their work.

Another feature which may affect the views of British federations is the great difference which exists in the relations subsisting between the employers and workmen's organisations here as compared with those in France, Germany, and Italy. Many of the concessions as to wages and hours of labour which workmen are asking for in those countries have been granted here long ago. Conciliation as a method of settling differences has become the rule here, while it is the exception elsewhere. The mutual relations are friendly here and unfriendly there. It might therefore be difficult for employers in this country to accord sympathy and active support to employers of countries where the conditions differed greatly from those in use here. Indeed, it may well seem to employers here that it would be correct to say that British employers accord conditions of labour quite half a generation ahead of what is usually accorded on the Continent, and that it is for the latter to approximate to the British standard.

These are some of the difficulties which lie in the way of international action on the part of both employers and workmen; and attention is here called to them, not with a view of deprecating such action, but in order that the difficulties may be clearly appreciated and adequately met.

It would seem that international federation should be based on special contributions for international purposes, levied on each individual member on a common basis, so that the revenue would be contributed in equal shares by every member of the International Federation. Representation should be so democratic that every member would feel that the highest offices in the federation are open to him;





and representatives should be chosen by voting taken in every local association so as to maintain local interest in the larger body. The revenue raised for the International Federation should be sufficient to enable it to issue printed information on a wide enough scale to maintain interest in its work.

The relations with labour, with the architects, with public bodies, and with the Legislature, should be the subject of careful and continuous study by such a federation, with the object of approximating the conditions of each country to those regarded as on the whole the best for all concerned—the common good to be aimed at rather than any individual or sectional advantage.

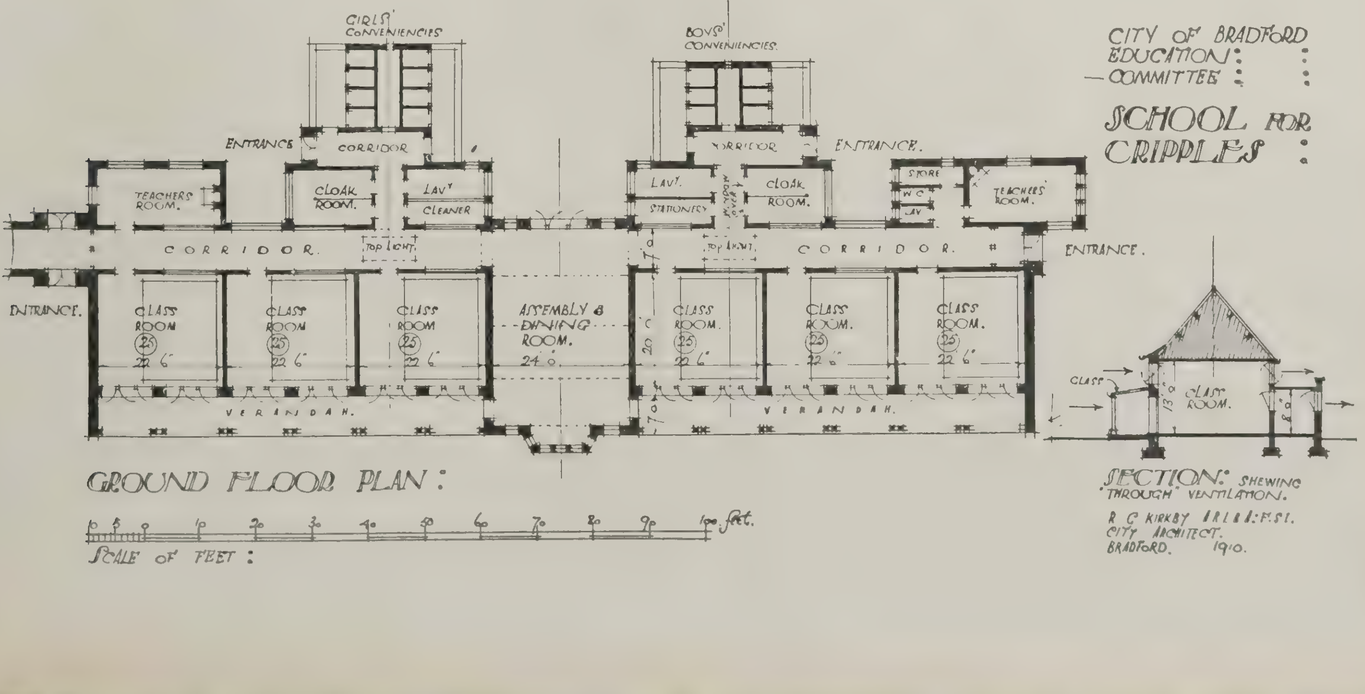
Acting on the lines of mutual fair play, equitable treatment as between employers, workmen, architects, public bodies, and the Legislature, international federations are capable of doing a humane work of great value, promoting peaceful methods, fostering mutual respect, and developing international amity, to the welfare of each and all.

THE NEW IRISH FORM OF CONTRACT.

For some time past negotiations have been proceeding between the Royal Institute of Architects of Ireland and the Dublin Builders' Association, in regard to the adoption of improved conditions of contract. These negotiations have now resulted in the issue under the sanction of the R.I.A.I., in agreement with the Dublin M.B.A., of a form of contract, based on the corresponding form issued by the R.I.B.A., in agreement with the Institute of Builders and the National Federation of Building Trades Employers, most of the clauses being identical in both forms. Passing one or two minor changes, it may be noted that the important points of difference are the following :—Clause 13 of the English form requires the surveyor to furnish a copy of his measurement and valuation of the variations to the contractor. In the Irish form he is to do the like to the employer. The importance of this change will appear when we come to clause 30.

The English form provides that when the works are practically complete, the contractor is entitled, under the certificate to be issued by the architect, to receive payment of part of the retention money. The Irish form provides that in issuing such certificate the architect shall mark it, "Works practically complete," and that the maintenance period shall run from the date of the certificate so marked.

Clause 30 of the English form provides that no certificate of the architect shall of itself be considered conclusive evidence as to the sufficiency of any work or materials to which it relates, so as to relieve the contractor of his responsibilities under the contract. The corresponding clause in the Irish form requires the architect to issue the last certificate but one, called in the document the penultimate certificate, within days after the receipt by the employer and the contractor of the surveyor's statement of extras and omissions. This provides for the prompt passing of the accounts by the employer, the contractor, and the architect, and is important in view of the great complaints as



to delays in settling accounts, to which frequent reference has been made in this journal. This certificate is to be final and binding on all parties, but if notice of arbitration is given by either party within days in respect of the said accounts, or if a notice of arbitration under clause 30 has been previously given, then the architect is to withhold his penultimate certificate until the arbitrator's award is given, and then issue it in accordance therewith.

When the maintenance period is complete (defects having, of course, been made good), the final certificate is to be issued, and to be conclusive evidence of the completion of the contract. It will be evident now why the surveyor is required by clause 13 to send a copy of the accounts to the employer as well as to the contractor, the object being to enable the former to give notice of arbitration if necessary.

The whole object and effect of the changes is to provide definite terms for fixing the completion of the contract, rendering and passing of accounts, raising and dealing with objections to the accounts, if any, and prompt payment to the contractor of the final amounts due.

These provisions may be commended to the consideration of the parties to the English form of contract as a probable remedy for grievances of which serious complaint has been made. The architects of the Royal Institute of Ireland and the Dublin Master Builders' Association are to be congratulated on the way in which they have carried out their labours.

WORKERS' VIEWS ON HOUSING.

Large numbers of workmen having assembled at Sheffield to attend the Trades Union Congress, the Workmen's National Housing and Town Planning Council took the opportunity of inviting them to a conference at the Sheffield Town Hall, over which Mr. John Wilson, M.P., presided.

Mr. Marsland (Manchester), the general secretary of the Operative Cotton Spinners, proposed a resolution calling the attention of local authorities entrusted with the administration of the Act to the pressing and immediate need for fulfilling the new duties placed upon them. Some workshops, he said, were a great deal more sanitary than some of the houses in which the workers lived.

Mr. Fred Knee (London), of the Workmen's National Housing Council, seconded.

The resolution was carried unanimously.

Mr. T. C. Horsfall, of Manchester, then moved a resolution urging all local authorities to appoint town planning committees, and to prepare town plans. The physical condition of the people, he declared, was far lower than that of other nations, partly owing to lack of light, to foul air, and the drunkenness encouraged by the condition of our towns, and partly owing to the failure of our Government to supply any physical training to take the place of that which the people of most other countries receive in the army and at school in preparation for the army. He dwelt on the necessity for good lighting, for the limitation of the number of houses per acre, and for limitation of the width of streets. It was because in Continental towns streets had been made so very wide at terrible expense, and therefore houses had had to be made high and deep enough to contain a great many tenants, and consequently had had to be solidly built, that land in all towns except those in Belgium was very much dearer than in our towns, and rents so much higher that there was serious overcrowding, not only in workmen's dwellings, but also in those of the majority of members of the middle classes. In German towns, for instance, land was from three to ten times as dear as in towns of corresponding size in this country. While there were 32,000 persons to a square kilometre in Berlin, there were only 15,000 in London. Mr. Horsfall then mentioned certain types of Berlin workmen's dwellings and courts which were of the back-to-back type and placed one tier over another to a height of five storeys. And these, he said, were the houses which a number of English working men had been admiring lately, whereas the Germans would give their ears to have our dwellings in place of theirs. But they could not help themselves, being in the hands of land speculators. "Don't," he appealed, "let us go in for monstrosities of the Berlin type." As for house inspection, he quoted the example of Essex, saying that there the inspector had come to be looked upon as a friend. The only way, he declared, of getting our houses into proper order is to make it the duty of inspectors to inspect every house.

Mr. Tom Shaw, of Sheffield, seconded. The Sheffield Corporation wanted to build cheap houses, he said, but they could not build cheap houses possessing all the advantages that Mr. Horsfall had pleaded for. They would never get the Housing and Town Planning Act put into force until they sent men to the Council who were in sympathy with housing reform. "If you put into a council a majority of men who are lawyers, financing jobbing land speculators, financing men who build these modern slums, whose only desire is to make money and not to construct good houses," declared Mr. Shaw; "if you put that class of men to administer this Act, then you might as well put the Act into the waste-paper basket."

Mr. J. Holmes, of Doncaster, in supporting the motion, declared that "The whole problem of housing lies in the question of the land."

Mr. Quibell (Scunthorpe) pleaded for more sympathy for the jerry builder. The high price paid for land, he said, compelled the builder when constructing a new house to take off £5 here and £5 there.

The resolution was carried.

COMPETITIONS.

Municipal Buildings, Karachi.

Mr. S. Wittet, a consulting architect to the Government of India, the assessor in the above competition, has awarded first place to the design of Mr. James Cummings Wynne, of 9, Woodburn Terrace, Edinburgh, who gains the first premium of £500. The design of Messrs. Groll and Treacher, London, was placed second. Mr. Wynne's design is for a stone building, three storeys in height, with domed bays at each end, the main façade extending to just over 300 feet. A clock tower, 140ft. high, rises in the centre of the elevation. The Municipality have accepted the design, which will be erected under the supervision of their engineer.

Telegraph Union Monument.

The result of the competition for a monument commemorative of the International Union of Telegraphs, to be erected at Berne, has had a disappointing result. The jury have been unable to adopt any of the designs submitted, and the premiums offered have been withheld. A fresh competition is to be held, and this will close on June 15, 1911.

Acton School Competition.

The sub-committee appointed by the local education authority to deal with this competition has had a meeting to consider the assessor's award, and to recommend which plan shall be adopted for the erection of the building. The report will be submitted to the Education Committee at a meeting to be held to-morrow, Thursday, September 22nd. The competition will then be advised as to the awards.

LIST OF COMPETITIONS OPEN.

Oct. 1. ANTWERP. SCHEME FOR LAY-OUT OF SITE OF FORTIFICATIONS, ETC.—Premiums £1,000, £400, and £200. Conditions may be seen at Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Oct. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., at a cost not to exceed £10,000. Particulars (deposit £1 1s.) of J. Parry Jones, Town Clerk, Denbigh.

Oct. 1. BRIGHTON. The Governors of the Brighton, Hove, and Sussex Grammar School invite architects who have erected grammar schools, higher grade or secondary schools, or schools of a similar character during the last fifteen years, to send their names and particulars of such buildings to A. F. Graves, Clerk to the Governors, 9, North Street, Quadrant, Brighton. A selection will be made from those who respond to this invitation, and a limited competition under motto will be instituted, with a professional adviser to assist the Governors in their ultimate choice. The number of competitors selected will probably not exceed seven, and it is the intention of the Governors to employ the author of the approved design to erect the school.

OCTOBER 31, ETC. ROMFORD GARDEN SUBURB. Competitions in six classes for architects and in one class for builders for the best cottages, etc., erected in the Town Planning and Modern House and Cottage Exhibition, Gidea Park, to be held in June and July, 1911. Prizes amounting to £1,050. Particulars of the Secretary of the Exhibition, 33, Henrietta Street, London, W.C.

NOV. 15. TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan in the parishes named. Terms and conditions obtainable from the company. Deposit, one guinea.

Nov. 29. BANGOR (COUNTY DOWN). SEA-WATER BATHS.—The U.D. Council invite experienced architects to submit plans, specifications, and estimates for the erection of hot sea-water baths, at Pickie. Further particulars can be had on application to J. Milliken, Clerk to the Council, Town Hall, Bangor, Co. Down.

DEC. 1. DUBLIN. NEW PAVILION, ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK. Open only to architects practising in Dublin. Premiums £100 (to be merged), £30, and £20. Conditions on application to the Registrar.

DEC. 1. MANCHESTER. LAYING OUT OF THE BLACKLEY ESTATE. The Manchester Corporation invite architects and others to submit competitive plans, specifications, and estimates for the laying-out of their Blackley Estate. Plans of the estate, etc., from the City Surveyor's office, Town Hall, Manchester. Deposit three guineas.

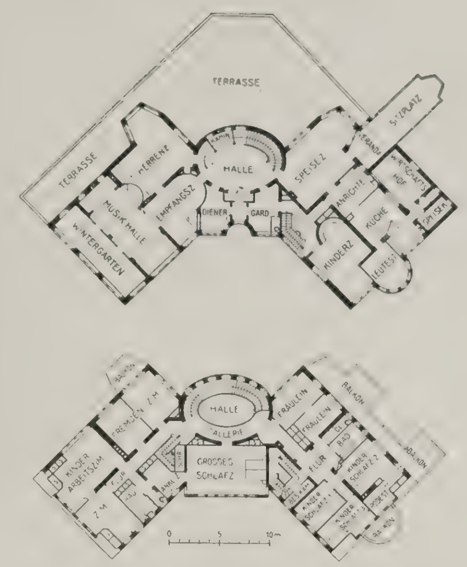
Dec. 1. BOURNEMOUTH. REBUILDING OF MR. J. E. BEALE'S PREMISES. Competitive designs are invited from architects for rebuilding the above property, for which the following premiums are offered for three selected designs:—1st £100, 2nd £50, 3rd £25. A plan of the site and particulars can be obtained from J. Elmes Beale, owner, Bournemouth, on payment of a deposit of one guinea, which will be refunded upon receipt of a bona-fide design.

MAGAZINES & REVIEWS.

The "Century" contains an appreciation of the art of Mr. W. Orpen, in the usual style of sneers at the Royal Academy and the upholding of the New English Art Club as the goal for all true artists. This kind of thing seems now to be a matter of course with all American writers who touch on the subject of English painting, and is hardly worth commenting on seriously. Reproductions of some of Whistler's early drawings when a cadet at West Point form the illustrations to a few remarks; the sketches are mostly studies of figures in uniform, and one illustration for "Pickwick"; they are not of special interest except for the fact that they are so utterly different from anything that we are now accustomed to connect with the name of Whistler. "Shakspeare and Blackfriars," by Dr. Wallace, of Nebraska University, contains some investigations into the history of the theatres of Shakspeare's day, with some curious plans and views reproduced from old engravings, including a view of the interior of the old Swan Theatre, with the covered auditorium round it, and the platform stage under the open air in the centre. Mr. Cole's wood-engraving after Corot's fine picture called "The Bathers" (from the two small figures introduced), which forms the frontispiece, is a perfect masterpiece of the wood-engraver's art.

In the "Antiquary," Mr. Coltman Clephan commences a series of articles on the keramic and plastic arts of the ancient Greeks, illustrated from objects in the author's collection. This promises to be a valuable essay on the subject.

The "Berliner-Architekturwelt" is occupied with the illustration of some dwelling-houses by Herr Muthesius, one of which, the "Haus Freudenberg," is worth attention, both for its unusual plan and the treatment and decoration of the interiors, of which numerous photographs are given. Externally, the house has too much of the contrived picturesque—a kind of rural cottage on a large scale, with an immense expanse of high roof, but much of the interior work is very good.



"HAUS 'FREUDENBERG," [NIKOLASSEE, BERLIN. HERR MUTHESIUS. ARCHITECT.

(From the "Berliner Architekturwelt.")

The "Fortnightly Review" has what is, on the whole, a very laudatory article on the Garden City at Letchworth, the only unfavourable criticism being just where we should have put it, viz., on the style and planning of the smaller houses. It is admitted that these have "a pleasing, old-world appearance," which seems to be regarded as praise, though why houses for occupation to-day should be the better for having an old-world appearance is not very obvious. But the writer has common sense enough to see that the rooms in these houses are often of eccentric shapes, their windows too small (that, of course, is part of the "old-world appearance"), and the stairs and landings "inconvenient and oddly shaped." It was, says the author (Mr. W. C. Bremner), a mistake to provide such houses for the working classes; the condition of the workers should be studied. "Their furniture is usually large and unwieldy, probably because bought cheap"; and "the squarer the room the better will be the results for general comfort and order." It is pointed out that the landings and the bedrooms were very small, and the rooms nearly filled up with very large beds, and the ceilings usually low—eight to eight-and-a-half feet. All this, though Mr. Bremner does not seem to see it, is the result of the struggle to gain the praise of providing cottages at a cheap rate; an influence which also brought about the flimsy construction of many of these cottages, another point which the author does not seem to see. But he evidently does recognise that a struggle after what is supposed to be the picturesque in small cottages does not lead to the most convenient planning or the best building; and to find a writer in a general magazine admitting that, is something gained.

An article in "Munsey's Magazine" on "The Passing of the Chestnut Tree" gives particulars of the timber disaster in the United States, through the wholesale destruction of the chestnut trees from the ravages of a fungoid bacillus. The plague started in New England States, and is spreading all over the Continent, and no cure has yet been found, although many thousands of dollars have been expended on remedies. It is feared that the bacillus after destroying the chestnuts may acclimatise itself to some other variety of timber, and thus work world-wide destruction.

"HAUS FREUDENBERG" NIKOLASSEE, BERLIN: GENERAL VIEW. HERR MUTHESIUS. ARCHITECT.

(From the "Berliner Architekturwelt.")

THE HOUSES OF THE PICTS.

Mr. Alex Sutherland, in a paper read at the Sheffield meeting of the Bristol Association, describing the excavation of the Broch of Cogle at Watten, Caithness, said Dr. Anstruther Davidson of Los Angeles, in August, 1905, resolved to test the possibility of this Cogle mound containing anything of a bygone age. It stood about 6ft. high and 60 yards in diameter. He made a trial cut through the middle, and from this was satisfied there was here another of those prehistoric buildings called Brochs or Picts' houses, of which Mousa, in Bressay, Shetland, might be regarded as the best preserved specimen. After excavation it was found that the only entance, about 2ft. wide, to the Cogle broch was on the west. At the Scottack, and other excavated Caithness brochs, the entrance was on the east. The thickness of the walls was 15ft., and the circle enclosed had a diameter of 30ft. There were two upright flagstones 2ft. high and 2ft. apart. The average height of the walls remaining *in situ* would be about 3ft. Probably 60ft. or 70ft. had fallen and helped to form the mound. Vegetation had grown and decayed and buried the stupendous structure for ages. Who were the broch builders, and when did they live? are interesting questions. Dr. Davidson identified five successive layers of ashes and pavement, and the charred remains of wood indicated the fuel. The most important of the neolithic remains were the stone pestles found in the lowest *stratum* of ashes. These, over 20, were in only a few instances pestle shaped. They were made of hard-grained, basaltic-like stone, and were originally of oval or oblong shape. By constant use in pounding the edges were levelled, and a few of them were quite circular and bevelled all round. Two stones with shallow mortars were found, and also some saddle querns with the usual manu or hand-grinding stone. Numerous stone pebbles, probably used for sling stones, were found. Almost all the bones were broken to extract the marrow. None showed evidence of fire, and the condition of the bones would show that they were very imperfectly cooked. Parts of tusks of boar, goat, horse, and ox could be identified, and also bat, with probably great auk. These had been sent to Professor Bryce, Glasgow University, for further investigation.

NEWS IN BRIEF.

Broome Park, near Canterbury, of which it is stated that Lord Kitchener contemplates taking possession, stands in a nobly timbered park of 400 acres. The foundations were laid in April, 1635, and "it was up by the middle of November following, but although the maine house was builded, reared, and tiled by the time aforesaid, yet the inwork such as sealing and boarding was not done till the end of the year 1636, and it was September following in the year 1637 before the joiners had made any great progress in wainscotting the rooms, and it was St. Mich. 1638 before they and the painters had finished the work and made the house ready for Sir Basil Dixwell to come into it." The house was given over in 1778 to James Wyatt, the architect, for enlargement and improvements, which latter are questionable. There are many beautiful pictures in the fine house.

M. Ernest Gérard, the architect of the new Palace of French Arts and Industries on the vacant site in the Strand, is now in London completing his arrangements for commencing the work, and will spend a large portion of the next two years in superintending the creation of his scheme. The erection of the buildings will be pushed on rapidly, and arrangements are being made for the official opening early in 1913.

* * *

The statue of Lord Kelvin which is to be erected in Belfast, his birthplace, is being executed by Mr. Albert Bruce-Joy, and is far advanced towards completion. The figure stands ten feet high, and the sculptor has represented Lord Kelvin in the prime of life and intellectual power. He holds in his right hand a design of a gyroscope he invented, and by the side of the effigy is a model of the Kelvin compass. The statue is to be cast in bronze, and will be placed on a pedestal twelve or thirteen feet high. Mr. Bruce-Joy has completed the bust of King Edward in bronze for the Chelsea Hospital, which will be unveiled shortly.

* * *

In a paper read before the British Association last week, Mr. George Clinch suggested the establishment of regular and systematic oversight of great engineering works which involve excavation and removal of the soil. The value of the spade in archæological investigations, he said, was never more appreciated than it is today; yet, in spite of activity in various directions, many fields of research remained entirely unoccupied or only partly worked. Whilst Roman sites were being explored in considerable numbers in England, Wales, and Scotland, the remains of pre-Roman times were with one or two exceptions, comparatively neglected. It was remarkable, he thought, that so little attention was given to the sites of prehistoric huts and other dwellings. A hint of what might be expected by further excavation of these sites was afforded by the recent accidental discovery of gold torcs of the Bronze Age under the floors of ancient hut dwellings at Bexley, Kent. The wholesale destruction of antiquities now going on as a result of coast-erosion, railway and other great engineering works was a most serious matter. There was pressing need for supervision of all these great works, in order that the antiquities might be rescued and the circumstances of their discovery placed on permanent record. He advocated the immediate establishment, as far as possible, of a regular system of thorough oversight wherever and whenever excavations were being made in the soil; and he suggested that the matter be brought to the notice of the Government in order to enlist its sympathy and support.

The granite obelisk which has been erected in Forfar Parish Churchyard by public subscription to perpetuate the memory of George Don, the well-known Scottish botanist, has been unveiled by Mr. George Claridge Druce, M.A., F.L.S., J.P., Oxford.

* * *

A sculptored bust of an early bishop has been discovered in the heart of the Cheviots. It is beautifully cut in Sicilian marble, which has been rendered almost chalk by age, and the finder, Mr. John Wood, Spittal, suggests that it may represent Paulinus, the great apostle of Christianity to Northumbria.

* * *

A message from New York states that Mr. Oscar Hammerstein has announced his intention to begin and complete within a year the erection of an opera house seating 3,000 on a site in Kingsway, on which he has secured an option from the London County Council. Mr. Hammerstein will leave this month to supervise the erection of the building. The exact situation of the site in Kingsway is not yet made public.

* * *

The Mayor of Southampton presided over a recent meeting of the committee formed to erect a memorial on the spot whence the Mayflower sailed for America in 1620. Special interest in the memorial was shown in communications to Professor Hearnshaw, LL.D. (the hon. secretary), from the descendants of the Pilgrim Fathers on both sides of the Atlantic. The Winslow family wish to erect a special panel in memory of their ancestor. Mr. George W. Alden sent particulars of a gathering of 800 descendants of John Alden, of Southampton, who appears in Longfellow's "The Courtship of Miles Standish." It is hoped that a memorial will be erected next year.

* * *

An accident recently occurred in the excavation work for the sewage pumping station at Southend. When completed, the station will consist of a chamber 100ft. square sunk into the ground to a depth of nearly 60ft., and enclosed by concrete walls 5½ft. in thickness. A trial bore, originally made on the site by the Corporation, revealed a bed of wet sand at a depth of 35ft. from the surface. When excavating for the concrete walls, the contractors found this bed of sand to be 17ft. thick at one side, and extra precautions in the way of timber shoring were adopted. Unfortunately, severe rainstorms flooded the workings, and the sand began to run, causing the sinking of the central mass of earth and the collapse of the timbering. The accident happened on a Sunday, otherwise loss of life would probably have resulted. The pumping station includes a pump well 80ft. deep, with screening chamber, and in addition the contract comprises the laying of the main sewer and effluent outfall for a distance of nearly 1,300ft., and at a depth of 75ft. from the surface. The necessary tunnel, 9ft. by 6ft., was driven simultaneously at each end, the shafts having a double timber lining with puddled clay between the linings. The tunnel is driven through clay and supported by roof props and cross timbers, and the main sewer, 33in. in diameter, occupies the bottom of the tunnel and is flat topped to take the main outfall 39in. in diameter. Both pipes are built of silicated concrete, and the sewer has a fall of 1 in 1,400 towards the pumping station, whilst the outfall is level.

Mr. Horace Farquharson, F.R.I.B.A., architect, has removed from 41, Montpelier Square, Knightsbridge, S.W., to 14, North Audley Street, Grosvenor Square, W. Telephone, 6043 Gerrard.

* * *

The Mayor of Lincoln laid last Wednesday the commemoration stone at the pumping station at Elkesley, Notts., in connection with the provision of a new water supply for the city.

* * *

The death is announced of Professor William Harmon Niles, a well-known American geologist, at the age of seventy-two. Professor Niles had been Professor and Head of the Geological Department of Wellesley College since 1888, and Professor of Geology and Geography in the Massachusetts Institute of Technology from 1871 to 1902. He was a member of a number of scientific societies in the United States of America.

* * *

A new church is to be provided for the parish of Sulhamstead-Banister, Berkshire, under exceptionally interesting circumstances. Sulhamstead House, long the residence of the Thoyts family, is about to pass into the occupation of a fresh owner, and the former have decided that the time has come for them to carry out a long-cherished desire, for which they have laid aside certain sums of money during the last forty years, and to build a church to replace the existing one, dedicated to St. Michael. It will be the gift of Colonel Thoyts and his brothers to the parish, and is intended as a memorial to their father, who was really the originator of the scheme.

* * *

Plans have been submitted to Sculcoates Rural Council for a garden village in the Anlaby Road, near the Hull Golf course. Colonel Wellsted, the surveyor, said the site was known as Locky's estate, and the promoters were the City Land Syndicate. It was, he said, a gigantic affair. The proposed sanitary arrangements, however, did not meet the board's approval. It was decided to refer them back.

* * *

Referring to the note on the reparation of the roof of Glasgow Cathedral in our issue for Sept. 7, Mr. P. Macgregor Chalmers, I.A., writes to say that the work is not under his superintendence, but under that of Mr. W. T. Oldrieve, architect to the Office of Works for Scotland

* * *

The Institute of American Architects has decided to offer yearly two medals and four honourable mentions for the best façades for apartment houses built year by year in the Manhattan and Bronx districts. The jury, which is to consist of nine members, will, in making their awards, take into special consideration simplicity of character, happy proportions, the artistic employment of inexpensive materials, suitability of style to site, and convenient disposition of safety staircases, water supply tanks, etc.

* * *

In Archer Street, a narrow thoroughfare in Soho, there still stands, within a stone's throw of Piccadilly, an old farmhouse. Many a year has passed since the cattle lowed outside its windows, but it once faced a fair prospect of meadow land, and no doubt did a thriving dairy business. Here were lands granted to Henry Jermyn in 1672, known as Kemp's Field, Bunche's

Close, and Coleman Hedge Field, the whole being Soho Fields. But the house must have been old then for Archer Street, which it faces to-day, was already built. This old building is probably coming down very shortly. It is not generally suspected that there are in London eighteen other farmhouses, and that they are still in business. Of course they are not within a stone's throw of Piccadilly Circus, as is the doyen in Archer Street. These eighteen have a total annual value of £728, and are widely distributed over the metropolitan area. Two are in Greenwich, five in Lewisham, nine in Woolwich, one so near as Hammersmith, and one in Wimbledon. Incidentally 266 acres of London are under corn and 170 grow fruit.

* * *

The Schiff Home of Recovery, Cobham, is being supplied with Shorland's patent Manchester grates by Messrs. E. H. Shorland and Brother, Ltd., of Failsworth, Manchester.

* * *

With the completion of the tour just ended, the Garden Cities and Town Planning Association has during the past twelve months been responsible for bringing to this country parties of Continental housing reformers numbering about 350 people. The greater part of these have come from Germany. A large proportion of the visitors have been architects, most of them occupying official positions under their towns or Governments. Almost every housing scheme of importance in the country has been inspected with the greatest thoroughness. The testimony of the visitors has been uniformly that in the matter of housing they have everything to learn from the English system of cottage-building, while their admiration for the Garden City principle knew no bounds. The nationalities represented in the last parties included Germans, Austrians, Italians, Hungarians, Poles, Russians, Swiss, and others, and a party of Poles is being organised for a tour next year. The Association has also arranged for a visit of members to some of the chief Continental cities at Easter next year.

* * *

At a meeting of the Brighton Town Council, Alderman James Colbourne, chairman of the Finance Committee, stated that houses were letting most satisfactorily. It is stated that during the last six years Lord Rendel has invested £250,000 in property in Kemp Town, and that of the houses which he has modernised nearly all are occupied.

* * *

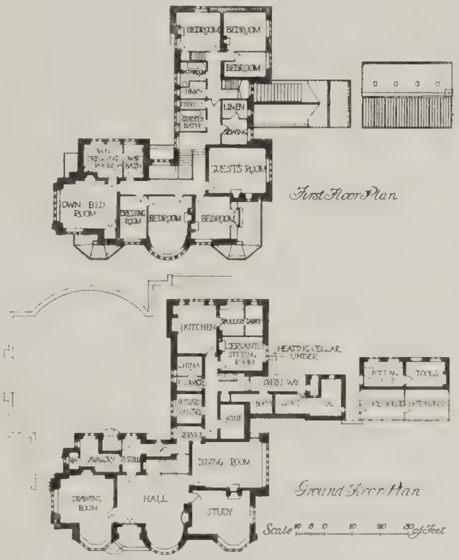
The House of Lords is in the hands of the decorators and builders. The solid brass outer doors of the House of Lords have been refurbished. The crowns surmounting the two figures over the gates will also be regilded; while in the vestibule new gilding will be laid on the delicate traceries. Several important structural alterations are being made with a view to the extension and improvement of the accommodation in the Upper House. Seating accommodation for secretaries and Ministers in charge of Bills, for instance, is being provided in a corner near the benches occupied by the Bishops, and on the right of the throne. Increased facilities are also being provided in the catering department, and the kitchen is being modernised and greatly enlarged. The sanitation is being thoroughly overhauled and modernised.

* * *

On and after September 24th the offices of the Institute of Builders, of the Builders' Benevolent Institution, and of the National Federation of Building Trade Employers of Great Britain and Ireland will be moved from Bedford Street, Strand, to Koh-i-noor House, Kingsway, London, W.C. On Wednesday, October 5th, at 4 p.m., 1910, Mr. Moritz Kahn will read a paper before the Institute of Builders on "American Methods as applied to Reinforced Concrete Contracting."

CRAGWOOD, WINDERMERE.

Cragwood is built on what is perhaps the finest site on the shores of Windermere, a peninsula jutting out boldly from the easterly side of the lake about two miles from the Ambleside end. It is built of local stone quarried on the site, and roofed with local green slate. The stone for dressings was obtained from the Cullingford quarry (Yorks.). Internally, the house has American oak floors in the principal rooms, and the hall panelling and staircase are of Austrian oak. Specially modelled ceilings have been fixed in the hall and drawing room. The general contractor was Mr. A. Jackson, Ambleside; plasterwork, Mr. Hindshaw, Manchester; carving, Messrs. Earp, Hobbs and Miller; heating, Messrs. G. N. Haden and Sons; leadlights and casements, Messrs. Humphries, Jackson, and Ambler, Manchester; sanitary goods, Messrs. S. Gratrix, Jun., and Bro.



"CRAGWOOD," WINDERMERE.
F. B. DUNKERLEY, F.R.I.B.A., ARCHITECT.

Mr. W. L. Mason, F.R.I.B.A., acted as superintending architect throughout the progress of the works.

CORRESPONDENCE.

The Town Planning Conference and Municipal and District Councils.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Much of the actual work of preparing the Town-Planning Scheme provided for under the new Act, will fall within the scope, not of the great Corporations, but of the Borough and Urban District Councils. It is, therefore, of the first importance that these authorities should avail themselves of the singular advantages offered by the Conference, which will be held in London from 10-15 October, for the study not only of the history of the subject, but also of the examples which will be presented of the architectural methods adopted in other countries as well as in our own.

The Local Government Board will, I am informed, be prepared to sanction such reasonable expenditure out of the rates subject to Government audit, as may be entailed by the attendance of representatives at this Conference, provided that not more than three members of an authority attend officially, one of whom should be the architect or surveyor.

The Royal Institute of British Architects has not hesitated to incur very heavy expenditure in the fulfilment of what it considers to be a public duty, by organising the Conference and bringing together the great collection of drawings and models which will be exhibited at the Royal Academy. It must necessarily be very long before the circumstances can recur which have rendered it possible to make the present arrangements, and the Royal Institute asks that all those who are responsible for the administration of the Town Planning Act of 1909 will support it in the effort which it is making for the public good, and send their applications for membership of the Conference to me without delay.

JOHN W. SIMPSON, F.R.I.B.A.,
Secretary-General,
The Royal Institute of British Architects' Town Planning Conference.

Lighting of London.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL

SIR,—A most misleading impression has recently been created by certain paragraphs appearing in the Press under the above heading. The impression given was that London, instead of continuing an electrically lighted city, as at present, was about to revert to gas. I need hardly say that nothing is further from the truth. The case, however, presents an interesting example of how easily an erroneous impression can be set afloat. The facts are as follows:—

One of the 29 London authorities, influenced by conditions which were purely local, decided to alter a few of their numerous electric lamps to gas lighting. The number of the lamps involved is quite small compared with the total number of lamps in the borough in question, and is altogether negligible in comparison with the total electric lighting of London. The whole case, in fact, is simply a local matter, confined to one authority only, and is quite undeserving of this wide publicity, were it not for these incorrect rumours which have given rise to so much misunderstanding.

For corroboration of the facts, reference need only be made to the official statistics of the London County Council, where it will be seen that the use of electric street lighting has more than doubled in half a dozen years, and that only 10 out of the 29 London authorities are wholly without electric street lighting.

As to the relative cost of electricity versus gas for street lighting, I need only mention that in St. Marylebone the saving effected last year was £1,500 in respect of a portion of their area only, and that this has encouraged them to convert the whole of the remaining gas lamps to electric light, which will bring the saving up to £2,600 per annum.

Further, the Boroughs of Hampstead and Shoreditch already extensively electrically lighted, are extending electric lamps practically throughout the whole of their areas.

H. B. RENWICK,
Chairman of the Electric Supply Publicity Committee.

THE ROYAL SANITARY CONGRESS.

UNCONTROLLED BUILDING.

In the course of his presidential address to the section devoted to sanitary science and preventive medicine, Professor E. W. Hope (Medical Officer of Health of the City of Liverpool) said it was only within comparatively recent years that the appreciation of the evils wrought by insanitary dwellings had been forcible enough to sweep away the vested interests in their maintenance, or to remove the apathy and indifference of those who suffered directly or indirectly from them, and even now there were many educated people who altogether failed to grasp the extent of the mischief they had wrought, or the necessity for wholesome dwellings for the people. Legislation initiated say about the middle of the last century, framed with a view to ameliorate the condition of the dwellings of the labouring classes, was cumbersome, costly, and difficult of application. The Housing and Town Planning Act, young as it was, had already borne valuable fruit in many parts of the country, and there are already conspicuous examples of cities which had been encouraged by it to go forward with greater energy in ensuring that the growth of the cities shall be properly controlled, and that they should be wholesome and pleasant to live in. But it was not only the suburb whose growth required to be directed, but the central parts of cities needed attention even still more. It must be recollected that whole populations could not altogether be displaced from one part of the city to another, some at least must be rehoused practically upon the original spots after reconstruction had taken place, and this was an exceedingly difficult and very costly process, and the value of legislation which was designed to lessen the difficulties of this task was immense. The Liverpool Corporation (Streets and Buildings) Act, 1908, had also rendered extremely valuable local service on these lines. One interesting fact, and a fact which might be recorded as the practical outcome of education in this particular direction, was the willingness evinced by many great landowners to meet their neighbouring municipalities in a liberal spirit and to co-operate in the formation of wide roads, good thoroughfares, and so forth on extremely liberal terms. The enlightened policy of the Marquis of Salisbury and other landowners might be cited as an illustration of this.

ILLUMINATION

Mr. John Darch contributed a paper on practical illumination, in which he said that the necessity for establishing rational modes of lighting had for years been strongly impressed by advanced thinkers, but it was only in 1908 that a combined effort was made in England, in which ophthalmologists, physicists, architects, and engineers joined hands to further this desirable object. The author proceeded to show that the principles governing the practice of lighting should be in strict conformity with the hygienic requirements of the eye. He suggested (1) the lamps or other sources of light should be so arranged that they are not visible from the more frequented or ordinary points of view; (2) the illumination should be sufficient to cause the objects to appeal at once to the eye, but should be free from glare; (3) for general illumination the light should have a preponderating downward direction, freely flooding ceilings and walls, uniformly distributed and fully diffused; (4) special work at desks, benches, etc., should have special lighting, adjustable in position and power, with opaque shades; (5) the colour of the light should be as pure and white as possible. Monochromatic light should, as a rule, be avoided. The stages of theatres were about the only places that were always well illuminated; the scenery and the lighting were each the complement of the other, with the most natural and agreeable results. If architecture had any power to charm, that power could only take effect when it was subjected to suitable lighting. It was curious that this truism was so completely overlooked, as one might see in any public building, sacred or secular. The architects of ancient Rome well knew that it was upon the lights and shadows that their superb art depended. With regard to the disputed question of direct v. indirect lighting: always prefer direct lighting in so far as it would accord with the rules he had laid down. Indirect lighting should only be used where specially suitable or inevitable; and for the rest, an arrangement of limited obscuration of lights which combined the advantages of the other two. The lighting of the average church had perhaps more than any other class of building transgressed the most elementary principles of good lighting. To see anything at all, the worshippers had to peer through a forest of low placed lights, or, at least, to enduce the glare of a couple of pulpit lights; and yet in many of the leading churches there was not enough light to read by. One would suppose that the beautiful decorations of a church were placed there to be seen, but in nearly every case, at least at night, the upper two-thirds are lost in gloom, and the lower third consisted of a few dazzling points of light that obscured all behind them. A chancel might be effectively lit by means of lights behind the chancel arch or other projections: one might instance the fine effect thus produced in the Guards' Chapel, St. James's Park. Such lighting was restful and soothing, and much more conducive to worship than the mystic gloom (always accompanied by the irritating points of light) which several architects had recently defended on religious grounds.

MOISTURE ON INTERNAL WALLS.

Before the Architectural and Engineering Section, Mr. H. D. Searles-Wood, F.R.I.B.A., described the Knapen process for the drying of buildings. He pointed out that the dampness encountered ordinarily in a building was due to the building materials originally employed; to capillary action; to humidity of condensation; to humidity due to infiltration. The different ways hitherto adopted to overcome humidity had only resulted in keeping the damp inside the walls. Thus waterproof cratings, bituminous slabs, bitume paint, covering materials, layers of metals, etc., were used to preserve the interior of the walls from external injurious influences. The systems adopted so far, however, could only mitigate for a time the damage which dampness might occasion in the building. Mr Knapen based his system on the difference existing between the mean hygrometric state of the atmosphere surrounding the building and the hygrometric degree of the materials used in the building. To utilise the hygrometric difference between the interior walls and the external air, the mass of the walls to half of their thickness was put into permanent communication with the external surfaces and the surrounding air by providing a series of small inclined apertures. As materials and circumstances differed, every application had to be treated according to its own special conditions, and so as to the dimensions, number, and the inclination of the apertures. The system allowed of the introduction of a quantity of air to the internal parts of the materials, such air entering the apparatus at the temperature and at the mean hygrometric state of the exterior. Therefore, when coming to the new medium the quantity of air tended to modify its dampness by becoming saturated with the excess of humidity, and it became cooler or warmer according to the seasons and the kind of materials. The quantity of air which had filled the apparatus after being conveyed through the apparatus to the interior of the damp wall would have its density modified by contact, and the equilibrium was then broken, and the air compelled to move and to leave the apparatus. As the syphons were placed with a calculated angle of inclination, the circulation of the air would be automatically and permanently maintained until there would be no hygrometric difference between the exterior of a wall and the materials inside of it.

Mr. Cooper (Wimbledon) said there could be no doubt as to the desirability of getting the walls of a building as dry as possible. The great trouble which the Council of the Royal Sanitary Institute had had was to get statistics of condensation on walls constructed of different materials, and it was a great pity that public authorities having control of public buildings did not take records on such an important point. It would be comparatively easy for some of these authorities who had buildings faced with different plasters and paint and enamels to make some investigations even if it were only to note the days on which there was condensation on the walls. There was a form of construction used in Cumberland and Westmorland which seemed to be for the purpose of reducing moisture in the walls, which perhaps someone from those districts might describe.

Mr. Munce, M.I.C.E. (Belfast), considered that a great deal depended on the ventilation of the houses, whether they were damp or not. He did not think the system described would be any good in this country. In Ireland they had tried battening the walls inside, which made a very comfortable warm house.

Mr. A. J. Price (Lythen) agreed with the last speaker as to dampness being largely caused by want of ventilation. In his district they had nothing but hollow walls. If they put glazed or hard vitrified bricks on the inner part of a building they would get condensation, but if they used a soft brick there was no condensation.

Mr. E. T. Hall, F.R.I.B.A., said the Knapen system was creating a good deal of interest on the Continent. The scientific argument was exceedingly sound, but the difficulties of applying the system to brick construction were greater than in the case of a wall of rubble stone. The hollow wall was a good system of construction, and gave satisfactory results, for moisture driven through the outer screen travelled down the cavity to the proper drains provided. It had been said that if they opened the windows they would get satisfactory results, but that was doubtful. In the case of a sanatorium, for instance, where every window was always open, they found water condensing on the walls for the simple reason that the temperature of the room was the same as the temperature of the outer air, and if they had a cold night, followed by a change which produced a moist atmosphere, the walls were at once affected. As architects, they liked to have hard bricks for their walls because they were great weight carriers, but where it was possible he did not know but what softer bricks were better, for they absorbed the moisture. He had recently been called in to examine a public building where all the ceilings were painted, and they had been troubled with very considerable condensation on them. Under his advice they were removing the paint and substituting distemper. He strongly deprecated the battening of walls, which simply meant hiding the moisture, and was a most insanitary thing, and a very fruitful source of dry rot. Dry rot was greatly on the increase, and the Agricultural Department of the Government had recently issued a circular drawing attention to its prevalence, and stating that it was sometimes imported in the midst of what looked like a quite sound lot of timber. It was not discovered until the house was built, and some circumstance in the house caused it to disclose itself. He was engaged at the present time in a case where a teak staircase had been so affected as to be reduced to powder. He hoped, therefore, no one would suggest battening walls to keep away damp.

Mr. Max Clarke, F.R.I.B.A., said he had been struck with the fact that in Westmorland all the walls seemed to be built with the courses of stone sloping from the inside to the outside. He thought that a considerable amount of the condensation of moisture in the inside of buildings nowadays was due to the hardness of the plaster used. Owing to the strikes of plasterers and the difficulty of getting ordinary plastering done, some architects had very largely adopted hard plastering, and the result was condensation due to the changes in the atmosphere. A few months ago he examined a number of houses in St. Albans, and found that in every house where hard plaster was used there was condensation, whilst where ordinary plaster was used this did not occur. It did not seem to him that the Knapen system would be a very sanitary one, as the tubes would get stopped up with dust and so on. On board ship the difficulty was got over by covering the paint with powdered cork.

Mr. Searles-Wood said the system had been applied to brick buildings, but he had not seen them. It was also applied to telegraph poles, and it was stated that their life thereby had been increased by 50 per cent.

THREE PAPERS ON SCHOOL BUILDING.

Three papers were then read on school planning and building by Mr. W. H. Webb, Lic.R.I.B.A. (Wimbledon Borough Council), Mr. R. G. Kirkby, A.R.I.B.A., F.S.I. (late City Architect, Bradford), and Mr. Edward Willis, Assoc.M.Inst.C.E., F.S.I. (Engineer and Surveyor, Chiswick U.D. Council). That by Mr. Kirkby was concerned with open-air schools, the points of which are given in the illustrated article on page 295. Extracts from the papers by Mr. Webb and Mr. Willis follow this, together with the discussion on all three papers.

Large Public Elementary Schools in Town Districts, by William H. Webb, Lic.R.I.B.A.

Speaking generally, the principal differences between English public elementary schools and those of America and the various northern European countries are these: (1) the ground floors for the infants' departments in this country are usually placed at or about the general ground level of the site, whereas those in the countries mentioned are invariably situated at various heights above the adjoining ground level, with a lower ground floor below variously utilised for heating chambers, manual training rooms, play rooms, gymnasia, douche baths, cloak rooms, conveniences, storage apartments, and other purposes; (2) the difference in shape of classrooms, and (3) more ample spacing in classrooms (except in the case of some German schools) than is considered necessary in English schools.

Accommodation.

Some of the more advanced education authorities, in addition to well-planned classrooms, generally require provision or accommodation for some of the following:—(1) Medical inspection and waiting room; (2) douche or spray baths and dressing room; (3) manual training room for boys; (4) workroom for girls for the cutting out of garments, etc.; (5) cookery and domestic economy room for girls; (6) room of sufficient size for the instruction by the ordinary teachers in educational handwork, supplemental to manual training, for the continuous and progressive instruction of both boys and girls between the ages of 7 and 11; (7) art and music rooms; and (8) suitable plots in the school playground for the cultivation of specimens for nature study.

Classrooms.

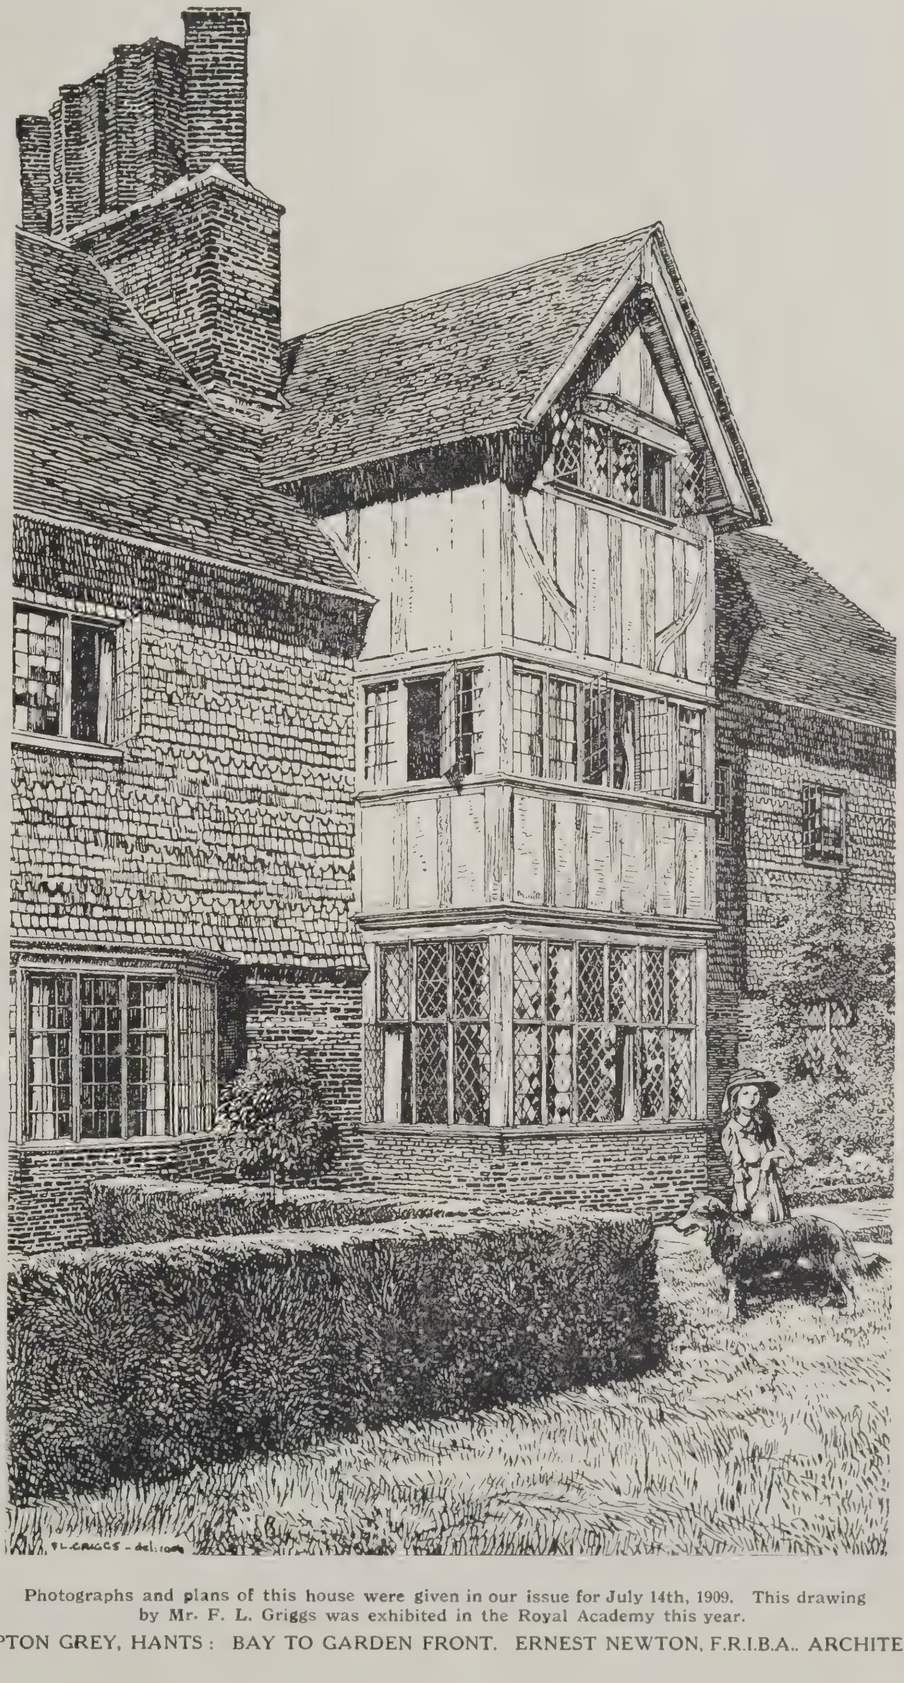
The Board of Education circular No. 709, par. 6, states that the present maximum number of 60 scholars per room will be subject to further reduction in future codes. For economical planning, therefore, 50 should be taken as a maximum, with grades of classrooms for numbers ranging from 30 to 50.

In English schools, classrooms generally, in the case of rows of dual desks five in depth, are in shape approximately square, and in the case of rows four in depth, the narrower side is placed to the external or window wall. This arrangement may be attributed to two reasons: (1) the grouping of as many rooms as possible around the three sides of the central or assembly hall for purposes of supervision; and (2) to a supposed economy in cost of construction. The more general use of the 40, or even less number, classroom in this type of school will thus render the questions of lighting and ventilation more difficult of satisfactory solution than before. In this respect the shape of the English classroom differs from that of the classroom in other countries.

The longer rectangular shape of classroom is due to a far wider study of hygienic conditions and advantages than the subject has hitherto received in this country. The important gains are: (1) increased direct lighting, (2) increased natural ventilation by external windows, and (3) the nearer proximity of the further or corridor side of the room to the direct rays of the sun.

Of mechanical ventilation the "Plenum" system imported from America is perhaps the best known, but the climatic differences between the two countries do not warrant a system so costly in installation and maintenance being adopted in English schools. The method of natural ventilation by external windows, fireplaces, and extract flues is apparently the best for school purposes. Windows fitted with properly designed hoppers, centre swing or double hung sashes and opening casements would amply provide the required quantity of fresh air if properly controlled, and no system of ventilation would be successful without the control and co-operation of the teacher. To facilitate the adjustment of windows the most simply controlled gearing is preferable to cords.

Dr. Cohn, of Breslau, as the result of his researches made in 1866, states that in class-



Photographs and plans of this house were given in our issue for July 14th, 1909. This drawing by Mr. F. L. Griggs was exhibited in the Royal Academy this year.

UPTON GREY, HANTS: BAY TO GARDEN FRONT. ERNEST NEWTON, F.R.I.B.A., ARCHITECT

Table of comparison showing the regulations or allowances in force or customary in the countries mentioned as regards accommodation, sizes, proportions, and other particulars in Public Elementary Schools (accompanying Mr. Webb's paper).

rooms lighted under the best conditions 1.8 per cent. of myopia was discovered as against 15 per cent. in badly or inefficiently lighted rooms. The almost general unilateral left hand and supplementary indirect right hand lighting in classrooms in this country, and the quantity of direct window light area per scholar usually provided, leaves little to be desired in this respect. The introduction of cross ventilation by bilateral windows for direct lighting, as mentioned in the case of the Derbyshire and Staffordshire schools, however, produces another evil, in that one side of an object is more strongly lighted than the other according to the relative distances at which it is placed from the opposite windows, with the result that the shadows are more or less accentuated, and the appearance of the object may be constantly changing.

The usual method of constructing the cloak-rooms between mezzanine floors is one that cannot be too strongly condemned, and it can only be on the grounds of economy in the primary cost of construction that such planning can be defended.

These rooms should be well lighted and ventilated on one or more sides, and so constructed as to secure the benefits of as much sunlight as the circumstances of the site will allow. They should also be efficiently heated for the drying of clothing and boots.

Statistics of children examined in Bradford in 1906 and 1908 show a large proportion described as "somewhat dirty, dirty, or very dirty." In Sheffield of 4,140 children examined in 1908, 36 per cent. had verminous heads, and 12 per cent. dirty bodies, and in London, of 92,185 children examined in 1908, 18 per cent. had verminous heads, and of another 23,849, 23 per cent. were so described.

It is not to be wondered at that parents, being aware of these facts, do not care to send their children to such schools, and endeavour by any means to send them to "private schools," and in the interests of these children, who would otherwise attend the public elementary schools, improvement in cloak-room accommodation is eminently desirable.

The cloak-room spaces in American schools are mostly situated in the corridors adjacent to the classrooms, and in close proximity to the ventilating and heating shafts. In many instances they are placed between the classrooms, and are accessible from the classrooms as well as from the corridors; and not infrequently portions of a sub-ground floor are utilised for the purpose. In all cases separate cloak-rooms are provided for each classroom.

In French schools cloak-rooms are accommodated in covered playgrounds, corridors, and sometimes between the classrooms, as in America. In Germany, Switzerland, and other countries the corridors sometimes serve as hanging places for garments; but in some of the larger and better schools an arrangement similar to the English cloak-room is adopted, with the exception that the cloak-rooms are in the nature of recesses formed in the corridor, and with open wire partitions separating them from the corridors.

Teachers' rooms required by the Board of Education both for head teachers and assistant teachers are generally planned as mezzanine floors between the cloak or other rooms on the main floors. Economy in the first cost of building is no doubt the reason for this objectionable method. The rooms are usually insufficiently lighted, low in height, and are most depressing apartments to occupy. It will be found on examination that these rooms, more especially those between the ground and first, and between the second and top floors, are not in compliance with the requirements of the London Building Act, or the Local Government Board's Model By-laws as to habitable rooms and windows.

In England the Board of Education require that the water closets and urinals for scholars should be placed outside the school buildings. In France, also, this system exists, as well as that of placing them adjacent to or inside the building. In America, Germany, and other European countries, they are invariably designed as an integral part of the school building, but with this difference, that in America they are mostly found in the sub-ground or ground floors. A frequent plan in modern German schools is to arrange them alongside detached assembly halls or gymnasia (on the ground floor only) approached by short covered ways. Those in other European countries are more frequently arranged off the corridors, staircases, etc., and adjacent to the classrooms of the floors they are intended to serve.

There are many advantages in the last method of placing the conveniences, amongst which may be noted (1) the supervision necessary for their perfect sanitary condition is more easily effected by the head teacher and staff; (2) the fittings and appliances are prevented from damage by frost and theft; (3) the possible saving in initial cost of construction and upkeep; (4) the facility of access by the scholars and the consequent saving of school time; (5) the gain in unobstructed playground area; (6) the prevention of nuisance to occupants of adjoining premises; and (7) the greater facility of supervision by teachers for the encouragement of cleanly habits in the younger scholars.

Amongst the disadvantages of placing the offices inside the building is, of course, the difficulty of preventing unpleasant odours pervading the corridors and classrooms.

There should be no reason why a properly constructed, lighted, ventilated, and furnished convenience, so placed as to be under the constant supervision of those in charge of the scholars, should be any more detrimental to health than those usually provided in English schools, which are generally dirty, the apparatus frequently out of order, and at such distances from the school building as to necessitate, in winter months, a scholar, fresh from the warm or over-heated room, crossing the playground in inclement weather, frequently without his or her outer garments.

The provision of suitable and convenient rooms for the school medical officer for the periodical inspection of children, with the necessary waiting room and lavatory accommodation, is an additional item of the modern requirements in school buildings.

On the Conversion and Equipment of Schools to be used as Special Subject Centres. By Edward Willis, Assoc. M.Inst.C.E., F.S.I., Engineer and Surveyor, Chiswick.

The first point is to arrange for combined centres so that the full grant can be obtained. The best position for a complete centre for 36 or 54 students appears to be one which is practically central or equidistant from a number of girls' elementary schools, and then by a careful arrangement full classes can be provided and the maximum advantages obtained for both the student and local authority. The alternative of a separate building is to attach the special centre to the largest girls' school or the one most central, and provide for separate entrances and exits.

The single floor system is by far the best where land is cheap, or where expense is a secondary consideration, but where economy is a *sine qua non*, and land expensive or not available, a useful method is to adapt existing buildings to the purpose required. There appears no objection to the cookery and housewifery centres being on the first floor.

Ample natural lighting is desirable in each centre; and where possible, handicraft, laundry, and cookery rooms should be provided with roof lighting. This, of course, is not possible in two-storey buildings, and in such cases windows should preferably be provided in at least two external walls.

Artificial illumination should be effected by incandescent electric light attached to balance pendants over the benches, desks, and tables, with brackets near the stove and fireplaces. If gas only is procurable, two or three light pendants (according to the size of room), with ball and socket heads, give the best illumination, providing incandescent mantles and reflecting shades are used. The inverted mantles, with proper shades, reduce shadow, and if properly disposed, give an excellent diffused light.

Warming is provided by hot water pipes or radiators, but open fires have many advantages, and if properly disposed and protected can generally be utilised at a nominal cost. This applies especially in the case of cookery, laundry, and housewifery centres, as it is usual and helpful for students to have continual practice in laying, lighting, and maintaining good fires in ordinary household grates and kitcheners, and not rely entirely on cooking by gas to avoid the trouble incidental to ordinary coal-fire stoves or ranges.

The permanent equipment of a handicraft centre should provide at least 35 square feet per boy, and include all that is necessary for 20 or 40 boys, the former being the maximum number allowed in a single class under one certified instructor.

The equipment consists of timber racks, which should be horizontal, as the vertical rack is often dangerous for boys; with cupboards or lockers, which are designed with at least ten separate compartments, and usually not more than twelve, forming a division for every class wherein the drawings and work are stored each week; museum cupboards with glass fronts, where all the models are stored when not in use, and the best examples of students' work should be kept for inspection; instructor's desks and lock-up cupboards for their own private use; students' lockers in which the students have similar privileges; blackboards and drawing appliances; dual benches and tool racks; grindstone, and a complete set of tools for the centre, with usual ordinary tools for every student.

The area in the general cookery demonstration rooms must be at least 25 square feet per girl; if used for lecture rooms as well, and existing buildings are converted, a margin is advantageous. This is especially useful if galleries are formed for the desks, and the laundry work is taught in the same room. A larder or pantry with window and ventilator in an external wall, should be provided for each cookery class, and also in the housewifery centre.

A difference of opinion exists as to the position of the sinks, some teachers prefering the sink kept away from the wall so that access can be had all round both sink and teak draining board, which enables more girls to have experience in washing up at one time. Others prefer the usual position against a continuous wall, or in an angle as being more practical. The depth and quality of the sink is a matter of choice, but a deep white glazed (all over) type, with upright waste and flap, is more easily kept in a cleanly condition, or more apparent if not kept clean. A tile or cement floor underneath and around same for at least two feet is desirable in new work, but a lead safe will meet the necessities in old buildings. A similar floor is advantageous in a laundry centre, if on an upper storey, where the copper and wringer usually stand, as also underneath the washing stools.

In the case of housewifery combined with laundry and cookery, the accommodation should be, sitting-room, bedroom, kitchen, scullery, store, coal cupboard, larder, and water-closets, whilst a small bathroom is desirable. It will thus be seen, the lecture-room is entirely done away with, and the Board have recently sanctioned the omission of kitchen and scullery where the combined cookery and laundry room adjoins. The internal water-closet should be used for demonstration purposes, the children's offices being provided if possible in the playground, clear of the building.

The actual arrangements for decoration, stoves, blinds, fittings, etc., should be largely in the choice of the head teacher.

General cookery rooms should be provided with desks for class work, preferably on two or more galleries, and in this case long continuous desks can be adopted, allowing about 1ft. 6in. to each girl. A similar space must be given to every child on the central table in the cookery centre, the width of 1ft. 6in. to 2ft. being absolutely necessary. Some teachers prefer the enclosed type with cupboards, others the open tables with solid top, and just one shelf below to place the utensils upon when not in use. A good arrangement is to have a capital E form, the top and bottom tables being 6ft. long, the long side being made up of two more each 7ft. 6in. long, and the middle being a table of about 2ft. square, to carry a grilling and boiling gas stove without an oven. This gives an excellent arrangement for demonstration purposes, and if a complete gas cooking stove with an ordinary kitchener are also provided inside the E against the wall, the students have an excellent opportunity of seeing the whole of the demonstration. Two cupboards for work, books, etc., are desirable, and a large dresser with the usual drawers and lower cupboard. Hot and cold water is also useful at the sinks.

Nine washing stools will be necessary, also a proper copper, or in lieu of this latter a gas-fired copper with a cold water supply above and a draw-off tap below. An ironing stove will also be required for about twenty-seven plain and nine smoothing irons, and to the roof should be suspended by pillars a complete system of drying frames, easily raised or lowered, which would reduce the usual number of clothes horses. This is the general accommodation and equipment required in a combined centre for thirty-six girls, which will give facilities for the education of 360 students per week.

Discussion.

Dr. Nash (Wimbledon) described the papers as being in some respect epoch making. It seemed to him that a large number of schools were designed from the wrong end. They would remember a meeting at Derby of the Institute where certain ideas ran riot altogether, and it seemed to him that schools should be designed and built up from a unit which should be the classroom, for, after all, schools were built for teaching. He had in his eye a school which had been built comparatively recently as the result of open competition, which was an annoyance to everyone interested in hygiene. What they had to establish first was what was the ideal classroom, and to build up from this, and that was what seemed to be Mr. Kirkby's idea, for on looking at the Butterworth school one saw that an ideal classroom had been made the basis of the whole school. Unfortunately most local authorities would not spend money in the lavish way that Bradford did in regard to schools. Mr. Webb had drawn attention to the marked deficiency which existed as regarded cloak-rooms, and in most schools they were an abomination. He saw that Mr. Kirkby had gone in the direction of coupling the lavatories up to the school, and he saw no objection to that. His idea of a cloak-room was to have a free current of air travelling right through, and between each row of pegs there should be hot-water pipes to dry the clothes. Another important point was the position of the fireplaces, and architects did not seem to realise that teachers had to teach in the room, and very often placed the fireplaces at a point which meant that the teacher had to have his back roasted by the fire. He contended that the wall facing the children should be absolutely flat. He disapproved of the design for classrooms in Derbyshire. There they found most of the schools had glass partitions, but those who knew anything thing about a child knew they could have nothing worse than broken lights.

Mr. Osborn Smith, F.R.I.B.A., thought the experience of Dr. Nash must have been unfortunate when he spoke in such sweeping condemnation of the schools provided for elementary education in this country. At the same time he agreed that there was room for considerable improvement, especially with regard to classrooms. If Dr. Nash went into the secondary schools in London he would find cloak-room arrangements which even he would approve of. They had windows on two or more sides of the room; the stands were placed 5 or 6 feet apart, and each peg was 12 inches apart, so that the clothes hung perfectly free of each other. There was ample circulation of air, and underneath were hot-water pipes for drying the clothes. In the elementary schools in London they had been rather wedded to the wretched rooms where the ceiling could be touched, and which were only ventilated from one end. With regard to Mr. Webb's paper, he saw no reason why cloak-rooms should be 13ft. high, although they should be higher than they were now. When the Institute met at Bradford some years ago they were taken over some of the schools, and were not favourably impressed with the means of ventilating. It was delightful therefore to hear that in Bradford, the home of the plenum system of ventilating schools, they were now moving in the direction of open-air schools, and advocates of the plenum system should carefully mark that. The cost of equipment mentioned by Mr. Willis seemed high. He thought where boys were going to be taught carpentering the teacher should be a thoroughly competent carpenter, and that the boys under instruction should make many of the fittings. With regard to the plans before them, he thought the schools ought to go more in the direction indicated by Mr. Kirkby, than in the Wimbledon school, and the cost should not exceed 6d. per cubic foot. The question of cross lighting was an extremely interesting one. He would be glad to hear if doctors objected to it on account of injury to the eye by conflicting lights. He would like to know why in the Wimbledon school the internal walls were so thick, the corridors so wide, why the staircases were not wider, and why the lavatories and cloak-rooms were so high.

Mr. Carden (Brighton) said that they could not all have open air schools. The Brighton authorities had inspected the Staffordshire type of school, and had decided to adopt that for a new school, but they thought they would get more fresh air into the classrooms. One great advantage of this type of school was that it was cheap, and the cost would come out at about £15 a head.

Dr. Smith (York) considered that in the future design of schools the school medical officer ought to be consulted by the architect, for it was rather lamentable to meet in comparatively recent years some of the defects in the design of schools by architects whom they knew were disposed to consider architecture first, and the principles of sanitation as a secondary matter. He was impressed with the idea that they ought to work more and more in the direction of open-air schools. He considered the Staffordshire type of school much the best, although the central hall type overcame one difficulty in regard to cross lights. It ought not, however, to be beyond the power of architects to design a school by which the amount of light should come to one side of the pupil. He had seen the new open-air school at Bradford, and thought it was constructed comparatively cheaply. It was a delightful place, and doing splendid work.

Mr. J. Darch said he noticed that in some of the plans the arrangements of the desks was far from satisfactory with regard to saving the children's eyes. He suggested that every architect should state in his specifications that every desk should have at least so much light, whilst he would also like to see in any legal enactments quantities of light specified in standard units.

Mr. J. H. Blizard (Southampton) asked Mr. Willis to explain how the children did practical work in the cookery centre as shown in the plan.

Dr. Freemantle (Herts) remarked that the point was how to do all the things suggested without increasing the cost of building. What they wanted to get at was what other things could be omitted to allow of improvements. From the health point of view they wanted a simpler type of school without unnecessary ornament. In his case he got into communication with the architect of schools before before their plans came before the committee, because naturally when the plans were once before the Education Authority professional self respect made it difficult for the architect to support the recommendations of the medical officer.

Mr. Webb said that the height of the cloakrooms referred to would be approximately 8 or 9 feet, with a space between used as store cupboards. The width of the corridors was 10 feet, but in a good many countries the width of the corridors ranged from 8ft. to 16ft. in the case of Switzerland. These corridors were used in Switzerland and Germany as marching corridors. They had not in this country approached anything like the cost per head of elementary schools in Germany, Switzerland, and America.

Mr. Kirkby said Dr. Nash had raised the question of cross lights. Although he should probably meet with opposition, still he was of opinion that lighting on two sides of a classroom was better than lighting on one side only. If they had light on both sides of the classroom they got rid of cross light because they diffused the light. If they had light only on one side a child was working in its own shadow. The cloak-rooms in the Bradford schools were heated by utilising the fittings as hot-water pipes. The cost of the open-air school would be about £14 a head, but the Butterworth school cost £8 or £10 more. At the Butterworth school, however, they had a system of baths, and a large kitchen, etc., and the building was not as costly as it looked, for owing to the position certain extras had to be added. He had never suggested the Thackley school as an elementary school, for it was designed for a class of children who were not fit to attend an elementary school. He always consulted the medical officer with regard to his plans before submitting them to the committee. At the same time he suggested that he would have a funny kind of building if he attempted to design a school according to the ideas of everyone in that room. An architect had to receive ideas and sift them, and when he had made up his mind he must go straight ahead. Medical officers and teachers and committees were always saying the accommodation for this, that, and the other should be increased, but the cost of schools was going up all the time, and the poor architects were blamed. At the same time he would point out that four of their schools at Bradford were built for 6d. a cubic foot. Thackley school was cheaper, and worked out at somewhere about 5d. The construction might not be so solid and permanent as some of the buildings constructed of stone, yet he thought the latest ideas which had been put forward in school planning could be embodied in a plan which would meet the most exacting requirement and yet could be put up at a minimum cost.

Mr. Willis said that Mr. Osborn Smith had mentioned the very large apparent cost of equipment, and the comparatively small cost of the school. What he wished to emphasise was the economy which could be obtained by careful design. Some of the fittings in the school were being made by the students. With regard to the cookery centre which Mr. Blizard asked about, the idea of galleries was to give better facilities for the documentary part of the work as distinct from the practical side. The practical part of the work must be carried on on tables such as the children had in their own homes, and these were provided.

FEVER HOSPITALS.

Mr. Saxon Snell, F.R.I.B.A., read a paper on Fever Hospitals, in the course of which he said:—

A general hospital may be considered as an institution for obtaining the best skilled treatment and nursing at the minimum of cost. A fever hospital is more than that. It is also a house of detention for, and destruction of, infectious disease germs, though how far it succeeds in these directions appears to be a debatable matter. The number of beds required is generally determined by a ratio to the population of the district (subject to modification in the light of local conditions); but the number so obtained is for the greater part of the time absurdly too large, and in times of epidemic it may easily prove too small. Authorities have to, and do, choose the lesser evil, and so are obliged to saddle the community with buildings which are wholly or partially unused for months or even years. Fever hospitals, as generally built, are expensive erections. The cubic space per bed is double that required in a general hospital, and the area of land is even greater in proportion. A general hospital may be built within the confines of a town; a fever hospital must be isolated in open country. Yet again different institutions, or at least different ward blocks, must be provided for different diseases. Now, as to hospital buildings (with which of course I am more immediately concerned), it has been sought to reduce the cost by constructing them of light and cheap materials—generally timber framing lined with boarding and galvanised iron; and this method has been advocated also on the ground that all fever hospitals ought to be pulled down and burnt within a limited number of years. They are, however, wasteful of heat, require great expense in repair and upkeep, and it must be added that the moral courage required to scrap them periodically is often wanting. Moreover, they are necessarily crowded with dust and germ-holding corners, angles, and hidden spaces.

It has always appeared to me that excellent buildings at comparatively small cost could be obtained with steel framing filled in with light concrete construction. The walls might be formed with two thin slabs fixed so as to cover the steelwork, and with a small air-space between them which would help to keep the building wind and weather tight and reasonably warm. They would be finished inside and out with hard plaster. The floors would be formed with concrete laid between steel joists, and covered with one or other of the many patent compositions in the market, which are both impervious and cheap. The ceilings would be formed in the same manner as the walls. With such construction it is easy to obtain flat and even surfaces, unbroken by unnecessary and dust-collecting ledges and angles, which are to be avoided at all costs in fever wards. The windows would be steel casements, and the doors might with advantage be framed with steel and sheet iron. Periodically the concrete filling and surface finishings might be removed and reinstated with new material. The steel framework would require washing only. Such buildings, or, rather, the framework, could be taken down with comparative ease and at small expense for re-erection on a different site if required; and their cost, although greater than ordinary wood-framed constructions, would be far less than for permanent brick and stone buildings.

The administrative and staff quarters would be designed as permanent structures and with due regard to comfort and pleasure. Radical spirits have advocated doing away with buildings altogether for housing fever cases, and substituting tents. The great point (apart from the question of cost) seems to be that the patients lie practically in the open air.

The second point I would refer to is the liability of fever hospitals to become a source of infection to the surrounding area.

The Local Government Board, taking as always the middle line of safety, insists that in case of smallpox hospitals this contingency should be taken into account. For other infectious diseases it prescribes a zone of 40 ft. only round the ward blocks.

Dr. B. W. Richardson proposed to avoid risks of the kind by passing the vitiated air of the hospital through the heated gases of a furnace; and Dr. Burden Sanderson advocated this system. Actual experiment has, however, shown that it was difficult to ensure the destruction of the germs owing to the fact that many passed through the furnace unscathed. I cannot but think the idea is worthy of further experiment.

The third point to which I would refer is a method of reducing the number of separate blocks for different diseases and obviating the necessity of placing more than one disease in a ward. The Pasteur Hospital in Paris is a practical experiment in this direction. —Mr. Snell then gave some particulars of a complete hospital designed by himself on these lines; a system has been adopted in this country at Norwich, Walthamstow and other places.—The Metropolitan Asylums Board have also made experiments in the same direction. My building is two storeys in height (one would be better, but the site was constricted). Each ward block is divided into separate rooms (12 on each floor) on either side of the corridor which is open to the air at each end. The internal walls of these rooms (each of which is for one patient) are of plate-glass fixed in light steel frames. The glass is obscured to a height of 30 inches. In this way the patients are more easily kept under observation, and suffer the monotony of isolation in a modified degree only. Each room is separately ventilated and heated. The casement windows are relied upon at most times for bringing in a flood of fresh air, and the vitiated air is drawn off by large flues at the ceiling level. I think it would be of advantage to assist the outflows by electric fans. By these means there is no possibility of the air from one compartment being carried into another; and under these circumstances (as conclusively proved by the Pasteur Hospital), it would be possible to treat several different diseases in the same building. A balcony is carried round the building on both floors from which the patients can be seen by friends or relatives. The staircase and lift approach, as also bath rooms, ward kitchens and soil sinks, are cut off by a passage open at each end to the air. A separate exit staircase and lift, linen rooms, discharge room, etc., are placed at the other end of the building and cut off in the same way. The floors and roof would be of solid construction and fire-resisting, and of course all angles are rounded and every kind of ledge for dust avoided. The lower floor is placed several feet above the level of the ground to allow of a free circulation of air below as well as above and around the building. The various pipes for conveying heat, water, and lighting would be suspended from the ceiling of this open basement, and all should be well insulated against cold. The whole building might with advantage be constructed throughout in reinforced concrete. It should not be beyond the powers of an architect to relieve the surfaces with colour and flat ornament which would render the building sightly and indeed attractive

Discussion.

Mr. Willis (Chiswick), in moving a vote of thanks to Mr. Snell, referred to the large practice which the author had in the design of hospitals, workhouses and other public buildings.

Dr. Nash, in seconding the motion, asked what the author estimated the construction of a modern hospital was going to work out at. He supposed Mr. Snell's idea was reinforced concrete. His authority had now under consideration an extension which would cost about £12,000, and had referred the scheme back for consideration with newer constructional methods. He would like the author also to give figures with regard to cost as compared with reinforced concrete of the method used at the Frimley Sanatorium.

Mr Snell said he had not worked out the cost of temporary hospitals, but from what he knew he should think the ward blocks could be done for about 6d. a foot.

Dr. Nash asked the cost per bed.

Mr. Snell said that would of course depend on many things.

NEW BUILDINGS.

PROPOSED.

Blackburn.—The Blackburn Town Council has decided to raise certain sums of money under the Local Loans Act, including the sum of £5,400 for the purchase of property in King Street and Penny Street for improvement, £24,150 for the higher elementary school, Blakey Moor, and £15,000 (part of a loan of £60,000) for new sessions house and police court on Blakey Moor.

Brighton.—The County Borough of Brighton having applied to the Local Government Board for sanction to borrow the sum of £3,790 for the erection of working-class dwellings on lands adjoining Tillstone Street, an inquiry has been held at the Town Hall, Brighton, by Mr. Edward Leonard, P.A., S.I. (Local Government Board Inspector). The Council also applied for consent to the appropriation of the money for the purposes of Part III. of the Housing of Working Classes Act, 1890. The scheme met with considerable opposition.

Burnham (Somerset).—The sea front improvement scheme was discussed at a recent meeting of the Urban Council, when it was stated that the result of the postcard poll showed a large majority in favour of the adoption of the full scheme. The Clerk said that the best plan was to accept the tenders provisionally, and then to acquire power to borrow the money required. The Surveyor reported that under correction the previous lowest tender, namely, that of Messrs. Morgan and Co., of Newport, had been increased to £4,427 16s. 6d., making that of Messrs. G. L. Morgan, of Pontypridd, at £4,144, lowest. It was decided that this tender for widening the Parade be provisionally accepted, and also that those of Mr. W. J. Pople for the substructure and other work at £1,002 10s., and that of Messrs. Macfarlane and Co., of Glasgow, at £1,351 3s. for the pavilion, be similarly accepted. Subsequently it was agreed to apply for a loan of £6,900.

Carluke (Scotland).—Plans have been approved for the erection of the new manual instruction room at Law School. They provide for a building having a room for the teaching of household management in front, and a manual instruction room is situated at the rear. The total cost will be about £850.

Kidderminster.—The Baths Committee of the Kidderminster Corporation have been considering the question of erecting new public baths for the borough. The existing baths have been in use for about half a century, and are both dilapidated and antiquated. The committee propose to bring the question before the Town Council at their next meeting.

Peebles.—It is announced that Mr. Andrew Carnegie has placed £10,000 in the hands of the Master of Elibank and Sir Henry Ballantyne for remodelling, extending, and improving the Chambers Institute, Peebles.

Perth.—The School Board are dealing with the problem of co-ordinating the educational system of the city. The necessity of so doing arose from the transference to their control of Sharp's Institution and the demand of the Education Department for the erection of a new Academy. The Board has decided to amalgamate the two schools (1) by adapting the buildings of Sharp's Institution to serve as a preparatory school, and (2) by erecting a new school on the site of the present Academy building to be used as a secondary school. The estimated cost of the scheme is £20,000.

Suffolk.—The recent circular from the Road Board inviting applications from county councils for grants for road improvements have been considered by both the East and West Suffolk Councils. When preparing the estimates for the coming year, the bad condition of the roads was the subject of very careful consideration by the East Suffolk County Council, who appointed a sub-committee to inspect and report. According to this body nothing short of reconstruction would have any lasting effect, the main roads between Stonham and Ipswich and from the latter to the Essex boundary at Stratford St. Mary being specified as requiring immediate attention. The cost of reconstructing these roads is estimated at £30,000, and the Council have decided to apply for a grant of £16,000.

In West Suffolk a conference has been held between a special committee of the county council and representatives of the various highway authorities. The improvements mentioned by the highway authorities include widening, modification of dangerous corners, tar-painting and the repair or construction of bridges.

IN PROGRESS AND COMPLETED.

Bootle.—The girls' new secondary school has been opened by Sir Benjamin S. Johnson. The building, which occupies a site between the Corporation baths and the Technical School in Balliol Road, provides accommodation for 200 girls, and includes, besides the classrooms and the large hall, a laboratory, lecture-room and art-room. Mr. Hastwell Grayson, M.A., was the architect, Mr. T. Spencer (Aintree) the builder, and Messrs. Killick and Cochrane the heating contractors.

Coventry.—The Town Council has approved the following plans:—Additions to Radford Schools, Radford Road; two houses, Humber Avenue; alterations and additions, Little Park Street; eight houses, Gulson Road; grand stand, Highfield Road; drainage, Coniston Road; three houses, North Street, Stoke; alterations and additions to Warwick Road Sunday Schools; additions to lodging house, 150, Spon Street; 12 houses, Mickleton Road; bacon curing premises, Garden Row, Smithford Street; two houses, Stoney Stanton Road; 10 houses, Heath Road; house and shop, Albany Road; two houses, Broadway; house, Stepney Road; factory, etc., Northey Road; boiler house, Sandy Lane; 26 houses, Stanway Road; alterations, 617, Stoney Stanton Road; two houses, Earlsdon Lane; boiler house and chimney stack, Radford Fields (off Sandy Lane); house and shop, Mayfield Road; two houses, Stanway Road; seven houses, Caldecote Road; eleven houses, Humber Avenue; two houses, St. Michaels Road; eight houses, Dean Street; two houses, Silverton Road; six houses, and house and shop, Swan Lane; additions to Garage, Drapers' Fields; four houses, Lythall's Lane; two houses Lythall's Lane; five houses, Lythall's Lane; two houses, Spencer Avenue.

Crewe.—Many important buildings are in course of erection at Crewe, among them being the Railway Orphanage off Victoria Avenue; the Cheshire Training College just outside the borough boundary; the Bedford Street Schools, the Ursuline Convent off Nantwich Road, the Lyceum Theatre in Heath Street, and the new Counties Bank in Market Street. New schools in Hightown and Derby Street are also about to be erected, and further new sewerage extensions are to be carried out.

Edinburgh.—A commencement has now been made with the construction of the new military station at Redford, near Edinburgh. The station is to include large Cavalry and Infantry barracks, and the buildings are to be proceeded with as soon as the ground has been levelled, a task on which about 100 men are now employed. The foundations for the soldiers' quarters will be laid in the course of the present month. The whole of the area acquired from the Heriot Trustees has now been handed over to the contractors.

Falkirk.—A large extension to the Falkirk High School has been formally opened by the chairman of the Burgh School Board. The extension consists of an entirely separate two-storey building situated at the corner of Rennie and Griffiths Streets, on what was formerly the lawn tennis court in connection with the High School. Messrs. A. and W. Black, Falkirk, were the architects, and the building has involved an estimated expenditure of £6,600.

Leicester.—Foundation stones have been laid of a new Primitive Methodist Church, which is in course of erection on the Humberstone Road, at a cost of £1,500. The building is designed in the Gothic style, and will be 56ft. long by 36ft. wide.

Little Staughton (Beds.).—Ten years ago the church of All Saints, Little Staughton, was struck by lightning, which destroyed the greater part of the octagonal spire and caused, in addition, much damage to the roof and interior of the church. As the interior was already in great need of restoration, it was decided to restore this at once, and the spire was left in a truncated condition, surmounted by an oaken cap for protection against the weather. The work of rebuilding the spire is now in progress, the contractors being Messrs. George Wrycroft and Sons, of St. Neots, and the architect, Mr. W. B. Stonebridge, Ely Diocesan architect.

London, E.C.—The Cordwainers' Company have rebuilt their premises in Cannon Street for the third time. The last hall was demolished little more than a year ago, and was built about 130 years since, from the designs of Sylvanus Hall. The new hall is designed in the English Renaissance style, and has a frontage to the street of about 60ft. It has an entrance hall of Aberdeen granite, with a shallow concrete dome. This hall gives access to a staircase of oak. Mr. H. Chatfeild Clark, F.R.I.B.A., the company's surveyor, was the architect.

London, S.E.—The Mayor of Deptford, Mr. Edward G. H. Berryman, has laid the foundation-stone of the first of three libraries which are to be built in the borough at the cost of Mr. Andrew Carnegie. This building, in the New Cross Road, is estimated to cost £4,500. Mr. Carnegie has promised to provide for the building of another at the same cost, and also of a central library, a site for which has been secured in Lewisham High Road at an estimated cost of £12,000.

Newcastle-on-Tyne.—The ancient church of St. Andrew has been in the hands of workmen for some months past, during which period a further advance has been made towards its complete restoration. The plaster which had for centuries hidden and disfigured the walls of the nave, aisles, chancel and north transept has been entirely removed, and the ancient walls, which were found in excellent preservation, have been carefully re-pointed. The work has been carried out under the superintendence of Messrs. Fenwicke and Watson, architects, Newcastle, by Mr. T. Lumsden, contractor, Newcastle and Jarrow, at a cost of about £350. This makes a total of £6,100 expended on the restoration to date.

Owlerton (Sheffield).—The foundation-stone has been laid of the new Methodist Church in Penistone Road, Owlerton. The buildings have been designed in the Norman style by Mr. Teather, of Messrs. Gibbs, Flockton and Teather, architects, Sheffield. The tenders of Messrs. Thomas Wilkinson and Sons, and others, have been accepted, amounting to £3,816 7s.

Redditch.—An inquiry has been held at Redditch by Mr. Edgar Dudley, on behalf of the Local Government Board, respecting an application by the Urban District Council for sanction to borrow £1,200 for the purchase of property for the widening of Alcester Street.

Romford (Essex).—The Urban District Council has approved the following plans:—Additions to the Convent, 24, Western Road; 10 houses in Balgores Lane; two houses in Heath Park Road; house in North Street.

Shrewsbury.—The work in connection with the building of the bridge stretching from the Castle Fields to the Cherry Orchard side of the River Severn at Shrewsbury is practically completed, and workmen are at present engaged in painting the structure. The new promenade from the English Bridge is to be illuminated by means of electric light in future, and the necessary standards are now being put up. The work of rebuilding the river wall and the improvement to the footpath is also well forward; and in spite of the many difficulties which have confronted the contractors the building of the weir is fast approaching completion. Some damage was done in the early stages by the excessive rush of water at high flood, but the scheme is now so far forward that the erection will be able to withstand the greatest strain that might be put upon it.

Stoke.—The decoration of the new Council Chamber, which forms part of the extensions being made to the Stoke Town Hall, is now in progress, the fittings, which are being supplied by Messrs. Jones, Moss and Co., of Newcastle, costing approximately £1,500.

Thornhill Lees (Dewsbury).—The Dewsbury Town Council has approved the following plans:—House and stable in Staithes Road; five houses and shops in Lees Hall Road; new back street off Ingham Lane; new back street in Thornhill Lees (position not specified); six houses in Ingham Lane.

PLANNING COWSHEDS.

An American agricultural journal has taken a consensus of opinion on the best way of building stalls in the cowsheds—to face the cows inward or the other way. Both methods have their advocates.

The following are some of the chief advantages and objections to each method, which may be considered when deciding which system will best fit in with individual conditions and general plan. With the feeding alley in the centre the advantages are:—

1. Greater convenience and rapidity of feeding, since liberal width for passage of feed trucks or carriers can be given without undue increase in construction cost.

2. There is much better natural light on the business end of the cow, and a liberal amount is required during nearly all the work here, such as cleaning the udders and cows, milking, weighing, and recording the milk, etc.

3. There is less interference with direct sunlight over the interior, as the vertical obstructions (stanchions or ties) are nearer the centre. It allows the walls to be used for supporting milk scales and milk-record sheets.

4. There is less confusion, with attendant crowding, butting, and loss of milk, among the cows when the doors are at end of wing, and much less when they can be located at centre of side.

5. The high-level feeding passage, which allows instantaneous return of all feed thrown out with a broom, can also be more conveniently constructed with this system.

The objections to this method are:—

1. The principal one is that there is at times (when cows are "loose" from rank grass or other causes) some splashing of the lower wall with manure, unless the walk behind can be made extra wide. As, however, concrete, or cement plaster on lathing is now almost invariably used at least for five feet up, an occasional cleaning with hose and brush, and once or twice a year cement wash or paint, will keep the cowshed up to inspection.

2. Another disadvantage is that in some climates the best ventilation is to introduce the fresh air through the side windows, and exhaust the hot and foul air through a central top exhaust. Now the fresh air should always be coming to the cows' heads, but in this case it has to pass over the opposite line of cows before reaching the cow. One can, however, be so liberal with openings that this trouble is not very material.

With cows facing outward, the advantages are:—

1. The chief advantage of this system is one that only applies to a breeding herd, especially one from which sales are made. By having the business ends of two rows of cows together, and on a platform raised some four or five inches, the cows and their udders show off to more advantages, and it is easier to make comparisons of the different animals.

2. If an overhead manure trolley or track is not used, and the manure is removed with a cart, this can travel between the two gutters, and be filled directly.

3. Where artificial light must be used for one of the milkings, or often both in winter, much better and cheaper results can be had here from drop lights between the cows.

4. As given above, for warm climate barns, the ventilation is a simpler and better problem.

The objections are:—

1. It is often hard to provide room cheaply for the passing on of the feed trucks or carriers from one line to the other, so as to make the operation as continous as possible. It is bad business to have to return idle along a row of cows that have to be fed before another one can be commenced.

2. Where the ceiling has to be cheaply supported, which means posts instead of trusses, there is generally trouble in spacing these posts. This system will not allow them to be placed against mangers as a part of the stanching or tie construction, as in this case this would leave two-thirds of the span unsupported, and just where most of the weight would be, each side the centre. This is one of the most serious objections to this method. When working out the details of a dairy plant it is well to keep in mind that the first and most important object to be secured is the rapid and easy milking of the cows, and the getting of this milk to the cooler or separator the first moment possible. This is a vital point where skilled labour is used. Feeding and cow comforts, with cost of construction, come next for consideration, and, lastly, the disposal of the manure, where no skilled labour is called for. If there must be any departure from the wished-for ideal method, let it be here rather than with the other operations.

FEDERATION NEWS.

Scottish Building Trades Federation.

The sixteenth annual meeting of the Scottish Building Trades Federation was held in the Building Trades Exchange, Edinburgh, on September 9, when delegates attended from the principal centres of Scotland, and Mr. Hector MacVinish, Inverness, presided.

The executive report on the past year was submitted by the secretary, Mr. James Cameron, solicitor, Edinburgh. The report stated that another lean year in the building trade throughout Scotland had to be recorded, but there was a glimmer of hope of improvement in the near future, as several of the principal centres reported that trade was on the upward trend. Trade was, however, reported to be dull in Aberdeen, Paisley, Kilmarnock, Dundee, Airdrie, Coatbridge, Inverness, and Hawick. Edinburgh showed signs of improvement, while the brick-building trade in Glasgow was better than it had been for some time past. Plumbing, masonry, and joinery still continued dull. The financial report showed the finances to be in a satisfactory state. In some centres it had been reported that difficulty was experienced in getting apprentices, masons particularly, but it was thought that with an improvement in trade the necessary supply of apprentices would be forthcoming.

The secretary was appointed to attend the next international conference of secretaries to be held in Manchester on October 19, and arrangements were also come to for a monthly exchange on matters of interest between the Scottish Building Trades Federation, and the Building Federations of Germany, Belgium, Holland, and South Africa. The following office-bearers were elected for the ensuing year:—President, Mr. David Wilson, J.P., Edinburgh; vice-president, Mr. James Farquharson, Aberdeen; secretary and treasurer, Mr. Cameron.

Nottingham.

The association's summer excursion took place on August 26th, when a party of about thirty left Nottingham by railway at 8.13 a.m., and arrived at Grimsby Docks about 11 o'clock. On arrival, most of the members made a tour of inspection of the Grimsby Docks, but this was brought to a sudden end by a heavy rain-storm, but by the time luncheon was over at the Royal Hotel, the weather had cleared, and the remainder of the day was beautifully fine. Immingham, which is only about six miles from Grimsby by river, is twelve miles distant by road, and it seems doubtful whether a more tortuous road than the one over which the party were driven to Immingham could be found elsewhere in England.

At Immingham the contractors, Messrs. Price, Wills, and Reeves, of London, had made excellent arrangements for the convenience of the visitors, who were received by Mr. E. and Mr. R. Holliday, sons of the gentleman who has the responsibility of directing the whole undertaking. Seated in a couple of large trucks, fitted with cushioned seats and drawn by one of the contractors' handy locomotives, the party glided from one point to another, the Messrs. Holliday explaining all the different points of interest. After travelling along the coal sidings for some distance, the party returned by a different route to the power station, which will contain very powerful and up-to-date plant. The next move was to the site of the docks proper, where the work of excavating and pile driving was in full swing. Having first viewed the operations from above, the visitors were conducted to the bottom for a detailed inspection of the operations, including the great lock gates, upon which a pneumatic riveter was then at work. By this time the afternoon was well advanced, but before ending the tour, a visit was paid to the stores and workshops. The party then drove back to Immingham, where dinner had been prepared at the Royal Hotel. After dinner the president (Mr. Jas. Wright) in a short informal speech, expressed to the management of the great works which they had just inspected their high appreciation of the kindness which had made the inspection possible, also to the gentlemen who had conducted them over the works. He also conveyed the thanks of the party to Mr. Barton, for making the arrangements for the outing, which had been such a great success.—W. J. Barton, Secretary.

Sunderland and District.

A general meeting of the Sunderland and District Building Trades Association was held in the board-room on August 30, when the president (Mr. J. Morice Wright) was in the chair.

The secretary reported that a communication had been received from the operatives' secretary of the Conciliation Board, asking for a meeting of the board for the purpose of deciding upon a boundary line between Sunderland and the Hartlepools. During the discussion which ensued, it was pointed out that it was useless making a boundary line which the association cannot control, and it was resolved "that it is not desirable in the interests of the association that any attempt should be made to extend the boundaries."

The President gave an interesting report upon the proceedings at the half-yearly meeting of the National Federation at Chester in July last, for which he was thanked.

The secretary reported that at the half-yearly meeting of the National Federation, Mr. Stephen Easten (Newcastle) raised the question of the Sunderland dressed stone rule, and asked the National Federation if they approved of the principle of such a rule. Mr. J. W. White (Sunderland) thereupon suggested that Mr. S. Easten should raise the matter at the Northern Counties Federation. Further discussion was, however, ruled out of order by the President of the National Federation.

A report was received upon the terms of settlement in connection with the St. Gabriel's Church dispute. The job has now been declared open.

The question of holding an association dinner was left over until the next meeting.

Mr. R. J. Huntley gave notice of motion that at the next meeting he would move:—"That consideration be given to the question of fixing a reasonable scale of charges for time and material work." The secretary was requested to ascertain from the local associations whether such a scale was in use among their members, and if so, to obtain a copy.—W. H. Hope, Secretary.

Tyne and Blyth District.

A meeting of the Executive Council of Tyne and Blyth District Building Trades Federation was held in the County Hotel, Newcastle-on-Tyne, on August 18th, Mr. W. T. Weir (president) in the chair.

The president explained that the meeting was called to consider the invitation to tender for work for the Gateshead Asylum, Stannington, the work being foundations and cottages. It had been announced that no tender would be considered which was not accompanied by a schedule of prices, and it is a rule of the Federation not to send in a schedule of prices along with the tender. Mr. W. Foster said that the quantities as to the cottages were complete, and in this case the tender would be sent in in the usual way.

It had been further stated that it was usual in the North for the schedule of prices to be sent in for foundation work, but that in this case the approximate amount of the works had been stated. The usual course is for a schedule of prices to be sent in for the different classes of excavation work.

Mr. S. Easten, who had seen the quantity surveyor, had explained to him that the interest of the architect was one with our own. The officials of local authorities, Mr. Easten said, often got the prices for comparison and their own use.

Mr. W. Foster contended that whether the bills of quantities were actual or approximate, made very little difference, the principle in both cases being the same. There was, he said, competition from the south, and it was possible these competitors would not act with us in the matter.

Mr. S. Easten said that the practice has been to give no schedule of prices for buildings, but that it was otherwise with foundations.

Mr. Foster said he thought the members should send in their tenders, and that a letter should be sent by the secretary.

Mr. S. Easten said that, having regard to the practice hitherto, it was not expedient to protest in the present case, but it was desirable to seek to alter the practice. He suggested that a conference should be held with the surveyors and architects to discuss the matter and arrange a settlement.

A resolution to this effect was passed, and the secretary was requested to notify the local secretaries of the terms of this resolution.

It was further resolved "that the secretary get into communication with the Northern Architectural Association and the Northern Quantities Association with a view to arranging a meeting to discuss the matter, and that the deputation from this Federation consist of Messrs. W. T. Weir, Stephen Easten, J. T. Armstrong, and A. Pringle."—W. H. Hope, Secretary.

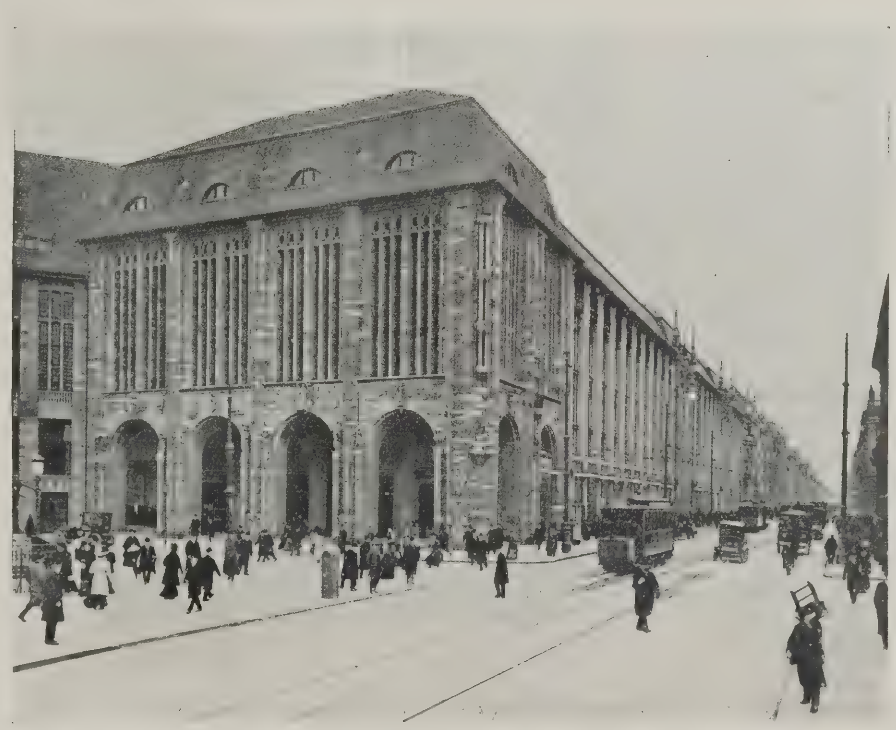
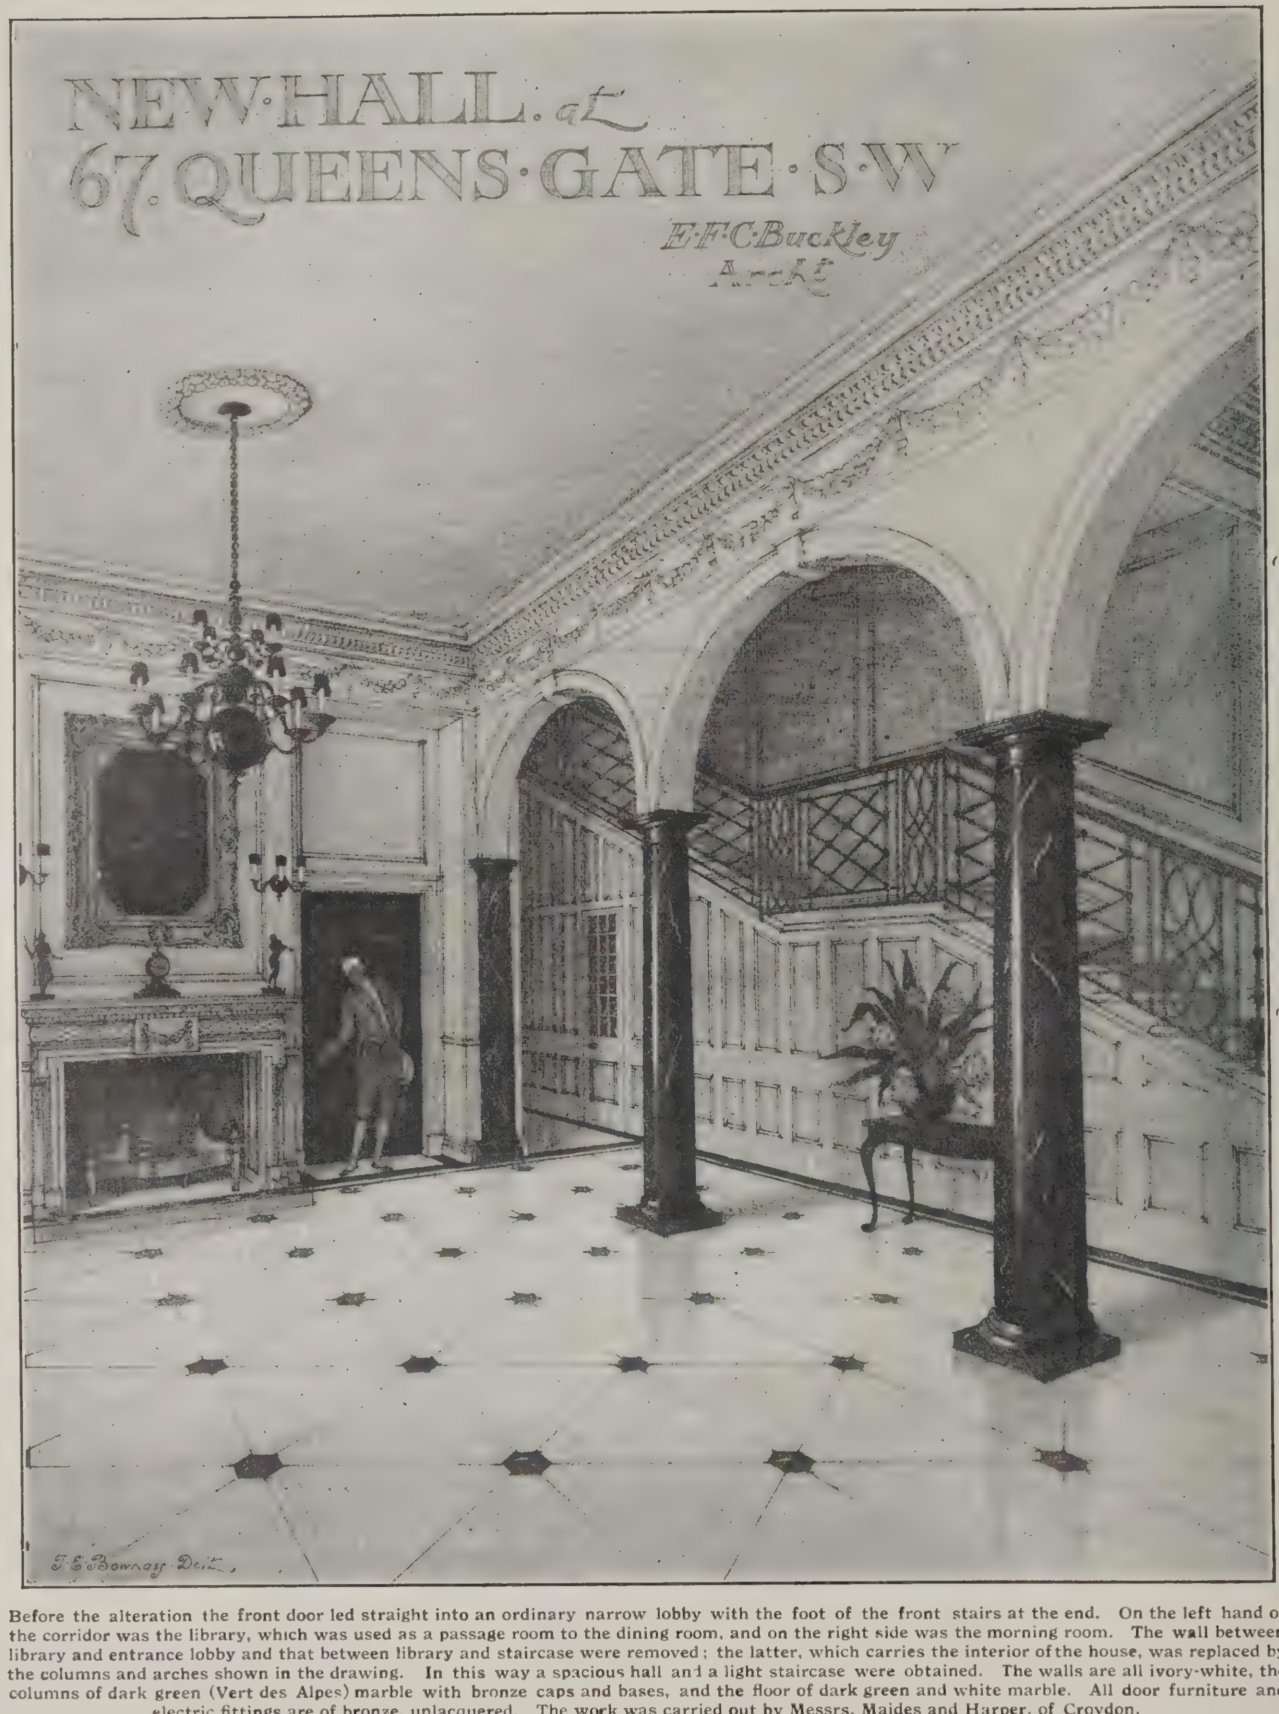
SEPTEMBER 28th, 1910.

Volume XXXII. No. 817.



A TYPICAL SPECIMEN OF MODERN GERMAN ARCHITECTURE: THE WERTHEIM SHOP PREMISES, LEIPZIGER PLATZ AND LEIPZIGERSTRASSE, BERLIN.



Before the alteration the front door led straight into an ordinary narrow lobby with the foot of the front stairs at the end. On the left hand of the corridor was the library, which was used as a passage room to the dining room, and on the right side was the morning room. The wall between library and entrance lobby and that between library and staircase were removed; the latter, which carries the interior of the house, was replaced by the columns and arches shown in the drawing. In this way a spacious hall and a light staircase were obtained. The walls are all ivory-white, the columns of dark green (Vert des Alpes) marble with bronze caps and bases, and the floor of dark green and white marble. All door furniture and electric fittings are of bronze, unlacquered. The work was carried out by Messrs. Maides and Harper, of Croydon.

Copyright in Architecture.

WE seem to be approaching the crisis in regard to the question of establishing a legal right on the part of architects to prevent their buildings being copied or being reproduced by other persons. That is the turning-point of the matter, and that is why we head these remarks "Copyright in Architecture," rather than "Copyright in Architectural Design." The copyright in an architect's design on paper may be considered to be protected on the same footing as that of drawings or paintings generally. But the popular idea in this country appears to be that, when once a building is erected from the architect's design, it becomes public property, and anyone who takes a fancy to it may commission another architect to build him one like it, or a builder to build him an imitation of it; in either case without any reference to the original designer. A good many instances of such action are on record, and were put in as evidence by Mr. Simpson, who (with Mr. Belcher) represented the Institute of Architects before Lord Gorell's Copyright Committee of last year.

That this is a substantial grievance there can be no doubt. The essence of the grievance, on its practical side, is that an architect who has applied thought and talent to devising a building of a certain definite architectural character, and has been duly paid for his services, may see another person paid for what is, practically, making use of his brains, without any compensation to himself. A further possible (or probable) injury to him is that he may see what is called "a colourable imitation" of his own design carried out with the details spoiled, and the whole thing vulgarised. It is possible to make outsiders understand the former grievance; it seems impossible (in England) to get anyone to understand the latter one, or to recognise that it is a grievance at all. This comes out in an amusing manner in the evidence before Lord Gorell's committee, where an architect witness said that an imitation of a building from observation merely, without measurements, "would probably be a caricature," and a member of the Committee immediately answered, "It would be a caricature to you, but not to me." That is typical of the whole attitude of the English public to such a question. They cannot appreciate the small differences of detail which spoil a design; and because they cannot, they think these are of no consequence, and that architects are merely faddists. And although the Committee thanked its two architect witnesses for their evidence, and discussed their views with them, it seems obvious that they were not much in favour of the idea of copyrighting architecture, and that their minds were chiefly occupied with the difficulties and objections in the way of it; some real and some imaginary. It is significant that while eight pages of the Report of the evidence are occupied with architecture, twenty-three are occupied with the rights of makers of gramophones and other mechanical reproductions of music—a subject no doubt much more interesting to the general public.

The architects' evidence goes to show that the copyright question is of most importance in respect of average buildings of comparatively small size—dwelling-houses, schools, etc Large buildings, such as town halls, it is said, are usually specially designed for special sites, at a large cost, and the people concerned with their erection would not wish for a copy of another building. Churches, however, we may suggest, are buildings of some importance which might be reproduced by Committees in want of funds, and we believe this has been done occasionally. It is the fact, however, of reproducing being mostly confined to the smaller and less important buildings that suggests one of the difficulties in connection with the subject, viz., the narrow margin which may separate a building of purely utilitarian character from one which has a recognisable element of architectural design. Section 36 of the draft Bill which is to be brought before Parliament defines the matter thus:—

> "Architectural work of art" means any building or structure having an artistic character or design, in respect of such character or design, but not in respect of the processes or methods of its construction.

The latter distinction is introduced because this is a Bill concerned with copyright in works of art; "processes and methods," if infringements, would come under the law of patents. Now, an ordinary four-storey house-front in brick may be a mere utilitarian erection; but some modifications, which might seem trifling to the outsider, may to the architect transform it into a front of architectural character. Who is to be the judge of this? It is not, it must be understood, to be a question of architectural *merit;* both the witnesses and the Committee agreed in ruling that out, as opening a way for a kind of discussion which the chairman and members of the Committee might well regard with apprehension. What is proposed is, not that a building should claim to have artistic excellence, but that it should have artistic character, good or bad—something more than mere building. As we all know, some of the best street buildings are among the plainest, and what the quality is which makes them of architectural value is not very evident to the outsider. If the Bill became law and there were any compensation to the architect provided for in it (we will come to that directly), the ultimate decision in such a case would rest with a jury, after hearing the evidence of architects; and though the jury would probably be quite incompetent to decide the point, there is as much chance that they would give a right verdict as a wrong one; and that is a chance that one has to take in other subjects of litigation besides architectural copyright. Juries are not supposed to know anything of the merits of a case; they are supposed to weigh the value of conflicting evidence. Another question which naturally arises is, how far plan, as well as design, can be made the subject of copyright protection. It might seem that it was more easy to determine the matter in regard to plan than design, as it is possible to see at once whether one plan is the same as another. But where a plan displays nothing but ordinary convenience in the arrangement of rooms, it would come under the head of utility only, and be outside the scope of the Bill. Where, however, a plan displays some special arrangement for internal effect, it is an element of design, and ought to be protected as such.

And now let us see what the draft Bill, which it is understood is to be brought forward in next session of Parliament, provides for the protection of the architect. We have seen that an "architectural work of art" is recognised, and so far as possible defined in Section 36 of the Bill. In Section 7 we find what is facetiously entitled in the margin, "Remedies in the case of Architecture":—

> 7. (1) Where the copyright in any work is infringed by the construction of a building or other structure, the owner of the copyright shall not be entitled to obtain an injunction or interdict to restrain the construction of such other building or structure or to order its demolition when constructed.
>
> (2) Such of the other provisions of this Act as confer on the owner of the copyright in any work the same remedies against a person having in his possession for sale or dealing with a pirated copy of the work as if it were his property, or as impose summary penalties, shall not apply in any case to which this section applies.

So that this section, entitled, "Remedies in the case of Architecture," is simply a statement depriving the architect of any remedy whatsoever! It seems almost incredible; but that is how it stands. Of course it can be understood that while a pirated painting or statue may be destroyed, there might be a difficulty in applying this to a building, partly because it would involve heavy loss and inconvenience to an owner who might be entirely innocent in the matter. The only argument is, however, that it is a rather more serious matter to pull down a building than to destroy a picture or statue; the principle is the same; the man who has paid for a pirated picture or statue has to lose it. But one naturally expects this to be followed by a provision whereby the architect may demand compensation. Not a word of the sort. As far as the protection of copyright in architecture is concerned the proposed Bill is an absolute farce.

As for any argument that it is impossible to protect architecture in that manner, we have only to turn to the evidence of the French *avocat*, M. Maillard. He says, "In our opinion, when an architect has prepared the plans and designs necessary for the construction of a building he ought to have the right to forbid its reproduction by anyone whomsoever." And in answer to a question, whether there were no difficulties in carrying out this view, he replies, "We see none. . . . In a French law of March 11, 1902, it was definitely enacted that architects were to be protected under the same conditions as designers, painters, and sculptors; *this law has not provoked any criticism, and has not given rise to any litigation.*" (The italics are ours.) In the Appendix to the Report of evidence is the statement of a case in Denmark where an architect brought an action against the owners of a new building for having copied a building of his; the court admitted some extenuating circumstances, but the defendants were made to pay an indemnity of 100 crowns to the plaintiff architect, a fine of 100 crowns, and 100 crowns costs. On another page of the Appendix is a letter from a German correspondent, Herr Osterrieth, stating that by the German Act of January 9, 1907, the infringer of a work of architecture may be fined up to a sum of 1,000 marks, but that he may also be compelled to pay to the original architect a much larger sum than this by way of damages. Quite recently in the Belgian Courts, M. Acker, the architect of the Brussels Exhibition, obtained £80 damages for the copying of a building designed by him in the Avenue Louise.

Have the framers of Mr. Buxton's proposed Bill drawn it up in entire ignorance of the Copyright Committee Bluebook? If not, how is it that they have drawn up a draft ostentatiously omitting architects from all chance of compensation, whilst making a pretence of considering their case? How is it that what is possible, and is received as perfectly just and fair in France, Germany, Belgium, and Denmark, is supposed to be impossible in England? The only explanation seems to be that it is the result of the traditional ignorance of, and indifference to, art, on the part of English public men, and of the English public generally. In other countries it seems quite natural that architecture should be considered an important art, and that an architect should be protected from injury to purse and reputation by the unauthorised reproduction of his work. In England it is evidently regarded as a claim that is absurd and unreasonable. The Institute of Architects, by means of a Special Committee, are, we believe, doing their best to get more reasonable counsels accepted. It is to be hoped they may succeed.

Limited Competitions.

IF the competition system presented no other advantages, it would be almost worth preserving for the infinite variety of the complaints to which it gives rise. These are usually interesting and stimulating, and are so frequent as to be in themselves a valuable corrective to any possible tendency towards mental stagnation in the profession. A comparatively new point has been raised in connection with a competition at Brighton. In last week's issue we announced that the governors of the Brighton, Hove, and Sussex Grammar School invite architects who have erected grammar schools, higher grade or secondary schools, or schools of a similar character, during the last fifteen years, to send in their names, with particulars of their work. A correspondent asks us whether in our opinion this is an admirable method of conducting a competition. As this is one of the questions which (as the Latin Primer puts it) "expect the answer, No," we hasten to supply that answer. The reason for thus limiting a competition is not easy to understand. Certainly trouble is saved, and some guarantee of the experience of the competitors is gained. But the mere saving of trouble in such a case can hardly be regarded as sound economy; and the guarantee of experience is probably of less value than the opportunity here deliberately thrown away, of examining the designs of men who, in the strenuous endeavour to win their spurs, might conceivably excel the best efforts of their more seasoned rivals. Some of our best and most important public buildings have been designed by men who certainly had never before erected similar buildings to the London County Hall and the Liverpool Cathedral. The disparity between these works and such common buildings as grammar schools may be readily admitted; but the greater probability of obtaining the most satisfactory design in the least restricted competition holds good in each case. In confining a competition to those who have actually erected buildings "of a similar character," three considerable factors present themselves:—(1) The experienced men are apt to repeat the conditions of former success, and thus there is some chance that the new building may be rather of the nature of a replica. (2) Not only the novices are excluded, but also men of considerable experience in similar competitions — who may have produced premiated designs without having the good fortune to get their designs carried out. (3) The exclusion of novices seems to be stultificatory. If the example were generally imitated, competitions must eventually die out, the supply of experienced men becoming in time exhausted, because the conditions of competitions prevented recruiting; which is admittedly an absurd deduction, but may nevertheless serve to indicate the essential weakness of a form of competition that seems to take advantage of a system which it does not adequately promote.

Building up a Tradition.

A SYMPOSIUM on architecture that is being conducted in the "New Age" has brought many interesting replies to the series of questions upon which the discussion is based. Mr. Mervyn E. Macartney, F.S.A., F.R.I.B.A., is particularly quotable. He points out that a tradition in architecture cannot be built up in a day, but the last two or three decades have seen the beginning of one—or rather a renascence of the older Palladian tradition. And there are to-day in the practice of architecture a number of men who, given opportunities, would produce work in no way inferior to that done in the seventeenth century. It may not be tedious to enumerate some notable buildings erected within the last twenty years: Mr. John Belcher's "Chartered Accountants"; the late John Sedding's Church in Clerkenwell; Messrs. Lanchester and Rickards' building for "Bovril"; the work of the late John Brydon hidden away up and down in London; Messrs. Adam and Holden's work; Mr. Lutyens' Offices of "Country Life"; the Gaiety Theatre, Scotland Yard, and part of the quadrant in Regent Street by Mr. Norman Shaw; Mr. Beresford Pite's Assurance Offices at Euston; Selfridge's. All this work in various designs expresses nobly, beside definite geometrical ideas, the personality or temperament of their designers, not in any *outré* fashion, but through definite style, and are not inferior to any architecture achieved since the time of Wren. These buildings give a not unfavourable view of the characteristics of the Renascence, the modern style par excellence. Pseudo-mediævalism is to-day a thing of the past, except it exist still in sentimental coteries. But without it it would be impossible to point to London churches so beautiful as those of Sedding, Gilbert Scott, and Bentley—work to which in the same kind there is nothing comparable in Europe or America. He holds that little more can be done by architects themselves, until the public expresses some kind of approbation. Perhaps on the whole the best work in England to-day is Domestic, for the simple reason that the leaven of taste works slowly and has only touched the extremities. And while the mob inhabiting great cities have none, individuals here and there have knowledge in matters of art. It is customary to sneer at American culture—American architecture, at any rate, flourishes in great vigour and beauty and scholarship, and will one day lead the world. But it seems that Americans want value for money, and when they employ an architect — they want to get architecture. In London we accept all kinds of vulgar fripperies from stockbrokers turned architects.

Hurstmonceux Castle.

THAT "sweet and delectable country seat," as Evelyn called it—Hurstmonceux Castle—which, notwithstanding its vicissitudes, is still one of the three chief glories of Sussex—the other two being Battle Abbey and Pevensey Castle, or, at option, Hastings Castle, or one of the many old manor-houses or sturdy ancient churches in which the county is so rich—has, it is announced, passed into the hands of Mr. Claude Lowther, who, it is stated, has in mind the benevolent intention of ultimately presenting it to the nation. It may without question be pronounced worthy of the national regard, for although of the original fabric begun in 1440 by Sir Roger de Fienes, who fought at Agincourt, little but the shell remains—the ruined interior having been cleared away in 1777—there is enough of it standing to afford a very interesting means of studying the methods and materials of the fifteenth-century castle-builders.

The Memorial to King Edward VII.

PROPOSALS for a memorial to the late King continue to fill the air; but they are mostly not very wise ones. Lord Plymouth has championed the idea of repairing the Crystal Palace and securing its grounds in perpetuity as a memorial; but while we should certainly desire to see the Crystal Palace and its surroundings preserved as long as possible, and its usefulness and accessibility increased, one can hardly regard a necessarily perishable palace of glass and iron as a building of very monumental character; nor can we see that the Crystal Palace, as an institution, has any very direct connection with the memory of the late Sovereign. Then Sir Edmund Currie has come forward with a recommendation for the foundation of a tuberculosis hospital as a memorial. This kind of proposal always looks like an excuse for raising subscriptions for a hygienic purpose under pretence of giving it a special significance; whereas if such a hospital is urgently required it ought to be built as a matter of utility, on that ground alone, without raising any adventitious plea for subscriptions. But this idea of a hospital as a memorial is thoroughly English. In every other country a memorial to a sovereign would be a work of art of some kind, erected solely as a memorial; but English public men are possessed with the idea that if one spends money on a memorial it should take the form of something "useful"; art being, in their view, of no use, and only a waste of public money. We can only repeat our previous suggestion, that no more suitable memorial could be found than a new façade to Buckingham Palace. Such a work would be directly connected with the memory of the late King, since this was his abode when in London; and it would be a fitting adjunct to the Victoria Memorial, to which Buckingham Palace (externally) forms at present a most poor and inadequate background.

Unexplained Fires.

AN explanation of the cause of fires in old country houses, usually attributed to "a defective flue," is given by Dr. Charles Mercier, of Wimpole Street, to the "Times." He propounds the theory that old houses are, as a rule, infested with rats and mice, which require to move from floor to floor in search of food, and, particularly, water. They have no route open to them but the stairs and the chimneys. In the winter when fires are going the chimneys are not available, but in the summer free use is made of them. The rodents gain access to them from the space in the floor by means of the joints in the brickwork, in which the mortar has become perished and friable. When fires are resumed in the autumn the hole thus made becomes a receptacle for soot, and an exceptionally hot fires ignites it so that there is a smouldering mass, one end of which is in the chimney, the other in contact with a joist. The mass may smoulder for a considerable time, but sooner or later the joist bursts into flame with disastrous results. It is stated that these fires occur some weeks after the resumption of fires in the autumn. The doctor's theory is ingenious, but not altogether convincing. In the first place, we doubt if rats and mice are confined for choice of route to the stairs and the chimneys; they will easily run up both walls and pipes, and we doubt whether either would frequent sooty places, because of their fur. In the second place, the brickwork in old chimneys is frequently thicker than that provided at the present day, and in such circumstances it would not be easy to find a direct vertical joint through the flue wall by which the soot could get access to the joists. Thirdly, the old builders were fairly punctilious in their construction, and with a proper arrangement of trimmer joists there should be no woodwork in contact with the brickwork of the flues. In the case of old panelled rooms there would certainly be a certain danger from contact. At the same time, it is idle to deny that some fires result from defective flues; but we think the cause is other than that given by Dr. Mercier. For instance, the old chimneys are generally tortuous, and the operations of generations of chimney-sweeps have resulted in knocking away bricks in the flues and rendering the walling dangerously thin, or even making holes in it. Also, in making past alterations, or additions, to old houses, builders have cut into walls to find a bearings for beams or joists, without always ascertaining what existed on the other side of the wall. And a defective flue, too, is often a handy excuse for the delinquencies of two-legged inhabitants. Fires in old country houses, so far as we have observed, usually break out during the night. Carelessness with lamps, candles, and matches, is a frequent cause. One fire, attributed to a defective flue, was really caused by a servant putting red-hot cinders and ashes with other rubbish into a housemaid's box in a cupboard by the side of the kitchen range, which cupboard extended under the kitchen stairs. In other cases we suspect that male servants smoking in bedrooms, and female servants reading in bed, have had quite as much to do with country house fires as the rats and mice upon whom Dr. Mercier fixes the responsibility. But this is not to argue that these rodents are an acquisition to old country houses, or that the doctor's suggestion of acquiring a cat or two should be ignored, even if we doubt their aid "as a valuable auxiliary against such fires."

NOTES AND NEWS.

"Cleopatra's Needle."

It has been again rumoured that Cleopatra's Needle, on the Thames Embankment, is suffering so severely from its thirty-two years' exposure to the vicissitudes of the London climate that its removal is necessary if the monolith is to be prevented from wilting away. The London atmosphere, with its smoke, its acid, and its fog, is once again said to be gradually destroying the sharpness of the hieroglyphics on which the people of Heliopolis gazed more than three thousand years ago, and which had hardly lost their first freshness when the Needle was removed to the Royal city of Cleopatra a generation or so before the beginning of the Christian Era. We understand, however, that the accusation against the London climate is greatly exaggerated —that its acid is not nearly so mordant, its fog and smoke not nearly so black as they are painted, and that the obelisk which withstood the seasons of three thousand years in Egypt has not yielded to thirty years in the atmosphere of London. There is no question of its decay and of its consequent removal to the South Kensington Museum or the British Museum. Like the statue of Boadicea and other monuments on the Embankment, the Needle is under the care of the London County Council, and that authority has decided that it must be cleaned, a process which takes place at certain intervals. At the same time, while the scaffolding is erected for the cleaning, the opportunity will be taken to make a thorough examination of the four faces of the monument in order to discover if it is really suffering from our climate. If it is, there is but little doubt that modern science will be equal to the occasion. If memory serves us, Sir Erasmus Wilson, who brought the monolith to London, and who was an eminent skin specialist, treated the surface with some preservative preparation, which may or may not have proved effectual.

The Tile Pavement of Reading Abbey.

During building operations which are being carried out at Reading Gaol, a part of an ornamental tile pavement has been unearthed at a depth of about 3ft. So far as can be seen from the portions exposed, it appears to have been the floor of a passage leading from the cloisters of Reading Abbey to the infirmary. This latter building stood on the east side of the site of the present gaol. The tiles themselves are of interest, and show *in situ* the effect of decorated tile pavements. These pavements were doubtless attempts of the Normans to imitate in tile the effective and rich mosaics of the Romans. The tiles are chiefly of two patterns, and represent grotesque figures and floral designs, with border tiles. They are of red colour, with a slightly impressed pattern which was filled with a fine white clay. The whole of the surface of the tiles was originally covered with a thick yellow glaze. They date late thirteenth century or early fourteenth century. It is hoped that the Governor will present the tiles to the town museum, where they will make an interesting and important addition to its relics of Reading Abbey.

Decoration at the Palace of Westminster.

Six new historical paintings for the Houses of Parliament are now being fixed in the panels of the east corridor of the House of Commons, i.e., in the corridor leading from the central hall to the waiting hall of the House of Commons. These paintings, which have been presented by six peers, are the outcome of a suggestion by Mr. Harcourt, the First Commissioner of Works, and the scheme has generally been under the supervision of Mr. Edwin A. Abbey, R.A. The pictures are not true frescoes, but, following the method employed for the decoration of the new London Session House and the Royal Exchange, are executed by the process of marophlage, in which the painting is executed on canvas and afterwards affixed to the walls.

The subjects of the six panels are as follows:—

On the Commons side:—

I. Painted by Mr. Byam Shaw, presented by Lord Airedale: The First Visit of Queen Mary, accompanied by Princess Elizabeth, to London, as described in a well-known passage by Froude. The Queen and Princess are seen at the gate of the Lions' Tower of the Tower of London, and the Queen is in the act of raising the Duke of Norfolk from his knees.

II. Painted by Mr. E. Board, presented by Lord Wandsworth: Latimer preaching at Paul's Cross before King Edward VI.

III. Painted by Mr. F. O. Salisbury, R.B.A., presented by Lord Stanmore: The Trial of Katharine of Aragon in the Hall at Blackfriars.

On the Lords side:—

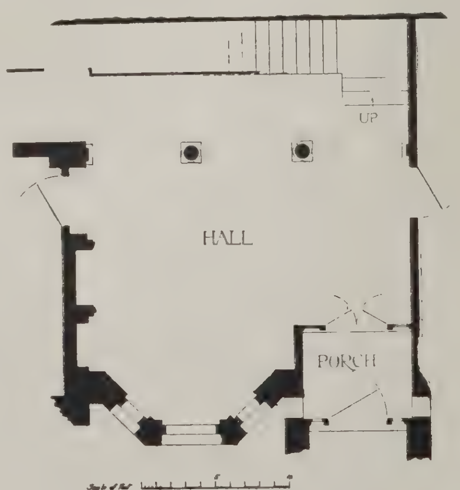
IV. Painted by Mr. H. Payn, presented by Lord Beauchamp: The Plucking of the Red and White Roses in the Temple Garden.

V. Painted by Mr. Denis Eden, R.A.I., presented by Lord Winterstoke of Blagdon: John Cabot receiving from Henry VII. the Charter for the Discovery and Conquest of Unknown Lands.

VI. Painted by Mr. F. Cadogan Cowper, A.R.A., presented by Lord Carlisle: Erasmus and Thomas More visiting the Children of Henry VII. at the Palace of Greenwich.

Professor Blomfield on the Copyright Bill.

Professor Blomfield shows a disposition to tear the Copyright Bill to shreds. As he reads the Bill, the right of veto is conferred not on the architect, but on the man who employed him, so that the architect has neither power nor remedy. Worse still, he might be compelled to seek permission to copy his own work! If this interpretation is accurate, the architect stands to lose more than he gains, and well might Professor Blomfield exclaim, "What with arbitrary limitations of this sort and the piling up on the architect of every conceivable responsibility, the pursuit of architecture will very soon be an impossibility in this country." That is, one may suppose, the pursuit of architecture properly so called—of architecture as an art. Professor Blomfield finds nothing in the Bill to prevent a practical designer from making a set of working drawings of another man's building, and reproducing items elsewhere; nor, he points out, "does the Bill make any attempt to deal with such cases of practical robbery as those in which an architect has made a design for a single building at the ordinary charge of five per cent., and the employer has used again and again the design in these plans without any further payment to the architect or any recognition of his authorship of the design." It will be remembered that, before the Bill was drafted, we laid special stress upon this point, and the failure of the Bill to deal with it would alone be sufficient to condemn the measure as useless, even if it were not as mischievous as Prof. Blomfield apprehends. He is apparently in favour of the principle, but repudiates the Bill.



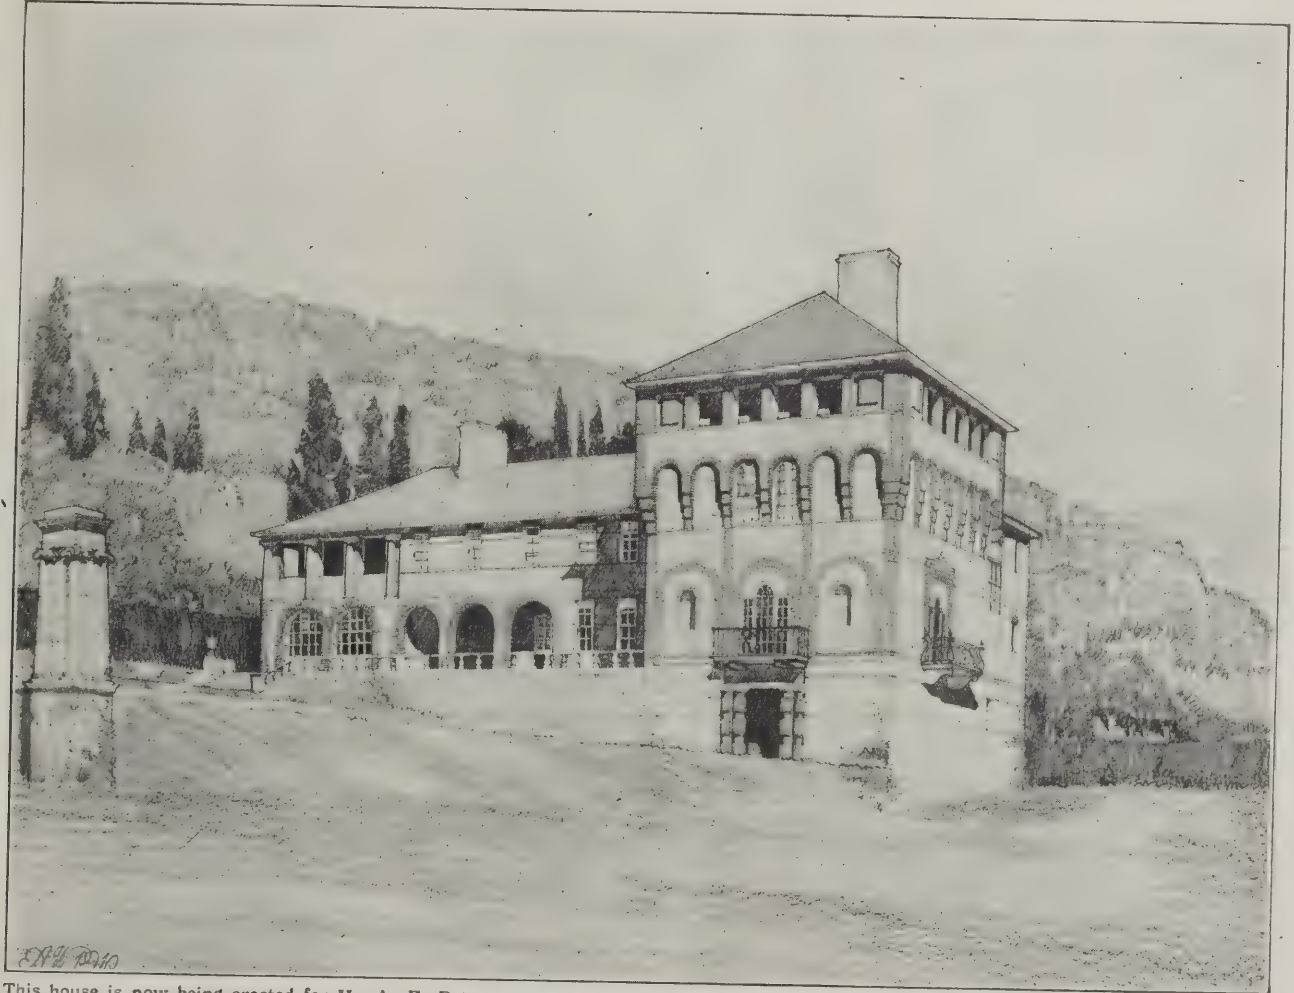
NEW HALL, 67, QUEEN'S GATE, LONDON, S.W.
E. F. C. BUCKLEY, ARCHITECT.

The Imaginative House Agent.

The wily house agent has been haled into the Palace of "Truth" by a perhaps too clever writer in that periodical, who has undertaken the invidious task of translating into plain English the "glowing particulars" written by "literary geniuses" for house agents. He gives three of these translations, this being one: "Disgusting little bijou villa to be let in a half-made suburb. Four bedrooms and three reception-rooms; the three last occupy nearly the space of one decent-sized room. Very artistic, which means that the decorations are carried out in an appalling medley of styles, including spurious Jacobean, Nouveau Art, and imitation Adams. No garden, but a cat-walk could be added if required. Within two minutes walk of Shoddy Park Station, whence there is a fitful service of trains." Very clever, but who was Adams? The writer calls this a "thoroughly honest" description, a phrase that might, in its, turn, deteriorate in translation. The other buildings with which he deals faithfully are a "Loathsome Victorian stucco atrocity in thorough ramshackle order," which has an "exposed garden, beautifully overlooked by palatial workhouse"; and a "beautiful old Cromwellian manor-house [was once]; thoroughly modernised [entirely ruined] by late owner." This is excellent fooling; and the adjective would not be justifiable unless there were some truth in the satire. One cannot altogether blame the house-agent, who, going to the opposite extreme, glorifies with his opulent imagination the houses that somehow or other he must get off his hands, nor the "Truth" humorist who finds him fair game. What is deplorable is the opportunity which inferior buildings afford to both forms of exaggeration.

The Quadriga for the Wellington Arch.

After nearly three years' work Captain Adrian Jones has completed the great bronze quadriga, or four-horsed chariot, which is to be erected on the Constitution Hill Arch at Hyde Park Corner. It is the largest group of statuary in bronze he has ever attempted. The figures have now gone to the foundry to be cast, and something like thirty tons of metal will be required for the purpose. The horses are double life size—that is to say, 32 hands high, or 10ft. 8in. from the withers to the ground. From head to ground that means nearly twenty feet. Leaning forward in the chariot is the driver. If standing, his full height would be nine feet. At the back is the figure of Peace, fourteen feet high. In her right hand she holds high a wreath of laurel, and in her left hand an olive branch. The distance from the tip of her wings to the base is thirty-one feet. First he modelled the two outside horses; secondly, the figure of Peace; next the chariot and one of the middle horses together; then the remaining horse, and lastly the driver. Some idea of the size of the models may be gathered from the sculptor's statement that there have been eight people at a time comfortably inside one of the horses, and more could have been accommodated. The Constitutional Hill Arch, otherwise known as the Wellington Arch, upon which this group will be placed, is the work of Decimus Burton, who originally intended it to bear a four-horse group. It was illustrated with the Quadriga in position, in our issue of September 30, 1908, p. 242. Among other notable contributions which Captain Jones has made to the statuary of the Metropolis are the Carabineers' monument at Chelsea, the equestrian statue of the Duke of Cambridge, opposite the War Office, and the Royal Marines' monument near the Admiralty.



This house is now being erected for Mr. A. F. Petersen, K.C., at Ewhurst in Surrey, at about 600 feet above sea level. It is designed on the lines of an Italian villa, but is constructed of local sandstone and generally of local material, and in accordance with English ideas. Quarry tiles are used for the bond courses, angles, arches, etc., and the dressed stone is confined to the loggia, porch, and grotto entrance. A small Italian terraced garden is shown, designed in harmony with the house. It is held up by retaining walls adapted to the sharp and difficult levels of the hill. Messrs. Goddard and Son, of Farnham and Dorking, are the builders, and Mr. Webber is acting as clerk of works. (*For plan see next page.*)

HURTWOOD EDGE, EWHURST, SURREY. ARTHUR T. BOLTON, F.R.I.B.A., ARCHITECT.

Royal Academy Exhibition, 1910.

FURTHER DISCOVERIES AT KNOSSOS.

Dr. Arthur J. Evans has contributed to "The Times" a lengthy account of further discoveries he has made at Knossos this season. Continuing the excavations already made in the hillside to solve the mystery of the deep vault beneath the Southern Porch of the Palace, the circumference of the vault was proved to be 95 feet, and a special staircase was discovered descending to within three feet of the floor level. From this it has been deduced that the vault was a large reservoir, the steps descending to the average water level, and from the consistent character of the filling in material, containing only pottery fragments of the first Middle Minoan period, it is considered that it formed part of an earlier palace, and was filled in to give secure foundation for this Southern Porch of a late building. No one can wonder at this conclusion, says Dr. Evans. No one, indeed, can wonder at this conclusion who has seen the products of this early civilisation revealed by recent excavations such as those of Mr. Seager at Mochlos.

Mr. Christian Doll's services have again been utilised to supervise various structural works required to ensure the stability of the excavated remains. In the course of these works some angular gypsum slabs which had been laid aside, revealed themselves as parts of steps in the grand staircase, and it has been possible to rebuild five steps of the fourth flight of the grand staircase. The great landing blocks of the fifth flight have also been set in place.

The fresco and plaster remains have been studied on the spot by Mr. Noel Heaton, and the extraordinary part played by painted decoration, both inside and outside the buildings, is now better realised. The lime plaster coating proves to have been faced by a true fresco process in brilliant colours. Close study of the costumes shown on the frescoes proves distinct divergencies from the Minoan costumes, and Dr. Evans deduces from this that the Mycæneans of the mainland represented an allied but independent element, distinguished by certain natural traits of their own from the people of contemporary Crete. The theory that the late Minoan civilisation of Crete was an importation of 'Mycænean,' or even Archæan conquerors, thus loses whatever basis it ever had."

The Little Palace is now shown to have had a considerable annexe to the west connected with the main building by a kind of bridge over a narrow intervening court. On the headland of Isopata, near the remarkably built tomb discovered last season, six other chamber tombs have been discovered, "some of which, for their size and the interest attaching to their contents and arrangement, surpass any hitherto known of this class. The chambers, two of which were about 20ft. square, were excavated in the soft rock and approached in each case by a deep passage way or *dromos*. The whole series was of earlier date than the previously excavated cemetery of Zafer Papoura—the interments in this case all belonging to the most flourishing period of the Later Palace—probably to the second half of the 15th century B.C. A beautiful array of painted vases in the best "Palace style" was thus one of their leading characteristics. The dignity of the departed was in several cases evident, and this notwithstanding the fact that most of the objects in precious metals had been removed in ancient times by tomb-robbers. The two largest tombs seen only to have contained single interments. The rank of the occupant of another chamber was clearly marked by a magnificent ceremonial mace-head of variegated stone. A bronze spear-head also found with him was over a foot and a half in length, exceeding by about a quarter the largest Minoan spear-head hitherto known—that from the 'Chieftain's Grave' at Zafer Papoura."

The most interesting discovery was that of a chamber about six metres square, which was named "The Tomb of the Double Axes." In this chamber the arrangement and relics found suggest that it was a chapel for sepulchral cult, where the protection of the Great Mother or the prehistoric Cretan cult was sought in the shades for the departed warrior. The stone benches ranged round the sides—that to the right lower, as if for children—may well have been devised for some memorial function in which the whole family partook. The interesting question arises—Was this memorial service held but once before the blocking up of the doorway of the tomb, and the filling in of the entrance passage?—or may it have been renewed at intervals of time? A circumstance observed, moreover, at the time when the tomb was opened, may be taken to supply a real indication of this. The filling in of the doorway with a thick walling of stone blocks is not in itself a difficult task. But the breaking open of such a walling is a far more tedious operation, involving the use of tools and implements. It is probable, indeed, that in such a case only so much of the upper part of the blocking would be removed as would allow an easy passage—the mere tomb-robber, indeed, contented himself with a small hole at the top. It is, therefore, certainly a suggestive circumstance that about a mètre down from the original lintel of the doorway, there was found, in the blocking itself, a bronze double axe, not of the thin ritual type found within the tomb, but of the solid make used by the Minoan workmen. A considerable probability therefore arises that the axe, a handy instrument for the purpose, had been used in removing the upper part of the wall on the occasion of some reopening of the sepulchral chamber, and had been overlooked when the upper part of the blocking was replaced. This Bronze Age implement, at any rate, has nothing to do with the iron-using tomb-robbers of the "Geometrical" Period. The "Tomb of the Double Axes" has produced more definite evidence regarding the sepulchral cult and religious ideas as to the after-world than any grave yet opened in Crete or prehistoric Greece. Some further touches are supplied by other tombs of the group, such as the clay chafing-pans that seem to have served as censers for the ritual fumigation of the chamber, and even lumps of actual incense which when burnt retains its characteristic odour after the lapse of thirty-five centuries.

FOREIGN NOTES.

Tenders have been opened in New York for a proposed system of subterranean public ways upon which about three and a quarter millions sterling will be spent.

* * *

The jury in the competition for the reconstruction of the Palais de Justice at Epinal have adopted the scheme of M. Mougenot, the chief city architect, who is to be entrusted with the execution of the work.

* * *

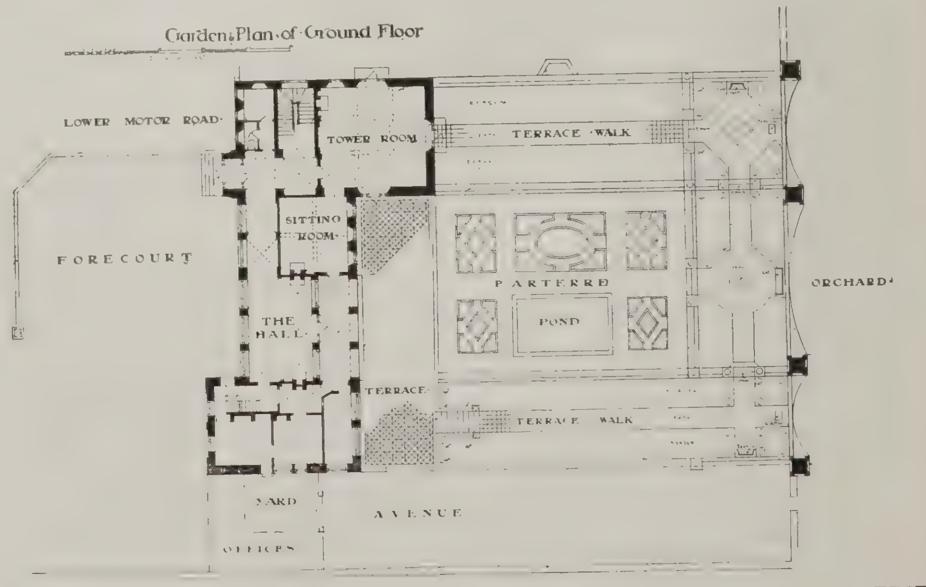
The death is announced of M. Paul Delefortrie, who was a past-president of the Société Regionale des Architectes de la Region du Nord. M. Delefortrie, who was in his sixty-eighth year, had built many châteaux and churches in the North of France. He was the son of an Amiens architect.

* * *

The elections of the offices vacated last July in the Société Centrale des Architectes have resulted as follows: President, M. Girault; vice-presidents, MM. Yvon and Etienne; principal secretary, M. G. Rozet; assistant secretary, M. Destors; editorial secretary, M. F. Bertrand; archiviste, M. Ch. Dupuy.

* * *

At the first sitting of the Literary and Artistic Congress held at Luxembourg, M. de Clermont presented a report on the legislative enactments in force in various centres for the preservation of open spaces, and of monuments. The following recommendations were adopted by the Congress: (1) To promote generally the principle of protecting open spaces and monuments; (2) to give effect to M. Roosevelt's idea of convoking at La Haye an international conference with the object of unifying legislation in this matter; (3) to invite all the national societies to form an international association; (4) to recommend legislative measures for ensuring that the extension of towns shall be in accordance with artistic and æsthetic propriety.



HURTWOOD EDGE, EWHURST SURREY. ARTHUR T. BOLTON, F.R.I.B.A., ARCHITECT.

NEWS IN BRIEF.

Acton was formerly noted for its spring water, and it now appears to be reclaiming its ancient reputation. Recently the Council made some experiments with boring for an artesian well, and the result has been that a large quantity of water has been discovered. The well is bored near the baths, and the quantity of water secured is so abundant that there is not only an adequate supply for the baths, but also sufficient to use for street watering in the neighbourhood. The water has just been analysed, and the analyst reports that it is free from sediment. There is an entire absence of any vegetable organisms, and he is of opinion that this is a good and safe drinking water, admirably suited for the purposes of public baths. It is, he adds, a moderately soft water, softer than any usually supplied to London.

* * *

A project for the convenience of motorists using the Brighton road was foreshadowed at a meeting of the Croydon Borough Council last week. That authority has made application to the new Road Board for advances towards the cost of widening certain bridges and constructing a main road from Thornton Heath pond to Purley, passing through districts in which there are few dwellings and avoiding the congested centre of Croydon by making a wide sweep. The Motor Union has submitted to the council a scheme for a more direct relief route.

* * *

More than £6,000 has been received towards the scheme for providing a fitting memorial at Windsor to King Edward VII. Subscriptions are still coming in to the Mayor of Windsor on behalf of Prince Christian, who is taking a deep personal interest in the proposal, and it is hoped that the total will exceed £10,000.

* * *

Already members of the Clearing Department have taken possession of a part of the new General Post Office, which has been erected on the site of Christ's Hospital, Newgate Street, E.C., but some time must elapse before the whole of the staff of 4,500 can migrate to the buildings from St. Martins-le-Grand. So great is the increase of postal business that it is probable when the shop leases in Newgate Street fall in the sites will be used for a further development of the new Post Office. In that case London will see a Post Office ranging from St. Sepulchre's Church to King Edward Street, and connected thence to the huge buildings of St. Martin's-le-Grand. The architect of the new buildings, Sir Henry Tanner, by the use of reinforced concrete, has provided an astonishing amount of floor space on the 4½ acres. Retaining walls of 8in. thick and floors of 3½in., a chimney shaft of incredible slenderness, have provided economies of space, so that the great sorting rooms are well ventilated and up to date in all requirements. The main public building is in King Edward Street, and, as in the postal department abutting on Newgate Street, a concession has been granted to public taste by having handsome pillared frontages of Portland stone, while the interior fittings are of handsome marbles and woods.

* * *

An official inspection of the new Glasgow Post Office Telephone Exchange took place last week. An exchange was started by the Glasgow Corporation some years ago, but in September, 1906, that service was acquired by the Government. The system then in vogue has since gone out of date, and the Post Office authorities have opened the new exchange, which is installed on the uppermost floor of the Waterloo Street Post Office, and has been fitted to accommodate twelve thousand subscribers' lines in the central district of Glasgow. With the possible exception of the London Central, it is the largest exchange in the Kingdom, and its scope of twelve thousand lines is the maximum limit to which the Post Office works in a single circuit. At present there are over seven thousand wires in operation, and there are ninety telephonists working on the switchboards in addition to a staff of ten supervisors. In all respects the exchange has been organised with a view to establishing a rapid and, as far as possible, automatic service. Every article in the contract. which has been carried out by the Peel Conner Company, is of British manufacture, with the minor exception of three or four slight wooden ladders in the distributing room which came from America. At the luncheon held on the occasion of the inspection, Mr. H. Hirst, chairman of the Peel Conner Telephone Works, said that about 50 per cent. of the total value of telephone contracts was distributed in wages, and in connection with that exchange the sum distributed to workmen exceeded thirty thousand pounds.

* * *

The future of Whitgift Hospital has been again warmly debated by the Croydon Borough Council. The Streets Improvement Committee recommended that application should be made to the Local Government Board for a provisional order containing powers to acquire some 30 properties, whereby the new frontage line would be continued to within about 70ft. of these Elizabethan almshouses. It was urged for the Committee that this was only the non-controversial portion of the old scheme, and that it did not endanger the hospital, as it reached a point where an alternative scheme of widening, by which interference with it would be avoided, could be begun at a future time. Eventually the recommendation was carried by 38 votes to 13.

* * *

At a meeting of the Lancashire County Education Committee, Mr. J. J. Cockshott stated that the Board of Education's schedules disclosed no overcrowding in the county schools, although in eighty-four out of a thousand departments there was an excess in the average attendance allowed by the Board, affecting 1,480 children. Sixty of these departments, however, could be met without providing additional school accommodation by the exclusion of children under five, and the transference of children from one school to another in the same district. In twenty-five cases it would be necessary to provide additional accommodation, and the Committee would at some future time have to replace 26,292 places cut down in the revised list at a cost of £400,000. With regard to the condemned school premises the Committee and managers had these cases well in hand, and there was every prospect of the difficulties being overcome in a satisfactory manner if the Board of Education allowed them sufficient time.

* * *

The proposal by American engineers to move the Liverpool Town Hall bodily so that certain much needed street improvements may be effected in connection with the contiguous streets is meeting with considerable approval and disapproval — approval on the part of those who desire to preserve the Town Hall, which would otherwise probably be demolished; and disapproval by others mainly on sentimental grounds. The scheme, which is based on reports by three firms of American engineers, was introduced for consideration by Mr. A. Lyl Rathbone, a City Councillor. It would involve insertion of a steel platform or cradle beneath the foundations, the removal of the building to the partially new site by screw action, the lifting by jacks, and the insertion of new foundations. The actual removal would occupy two days. Most of the steel platform would be recovered. Business within the building could proceed without interruption. As the structure was so solidly built, the engineers apprehended not the least risk, and Mr. Rathbone believes £30,000 to be an outside estimate of the cost of the work.

* * *

The National Association of Master House Painters and Decorators of England and Wales will hold their annual conference from Monday, October 3, until Friday, October 7. On Tuesday the Lord Mayor of Newcastle, Sir W. H. Stephenson, will extend a civic welcome to the visitors at the headquarters, the Exhibition Hall, and Earl Percy will open an exhibition, consisting of decorative art and manufactures arranged in the hall in connection with the convention. In the afternoon and evening of the same day meetings of a business nature will be held. The annual convention dinner will be given at the County Hotel, where Mr. John Brown, the president, will preside, on Wednesday night, and on Thursday there will be an excursion to Alnwick Castle, followed possibly by further excursions on Friday.

* * *

Jesmond Towers, Newcastle, one of the most commodious and magnificent houses in the district, with 11½ acres of grounds, was submitted for sale on September 20, but withdrawn after one bid of £20,000. It has been proposed that the Corporation should acquire the property for the purpose of a picture gallery, mansion house, and public pleasure gardens.

* * *

At a meeting of the Rotherham and District Trades and Labour Council on September 20, a speaker said that there was something wrong with the Labour Exchanges of the country, and the terrible big fight which had taken place at Sheffield had led him to think that. He was under the impression that Labour Exchanges were going to be a benefit to the working men of this country; still nearly three-parts of the Congress said they were nothing but a hindrance. In his view, that vote put such a ban upon Labour Exchanges that it would be wise for trades unionists to leave them alone. He would add that if they knew what the brassworkers knew, it would open the eyes of trades unionists to such an extent that they would have nothing to do with Labour Exchanges. Until they had a better and proper definition of what the Exchanges were for, they ought to leave them alone. Several speakers in a subsequent discussion on housing denounced the prevalence of "jerry building," and one speaker thought that there were houses in Rotherham that were a disgrace to any civilised community. It would be necessary for Rotherham under the new Act, to go in for a brand new set of by-laws, because the present by-laws were not worth much. Some of the builders were as keen as any lawyers in understanding the law. Another member said he knew of one builder who threatened to sack the first joiner who used a bit of new timber in building operations which were going on.

* * *

Mr. Herbert Measures, iron and steel contractor and engineer, has removed his offices from 4, Exchange Parade, Southwark Street, S.E., to No. 110, Cannon Street, E.C.

* * *

A rumour gained currency in several daily papers last week that the owner of the Adelphi Estate proposed to erect a block of flats on the vacant ground between the Adelphi Terrace and the Victoria Embankment Gardens. Because of the view from Adelphi Terrace, it was only proposed to make the block two storeys in height; but this, rising some 12 feet above the Terrace level, would obstruct the view from the ground floor windows of the Terrace, and the smoke from the flat chimneys would cause considerable annoyance to the inhabitants. Another paper has forecasted the demolition of the Terrace for an extension of the Hotel Cecil. "The Daily Graphic" has since contradicted the rumours, but without saying its authority. It is noteworthy that the original statement was very circumstantial, giving the name of the architects to the estate. A number of flats have been built on the Adelphi Estate in recent years, a whole floor of flats having been added on the tops of Nos. 1, 2, and 3, Robert Street, which houses have been made intercommunicating, and renamed Adelphi Terrace House. An additional floor has recently been added to one of the houses in the Terrace; and the building partly occupied by the Little Theatre and the Camera Club has had two floors of flats added to it. These facts may have given rise to the rumour, or may have given point to it. Particular care seems to have been exercised by the architects, in the Little Theatre building, now just completed, to preserve the amenities and general feeling of the Adelphi quarter.

* * *

At a dinner given by the Bridge House Estates Committee of the Corporation to celebrate the completion of the Blackfriars Bridge widening, Mr. Whitaker Thompson, Chairman of the L.C.C., said that although the City might once have been circumscribed within its walls, it now recognised that there was an extra-mural population with whom they must count, and with whose destinies and benefits the City was associated. He trusted there would be a mutual confidence between the Corporation and the County Council which would enable them to work together for the good of the general community. It may therefore be taken that the somewhat strained relations existing between the Corporation and the County Council over the question of St. Paul's Bridge are in the way of being settled. Mr. C. G. Algar, in recognition of five years' service as chairman of the Bridge House Estates Committee, was presented with an inkstand made of walnut, mounted with silver gilt decorative work, with shields enamelled with the City Arms, the cover being a gold model of the new and widened Blackfriars Bridge.

* * *

An interesting relic of the social life of old Glasgow—the punch-bowl of the Saracen's Head Inn—has been presented to the Glasgow Corporation by Mr. W. C. Carrick, of Eskbank. The Saracen's Head was in the latter part of the eighteenth century the chief hostelry in Glasgow. It was situated in the Gallowgate, and was built in 1755 by Robert Tennent on the site of an old kirkyard near the east or Gallowgate port of the city. Dr. Johnson, with Boswell, put up there on their return from their tour in the Hebrides. The inn was demolished in 1906. The bowl, which has a capacity of four gallons, is of delft ware, and is decorated in blue with a floral ornament inside, and it has a curious adaptation of the city arms on the bottom. On the outside is a landscape with figures.

* * *

It has been definitely decided that the East End Jewish memorial to the late King shall take the form of a fountain to be erected on a site to be selected in consultation with the Stepney Borough Council.

* * *

The pedestal for the memorial statue of the late Sir Henry Irving has been built on the site selected at the north side of the National Portrait Gallery, facing up Charing Cross Road. The statue, the work of Mr. Thomas Brock, R.A., is now being cast in bronze.

* * *

Mr. Andrew Carnegie has made a conditional offer of a further gift of £3,000 for the erection of branch libraries at Hackney.

* * *

With reference to the article by Mr. R. G. Kirkby, late City Architect, Bradford on the design and construction of open-air schools, it should be mentioned that the building at Thackley, near Bradford, was erected by the Frazzi Fireproof Construction, Ltd., on the Frazzi system. The whole contract was undertaken by the company, with the exception of the foundations, which were executed by a local contractor. The walls of the building are constructed with 3in. hollow Frazzi slabs, rough-cast externally, and pointed and left bare internally. Reinforcement of the walls is provided, where it has been considered necessary in the form of light steel stanchions, and the main roofs in the east and west wings are provided with rolled steel joist purlins, carried on the top of these stanchions, all the other roof-framing being done in wood. It is recognised in Mr. Kirkby's paper that this form of construction is permanent, and the Local Government Board has intimated that the system of building, although the walls do not comply with the ordinary by-laws, should be considered permanent, and has also intimated its willingness to grant loans on buildings, for public authorities, erected on this system.

* * *

The Hammersmith Guardians wish to provide additional accommodation at their workhouse, and the Workhouse Committee reported to the Local Government Board that accommodation could be provided for about 84 cases by taking three large rooms now used for storing the inmates' furniture, and extending one other room over the corn mills and labour master's office. The cost was estimated at £271, and the annual saving to the guardians at £866. The Board decided to employ inmate labour in the work. The plans were made by the carpenter on the workhouse staff. The Board in reply stated that they could not regard as a satisfactory arrangement the permanent appropriation of the workhouse basement for wood-chopping purposes, and would not be prepared to sanction any curtailment of the existing workshop accommodation unless other workshops are provided. They considered that the guardians should obtain professional advice before undertaking structural alterations, and should arrange for the carrying out of such work under contract and not by inmate labour. They suggested that the guardians would find it more economical to erect an inexpensive block for the accommodation of 150 to 200 male inmates on the vacant ground on the east end of the existing male blocks. The Board have decided to refer the further consideration of the question to a special committee of the whole Board.

* * *

A memorial is now in course of erection to "Ceiriog" (John Ceiriog Hughes, 1832-1887), the poet who, perhaps more than any other, appeals to the patriotic instincts of Welshmen, and has influenced the national spirit in Wales. The memorial takes the form of a "Ceiriog Memorial" Village Institute, with library and reading room, at Glynceiriog, near Chirk, a quarry village in the heart of the Denbighshire Valley, in which the poet was born, and from which he took his name. Mr. W. Goscombe John, R.A., with characteristic patriotism, is contributing to the institution a panel containing a portrait in relief of the poet, and numerous gifts of works of art and of books for the library have been promised by various donors. The memorial will cost, when complete, about £1,000.

* * *

The tender submitted by Messrs. Brown and Backhouse, of Liverpool, amounting to £5,019, has been accepted for the Waterloo Baptist Church and Schools, Liverpool. The architects are Messrs. George Baines and Son, 5, Clement's Inn, Strand, London, W.C.

* * *

The Dean and Chapter of Wells Cathedral are anxious to raise, without delay, £3,000 for the repair of the central tower and for the extinction of debts incurred in the general repair of the fabric. During the last few years their expenses upon the building have been unusually heavy. Between 1898 and the present time they have laid out over £5,000 upon necessary repairs of the exterior. Of this nearly £500 was spent on the underpinning and repairing of the Chapter House. According to a careful report by the surveyor, Sir Charles Nicholson, a finial of one of the niche-pinnacles on the north-west corner of the tower fell last December. The stone, which weighed over half a hundredweight, crashed through the leadwork and boarding of the roof. It was therefore necessary to erect a scaffold and examine the condition of the masonry. The lowest portion of this central tower, which originally formed a lantern, belongs to the twelfth century. Early in the fourteenth century its height was raised by the addition of a top stage—a tall storey originally lighted by 24 long lancet windows, which were afterwards filled up with stone panelling. To relieve the flatness of the effect, two statues with canopies were added in front of each of the old angle pinnacles. It is chiefly in connection with this last operation that danger has now arisen. The late fourteenth century builders chose their stone from an inferior bed, laid many of the slabs on edge, and scarcely bonded them at all into the main body of the tower, "scribing" them against the older mouldings and making free use of iron cramps. The statues are seriously damaged; the head of one is split into three pieces. Casts have now been taken of the heads, and the broken portions are being dowelled and cemented together. As to the masonry, the most defective stones are being renewed, iron cramps removed, and bonders inserted where possible; and in general every effort is being made to secure everything safely.

The Palladium Theatre of Varieties, London, will be lighted throughout by Siemens fittings and "Tantalum" lamps, and the circuits protected by Siemens "Zed" fuses. "Stannos" wires have been specified for wiring, which, as stated before, has been sublet to Messrs. Rashleigh Phipps and Co., whilst it is intended that the theatre shall be equipped with the most up-to-date and efficient system of illumination and lighting effects.

* * *

The Board of Trade "Labour Gazette" states that employment in the brick-trade continued fair during August, and was better than a year ago. As compared with a year ago, there was an increase of 1.2 per cent. in the number employed, and of 5.2 per cent. in the amount of wages paid.

* * *

The Liverpool autumn exhibition of pictures was opened on Saturday week by the Lord Mayor of London (Sir John S. Knill), who was accompanied by Lady Knill and Miss Knill. Mr. John Lea, chairman of the Arts Sub-Committee of the Liverpool Corporation, presided, and the Lord Mayor of Liverpool (Alderman W. H. Williams) and the Lady Mayoress took part in the ceremony.

* * *

As a memorial to eleven persons who suffered martyrdom at Coventry during the reigns of Henry VIII. and Queen Mary, a large Runic cross has been unveiled by the Mayor (Alderman W. Lee). The cross stands upon three stone tiers, and is 20ft. in height. At the foot are inscribed the names of the martyrs, who are also recorded as having suffered death for conscience' sake.

* * *

In the notes on St. Barnabas Church, Shacklewell (Professor Reilly, architect), last week, it should have been mentioned, with reference to the Seyssel asphalte, that this work was carried out by Messrs. William Salter, Edwards and Co., Hormead Road, W.

* * *

The death is announced of the Rev. Robert Medley Fulford, Vicar of Buckerell near Honiton. Mr. Fulford, who was 65 years of age, was trained as an architect and was for some time in the office of Mr. William White, F.S.A., London, afterwards practising in Exeter. He designed some churches and other buildings in that city and in the neighbourhood. Later he went to Australia, and entered the church in 1891, holding curacies at Ballarat, and, on his return to England, at Woodbury. Subsequently he held livings at Grenada, West Indies, Hennoch, near Bovey Tracey, and Buckerell, to which he was appointed early this year.

* * *

Mr. David Davies, M.P., presided at a Conference held at Shrewsbury in support of the Welsh national memorial to King Edward, among those present being Lord Glanusk and Lord Kenyon. It is proposed to erect a sanatorium. and take other means to fight consumption in the Principality. The scheme is estimated to cost £300,000, and Mr. Davies has already received promises of nearly £150,000.

* * *

The Wandsworth Borough Council has had before it the scheme for enlarging Wimbledon Common, but by 30 votes to 26 refused to support the scheme or contribute to it. Alderman Hunt, L.C.C., moved that the matter should be again referred to the committee in the interests of the whole borough, but this motion was rejected.

Mr. Walter G. Ross, A.R.I.B.A., has removed from 1, West Street, Finsbury Circus, E.C., to 4, Broad Street Buildings, Liverpool Street, E.C. The telephone number (Central 5775) remains the same.

* * *

The Birkenhead Town Council has appointed a committee to consider the future development of the town as to the laying out of new areas, the improvement of areas already built upon, the provision of a town plan, and to report to the Council; and that such committee shall consist of the members of the Road and Improvement Committee, together with Aldermen Mason and Oldham, and Messrs. Bridges, Dodds, Russell, and Tibbits. After some discussion it was decided, on the suggestion of Alderman B. Jones, that the second part of the resolution be altered, so that the new committee should consist of the Road Improvement Committee, with authority to call in other members of the Council and to obtain all necessary information. With this amendment, the motion was unanimously agreed to.

* * *

Lord Pentland, in opening the Smoke Abatement Exhibition promoted by the Glasgow Exhibition, said that the whole history of the development of Glasgow was the conquest of obstacles. He was not sure that that delightful dav was quite the best means of impressing upon people the need for the appliances exhibited, but all who knew Glasgow at other times of the year knew well that nothing could lift a greater load from the industry of the city than to purify its atmosphere, and to relieve it from the gloom which often overtook it on winter afternoons.

* * *

The Local Government Board has decided to hold, or has already held, inquiries into the following items of proposed expenditure by public bodies:—*Water supply.*—Westbury and Wherwellsdown Rural District Council, £3,250 for Steeple Ashton (September 23). *Sewerage and sewage disposal, etc.*—Sheffield City Council, no amount stated (September 23); Plympton St. Mary Rural District Council, £2,600 for Plymstock (September 21); Oldbury Urban District Council, £4,495 (September 24); Easlington Rural District Council, £4,800 (September 21); Leigh-on-Sea Urban District Council, £1,217 (September 28); Surbiton Urban District Council, £63,500 (September 29). *Street improvements, etc.*—Aldeburgh Borough Council, £2,200 (September 21); Hove Borough Council, £1,370 (including £420 for underground convenience) (September 23); Dawlish Urban District Council, £4,000 (September 23); Wrexham Borough Council, £2,800 (September 27); Leigh-on-Sea Urban District Council, £7,522 (September 28); West Bromwich Borough Council, £4,270 (September 28); Warrington Borough Council, £12,519 (September 27); Carshalton Urban District Council, £3,768 (September 27); Finchley Urban District Council, £8,337 (September 26); Chester City Council, £5,434 (September 29); Gosport and Alverstoke Urban District Council, £2,028 (September 30); Ashton-under-Lyne Borough Council, £2,300 (September 28). *Electricity undertakings.*—Walsall Borough Council, £23,225 (September 28); Leigh Borough Council, £1,500 (September 28). *Various.*—Wolverhampton Borough Council, £6,740 for extension of refuse destructor and power plant (September 23); Thornbury Rural District Council, £4,800 for market (September 23); Clevedon Urban District Council, £1,210 for shelter (September 21); Pudsey Borough Council, £7,500 for town hall (September 22); Torquay Borough Council, for gas undertaking, no amount stated (September 22); Ashton-under-Lyne Borough Council, £1,000 for disinfecting station (September 28); Leigh Borough Council, resumption of previous inquiries into town hall, fire brigade, and bridge improvement loans, £2,142, £4,837, and £115 respectively (September 28).

THE NEW Y.M.C.A. BUILDING, MANCHESTER.

A series of interesting tests recently took place at the new Manchester Y.M.C.A., which has been erected to the design of Messrs. Woodhouse, Corbett and Dean, of Manchester, at a cost of some £45,000.

The building, which is seven storeys in height, is constructed with reinforced concrete throughout, faced with faience tile. It contains some very interesting features, amongst others being a large public hall and galleries on the third floor, a gymnasium on the fifth floor, and a running track on the sixth floor (24 laps to the mile), suspended from the roof principals, between which, on the seventh floor, is situated the fives court. On the other side of the building is a swimming bath on the fifth floor, which is 58ft. 6ins. above the ground floor, 60ft. long, by 22ft. wide, and 8ft. deep. The running track is 64ft. above the pavement.

The gallery cantilever, which was tested, was loaded with pig iron over the whole area between cantilevers Nos. 97 and 99, as shown by the accompanying sketch, when the following results were obtained:—

In sixty-fourths of an inch.

Time	Load per sq. ft.	Deflection at A	Deflection at B	Difference between A & B
12.25	Empty	0.0	0.0	—
12.55	1.2 cwts.	1.9	0.3	1.6
One hour interval.				
2.5	Same load and readings.			
2.30	1.8 cwts.	2.7	0.8	1.9
2.40	2.0 cwts.	3.2	0.3	2.9
4.5	Do.	3.2	0.5	2.7
5.0	Do.	3.5	0.5	3.0 *i.e.*, 3/64 ins.
Load removed.				
8.0	Nil	1.8	0.2	1.6

The beams underneath the Bath were also tested with the following results, the bath being filled with water to the extent of 40,468 gallons of water, weighing 183 tons.

Date	Time	Depth of Water at Beam 52	Deflection of Beam 52 in sixty-fourths	Deflection of Beam 51 in sixty-fourths.
July 21,	11.30	0ft. 8ins.	0.0	0.0
July 21,	4.0	0ft. 10ins. minus	0.2	0.0
July 22,	12.0	1ft. 6ins.	0.0	0.0
July 23,	10.45	2ft. 0ins. plus	0.2	0.3
July 25,	12.0	2ft. 6ins.	0.6	0.2
July 26,	3.30	3ft. 6ins.	0.9	0.6
July 27,	1.0	4ft. 3½ins.	2.0	0.7
July 28,	2.30	5ft. 2½ins.	2.3	1.3
July 29,	1.0	6ft. 0½ins.	2.0	2.0
July 30,	12.0	6ft. 3½ins.	2.1	2.0
Aug. 2,	12.0	6ft. 4ins.	2.0	2.0
Aug. 3,	12.0	6ft. 7ins. (full)	2.1	2.0
Aug. 5,	3.0	6ft. 7ins.	2.7	2.1
Aug. 6,	3.0	6ft. 7ins.	2.7	2.2
Aug. 11,	3.0	6ft. 7ins.	2.7	2.2

It was anticipated that the beams would return to the normal, but as it was not convenient to leave the deflectometers in position until the bath was emptied, no results were ascertained.

The engineers for the building were the Trussed Concrete Steel Co., Ltd., of Caxton House, Westminster, and Kahn Trussed Bars and Kahn Bars were used throughout.

The tests were carried out under the supervision of the architects, Messrs. Woodhouse, Corbett and Dean.

COMPETITIONS.

Rothschild Road School, Acton.

The Acton Education Committee adopted on Thursday last the award of the Assessors in the above competition, which is as follows: 1st, Mr. Arthur H. Fitzgerald, 12, Shipley Road, Teignmouth; 2nd, Mr. Percy Brockbank, 14 and 15, County Chambers, Southend-on-Sea; 3rd, Mr. H. A. Cheers, Twickenham.

LIST OF COMPETITIONS OPEN.

OCT 1. ANTWERP. SCHEME FOR LAY-OUT OF SITE OF FORTIFICATIONS, ETC.—Premiums £1,000, £400, and £200. Conditions may be seen at Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

OCT. 1. DENBIGH PUBLIC HALL, MARKETS, MUNICIPAL BUILDINGS, ETC. The Town Council invite competitive plans and designs of a public hall, markets, municipal buildings, etc., at a cost not to exceed £10,000. Particulars (deposit £1 1s.) of J. Parry Jones, Town Clerk, Denbigh.

OCT. 1. BRIGHTON. The Governors of the Brighton, Hove, and Sussex Grammar School invite architects who have erected grammar schools, higher grade or secondary schools, or schools of a similar character during the last fifteen years, to send their names and particulars of such buildings to A. F. Graves, Clerk to the Governors, 9, North Street, Quadrant, Brighton. A selection will be made from those who respond to this invitation, and a limited competition under motto will be instituted, with a professional adviser to assist the Governors in their ultimate choice. The number of competitors selected will probably not exceed seven, and it is the intention of the Governors to employ the author of the approved design to erect the school.

OCTOBER 31, ETC., ROMFORD GARDEN SUBURB. Competitions in six classes for architects and in one class for builders for the best cottages, etc., erected in the Town Planning and Modern House and Cottage Exhibition, Gidea Park, to be held in June and July, 1911. Prizes amounting to £1,050. Particulars of the Secretary of the Exhibition, 33, Henrietta Street, London, W.C.

NOV. 15. TOWN PLAN FOR ESTATES AT RUISLIP AND NORTHWOOD.—The directors of Garden Estates, Limited, 33, Henrietta Street, Covent Garden, W.C., invite competitive designs for a town plan in the parishes named. Terms and conditions obtainable from the company. Deposit, one guinea.

NOV. 29. BANGOR (COUNTY DOWN). SEA-WATER BATHS.—The U.D. Council invite experienced architects to submit plans, specifications, and estimates for the erection of hot sea-water baths, at Pickie. Further particulars can be had on application to J. Milliken, Clerk to the Council, Town Hall, Bangor, Co. Down.

DEC. 1. DUBLIN. NEW PAVILION, ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK. Open only to architects practising in Dublin. Premiums £100 (to be merged), £30, and £20. Conditions on application to the Registrar.

DEC. 1. MANCHESTER. LAYING OUT OF THE BLACKLEY ESTATE. The Manchester Corporation invite architects and others to submit competitive plans, specifications, and estimates for the laying-out of their Blackley Estate. Plans of the estate, etc., from the City Surveyor's office, Town Hall, Manchester. Deposit three guineas.

DEC. 1. BOURNEMOUTH. REBUILDING OF MR. J. E. BEALE'S PREMISES. Competitive designs are invited from architects for rebuilding the above property, for which the following premiums are offered for three selected designs:—1st £100, 2nd £50, 3rd £25. A plan of the site and particulars can be obtained from J. Elmes Beale, owner, Bournemouth, on payment of a deposit of one guinea, which will be refunded upon receipt of a bona-fide design.

IMPROVEMENTS AT WATERLOO STATION, LONDON

The London and South-Western Railway Company are contemplating further improvements in the neighbourhood of Waterloo Station in connection with the enlargement scheme which is now being carried out.

The extension on the south side of the station has already been completed. Spacious new platforms have been provided and the roof area has been increased. Workmen are now busily engaged upon buildings on one side of the slope leading from the south platforms to Waterloo Road, and it is understood that the full scheme will not be completed within the next two years.

The latest idea of the company is to construct a new road which will practically surround the station. This will involve the demolition of some small property and the diversion and improvement of Mepham Street. The latter thoroughfare runs parallel with the South-Eastern Company's line for some distance from the York Road entrance, and afterwards turns round into Waterloo Road. The scheme provides for a new route that will make Mepham Street practically straight. The line of the deviated street is through the company's property on the east side of Mepham Street and Waterloo Road. They are willing to sacrifice their property to the purposes of the improvement, which will undoubtedly be in the interests of the public using the road, while it will also enhance the appearance of a not altogether salubrious locality. It will be necessary to obtain Parliamentary sanction for the scheme. The approval of the Lambeth Borough Council has been given.

CORRESPONDENCE.

"The Difficulties of Preserving Buildings."

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—I send you a sketch of the old building at Limpsfield referred to in your note under the above heading. The most picturesque part of Limpsfield village will certainly be spoilt if this building is demolished, but it should surely be possible to convert it into quite a good post office without injuring it to any great extent.

There is a small yard at the back of the building, and I suggest that if the first floor of the old building were taken out so as to give sufficient height for a post office, leaving in any beams that are necessary to tie the old walls in, and leaving the loft floor intact so as to have a room in the gable, the yard might be built over in three stories, with rooms about 7ft. high, and by this means I should think sufficient accommodation could be secured. The windows in the front of the timber building would, of course, be reinstated in their old position, and as there would be four of these in addition to the door, there would be plenty of light in the public office. The rear room would be lighted from the side and roof, and possibly also from the back. At any rate, some effort should be made to deal with the matter without destroying such a characteristic piece of old timber work, and without injuring the appearance of the village street.

ARTHUR KEEN.

[The note referred to by Mr. Keen under the above heading appeared in our issue for September 14th, under "Notes and News."
—EDITOR.]

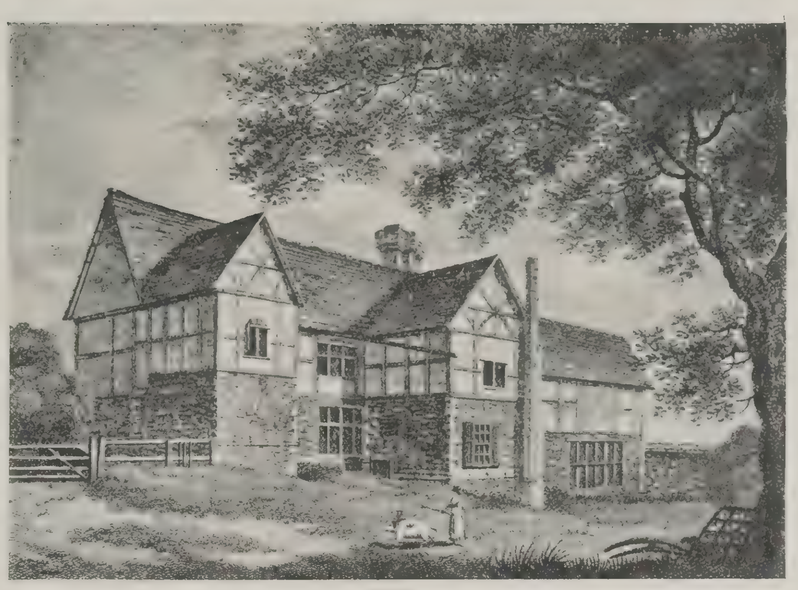
EXPLORATIONS AT LESNES ABBEY.

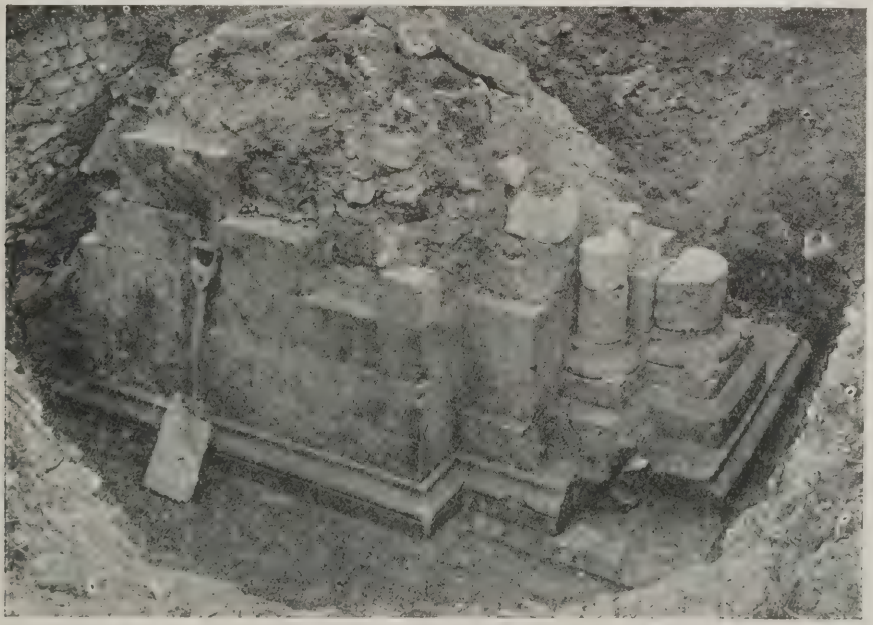


LESNES ABBEY: ABBOT'S LODGING FROM NORTH-EAST, 180'.
(From an engraving in the British Museum.)

A "Report on Explorations at Lesnes Abbey, Kent," which has just been issued by the Woolwich Antiquarian Society, is, both in subject and treatment, an unusually interesting specimen of its class. It contains about fifty well-produced illustrations, a well-written general account of the explorations, and separate descriptions of special features, as well as careful and copious historical notes on the abbey and its founder. A thorough and systematic investigation of the abbey walls and their surroundings was undertaken during 1909, and is still proceeding. It is therefore anticipated that the important discoveries that have been already made will be largely extended.

The history of the abbey may be shortly summarised. It was founded and endowed in 1178, by Richard de Luci, Lord Chief Justice of England, who, during the absence of Henry II. in France, was Regent of the Kingdom. The abbey fell into decay after the dissolution of 1524-5, when its revenues were diverted by Wolsey to his college at Oxford. Since 1633 the property has been rented by farm tenants. Until the present excavations were made, the visible remains of Lesnes Abbey were comparatively insignificant. Operations were begun in the cloister area, where portions of the arcade wall on the north and east sides were discovered, and on work being transferred to the nave of the church, this building was found to have been about 140ft. long by 65ft. 6ins. wide, with north and south aisles. The existing remains above ground comprise two bays of the north aisle wall, with a square angle buttress at the north end of the west front. The bases of two of the responds against this wall, and the base of the circular vaulting shaft in the north-west angle of the aisle, were found in position. The lines of the west front were laid bare, and portions of the two sleeper walls under the main arcades, with the flanking buttresses and the bases of both jambs of the great west door, were located. The transitional character of the work was exactly what might have been expected from the date of the house (1178).

On the site of the north transept, the western wall flanking the cloister was uncovered, and a tiled pavement was found. On the east side of this transept are three chapels of equal size, two of them revealing remains of altars. Here also a portion of tiled pavement was found; and the discovery of such pavements has been so important as to warrant a special description by Mr. Frank C. Elliston Erwood, whose excellent drawings of some of them show many designs that are admirable, as well as some that are quaint rather than artistic. Many interesting fragments of moulded stone, tracery, and vaulting ribs were brought to light, and the many fragments of glass that have been unearthed justify a special note by Mr. Harry J. Powell, who believes that the pieces may be assigned roughly to a period extending from about 1280 to the end of the fourteenth century. He thinks that possibly the collection may be of special value if it throws some fresh light on the decay of mediæval glass and the effect of decay on the transmission of light and colour. Cast into a vault in the Lady Chapel was the effigy of a cross-legged knight, richly coloured, and bearing the arms of a De Luci of Newington, Kent, 1310-20; and under the altar of the Lady Chapel is a curious crypt or chamber, roughly constructed and irregular in shape, with narrow steps leading up to the church presbytery, and probably used as a reliquary. The pamphlet in which these interesting particulars are set forth is issued at half-a-crown, and may be obtained from Squires and Son, 95 and 96, Wellington Street, Woolwich. Subscriptions in furtherance of the excellent work that is being done would be welcomed by Mr. W. T. Vincent, chairman and treasurer of the Works Committee, 189, Burrage Road, Woolwich.



The western piers of the tower were rectangular on plan, having a plain square abutment fronting the aisles, with a semicircular pier, and two side shafts supporting the North and South Tower arches. The abutments of the Nave arcades were unfortunately destroyed by the erection of a garden wall over them.

LESNES ABBEY: SOUTH-WEST PIER OF TOWER.

LESNES ABBEY: WINDOW OF PULPIT STAIRS.

THE R.I.B.A. TOWN PLANNING EXHIBITION

Mr. Raymond Unwin has given to the "Morning Post" some details of the exhibition he is arranging for the forthcoming R.I.B.A. Conference, which exhibition will be held in the galleries of the Royal Academy from October 10 to 22. Mr. Unwin has visited the town planning exhibitions at Berlin and Düsseldorf for the purpose of selecting material, and has obtained examples of the best town-planning work that has been done throughout the world. "We shall show a large selection of plans that have been made by the chief cities in Germany, Austria, Sweden, Denmark, Holland, and France. The Prefect of the Seine has sent us a valuable collection of plans showing the development of Paris from the time of the Revolution, the work that has been carried out by Baron Haussmann, and the work contemplated as part of the great scheme for improving the city, and towards which thirty-two millions were voted some time ago. In addition there will be a large number of models and competitive drawings showing the great care taken in many foreign cities for the improvement of squares, streets, façades, etc. We expect to have over a thousand plans and models of various sorts, and of course many beautiful drawings and perspective sketches, and all the interesting features bearing on town planning. We shall show how many Continental authorities, particularly Scandinavian, are purchasing the land around their towns and developing it, sometimes building themselves, sometimes assisting societies of public utility to build, and generally controlling land speculation and arranging the best system of development.

"The exhibition will also demonstrate how other towns are laying themselves out to foster their industries, reserving all the best sites adjacent to the railways, canals, rivers, or docks, for industrial purposes; how the municipalities—Frankfort and Mannheim, for example—are building new docks (they are building seven miles of new docks at Frankfort, five hundred miles from the sea), with a view to fostering the industries of the town; and how they are laying out areas for industrial dwellings near the manufacturing areas, so that the workmen may have habitations near their work. The exhibit from America will include Mr. Burnham's wonderful series of drawings for remodelling and extending Chicago to almost any extent, preserving the parks, and particularly the recreation grounds for children and adults in proportion to the population in the different areas."

Mr. Unwin said that the Berlin Exhibition was visited by 65,000 people, who paid a shilling each for admission. A great many more were admitted to see the exhibition plans resulting from the competition for laying out the whole of the area round Berlin for a radius of fifteen miles, "one of the greatest town planning competitions ever held. A sum of £8,000 was subscribed for prizes by the different municipalities for suggestions for dealing with serious traffic problems in various parts of Berlin, rearranging railway stations, providing additional railways, and areas for residences of all classes. The prize drawings of this exhibition will be brought to London, and they will show three or four of the best schemes for dealing with the problem, which, though smaller, is still comparable in character to the town planning of Greater London which we are about to face here. The Germans have found that the physical condition of the people is deteriorating as a result of the block system of dwellings, and they are now adopting the cottage system. The city of Ulm is foremost in this innovation. We shall show plans of the cottages of Ulm, and we expect to obtain a larger exhibit showing the workmen's colonies which have been developed at Essen.

"All the garden cities and suburbs planned in England, including Letchworth and Hampstead, will be shown at the exhibition. The subject of town planning will be treated historically. We shall show the development of town planning from the earliest times. There will be Roman, Greek, and Mediæval examples. It is interesting to note," said Mr. Unwin in conclusion, "that the District Surveyor of Marylebone will exhibit a series of drawings in the competition for the laying out of Regent's Park held over a century ago."

FIRES AND WIRE-FUSING.

For some time past it has been customary to attribute all fires whose origin is unknown to the fusing of an electric wire. This has been offered as a complete explanation, as though the fusing of a wire were a mysterious accident without cause or reason.

"It would be much nearer the truth," said Mr. Borlase Matthews, an expert electrician, who has made a special study of this subject, and who has been interviewed by a correspondent of the "Evening News," to attribute many of these fires to the craze for cheapness.

"Drapery firms and others, when they are putting in electric light, ask for estimates. A reliable firm sends in an estimate for, say, £200, and this is received along with an offer for £160. In the majority of cases the offer of £160 is jumped at.

"The reason for the cheapness in the second offer is that it is probably made by a man absolutely without any qualification for his work. The local plumber has picked up a little knowledge of how to lay wires perhaps by living in the same house as an electrical fitter, and he straightway calls himself an electrical engineer.

"It is a wonder there are not more fires. The man's material is of the worst description, and is a constant source of danger.

"There are German firms which manufacture cheap shoddy stuff almost solely for these small men. They don't use it themselves; but they send it over here.

"The Cable Makers' Association in England charges 6d. a yard for 'flex'—the wires by which electric light in shop windows are suspended. That price ensures a standard high quality. These plumbers and carpenters sell 'flex' at 1½d. a yard—made in Germany, of course.

"The result is, that under any strain the outer covering gives way and leaves the wires bare, so that they can come in contact with any metal that lies near. Then there is risk of fire.

"The extraordinary ignorance of people in regard to 'fuses' is another fruitful source of accidents and fires.

"The fuse is a safety device. It is a piece of metal that readily melts under the undue strain of a 'short circuit' caused by the wire breaking or coming in contact with a metal.

"If the fuse is removed and something that does not heat and melt so quickly with the electric current is put in its place, the weakest part of the wire will then 'fuse'—that is, become white hot and melt. This is as likely as not to be in the wood work, and the building is set on fire.

"Yet I have seen the 'fuse' replaced by hairpins of every variety, by wire from a ginger beer bottle, and by a spanner. I have seen the 'fuse' replaced by a coil of wire wound round and round a score of times—which means that at any point of the wire throughout the whole building a fire may occur, for the 'fuse' instead of being the weakest part has been made into the strongest.

"Drapery assistants also do many foolish things. They find that the electric cord in the window is handy for suspending light goods, so they shove pins right through it. The pin joins the two wires, and a short circuit is formed, and unless the fuse is working all right there is risk of fire.

"In America the fire insurance companies allow 5 per cent. reduction to those firms which have electric light, but they do not allow these flexible wires, with hanging lamps in the windows of drapery establishments. The carelessness of the assistants in the matter of pulling them about, bending and straining them, is too great a risk."

There is a patent fuse system by which fires caused through short circuits are rendered impossible. The fuse consists of a bit of silver wire enclosed in a kind of cartridge. As soon as a short circuit is formed the silver wire melts, and the current stops. The molten metal, being enclosed, cannot drop out and set fire to the floor.

THE MITCHELL LIBRARY, GLASGOW.

(*See Centre Plate.*)

This library had its origin in a bequest by the late Mr. Stephen Mitchell, tobacco manufacturer, who, in the year 1877, bequeathed the residue of his estate, amounting to nearly seventy thousand pounds, to the Corporation of the City for the establishment of a large public library chiefly for the purpose of reference and consultation.

The library was opened in temporary premises with fifteen thousand volumes, and in 1891, when it had increased to eighty thousand volumes, it was removed to the building in Miller Street, which it at present occupies.

The development of the library has been continuous and steady, the number of volumes contained in it now being over a hundred and seventy thousand, and the present building has long been inadequate, both for the stock of books and for the accommodation of readers. The Corporation therefore decided upon the erection of the new building, which is now nearing completion, on a site adjoining St. Andrew's Halls, with frontages to North Street, Berkeley Street, and Kent Road.

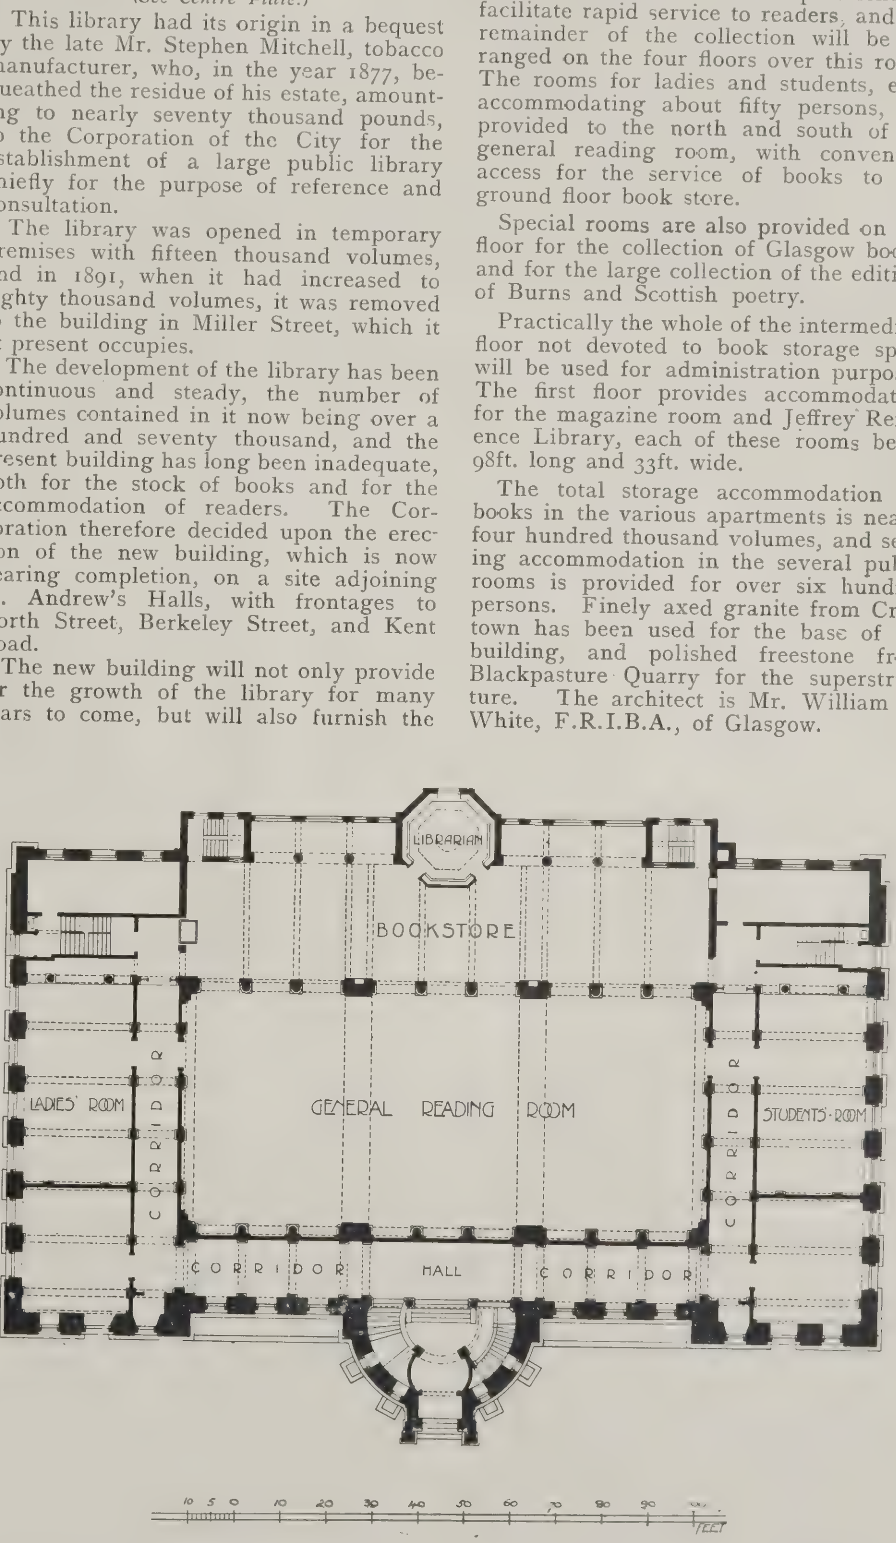
The new building will not only provide for the growth of the library for many years to come, but will also furnish the required space for the Jeffrey Collection, which was some years ago bequeathed to the Corporation on condition that it was kept apart and called The Jeffrey Reference Library.

The basement floor, extending under the entire building, is largely devoted to the storage of books, and also provides the space required for a very complete installation of the plenum system of heating and ventilation. The principal reading room, 113ft. by 52ft., occupies the centre of the building on the ground floor. It is lighted entirely from the roof, and provides accommodation for over 320 persons seated at tables. About forty thousand volumes of the most-used books in the collection will be placed in the book store to the west of this apartment to facilitate rapid service to readers, and the remainder of the collection will be arranged on the four floors over this room. The rooms for ladies and students, each accommodating about fifty persons, are provided to the north and south of the general reading room, with convenient access for the service of books to the ground floor book store.

Special rooms are also provided on this floor for the collection of Glasgow books, and for the large collection of the editions of Burns and Scottish poetry.

Practically the whole of the intermediate floor not devoted to book storage space will be used for administration purposes. The first floor provides accommodation for the magazine room and Jeffrey Reference Library, each of these rooms being 98ft. long and 33ft. wide.

The total storage accommodation for books in the various apartments is nearly four hundred thousand volumes, and seating accommodation in the several public rooms is provided for over six hundred persons. Finely axed granite from Creetown has been used for the base of the building, and polished freestone from Blackpasture Quarry for the superstructure. The architect is Mr. William B. White, F.R.I.B.A., of Glasgow.



THE MITCHELL LIBRARY, GLASGOW. WILLIAM B WHITIE, F.R.I.B.A, ARCHITECT.

FIRE-PREVENTION NOTES.

Drapery Fires. "Another Fatal Drapery Fire" is becoming a too familiar heading in the newspapers. Its latest application (up to the time of going to press) referred to a further fire at the premises of Mr. Wallace Hughes, of the Brixton Road—the third fire of a mysterious series at the same establishment, and the fourth fire that had occurred in the same district within a few weeks. The fire was observed at half-past two in the morning. Dense smoke was seen then to be coming from the windows of a front bedroom occupied by girls, who appeared at the windows, which were about 30ft. above the pavement. As the fire-engines and escapes were heard approaching, the girls were urged not to jump, but to await their arrival. Three of them leapt down, however, and of these one was killed and two were seriously injured. At the inquest it was stated that a projecting signboard played an unfortunate part in the disaster. The girl who met her death struck her head on it as she fell; and some of the witnesses thought that it had prevented the chute from being used, the chute having fallen between the stays and the sign. A fire officer, however, said that the girls, in their panic, had not put out the framework of the chute.
